**Condensation of piperonal with hippuric acid.** II. G. LABRUTO and L. IRRERA (Gazzetta, 1935, 65, 1201—1202).—The condensation product (I), the lactimide of  $\alpha$ -benzamido-3:4-methylenedioxy-cinnamic acid (II) [cf. A., 1934, 526, in which the formula (I) should read CH<sub>2</sub>O<sub>2</sub>·C<sub>6</sub>H<sub>3</sub>·CH·CH<NBz  
CO

reacts with NPh·NH<sub>2</sub> to give a *compound*, C<sub>7</sub>H<sub>8</sub>ON, m.p. 220°, insol. in EtOH, and a *compound*, m.p. 130°, sol. in EtOH. When (II) is boiled with MeOH, the *Me ester*, C<sub>10</sub>H<sub>15</sub>O<sub>5</sub>N, m.p. 150°, is formed.

E. W. W.

**General method for synthesis of substituted phthalidecarboxylic acids.** S. K. CHAKRAVARTI and P. R. VENKATARAMAN (Current Sci., 1936, 4, 483—484).—*o*-Nitromandelic acid, and substituted acids, can be smoothly converted by FeSO<sub>4</sub> and Ba(OH)<sub>2</sub> into the corresponding NH<sub>2</sub>-acids, and then (Sandmeyer) into cyanomandelic acids, which are hydrolysed to phthalidecarboxylic acids. E. W. W.

**Bile acids. XLVIII. Method of production of the compound C<sub>24</sub>H<sub>36</sub>O<sub>10</sub>N<sub>2</sub> (bilianic acid series). Mode of action of nitric acid in oxidations.** M. SCHENCK (Z. physiol. Chem., 1936, 239, 135—142; cf. this vol., 74).—The compound is a lactamamide of which the precursor, in each of the 5 methods described, is the ketolactam. HNO<sub>2</sub> originally present or produced during the reaction is the active agent in the HNO<sub>3</sub> oxidation, which is restricted or prevented by addition of CO(NH<sub>2</sub>)<sub>2</sub>. W. McC.

**New diene syntheses. II.** E. LEHMANN (Ber., 1936, 69, [B], 631—635; cf. A., 1935, 978).—2-*m*-4'-Xylyl-2-methyl- $\Delta^3$ -tetrahydrobenzaldehyde (I) (*loc. cit.*) is reduced by Zn-Hg and 6*N*-HCl to 1:3:1':2'-tetramethyl- $\Delta^5$ -tetrahydrodiphenyl, b.p. 155—158°/12 mm. (very unstable *bromide*), which could not be satisfactorily dehydrogenated. (I) with CrO<sub>3</sub> in AcOH or with conc. aq. KOH affords 2-*m*-4'-xylyl-2-methyl- $\Delta^3$ -tetrahydrobenzoic acid (II), m.p. 102° (accompanied when NaOH is used by 2-*m*-4'-xylyl-2-methyl- $\Delta^3$ -tetrahydrobenzyl alcohol, b.p. 145—146°/0.8 mm.).

(III)

(II) is oxidised by KMnO<sub>4</sub> in alkaline solution to 1':2':3':4'-tetrahydrodiphenyl-1:3:2'-tricarboxylic acid or, more probably, the *lactone* (III), m.p. > 300°.

Phenylmethylallylcarbinol is transformed by PCl<sub>3</sub> in CHCl<sub>3</sub> or by HCl in EtOH into the corresponding unstable *chloride*, converted by KOH at 210—230° into  $\beta$ -phenyl- $\Delta^{8,9}$ -pentadiene (IV), which could not

be purified owing to its great ease of polymerisation. When heated with acraldehyde in C<sub>6</sub>H<sub>6</sub> at 100—105° it gives 2-phenyl-2-methyl- $\Delta^3$ -tetrahydrobenzaldehyde, b.p. 172—174°/12 mm., m.p. 48° (additive compound with NaHSO<sub>3</sub>). Similarly, *p*-tolylmethylallylcarbinol affords successively the corresponding *chloride*, impure  $\alpha$ -*p*-tolyl- $\Delta^{8,9}$ -pentadiene, and 2-*p*-tolyl-2-methyl- $\Delta^3$ -tetrahydrobenzaldehyde, b.p. 176—178°/12 mm., m.p. 51° (corresponding NaHSO<sub>3</sub> compound). H. W.

**Ethyl acetal of cyclohexanone, and its transformation into cyclohexenyl ethyl ether.** A. E. ARBUSOVA and B. M. MICHAILOVA (Trans. Kirov Inst. Chem. Tech. Kazan, 1935, No. 4—5, 41—45).—cycloHexanone and CH(OEt)<sub>2</sub> in presence of H<sub>2</sub>SO<sub>4</sub>

afford CH<sub>2</sub><CH<sub>2</sub>·CH<sub>2</sub>>C(OEt)<sub>2</sub> (I), in 38% yield.

1:2:4 mixtures of (I), P<sub>2</sub>O<sub>5</sub>, and C<sub>5</sub>H<sub>5</sub>N (5 hr.; 100°) yield  $\Delta^1$ -cyclohexenyl Et ether. R. T.

**Pyrolysis of tetrahydronaphthyl naphthyl ketones.** L. F. FIESER and A. M. SELIGMAN (J. Amer. Chem. Soc., 1936, 58, 478—480; cf. A., 1935, 480).—The Grignard reagent from 1-bromo-5:6:7:8-tetrahydronaphthalene, b.p. 130°/2 mm. (from the 1-NH<sub>2</sub>-derivative), with  $\alpha$ - and  $\beta$ -C<sub>10</sub>H<sub>7</sub>-COCl gives  $\alpha$ - $\alpha$ -tetrahydronaphthyl  $\alpha$ - (I), m.p. 107°, and  $\beta$ - (II), m.p. 98°, -C<sub>10</sub>H<sub>7</sub> ketone, respectively. (I) heated at 395—400°/45 min. in N<sub>2</sub> affords 1:12-trimethylene-chrysene, m.p. 116.5—117° (corr.) (*picrate*, m.p. 170—171°), oxidised (Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, AcOH) to (probably) a *ketoguinone*, C<sub>21</sub>H<sub>12</sub>O<sub>3</sub>, m.p. 268—270° (decomp.). (II) heated at 400°/30 min. gives a *hydrocarbon* (III), C<sub>21</sub>H<sub>16</sub>, m.p. 113—115° (corr.) (*picrate*, m.p. 168—169°) (31%), a *hydrocarbon* (IV), C<sub>21</sub>H<sub>14</sub> (? dehydro-8:9-trimethylene-1:2-benzanthracene), m.p. 149—149.5° (corr.) (*picrate*, m.p. 146—147°) (10%), about 7% of (probably) 8:9-trimethylene-3:4-benzphenanthrene, m.p. 138—138.5° (corr.) (*picrate*, m.p. 125—126°), and a little of a *hydrocarbon*, C<sub>21</sub>H<sub>16</sub>, m.p. 96.5—97° (corr.). The hydrocarbon, m.p. 270°, previously obtained (*loc. cit.*) from crude (II), has not been encountered. (III) and (IV) are oxidised to *compounds*, C<sub>21</sub>H<sub>10</sub>O<sub>4</sub>, m.p. 220—223°, and C<sub>21</sub>H<sub>12</sub>O, m.p. 201°, respectively. Ketones containing the tetrahydrobenzo-group are thus unsuitable for the Elbs synthesis; dehydrogenation and migration of H may take place [as with (II)]. H. B.

**Phenylbenzoyldiazomethane.** C. D. NENITZ-ESCU and E. SOLOMONICA (Org. Syntheses, 1935, 15, 62—63).—The prep. from CPhBz·N·NH<sub>2</sub> is described. CH. ABS. (r)

**2':6'-Dihydroxy-4'-methoxy- $\beta$ -phenylpropio-phenone from essential oil of *Populus balsamifera*, L.**—See this vol., 533.

**Constituents of the adrenal gland. II. " $\beta$ -Adrenosterone."** T. REICHSTEIN (Helv. Chim. Acta, 1936, 19, 223—225).—The diketone, G (this

vol., 473), has no oestrogenic effect on mice, but one fifth of the activity of androsterone by the capon test; it is called *adrenosterone* and given the partial formula shown; it is probably a normal constituent of the adrenal gland.

The absorption spectrum of its disemicarbazone is given. R. S. C.

**Sex hormones. XIII. Preparation of 17-ethyltestosterone and the 3-trans-17-cis-diols of androstane and androstene.** Specificity of the sex hormones. L. RUZICKA and H. R. ROSENBERG (Helv. Chim. Acta, 1936, 19, 357—366; cf. this vol., 467).—Dehydro-trans-androsterone (I) and trans-androsterone (II) with MgMeI give mixtures. (I) affords 17-ethyl- $\Delta^5$ -androstene-3-trans-17- $\beta$ -diol (III), m.p. 199—200°, and 30—40% of  $\Delta^5$ -androstene-3-trans-17-cis-diols (IV), m.p. 173—173.5°, sublimes at 100°/0.01 mm. (diacetate, m.p. 149—151°). (I) affords 17-ethylandrostane-3-trans-17- $\beta$ -diol, m.p. 205°, and androstane-3-trans-17-cis-diols (V), m.p. 178—179°, sublimes at 150°/0.01 mm. (V) is also obtained by hydrogenation (PtO<sub>2</sub>) of (IV) in AcOH-EtOH and from (II) and MgPrI with a little 17-Pr derivative. (IV) and CrO<sub>3</sub> give androstane-3:17-dione. (III) and Br-AcOH, followed by CrO<sub>3</sub> (1.5 O), give 17-ethyltestosterone, m.p. 143°. New and revised data are given of the activity of 15 compounds by the capon and rat tests. 17-Methyltestosterone is the most active and also has considerable progesterone activity. The presence of a  $\Delta^4$ - or  $\Delta^5$ -ethylenic linking and the position of the 17-OH are without effect. 3-cis-are more effective than 3-trans-OH-compounds. Me in position 17 raises the efficiency, Et reduces it.

R. S. C.

**Behaviour of magnesium diphenyl bromide with benzoquinone.** D. E. WORRALL and S. COHEN (J. Amer. Chem. Soc., 1936, 58, 533).—*p*-C<sub>6</sub>H<sub>4</sub>Ph-MgBr (I) and *p*-C<sub>6</sub>H<sub>4</sub>O<sub>2</sub> give (*p*-C<sub>6</sub>H<sub>4</sub>Ph)<sub>2</sub> (44%) [also formed from (I) and (NPh)<sub>2</sub>], *p*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub>, and smaller amounts of Ph<sub>2</sub> and *p*-C<sub>6</sub>H<sub>4</sub>Ph-OH. Hydrocarbon formation does not occur with MgPhBr or MgBu<sup>n</sup>Br and *p*-C<sub>6</sub>H<sub>4</sub>O<sub>2</sub>. H. B.

**Sugar-absorption by hydroxyanthraquinones.** I. S. MÜLLER (Magyar chem. Fol., 1934, 40, 135—146; Chem. Zentr., 1935, ii, 514—515).—Co-ordination between the 1-OH and the CO is assumed to occur; the effect of 2- and 8-OH groups in lowering the reactivity of the 1-OH is due to their action in stabilising the ring so formed. H. N. R.

**1:1'-Dianthraquinonyl glyoxal and the anthraflavone of the  $\alpha$ -series.** R. SCHOLL and H. D. WALLENSTEIN (Ber., 1936, 69, [B], 503—513).—Oxidation of 4-chloro-1-methylantraquinone with MnO<sub>2</sub> and H<sub>2</sub>SO<sub>4</sub> and successive treatments of the product with boiling H<sub>2</sub>O and C<sub>5</sub>H<sub>5</sub>N (whereby autoxidation takes place) yields 4:4'-dichloro-1:1'-dianthraquinonyl glyoxal [(I) R=Cl], decomp. 280—300°, which readily gives an alkaline vat from which it cannot be regenerated, is oxidised by HNO<sub>3</sub> in

PhNO<sub>2</sub> to 4-chloroanthraquinone-1-carboxylic acid (II), and is transformed by Me<sub>2</sub>SO<sub>4</sub> into Me 4-chloroanthraquinone-1-carboxylate. Treatment of (I) with

conc. H<sub>2</sub>SO<sub>4</sub> under defined conditions leads to the violet hexasulphate of the lactol form of 4:4'-dichloro-1:1'-dianthraquinonyl ethylenediol [(III) R=Cl, R'=H], which passes when treated with H<sub>2</sub>O into a blue, then violet, powder and ultimately in presence of air affords (I). (III) and NaNO<sub>2</sub> in conc. H<sub>2</sub>SO<sub>4</sub> at 60—90° yield (II). Treatment of the sulphate of (III) with boiling EtOH gives the Et<sub>2</sub> ether [(III) R=Cl; R'=Et], m.p. 240—241°, which is not sensitive to light, does not give a vat, and is de-alkylated to (III) by conc. H<sub>2</sub>SO<sub>4</sub>. The corresponding Me<sub>2</sub> ether has m.p. 241—243°. 1:1'-Dianthraquinonyl glyoxal (IV) [(I) R=H], m.p. 320° (decomp.) when rapidly heated, is obtained by the oxidation of 1-methylantraquinone with MnO<sub>2</sub> and conc. H<sub>2</sub>SO<sub>4</sub> at 65—70°, from anthraquinone-1-carboxyl chloride and Na in xylene at 120—130°, or (best) from Bz-1-Bz'-1-dibenzanthronyl and CrO<sub>3</sub> in boiling AcOH. The corresponding cryst. dilactol sulphate is very sensitive towards H<sub>2</sub>O; with MeOH and EtOH it gives the corresponding ethers. (IV) is transformed by NaOMe in boiling MeOH into anthraquinone-1-carboxylic acid, is converted by NH<sub>2</sub>OH.HCl in boiling C<sub>5</sub>H<sub>5</sub>N into the (?) oxime, m.p. > 360°, and a substance C<sub>13</sub>H<sub>7</sub>O<sub>3</sub>N, m.p. 238—239°, and a bis-diazine, m.p. > 500°. Treatment of (IV) in conc. H<sub>2</sub>SO<sub>4</sub> with Cu powder at 50° gives the dianhydride of dianthramol-9:9'-yl-1:1'-ethylenediol (V), m.p.

about 400°. A further argument in favour of the dilactol structure is found in the conversion of 1-methylantraquinone by KOH and a little anhyd. NaOAc in EtOH at 165° into s-1:1'-dianthraquinonyl ethylene [isoanthraflavone] (VI), m.p. > 360°, which dissolves in conc. H<sub>2</sub>SO<sub>4</sub> to a yellow solution which becomes bluish-red and then shows the absorption spectrum of the dilactol and yields (V) with Cu powder. The following compounds are incidentally described: 9:9'-dihydroxy-9:9'-dianthronyl-1:1'-dicarboxy-dilactone, m.p. 282° (decomp.), from anthraquinol-1-carboxylactone in boiling PhNO<sub>2</sub>, which behaves towards NaOH in the same manner as does (IV); acetic 4-chloroanthraquinone-1-carboxylic anhydride, which softens and evolves Ac<sub>2</sub>O at 141° and passes in C<sub>6</sub>H<sub>3</sub>Cl<sub>3</sub> at 180° into 4-chloroanthraquinone-1-carboxylic anhydride, m.p. 260—262° (decomp.).

H. W.

**Perylene and its derivatives. LXVII. Vat dye of the isoviolanthrone series from perylene-1:12-quinone.** A. ZINKE, W. PENECKE, and F. HANUS (Ber., 1936, 69, [B], 624—630; cf. B., 1929, 891, 1008).—Perylene-1:12-quinone (I) is converted by Zn dust and anhyd. NaOAc in boiling Ac<sub>2</sub>O into 1:12-diacetoxyperylene, m.p. 196°, transformed by AlCl<sub>3</sub> and BzCl in CS<sub>2</sub> followed by hydrolysis into 1:12-dihydroxy-3:9-dibenzoylperylene (II), m.p. about 217° (decomp.). When heated with AlCl<sub>3</sub> (II) gives a blue vat dye also obtained from 1:12-dibenzoyldioxyperylene (III), which cannot be oxidised subsequently to the green dye (*loc. cit.*). The

latter compound is, however, obtained from (II) or (III) and  $\text{AlCl}_3$  in presence of  $\text{MnO}_2$  or from (I) and  $\text{BzCl}$  in absence of added oxidising agent. Oxidation of (II) with  $\text{PbO}_2$  gives a product insol. in  $\text{NaOH}$  which does not give the analytical data of 3:9-dibenzoylperylene-1:12-quinone. The production of the blue and green dyes from (II) indicates the occurrence of a Fries displacement during their formation from (III). Early interruption of the process or the use of milder conditions does not lead to the isolation of intermediate products but establishes the fission of (III). The dyes therefore arise from 1:12-dihydroxyperylene and  $\text{BzCl}$ . Since the green compound is converted by red P and HI ( $d$  1.7) at  $220^\circ$  into isoviolanthrene it has the constitution (IV). (I) is transformed by Br in  $\text{C}_6\text{H}_6$  into tetrabromotetrahydroperylene - 1:12-quinone, decomp.  $220\text{--}230^\circ$  after darkening at  $170^\circ$ , which passes in boiling  $\text{C}_5\text{H}_5\text{N}$  into dibromoperylene-1:12-quinone, m.p.  $272^\circ$  (decomp.). Dichlorodihydroperylene - 1:12-quinone,

from (I) and  $\text{Cl}_2$  in cold  $\text{C}_6\text{H}_6$ , is very unstable, readily yielding chloroperylene-1:12-quinone, m.p.  $271\text{--}272^\circ$  (decomp.). (I) with warm  $\text{HNO}_3$  ( $d$  1.34) affords dinitroperylene-1:12-quinone, decomp.  $> 300^\circ$ , transformed by Zn dust and  $\text{NaOAc}$  in boiling  $\text{Ac}_2\text{O}$  into tetra-acetyldiamino-1:12-diacetoxyperylene, m.p.  $246\text{--}247^\circ$ . 1:12-Di-*p*-bromobenzoyl-, m.p.  $247^\circ$ , and 1:12-dianisoyl-, m.p.  $188^\circ$ , dioxyperylene are described.

H. W.

Perylene and its derivatives. XLV. A tribenzoylperylene. A. ZINKE and E. GESELL. XLVI. A perylene-1:12-cycloperoxide. A. ZINKE and K. J. VON SCHIESZL [with F. HANUS] (Monatsh., 1936, 67, 187—192, 196—202).—XLV. 3:9-Dibenzoylperylene when heated (water-bath; 5 hr.) with anhyd.  $\text{AlCl}_3$  and  $\text{BzCl}$  affords a tribenzoylperylene (I), m.p.  $236\text{--}237^\circ$  [the  $(\text{NO}_2)_3$ -derivative, decomp. about  $300^\circ$ , is reduced by  $\text{NaOH}\text{--}\text{Na}_2\text{S}_2\text{O}_4$  (water-bath) to a dark blue compound], which on Clemmensen reduction yields a compound  $\text{C}_{41}\text{H}_{26}\text{O}_2$ , m.p.  $208^\circ$ , and when heated at  $160^\circ$  with  $\text{AlCl}_3$  gives a trace of an isoviolanthrone-like derivative. It is concluded that migration of Bz from position 3 or 9 during formation of (I) has not taken place, and that the third Bz is not in one of the remaining positions (cf. A., 1930, 1587).

XLVI. 1:12-Dihydroxyperylene (improved prep.) when heated at  $450\text{--}500^\circ$  with moist  $\text{ZnCl}_2$  and Zn yields perylene, but with anhyd.  $\text{ZnCl}_2$  at  $250\text{--}260^\circ$  yields also perylene-1:12-cycloperoxide, m.p. above  $340^\circ$  (cf. A., 1933, 552). This is very stable, being unaffected by  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  in boiling PhMe, or when heated with HI. Only a part dissolves in 20%  $\text{NaOH}\text{--}\text{MeOH}$  during 3 hr. at  $130^\circ$  (sealed vessel). In accord with the structure given, it cannot be used as a vat dye.

H. G. M.

Linalool in coriander oil. Oil from flowering *Coriandrum sativum*.—See B., 1936, 348.

Isomerisation of  $\alpha$ -pinene to an aliphatic terpene (alloocimene). VI. Isomerisation of nopinene,  $d$ - $\Delta^3$ -carene, camphene, and pinocam-

phone. B. A. ARBUSOV (Trans. Kirov Inst. Chem. Tech. Kazan, 1935, No. 4—5, 53—56; cf. A., 1935, 1246).—alloOcimine is obtained in 20% yield by passing nopinene over glass at  $345\text{--}350^\circ$ ; under these conditions  $\Delta^3$ -carene, camphene, and pinocamphone do not undergo conversion into (I).

R. T.

Terpenes and camphors. I. Isomerisation of  $\alpha$ -pinene by activated charcoal. T. MOCHIDA (J. Pharm. Soc. Japan, 1933, 53, 936—947).— $l$ - $\alpha$ -Pinene with active C at  $145\text{--}150^\circ$  affords 95—98% of monoterpenes (75—80% monocyclic, 20—25% camphene) and 2—3% of diterpenes;  $\text{B}_2\text{O}_3$  and  $\text{H}_3\text{BO}_3$  catalyse the reaction. In the gaseous state camphene (12—30%), limonene, dipentene, diterpenes (6—7%), and *p*-cymene are produced.

CH. ABS. (r)

apoBornylene from camphenyl chloride. P. LIPP and J. DANIELS (Ber., 1936, 69, [B], 586—588).—The removal of HCl from camphenyl chloride (I) by  $\text{NaOEt}$  is effected with difficulty so that an exact repetition of Snitter's work (A., 1933, 1300) is impossible. Treatment of (I) with  $\text{KOPh}$  gives a semi-solid cryst. product from which apobornylene is readily isolated. Santene could not be detected. The composition of camphenylene appears to vary greatly and to depend on the mode of elimination of HCl from (I).

H. W.

Polyterpenes and polyterpenoids. CI. Constitution of cedrene and cedrol. L. RUZICKA and E. JUTASSY. CII. Constitution of components of the caryophyllene mixture. L. RUZICKA, W. ZIMMERMANN, and K. HUBER. CIII. Synthesis of the five isomeric methoxy-1:2:7-trimethylnaphthalenes (methoxysapotalins). L. RUZICKA, H. HÖSLI, and K. HOFMANN [with H. BLEULER, S. DEUTSCH, P. J. G. VAN HECK, L'ORANGE, O. NERACHER, E. VON ORELLI, G. PÜRNER, E. REICH, T. SCHINZEL, N. STERNBUCH, W. ZÜRCHER, G. ZUNANA, (FRLNS.) R. ALLEMANN and A. M. SIRKS]. CIV. Synthesis of 3:9:10-trimethyl- and 3:8-dimethyl-picene. L. RUZICKA and E. MÖRGELI. CV. Constitution of the trimethylnaphthols formed during dehydrogenation of triterpenes. Carbon skeleton of pentacyclic terpenes. L. RUZICKA, K. HOFMANN, and J. FREI (Helv. Chim. Acta, 1936, 19, 322—325, 343—353, 370—377, 377—386, 386—392; cf. this vol., 477).—CI. The formation of *p*-cymene at  $> 420^\circ$  does not necessarily indicate the presence of its C-skeleton in cedrene, which may have either of the formulæ shown. Cedrenedicarboxylic

acid with  $\text{HN}_3\text{--CHCl}_3$  and  $\text{H}_2\text{SO}_4$  at  $40\text{--}45^\circ$  gives a 40% yield of a diamine,  $\text{C}_{12}\text{H}_{24}\text{N}_2$  [picrate and hydrochloride, hygroscopic;  $\text{Ac}_2$  derivative, m.p.  $180\text{--}181^\circ$  (corr.)], the phosphate of which at about  $320^\circ$  gives a hydrocarbon,  $\text{C}_{12}\text{H}_{18}$ , b.p.  $85\text{--}87^\circ/10$  mm.

CII. The chemistry of caryophyllene (I) is discussed at length. Ruzicka's formula is preferred, mainly because the Me ester of the derived acid,  $\text{C}_{11}\text{H}_{18}\text{O}_2$ , and Me<sub>2</sub> ester of the acid,  $\text{C}_{13}\text{H}_{18}\text{O}_4$ , are completely hydrolysed by hot 0.1N-KOH-EtOH in 10 hr. *cis*-

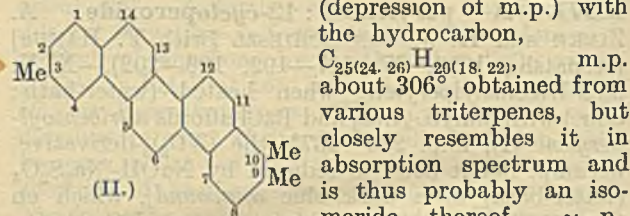

Norcaryophyllenic acid, m.p. 149—150°, is described. The neutral portion obtained on ozonisation of (I) in AcOH yields a ketone,  $C_{10}H_{18}O$ , b.p. 84—85°/12 mm. (*semicarbazone*, m.p. 181°; oxidised by  $KMnO_4$  to an acid,  $C_8H_{14}O_2$ , b.p. 108—110°/12 mm.), possibly  $CH_2<\overset{CMc_2}{\underset{CHMe}{C}}>CH\cdot CH_2Ac$ , and a diketone,  $C_{13}H_{22}O_2$  (lit.,  $C_{13}H_{20}O_2$ ), b.p. 136°/12 mm. (*disemicarbazone*, m.p. 219°, oxidised by  $KMnO_4$  to caryophyllenic acid and  $CO_2H\cdot CH_2\cdot CMe_2\cdot CO_2H$ ), possibly

$CH_2<\overset{CMc_2}{\underset{CHR}{C}}>CH\cdot CH_2Ac$  ( $R=CH_2\cdot CH_2Ac$ ). The dicarboxylic acid,  $C_{10}H_{16}O_4$  (A., 1931, 735), is obtained pure, b.p. about 175°/0.4 mm.; when heated with  $Ac_2O$  at 200° and then decarboxylated, it gives a ketone,  $C_{10}H_{14}O$  (*semicarbazone*, m.p. 186—188°).

CIH. The OH-compound, m.p. 153°, obtained from oleanolic acid by Se, with Ni-pumice in  $H_2$  at 300° gives 1 : 2 : 7- $C_{10}H_5Me_3$ , but its Me ether is not identical with any of the five possible methoxy-1 : 2 : 7-trimethylnaphthalenes, which are synthesised. 4-Methoxy-2 : 3-dimethylbenzaldehyde (prep. by a Gattermann reaction) with  $CHMeBr\cdot CO_2R$  and Mg (not Zn) in  $C_6H_6$  gives a 60—70% yield of a mixture of esters, (?) *Et*  $\beta$ -hydroxy- $\beta$ -4-methoxy-2 : 3-dimethylphenylisobutyrate and  $\beta$ -4-methoxy-2 : 3-dimethylphenyl- $\alpha$ -methylacrylate, from which the latter ester is obtained pure, b.p. 180—185°/12 mm., m.p. 49—50°, by dehydration with  $PBr_3$  in  $C_6H_6$ . Bouveault reduction then affords  $\beta$ -4-methoxy-2 : 3-dimethylphenylisobutyl alcohol, b.p. 170—175°/12 mm., converted by  $PBr_3$  at 100° into the bromide, b.p. 165—170°/12 mm. (decomp.), which leads by way of the nitrile to  $\gamma$ -4-methoxy-2 : 3-dimethylphenyl- $\beta$ -methyl-n-butyric acid, m.p. 107—108°, b.p. 165—170°/0.2 mm. The corresponding acid chloride (prep. by  $SOCl_2$ ) with  $AlCl_3$  in  $CS_2$  at 20° gives 1-keto-7-methoxy-3 : 5 : 6-trimethyl-1 : 2 : 3 : 4-tetrahydronaphthalene, b.p. 158—160°/0.2 mm., reduced (Clemmensen) to a hydrocarbon, which with Pd-C at 300° gives 3-methoxy-1 : 2 : 7-trimethylnaphthalene, m.p. 69—70° [ $1 : 3 : 5-C_6H_3(NO_2)_3$  compound, m.p. 169—170°]. 2-Methoxy-4 : 5-dimethylacetophenone (prep. by Fries rearrangement of 1 : 2 : 4- $C_6H_3Me_2\cdot OAc$  and subsequent treatment with  $Me_2SO_4$ ), b.p. 150—152°/12 mm., with Br in  $Et_2O\cdot CHCl_3$  (3 : 1) gives the  $\omega$ -Bretone, which by condensation with  $CHMe(CO_2R)_2$  leads to  $\gamma$ -keto- $\gamma$ -2-methoxy-4 : 5-dimethylphenyl- $\alpha$ -methyl-n-butyric acid, b.p. 233—238°/15 mm., reduced (Clemmensen) to  $\gamma$ -2-methoxy-4 : 5-dimethylphenyl- $\alpha$ -methyl-n-butyric acid, b.p. 208—211°/15 mm. The corresponding acid chloride (prep. by  $SOCl_2$ ), b.p. 183—184°/15 mm., gives ( $AlCl_3$ ) 1-keto-5-methoxy-2 : 7 : 8-trimethyl-1 : 2 : 3 : 4-tetrahydronaphthalene, b.p. 197—198°/15 mm., which affords (Clemmensen and then Pd-C) 4-methoxy-1 : 2 : 7-trimethylnaphthalene, m.p. 89—90°, b.p. 175—177°/15 mm. [ $1 : 3 : 5-C_6H_3(NO_2)_3$  compound, m.p. 193—194°].  $m-C_6H_4Me\cdot OAc$  leads (Fries;  $Me_2SO_4$ ) to 2-methoxy-4-methylacetophenone, b.p. 135—138°/15 mm., which yields the  $\omega$ -Br-ketone, b.p. 190°/15 mm. (decomp.), and thence  $[CHMe(CO_2R)_2]$   $\gamma$ -keto- $\gamma$ -3-methoxy-p-tolyl- $\alpha$ -methylbutyric, m.p. 121—122°, b.p. 225—230°/15 mm., and (Clemmensen)  $\gamma$ -3-methyl-p-tolyl- $\alpha$ -methylbutyric acid, b.p. 200—215°/15 mm. The chloride, b.p. 165—170°/13 mm., of the latter acid gives 1-keto-

5-methoxy-2 : 7-dimethyl-1 : 2 : 3 : 4-tetrahydronaphthalene, b.p. 185—190°/15 mm., converted by  $MgMeI$  into the impure 1-hydroxy-1 : 2 : 7-trimethyltetrahydro compound, b.p. 165—170°/14 mm., which with Pd-C yields 5-methoxy-1 : 2 : 7-trimethylnaphthalene, m.p. 81—82° [ $1 : 3 : 5-C_6H_3(NO_2)_3$  compound, m.p. 212—213°]. 2-Methoxy-p-toluic acid (from the OH-acid by  $Me_2SO_4$  and subsequent hydrolysis), b.p. 168—170°/11 mm., m.p. 158°, gives the acid chloride, b.p. 127—129°/13 mm., and thence  $\omega$ -chloro-2-methoxy-4-methylacetophenone, b.p. 157—160°/10 mm. This with  $CHMe(CO_2R)_2$  leads to  $\gamma$ -keto- $\gamma$ -2-methoxy-p-tolyl- $\alpha$ -methyl-n-butyric acid, m.p. 106—107°. Clemmensen reduction and ring-closure afford 1-keto-6-methoxy-2 : 7-dimethyl-1 : 2 : 3 : 4-tetrahydronaphthalene, m.p. 95—96°, converted by  $MgMeI$  in  $Et_2O$  and subsequent heating with Pd-C into 6-methoxy-1 : 2 : 7-trimethylnaphthalene, m.p. 83—84° [ $1 : 3 : 5-C_6H_3(NO_2)_2$  compound, m.p. 160—161°].  $o-C_6H_4Me\cdot OAc$  leads (Fries, etc.) to 2-methoxy-3-methylacetophenone, b.p. 125—128°/15 mm., which with  $CHMeBr\cdot CO_2Et$  gives a mixture of esters converted by  $PBr_3$  and finally  $NPhMe_2$  into *Et*  $\beta$ -2-methoxy-m-tolyl- $\alpha$ -methylcrotonate; Bouveault reduction affords  $\gamma$ -2-methoxy-m-tolyl- $\beta$ -methyl-n-butyl alcohol, b.p. about 165°/12 mm., converted by way of the bromide and nitrile into  $\gamma$ -2-methoxy-m-tolyl- $\beta$ -methyl-n-valeric acid, b.p. 146—147°/0.2 mm. The corresponding acid chloride with  $AlCl_3$  in  $CS_2$  gives 1-keto-5-methoxy-3 : 4 : 6-trimethyl-1 : 2 : 3 : 4-tetrahydronaphthalene, b.p. 137—138°/15 mm., which yields 8-methoxy-1 : 2 : 7-trimethylnaphthalene, b.p. 151—153°/9 mm. [ $1 : 3 : 5-C_6H_3(NO_2)_3$  compound, m.p. 176—177°].

CIV. 3 : 9 : 10-Trimethylpicene (II) is not identical (depression of m.p.) with the hydrocarbon,

$C_{25(24, 26)}H_{20(18, 22)}$ , m.p. about 306°, obtained from various triterpenes, but closely resembles it in absorption spectrum and is thus probably an isomeride thereof.  $\gamma$ -p-Tolylbutyryl chloride, b.p. 132°/11 mm., with  $AlCl_3$  in  $CS_2$  gives a 90% yield of 1-keto-7-methyl-1 : 2 : 3 : 4-tetrahydronaphthalene (III), b.p. 131—132°/9 mm., converted by Pd-C at 300—320° in good yield into 7-methyl- $\alpha$ -naphthol, m.p. 110—111°, b.p. 155—156°/10 mm. With  $(NH_4)_2SO_3$  and aq.  $NH_3$  at 160—170° this gives 7-methyl- $\alpha$ -naphthylamine, m.p. 58—59°, b.p. 162°/10 mm. [Ac derivative, m.p. 178—179° (lit. 175—176°)], which [diazo-reaction;  $Hg(NO_3)_2\cdot KBr$ ] gives the salt,  $[C_{10}H_6Me\cdot N_2Br_2]\cdot HgBr_2$ , converted by heating with KBr into 1-bromo-7-methylnaphthalene, b.p. 144.5—146°/12 mm. (picrate, m.p. 101—102°). The Grignard reagent therefrom with  $(CH_2)_2O$  gives  $\beta$ -7-methylnaphthyl-1-ethyl alcohol, b.p. 154—157°/0.5 mm. (p-nitrobenzoate, m.p. 118—119°), and thence ( $SOCl_2\cdot NPhMe_2$ ) the chloride (IV), b.p. 124—125°/0.4 mm.  $\beta$ -3-o-Xylylethyl bromide and  $CH_2(CO_2R)_2$  lead to  $\gamma$ -3-xylyl-n-butyric acid; the corresponding chloride, b.p. 144—146°/10 mm., and  $AlCl_3$  in  $CS_2$  yield 1-keto-5 : 6-dimethyl-1 : 2 : 3 : 4-tetrahydronaphthalene, b.p. 154—158°/8 mm., m.p. 61—62°, which with the Grignard reagent from (IV) gives  $\alpha$ -1-7-methylnaphthyl-

$\beta$ -1'-5' : 6'-dimethyl-3' : 4'-dihydronaphthylethane, b.p. 215—217°/0.3 mm., dehydrogenated by Pd-C to  $\alpha$ -1-7-methylnaphthyl- $\beta$ -1'-5' : 6'-dimethylnaphthylethane, b.p. 225—230°/0.2 mm., m.p. 108.5—109.5° (picrate, m.p. 167—168°). With  $\text{AlCl}_3$  in  $\text{CS}_2$  (3 days; room temp.) this gives (II), b.p. 270°/0.1 mm., m.p. 308—310° after sintering at 305°. The Grignard reagent from (IV) with (III) gives  $\alpha$ -1-7-methylnaphthyl- $\beta$ -1'-7'-methyl-3' : 4'-dihydronaphthylethane, b.p. 198—205°/0.2 mm., which yields (Pd-C)  $\alpha\beta$ -di-(1-7-methylnaphthyl)ethane, b.p. 220—225°/0.3 mm., m.p. 122.5—123.5°, and thence ( $\text{AlCl}_3$ ) 3 : 8-dimethylpicene, m.p. 293—294°. Temp. in this paper are corr.

CV. Hydrogenation ( $\text{PtO}_2$ ) of 7-methoxy-2 : 6-dimethylnaphthalene in AcOH at 60—70° gives the dimethyldecahydronaphthalene, converted by Pd-C at 300—320° into 2 : 6- $\text{C}_{10}\text{H}_8\text{Me}_2$ . The triterpene degradation product (V),  $\text{C}_{10}\text{H}_8\text{Me}_3\cdot\text{OH}$ , m.p. 153°, gives similarly 1 : 2 : 8-trimethyldecahydronaphthalene and thence 1 : 2 : 8- $\text{C}_{10}\text{H}_8\text{Me}_3$ . The conversion of (V) by Se or  $\text{H}_2$ -Ni at 300° into 1 : 2 : 7- $\text{C}_{10}\text{H}_8\text{Me}_3$  must thus be due to migration of Me; (V) is thus 7-hydroxy-1 : 2 : 8-trimethylnaphthalene. Formation of 1 : 2 : 7- $\text{C}_{10}\text{H}_8\text{Me}_3$  during treatment of pentacyclic terpenes

with Se or Ni is probably due either to a similar interchange of Me and OH or to a pinacolin change [(VI)  $\rightarrow$  (VII)]. Ring A of pentacyclic terpenes is probably as in either (VI) or (VIII). Other  $\text{C}_{10}\text{H}_8$  derivatives isolated may also (less probably) have been formed by such reactions and four structures are thus possible for ring E. Sixteen

C-skeletons derived from picene are thus possible for triterpenes and all contain only isoprene units; (IX) is favoured.

R. S. C.

**Mono- and sesqui-terpene series. XI. [Caryophyllenes and related compounds.]** E. DEUSSEN (J. pr. Chem., 1936, [ii], 145, 31—59).—Caryophyllenic acid (I) (prep. essentially that of A., 1929, 931) (as chloride) and Br (1 mol.) give the  $\text{Br}_1$ -derivative, converted by aq.  $\text{Ba}(\text{OH})_2$  into impure hydroxycaryophyllenic acid (*Pb* and *Ba* salts), which is oxidised (2%  $\text{KMnO}_4$ , dil.  $\text{H}_2\text{SO}_4$ , room temp.) to  $\alpha$ -hydroxyisovaleric acid. KOH-fusion of pinic acid (prep.; von Beyer, A., 1896, i, 245) affords AcOH and isovaleric acid; more AcOH is obtained than with (I) (*loc. cit.*). Evidence (lit.) proving the homogeneity (cf. Ruzicka and Wind, A., 1931, 734) of  $\gamma$ -caryophyllene (II) is reviewed. The reactions of (II) are better explained by the Semmler-Deussen (cf. A., 1926, 1252) than the modified structure (Ruzicka, A., 1935, 866). The mechanism previously suggested (A., 1926, 1252) to explain the interconversion of the blue and colourless  $\beta$ -caryophyllene nitrosites is reaffirmed. Contrary to Chapman (A., 1928, 646;

1929, 450), humulene is considered to be identical with optically inactive  $\alpha$ -caryophyllene.

[With E. ROTTSCHIL.] Crude verbanol [obtained by reduction ( $\text{H}_2$ , Pt) of crude verbenol] is oxidised ( $\text{CrO}_3$ , 75% AcOH) to verbanone, b.p. 93—94°/8—9 mm.,  $\alpha$  +49.46° (10 cm.) [when purified through the semicarbazone, m.p. 225° (decomp.)], which with Mg isoamyl bromide gives the carbinol (III), b.p. 120—125°/8 mm., de-

hydrated ( $\text{KHSO}_4$  at 175°) to an impure hydrocarbon [as (III) with double linking at \*\*], b.p. 135°/17 mm.

isoCaryophyllene alcohol (IV) is oxidised ( $\text{MnO}_2$ , dil.  $\text{H}_2\text{SO}_4$ ) to  $\alpha$ - $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ ; definite products are not obtained by the prolonged action of fuming  $\text{HNO}_3$  at 60—100°. (IV) and Br (3 mols.) in AcOH-I (trace) give isocaryophyllene bromide (V), m.p. 61—62°; with 25—26 mols. of Br a product (A) (58.25—59.28% Br) results. Treatment of (A) with 20% EtOH-KOH and 50% NaOH (?) affords products containing less Br; KOH in boiling amyl alcohol removes almost all the Br. Little depression of m.p. is found with (V) and isocaryophyllene chloride or with  $\alpha$ -caryophyllene nitrosobromide and  $\alpha$ -bromocaryophyllene nitrosochloride. H. B.

**Lignin and related compounds. XX. Methanol lignin and its relation to the so-called "primary lignin" of Friedrich and Diwald.** E. G. KING and H. HIBBERT (Canad. J. Res., 1936, 14, B, 12—19; cf. A., 1935, 1373).—Treatment of spruce wood with 5% aq. NaOH at room temp. in  $\text{N}_2$  does not affect the properties or OMe content of the lignin extracted by MeOH. Treatment with 17% HCl leads to lignin of lower OMe content. Thus the "primary lignin" of Friedrich *et al.* (B., 1926, 151) is a degradation product. Hot alkali is without effect on methanol or "primary" lignin in absence of air, but in air gives an acid of lower OMe content. Lignin thus contains no ester groups (cf. *loc. cit.*). If dioxan solutions of lignins with 21% of OMe are treated with  $\text{Et}_2\text{O}$ , 80—85% is pptd., but the sol. portion has > 23% of OMe. R. S. C.

**Lignin and related compounds. XXI. Insoluble methanol lignin.** H. W. MACKINNEY and H. HIBBERT (Canad. J. Res., 1936, 14, B, 55—64).—Spruce wood meal when treated with MeOH dry HCl affords some sol. methanol lignin,  $\text{C}_{42}\text{H}_{32}\text{O}_6(\text{OMe})_6(\text{OH})_4$  (A., 1934, 74), and the residue after complete methylation ( $\text{Me}_2\text{SO}_4$ ) followed by MeOH-dry HCl at 100° affords insol. methanol lignin (I),  $\text{C}_{42}\text{H}_{32}\text{O}_6(\text{OMe})_9$ , (OMe 31.1%), which cannot be further methylated or acetylated. (I) with a large excess of 40—59% HI at 100° is partly demethylated. The product (II) (OMe 4.6%) with  $\text{CH}_2\text{N}_2$  in  $\text{Et}_2\text{O}$  gains 4 OMe (III) [showing that 4 OH are acidic; the original lignin must contain three of these as OMe as only one is phenolic in character (A., 1934, 74)], and after acetylation ( $\text{Ac}_2\text{O}-\text{C}_5\text{H}_5\text{N}$ ) is converted by  $\text{Me}_2\text{SO}_4$  into a  $(\text{OMe})_5$ -derivative (OMe 18.5%), which indicates that demethylation of (I) is accompanied by secondary intramol. changes

involving loss of  $\text{H}_2\text{O}$  from 4 OH groups.  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\text{Cl}$  converts (III) into a *mono-p-toluene-sulphonate* (OMe 12.3%). (II) with  $\text{Ac}_2\text{O}\cdot\text{C}_5\text{H}_5\text{N}$  affords a  $\text{Ac}_4$  derivative. The basis of the lignin structure is probably a group of heterocyclic rings containing O. J. L. D.

**Acidity of pine nitrolignin.** W. RUZICKA and K. KURSCHNER (J. pr. Chem., 1936, [ii], 145, 18—22).—The acidities of the nitrolignin (I) (obtained by nitration of the technical lignin in EtOH-suspension) and its Ac derivative (II) are determined by Kolthoff's iodometric method (A., 1926, 813); 89.14 and 90.7%, respectively, of the H of the  $\text{CO}_2\text{H}$  are calc. to have reacted. The results afford a further proof that (I) contains  $\text{NO}_2$  and  $\text{CO}_2\text{H}$  in the ratio 1:1. The "iodometric acid vals." (cf. B., 1930, 1118) of (I) and (II) are determined under various conditions; hydrolysis is best accomplished with dil. aq. EtOH-NaOH at  $100^\circ$  (bath). H. B.

**Action of carbon disulphide and aqueous potassium hydroxide on alkali lignin.** R. L. GLOVER and J. W. BAIN (Canad. J. Res., 1936, 14, B, 65—75).—Alkali lignin (A., 1926, 209) shaken in dil. KOH with  $\text{CS}_2$  is converted into a lignin-like material containing chemically bound S. An interpretation of the results, involving the formation of a xanthate as the main reaction, is given. J. L. D.

**Constituents of natural phenolic resins. IV. Synthesis of dehydroanhydropicrodophyllin.** R. D. HAWORTH and J. RICHARDSON (J.C.S., 1936, 348—352).—Safrole oxide (I) and Et sodiomalonate give Et  $\beta$ -(3:4-methylenedioxybenzyl)butyrolactone- $\alpha$ -carboxylate, b.p.  $210\text{--}215^\circ/0.5\text{ mm.}$ , which with Na and 3:4:5-trimethoxybenzoyl chloride affords Et  $\alpha$ -(3:4:5-trimethoxybenzoyl)- $\beta$ -(3:4-methylene-dioxybenzyl)butyrolactone- $\alpha$ -carboxylate, m.p.  $156\text{--}157^\circ$ . (I) and Et sodioacetate form  $\alpha$ -acetyl- $\beta$ -(3:4-methylenedioxybenzyl)butyrolactone, m.p.  $91\text{--}92^\circ$ , which is hydrolysed with NaOH to Me  $\gamma$ -hydroxy- $\beta$ -(3:4-methylenedioxybenzyl)propyl ketone, m.p.  $79\text{--}80^\circ$ , or with MeOH-KOH to  $\beta$ -(3:4-methylenedioxybenzyl)butyrolactone, b.p.  $183\text{--}186^\circ/0.5\text{ mm.}$ , and with Na and 3:4:5-trimethoxybenzoyl chloride gives  $\alpha$ -(3:4:5-trimethoxybenzoyl)- $\beta$ -(3:4-methylenedioxybenzyl)butyrolactone, m.p.  $110\text{--}111^\circ$ . This lactone with MeOH-HCl yields the lactone of 1-hydroxy-6:7-methylenedioxy-1-(3':4':5'-trimethoxyphenyl)-3-hydroxymethyl-1:2:3:4-tetrahydronaphthalene-2-carboxylic acid, m.p.  $138\text{--}139^\circ$ , dehydrated ( $\text{KHSO}_4$ ) to the lactone of 6:7-methylenedioxy-1-(3':4':5'-trimethoxyphenyl)-3-hydroxymethyl-3:4-dihydronaphthalene-2-carboxylic acid, m.p.  $248\text{--}249^\circ$ , which with Pd or Pb( $\text{OAc}$ ) $_4$  in AcOH gives the lactone of 6:7-methylenedioxy-1-(3':4':5'-trimethoxyphenyl)-3-hydroxymethyl-naphthalene-2-carboxylic acid, identical with dehydroanhydropicrodophyllin. F. R. S.

**Identity of noroxylin and baicalein.** R. C. SHAH, C. R. MEHTA, and T. S. WHEELER (Current Sci., 1936, 4, 587).—A mixed m.p. indicates the identity. F. N. W.

**Distinction between strophanthins "g" and "k" on the basis of microchemical identification of the sugars obtained on fission.** R.

FISCHER and W. PAULUS (Sci. pharm., 1935, 6, 32—33; Chem. Zentr., 1935, ii, 722).—Strophanthin-g gives rhamnosephenylosazone and strophanthin-k gives glucosephenylosazone. H. N. R.

**Columbin. II. Bitter principles of Colombo root.** II. F. WESSELY, W. ISEMANN, G. SINGER, and K. SCHÖNOL (Annalen, 1936, 522, 41—47; cf. A., 1935, 1432).—A reply to Feist *et al.* (this vol., 89). The methods of isolation and determination of the purity of columbin are described. H. B.

**Constitution of aloins.** E. LÉGER (Bull. Soc. chim., 1936, [v], 3, 435—439; cf. A., 1931, 490).—Structures proposed by Rosenthaler (Pharm. Acta Helv., 1929, 4, 128), Hauser (A., 1932, 370), Cahn and Simonsen (*ibid.*, 1252), and MacDonnell and Gardner (A., 1934, 774) for barbaloin and aloemodin are criticised. H. B.

**Erythrodiol.** J. ZIMMERMANN (Helv. Chim. Acta, 1936, 19, 247—253).—Erythrodiol stearate, m.p.  $125^\circ$  (corr.) [isolation from *Erythroxylon novogranatense* (A., 1932, 1178) described], with  $\text{CrO}_3$  gives a compound (oxime,  $\text{C}_{45}\text{H}_{84}\text{O}_2\text{N}$ , m.p.  $132^\circ$ ) and thence oleanolic acid. The diol, m.p.  $232^\circ$  (corr.) [*diformate*, m.p.  $195^\circ$ , very readily formed; diacetate, m.p.  $232^\circ$  (corr.); formate stearate, m.p.  $65\text{--}66^\circ$ ], with  $\text{CrO}_3$  gives a ketoaldehyde,  $\text{C}_{30}\text{H}_{46}\text{O}_2$  (oxime, m.p.  $275^\circ$ ; dioxime, m.p.  $263^\circ$ ), and thence oleanonic acid, m.p.  $231^\circ$ ; although it gives a colour in  $\text{C}(\text{NO}_2)_4$ , it is not hydrogenated under conditions effective for betulin and thus differs therefrom in the position of the ethylenic linking and of the  $\cdot\text{CH}_2\cdot\text{OH}$ . R. S. C.

**Constituents of *Dicranopterus glauca*, Nakai.** I. New catechutannic substance, "dicranin." S. AKAI and K. NAKAZAWA (J. Pharm. Soc. Japan, 1933, 53, 891—903).—*Dicranin*,  $\text{C}_{44}\text{H}_{40}\text{O}_{18}$  (Ac, Bz, Me $_6$ , and Me $_{10}$  derivatives), containing 10 free OH, is extracted from the dried roots. KOH fusion affords  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  and phloroglucinol. CH. ABS. (r)

**Fukugetin, the colouring matter of the bark of "Fukugi."** III. J. SHINODA and S. UEDA (J. Pharm. Soc. Japan, 1933, 53, 921—931).—Garcinol (I) (Ac $_3$  derivative, m.p.  $202^\circ$ ; Bz $_3$  derivative, m.p.  $224^\circ$ ; Et $_3$  ether, m.p.  $168.5^\circ$ ; dihydro-compound, m.p.  $242\text{--}243^\circ$ ; dihydrotrimethyl ether, m.p.  $95^\circ$ ) is now shown to be  $\text{C}_{16}\text{H}_{12}\text{O}_5$ . Alkali fusion of (I) yields phloroglucinol (III), while oxidation of its Me derivative (II) affords  $p\text{-OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ ; (I) contains 3 phenolic OH, one double linking, and a lactone ring. Possible formulæ are discussed. Alkali fusion of fukugetin (IV) affords (I), AcOH, 3:4-dihydroxyacetophenone, and (III); possible structures are discussed. Garcinin (Murakami, A., 1933, 398) is the Ac derivative, not an isomere of (IV). (II), with EtOH-NaOH, gives a substance,  $\text{C}_{19}\text{H}_{18}\text{O}_6\text{Na}_2$ , converted by MeI into a substance,  $\text{C}_{19}\text{H}_{18}\text{O}_6\text{Me}_2$ , m.p.  $146^\circ$ , which, on reduction, yields a substance,  $\text{C}_{19}\text{H}_{20}\text{O}_6\text{Me}_2$ , m.p.  $117^\circ$ . CH. ABS. (r)

**Pigmentation of the ripening gourd blossom.** II.—See this vol., 651.

**Constituents of *Hydrangea paniculata*.** Hydrangin.—See this vol., 651.

**Condensation reactions of furfuraldehyde and its derivatives.** N. O. CALLOWAY (Iowa State Coll. J. Sci., 1934, 9, 141—143).—The halides of elements in groups III, IV, and V, and org. compounds containing active halogen, resinify furfuraldehyde. For introducing alkyl groups the order of efficiency of catalysts is  $\text{AlCl}_3 > \text{FeCl}_3 > \text{SnCl}_4$ ; for acylation the order is  $\text{SnCl}_4 > \text{FeCl}_3 > \text{AlCl}_3 > \text{TiCl}_4$ . The 5-alkyl-2-furoic acids have marked germicidal activity.

CH. ABS. (r)

**Synthesis of carlina oxide.** R. PAUL (Compt. rend., 1936, 202, 854—856; cf. A., 1933, 1055).—Furfuraldehyde and  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{MgBr}$  give 2-hydroxy- $\alpha$ -phenyl- $\gamma$ -2-furylpropane, b.p. 165—167°/10 mm., which, distilled in  $\text{N}_2$ , gives  $\alpha$ -phenyl- $\gamma$ -2-furyl- $\Delta^2$ -propene, b.p. 138—140°/10 mm. The dibromide of this with  $\text{KOH}\cdot\text{EtOH}$  in  $\text{N}_2$  gives a little  $\alpha$ -benzyl- $\beta$ -2-furylacetylene, b.p. 164—166°/20 mm., which is probably identical with carlina oxide. J. N. A.

**Occurrence of furan derivatives in volatile oils.** III.  $\beta$ - and  $\gamma$ -Clausenan. B. S. RAO and K. S. SUBRAMANIAM (Proc. Indian Acad. Sci., 1936, 3, A, 31—37; cf. this vol., 429).—The leaves from *Clausena Willdenovii*, W. and A., collected in winter, yield oils closely resembling in physical properties those collected previously (A., 1935, 134) in a different place, but differed in that the first fraction consisted mainly of  $\gamma$ - (I),  $\text{C}_{10}\text{H}_{12}\text{O}$ , b.p. 103—104°/50 mm., and little  $\beta$ -clausenan, b.p. 96—97°/50 mm. (Ac derivative, b.p. 105°/32 mm.), which are readily separated since (I) does not form a salt with ferro- and ferri-cyanic acid. (I) is unchanged by  $\text{Ac}_2\text{O}$  etc., does not give a ketone with  $\text{KMnO}_4$ , and is reduced by  $\text{Na}\cdot\text{EtOH}$  to a  $\text{H}_4$ -derivative, b.p. 105°/100 mm. Physical data are given. R. S. C.

**Pyrone series.** III. Influence of the phenyl group in the Kostanecki reaction. I. M. HEILBRON, D. H. HEY, and B. LYTGOE (J.C.S., 1936, 295—300).— $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{Na}$  and  $\text{PhOAc}$  with 2-hydroxy-4-methoxyacetophenone give 7-methoxy-3-phenyl-4-methylcoumarin, hydrolysed ( $\text{NaOH}\cdot\text{MeOH}$ ) to 2:4-dimethoxy- $\alpha$ -phenyl- $\beta$ -methylcinnamic acid, m.p. 153·5°. 2:4-Dimethoxyacetophenone,  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{Et}$ , and Na yield 2:4-dimethoxy- $\omega$ -phenylacetylacetophenone, m.p. 91°, hydrolysed to 7-methoxy-2-benzylchromone, m.p. 192°.  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{Na}$  and  $\text{PhOAc}$  with 2-hydroxy-4-methoxypropionophenone afford 7-methoxy-2-phenyl-4-ethylcoumarin (I), m.p. 115° [hydrolysed ( $\text{NaOH}\cdot\text{MeOH}$ ) to 2:4-dimethoxy- $\alpha$ -phenyl- $\beta$ -ethylcinnamic acid, m.p. 137°], and 7-methoxy-2-benzyl-3-methylchromone, m.p. 102·5°. Resorcinol and  $\alpha$ -propionylphenylacetonitrile with  $\text{H}_2\text{SO}_4$  yield 7-hydroxy-3-phenyl-4-ethylcoumarin, methylated to (I). 2-Hydroxy-4-methoxyphenyl benzyl ketone,  $\text{NaOAc}$ , and  $\text{Ac}_2\text{O}$  afford 7-methoxy-3-phenyl-2-methylchromone (7-methoxy-3':4'-methyleneedioxy-3-phenyl-2-styrylchromone, m.p. 246°) and no coumarin, whilst the ketone and  $\text{NaOPr}$  and  $\text{Pr}_2\text{O}$  give 7-methoxy-3-phenyl-2-ethylchromone, m.p. 119·5°.  $\text{NaOPr}$ ,  $\text{Pr}_2\text{O}$ , and 2-hydroxy-4-methoxyacetophenone yield 7-methoxy-3:4-dimethylcoumarin and 7-methoxy-2-ethylchromone; with  $\text{EtOPr}$  and Na the ketone forms 5-methoxy-2-propionacetylphenol, m.p. 83·5° (cf. Heilbron *et al.*, A., 1934, 1361).

F. R. S.

Dipole moments of two oxonium salts. See this vol., 550.

**Di-*p*-tolylene oxide of Sabatier.** I. Y. SUGII and T. SENGOKU (J. Pharm. Soc. Japan, 1933, 53, 951—952).—The “di-*p*-tolylene oxide,” m.p. 166°, of Sabatier and Mailhe (I) (A., 1910, i, 669) gives on oxidation a dicarboxylic acid,  $\text{C}_{11}\text{H}_8\text{O}_5$ , m.p. > 300° ( $\text{Me}_2$  ester, m.p. 257°), whereas the di-*p*-tolylene oxide, m.p. 64°, of Sugii gives dibenzfuran-3:6-dicarboxylic acid, m.p. > 300° ( $\text{Me}_2$  ester, m.p. 167°), independently synthesised from 3:6-diacetyldibenzfuran. (I), therefore, has not the supposed structure. CH. ABS. (r)

**Sabatier's products of catalytic oxidation of cresols with thorium oxide at high temperature.** T. SENGOKU (J. Pharm. Soc. Japan, 1933, 53, 962—978; cf. preceding abstract).—Oxidation of *o*-cresol with  $\text{PbO}$  gives a so-called “xanthone homologue” (I), m.p. 162—163°, which is oxidised ( $\text{CrO}_3\cdot\text{AcOH}$ ) to xanthone (II), and reduced ( $\text{Na}\cdot\text{EtOH}$ ) to xanthen (III); (I) is probably a mixture of (II) and (III). With  $\text{PbO}$ , *m*-cresol yields Sabatier's “di-*m*-tolylene oxide” (IV), m.p. 200° (A., 1910, i, 669), whilst *p*-cresol furnishes his “di-*p*-tolylene oxide” (V), m.p. 166°. Distillation of *o*-cresol with  $\text{ThO}_2$  yields (II) and (III); hence Sabatier's “di-*o*-tolylene oxide” is a mixture of (II) and (III). *p*-Cresol with  $\text{ThO}_2$  yields (V), which is oxidised ( $\text{K}_2\text{Cr}_2\text{O}_7\cdot\text{AcOH}$ ) to a compound (VI), m.p. 143°, reduced ( $\text{Na}\cdot\text{EtOH}$ ) to (V). 2:5-Cresotic acid yields 2:7-dimethylxanthone, m.p. 143°, identical with (VI), reduced to 2:7-dimethylxanthen, m.p. 166°, identical with (V). Oxidation ( $\text{CrO}_3\cdot\text{AcOH}$ ) of (V) or (VI) yields xanthone-2:7-dicarboxylic acid, m.p. > 300° ( $\text{Me}_2$  ester, m.p. 257°). *m*-Cresol and  $\text{ThO}_2$  afford 3:6-dimethylxanthen, m.p. 200°. CH. ABS. (r)

**Steric configuration and the condition of some ring compounds.**—See this vol., 550.

**Thiophen series.** XXX. Derivatives of 2:2'-dithienyl and  $\alpha\alpha\alpha$ -tetrathienyl. W. STEINKOPF and W. KÖHLER (Annalen, 1936, 522, 17—27).—The Grignard reagent (prep.: A., 1934, 1108) from 2:3:4-tribromothiophen with anhyd.  $\text{CuCl}_2$  gives 3:4:3':4'-tetrabromo-2:2'-dithienyl, m.p. 110°. The tetrabromo-2:2'-dithienyl, m.p. 139—140°, of Auwers and Breddt (A., 1894, i, 444) is probably the 3:5:3':5'-derivative since it is converted by short treatment with  $\text{H}_2\text{SO}_4\cdot\text{H}_2\text{O}$  into a hexabromo- $\alpha\alpha\alpha$ -tetrathienyl (I) (probably A), m.p. 256—258° (accompanied by a trace of

$\text{Br}_2$ -derivative), and by 33% oleum into an octabromo- $\alpha\alpha\alpha$ -tetrathienyl (II), m.p. 297—299°. The formation of (II) probably involves a pentabromodithienyl, i.e., a Jacobsen rearrangement. (I) and (II) are brominated to decabromo- $\alpha\alpha\alpha$ -tetrathienyl, m.p. 324—326°, also formed from hexabromo-2:2'-dithienyl and oleum. 2:2'-Dithienyl (III),  $\text{HgCl}_2$ , and  $\text{NaOAc}$  in aq.  $\text{EtOH}$  give the 5:5'-( $\text{ClHg}$ ) $_2$ -derivative, which is converted by dil.  $\text{HCl}$  into (III),

by I-KI into 5:5'-di-iodo-2:2'-dithienyl, m.p. 164° [also obtained from (III), I, and yellow HgO in C<sub>6</sub>H<sub>6</sub>], and by NaI (4 mols.) in C<sub>5</sub>H<sub>5</sub>N into Hg<sub>2</sub> 5:5:5':5'-di-(2:2'-dithienylene) (IV). (III) and HgO in AcOH afford the (OAc·Hg)<sub>6</sub>-derivative, convertible into the (ClHg)<sub>6</sub>-derivative, decomp. when heated, and thence into hexaiodo-2:2'-dithienyl, m.p. 284—285°. (III) and fuming HNO<sub>3</sub> in Ac<sub>2</sub>O at 0—5° give 5-nitro-2:2'-dithienyl, m.p. 109°, which with Br affords hexabromo-2:2'-dithienyl, m.p. 257°. The hexabromodithienyl, m.p. 125°, of A., 1934, 1108 is wrongly described and should be deleted from the lit. Reaction between thiophen and pure CNBr does not always occur (cf. A., 1923, i, 124); a trace of Br is a catalyst. A Grignard reagent could not be prepared from 2:3-dibromothiophen. 2-Thienoyl chloride, 3:4-dibromothiophen, and AlCl<sub>3</sub> in light petroleum give 3:4-dibromo-2:2'-dithienyl ketone, m.p. 110—111°, brominated to the 3:4:5:4':5'-Br<sub>5</sub>-derivative, m.p. 143—144°. 5-Bromo-, b.p. 238—240°, m.p. 37—38°, 3:4-dibromo-, m.p. 84—85°, and 3:4:5-tribromo-, m.p. 83—85°, -2-thienoyl chlorides do not undergo the Friedel-Crafts reaction. Me 3:4:5-tribromo-2-thienoate has m.p. 113—116°.

H. B.

**Electrolytic reduction of N-methyl- and N-ethyl-succinimide.** B. SAKURAI (Bull. Chem. Soc. Japan, 1936, 11, 41—43).—The electrolytic reduction of N-methylsuccinimide can be carried beyond N-methylpyrrolidone (Lukes, A., 1930, 1296) by using a Zn-Hg cathode in 50% H<sub>2</sub>SO<sub>4</sub> at c.d. 100—125 amp. per sq. dm., at < 30°. N-Ethylsuccinimide under the same conditions gives N-ethylpyrrolidine, and when a Pb cathode in 10% H<sub>2</sub>SO<sub>4</sub> at 3 amp. per sq. dm. is used, gives N-ethylpyrrolidone.

E. W. W.

**Tetra-anisylpyrrole.** F. E. KING and G. D. PATERSON (J.C.S., 1936, 400).—Deoxyanisoin (phenylhydrazone, m.p. 79°), prepared by reducing (SnCl<sub>2</sub>-HCl) anisoin, with N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>SO<sub>4</sub> and NaOAc gives anisyl p-methoxybenzyl ketazine, m.p. 155°, which is cyclised (HCl) to tetra-anisylpyrrole, m.p. 184°, demethylated to tetra-p-hydroxyphenylpyrrole (Ac derivative, m.p. 195°).

F. R. S.

**Fused "onium" salts as acids.** Reactions in fused pyridinium hydrochloride.—See this vol., 574.

**Neutral substances formed in Tschitschibabin's synthesis of β-collidine.** W. HUNTENBURG (J. pr. Chem., 1936, [ii], 145, 23—30).—The following compounds are shown to be present in the neutral fraction, b.p. 60°/760 mm. to 100°/12 mm., formed from CHMe·CH·CHO (I) and NH<sub>3</sub> in presence of Al<sub>2</sub>O<sub>3</sub> at 390° (cf. Tschitschibabin and Oparina, A., 1927, 1086): C<sub>6</sub>H<sub>6</sub>, PhEt, o- and p-C<sub>6</sub>H<sub>4</sub>Me<sub>2</sub>, CHPh·CH<sub>2</sub>, C<sub>10</sub>H<sub>8</sub>, MeCN, PhCN, and o- and p-C<sub>6</sub>H<sub>4</sub>Me·CN. The probable modes of formation from (I) or its decomp. product MeCHO are discussed. Generally, the C<sub>6</sub>H<sub>6</sub> derivatives arise by aldol and similar condensations, whilst RCN result by dehydrogenation of CHR·NH. The main gaseous product is butadiene (probably formed by hydrogenation of cyclobutadiene).

H. B.

**s-Di-(α-picoly)thiocarbamide.** K. S. TOFT-SCHIEV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1,

77—78; cf. A., 1934, 1228).—Prolonged interaction of 6-amino-α-picoline with boiling CS<sub>2</sub> containing a little S affords s-di-(6-methyl-2-pyridyl)thiocarbamide, m.p. 158° (hydrochloride, m.p. 206°). J. L. D.

**Colour reaction of isatin with pyridine and acetic anhydride.** W. GRASSMANN and K. ARNM (Annalen, 1936, 522, 66—74).—Isatin (I), 1-acetyl-isatin, and oxindolylideneacetic acid,

NH< $\begin{smallmatrix} \text{C}_6\text{H}_4 \\ \text{CO} \end{smallmatrix}$ >C:CH·CO<sub>2</sub>H, with C<sub>5</sub>H<sub>5</sub>N and Ac<sub>2</sub>O give

a compound (II), C<sub>30</sub>H<sub>25</sub>O<sub>7</sub>N<sub>3</sub>, red-violet with metallic reflex, which contains 1 mol. of C<sub>5</sub>H<sub>5</sub>N (eliminated by distillation with conc. NaOH) and 3 Ac groups; 1-methylisatin similarly affords a compound, C<sub>28</sub>H<sub>25</sub>O<sub>5</sub>N<sub>3</sub>. Tetrahydroisoquinoline, (I), and Ac<sub>2</sub>O give an analogous compound (III), C<sub>34</sub>H<sub>31</sub>O<sub>7</sub>N<sub>3</sub>, converted by C<sub>5</sub>H<sub>5</sub>N-Ac<sub>2</sub>O into (II). Di-(1-acetyloxindolylidene)acetone (IV), (NAc< $\begin{smallmatrix} \text{C}_6\text{H}_4 \\ \text{CO} \end{smallmatrix}$ >C:CH·)<sub>2</sub>CO

[tetrabromide; p-nitrophenylhydrazone, obtained from (II), (III), or (IV) and p-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·NH·NH<sub>2</sub> in AcOH], prepared from (I), Ac<sub>2</sub>O, and NaOAc, is spectroscopically identical with (II), which is, therefore, a compound of 1 mol. each of (IV), C<sub>5</sub>H<sub>5</sub>N, and AcOH. Reduction (Zn dust, AcOH; H<sub>2</sub>, PtO<sub>2</sub>, AcOH) of (II) or (IV) gives di-(1-acetyloxindolyl)acetone, m.p. 245°.

H. B.

**Polyhalogenated ketones. II. Indole.** G. SANNA (Rend. Seminar. Fac. Sci. R. Univ. Cagliari, 1934, 4, 28—33; Chem. Zentr., 1935, ii, 367; cf. A., 1931, 630).—CHCl<sub>2</sub>·COCl and Mg-indole (I) afford 1:3-bis(dichloroacetyl)indole and 3-dichloroacetylindole, m.p. 202°, yielding indole-3-carboxylic acid (II) on KOH fusion and 3-dibromoacetylindole with aq. KBr; treatment with dil. KOH affords indolyl-3-glycollic acid, m.p. 174°, whilst aq. NH<sub>3</sub> yields 3-carbamylindole, m.p. 201°. Similarly, CCl<sub>3</sub>·COCl and (I) yield 1:3-bis(trichloroacetyl)indole, m.p. 175°, and 3-trichloroacetylindole, m.p. 228°. The latter affords (II) with KOH, whilst, with K<sub>2</sub>CO<sub>3</sub>, it yields some indolyl-3-glyoxylic acid; it is unchanged by KBr or KI. H. N. R.

**Synthesis of δ-3-indolylvaleric acid.** Effects of indole acids on plants. R. H. F. MANSKE and L. C. LEITCH (Canad. J. Res., 1936, 14, B, 1—5).—The following are plant hormones: 3-indolylacetic > γ-3-indolylbutyric (I) > β-3-indolylpropionic > δ-3-indolylvaleric (II) > β-3-(4-methylindolyl)propionic (II) > indylene-1:3-diacetic acid. Root growth, particularly from stems, is increased most by (I). Et cycloheptanone-2-carboxylate (from suberone, Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, and NaOEt), b.p. 135—138°/22 mm., and PhN<sub>2</sub>Cl in 20% KOH give a phenylhydrazone, which with hot EtOH-H<sub>2</sub>SO<sub>4</sub> yields a small amount of a substance, C<sub>29</sub>H<sub>34</sub>O<sub>7</sub>N<sub>2</sub>, m.p. 170° (with N<sub>2</sub>H<sub>4</sub>-MeOH gives a substance, C<sub>25</sub>H<sub>30</sub>N<sub>2</sub>, m.p. 146°), and a product, which with hot KOH-aq. EtOH affords a little pimelic acid and much δ-3-(2-carboxyindolyl)valeric acid, m.p. 204° (decomp.), decarboxylated at 210° to (II), m.p. 105° (Me ester, b.p. 210°/2 mm., m.p. 57°). In the prep. of the indolyl-butyric and -propionic acids adipic and glutaric acid, respectively, are also obtained. (II), m.p. 137°, is obtained similarly, but in poor yield, from Et cyclopentanonecarboxylate and p-C<sub>6</sub>H<sub>4</sub>Me·N<sub>2</sub>Cl. M.p. are corr. R. S. C.

$\alpha\beta$ -Diarylethylamines and their transformation into tetrahydroisoquinolines. II. B. REICHERT and W. HOFFMANN (Arch. Pharm., 1936, 274, 217—221; cf. this vol., 483).—3 : 4 : 5- $C_6H_2Me_3\cdot CHO$ ,  $CH_2Ph\cdot NO_2$ , and a little  $NH_2Me$  in EtOH give  $\alpha$ -nitro- $\alpha$ -phenyl- $\beta$ -3 : 4 : 5-trimethoxyphenylethylene ( $\alpha$ -nitro-3' : 4' : 5'-trimethoxystilbene) (I), m.p. 147°, and a little  $\alpha\gamma$ -dinitro- $\alpha\gamma$ -diphenyl- $\beta$ -3 : 4 : 5-trimethoxyphenylpropane, m.p. about 217° (decomp.). (I) is hydrogenated (Pd-C) in  $C_5H_5N$  to 3' : 4' : 5'-trimethoxydeoxybenzoixime, m.p. 83—84°, reduced (Na-Hg in EtOH) to  $\alpha$ -phenyl- $\beta$ -3 : 4 : 5-trimethoxyphenylethylamine, b.p. about 240°/14.5 mm. (hydrochloride, m.p. 224°), converted by  $CH_2O$  and HCl into 6 : 7 : 8-trimethoxy-3-phenyl-1 : 2 : 3 : 4-tetrahydroisoquinoline, m.p. about 56—58° [hydrochloride, m.p. 258—261° (decomp.)]; NO-derivative, m.p. 127°]. R. S. C.

Ammonium salts containing the cetyl radical. E. MACOVSKI (Bull. Soc. chim., 1936, [v], 3, 498—500).—Trimethylcetylammmonium iodide, m.p. 247° (lit. 222°), and chloride, m.p. 240°, cetyl-pyridinium iodide, m.p. 101°, and chloride, m.p. 110°, -quinolinium iodide, m.p. 99°, and chloride, m.p. 114°, and -isoquinolinium iodide, m.p. 75°, and chloride, m.p. 95°, are described. H. B.

Bis-8-hydroxyquinoline inner complex salt of bivalent silver. Y. NAKATSUKA (Bull. Chem. Soc. Japan, 1936, 11, 45—48).—When 8-hydroxyquinoline in EtOH is added to  $AgOAc$  in hot instead of cold  $H_2O$ , the product is not the yellow complex,  $[(C_9H_6N\cdot O)Ag(C_9H_6N\cdot OH)]$  of  $Ag^+$ , but the green complex  $[(C_9H_6N\cdot O)_2Ag]$ , of  $Ag^+$ ; both crystallise +  $C_5H_5N$ . The complex,  $[(C_9H_6N\cdot O)_2Cu]$  is now obtained +  $2H_2O$ , +  $0.5H_2O$ , and +  $C_5H_5N$ . E. W. W.

Thalleioquinine reaction. II. (SIGNA.) L. MONTI and (SIGNA.) V. CIRELLI (Gazzetta, 1936, 66, 38—41).—The authors' views (A., 1935, 500) are confirmed. Aminoethyl condenses with  $CH_3Ac\cdot CO_2Et$  to form *Et*  $\beta$ -(4-hydroxy-2-methyl-5-isopropylanilino)-crotonate, m.p. 102—104°, which when heated in  $CO_2$  with paraffin oil at 320° gives 4 : 6-dihydroxy-2 : 8-dimethyl-5-isopropylquinoline, m.p. < 300° [picrate, m.p. 216—218°; platinichloride, m.p. 266—268° (both decomp.)]. This, in which position 5 is not free, does not give the thalleioquinine reaction. 8-Hydroxy-5-methylquinoline also fails to give the similar reaction, which is positive with 8-hydroxyquinoline (cf. loc. cit.). E. W. W.

Benzoylation of quinaldine oxide. M. HENZE (Ber., 1936, 69, [B], 534—536).—2-Methylquinoline 1-oxide appears to react in the hydrate form towards NaOH and BzCl, giving an ester which is isomerised to the  $\mu$ -base, which loses  $H_2O$  with formation of 1-benzoyloxy-2-methylene-1 : 2-dihydroquinoline (I), m.p. 52° (picrate, m.p. 164°; platinichloride, m.p. 120°). (I) is transformed by HCl into BzOH and 1-hydroxy-2-methylene-1 : 2-dihydroquinoline, m.p. 66° (picrate, m.p. 144°), which strongly reduces Fehling's and Ag solution, gives a red colour with  $FeCl_3$  in EtOH, and couples with  $p\text{-}SO_3H\cdot C_6H_4\cdot N_2Cl$ . H. W.

Acridine compounds and their antimalarial action. II. Compounds with cyano- and methylthiol groups. O. J. MAGIDSON and A. I.

TRAVIN (Ber., 1936, 69, [B], 537—544; cf. this vol., 484).—Replacement of the 7-Cl in 7-chloro-2-methoxyacridine derivatives by CN does not introduce sp. toxic properties, CN behaving biologically as a stable org. nitrile. Replacement of 2-OMe by 2-SMe has a negative influence on the antimalarial action and considerably increases the toxic effect. 3-Chloro-4-methylbenzonitrile suspended in 70%  $H_2SO_4$  at 55—70° is oxidised by  $K_2Cr_2O_7$  to 2-chloro-4-cyanobenzoic acid (I), m.p. 170—171°, the relatively poor yield being due to enclosure of the nitrile by the insol. acid so that the product contains unchanged nitrile and also 3-chloro-*p*-toluamide; on one occasion when agitation was inefficient, 2-chloro-*p*-carbamidobenzoic acid, m.p. 220° (K salt; hydrolysed to chloroterephthalic acid), was produced. (I),  $p\text{-}OMe\cdot C_6H_4\cdot NH_2$ ,  $K_2CO_3$ , and mol. Cu in boiling isoamyl alcohol afford 4-cyano-2-*p*-methoxyaminobenzoic acid, m.p. 195—196° (K salt), transformed by boiling  $POCl_3$  into 5-chloro-7-cyano-2-methoxyacridine (II), m.p. 228—230°. Condensation of (II) with 8-amino- $\alpha$ -diethylaminopentane in PhOH at 120—130° gives 7-cyano-5-8-diethylamino- $\alpha$ -methylbutylamino-2-methoxyacridine (dihydrochloride, m.p. 240—245°; oxalate, decomp. 180—185°). 7-Cyano-5- $\gamma$ -diethylamino-propylamino-2-methoxyacridine, m.p. 85—87° [dihydrochloride, m.p. 235—245° (decomp.)], and - $\beta$ -hydroxypropylamino-2-methoxyacridine [dihydrochloride (+  $2H_2O$ ), m.p. 220—225° (decomp.)] are obtained similarly. (II), PhOH, and  $NH_3$ —96% EtOH afford 7-cyano-2-methoxyacridone, decomp. 370—375°, whereas in abs. EtOH 7-cyano-5-amino-2-methoxyacridine (hydrochloride) is produced. (II) is hydrolysed by conc. HCl at 140° to 2-methoxyacridone-7-carboxylic acid, decomp. 380—400° (Na salt). 2 : 4- $C_6H_3Cl_2\cdot CO_2H$ , thio-*p*-anisidine,  $K_2CO_3$ , and mol. Cu in boiling isoamyl alcohol give 4-chloro-2-*p*-methylthiophenylaminobenzoic acid, m.p. 194—195°, converted by boiling  $POCl_3$  into 5 : 7-dichloro-2-methylthiolacridine (III), m.p. 182—183° (sulphate), from which 7-chloro-5-8-diethylamino- $\alpha$ -methylbutylamino-2-methylthiolacridine [dihydrochloride (+  $4H_2O$ ), m.p. 210°] and 7-chloro-5- $\gamma$ -diethylaminopropylamino-2-methylthiolacridine (dihydrochloride) are derived. (III) and boiling dil. HCl yield 7-chloro-2-methylthiolacridone, m.p. 335—337°. H. W.

[Acridine compounds and their antimalarial action.] H. MAUSS and F. MRETZSCH (Ber., 1936, 69, [B], 641).—A claim for priority against Magidson *et al.* (preceding abstract). H. W.

Synthesis of compounds with hypnotic properties. I. Alkoxymethylhydantoins. N. E. RIGLER [with H. R. HENZE] (J. Amer. Chem. Soc., 1936, 58, 474—477).— $OAlk\cdot CH_2\cdot CN$  [from  $OAlk\cdot CH_2Cl$  and  $Cu_2(CN)_2$  in  $C_6H_6$ ] and  $MgRBr$  give (cf. A., 1934, 871)  $OAlk\cdot CH_2\cdot COR$  (I), which with  $NH_4CN$  (Herbst and Johnson, A., 1932, 862) or  $(NH_4)_2SO_4$ , KCN, and aq.  $NH_3$  in MeOH (cf. Zelinsky and Stadnikoff, A., 1906, i, 425) afford  $OAlk\cdot CH_2\cdot CR(CN)\cdot NH_2$ . These with  $KNCO$  in 70% AcOH give  $OAlk\cdot CH_2\cdot CR(CN)\cdot NH\cdot CO\cdot NH_2$ , converted by 20% HCl into 5-alkyl- (or aryl)-5-alkoxymethylhydantoins (II). Some of the (II) are also prepared directly from (I) by the method of Bucherer *et al.* (A., 1934 1231). The following are described :

ethoxy-, b.p. 134—135°/755 mm., and isoamyloxy-, b.p. 186—187°/753 mm., acetonitriles; isoamyl methoxymethyl, b.p. 185—186°/752 mm., Et, b.p. 146—147°/752 mm., sec.-Bu, b.p. 172—173°/743 mm., isoamyl, b.p. 105—106°/35 mm., and Ph, b.p. 120—122°/15 mm., ethoxymethyl, and Et isoamyloxymethyl, b.p. 196—197°/752 mm., ketones;  $\alpha$ -amino- $\alpha$ -methoxy- and - $\alpha$ -ethoxy-methylisocyanonitrile (Bz derivatives, m.p. 103° and 66°, respectively; corresponding carbamides, m.p. 127—128° and 126.5°, respectively, and phenylcarbamides, m.p. 151—151.6° and 138°, respectively);  $\alpha$ -amino- $\beta$ -methyl- $\alpha$ -ethoxymethyl-valeronitrile (carbamide, m.p. 113.5—114.5°, and phenylcarbamide, m.p. 119—119.5°);  $\alpha$ -amino- $\alpha$ -ethoxy- and - $\alpha$ -isoamyloxy-methylbutyronitriles (carbamides, oils);  $\alpha$ -amino- $\beta$ -ethoxy- $\alpha$ -phenylpropionitrile (Ac, m.p. 164—165°, and Bz, m.p. 164°, derivatives; carbamide, m.p. 167°; phenylcarbamide, m.p. 167°); 5-isoamyl-5-methoxymethyl-, m.p. 195—196°, 5-ethyl-5-isoamyloxymethyl- (III), m.p. 107—108°, and 5-ethyl-, m.p. 147—148°, 5-sec.-butyl-, m.p. 164.5—165°, 5-isoamyl-, m.p. 179—180°, and 5-phenyl- (IV), m.p. 191.5°, 5-ethoxymethyl-hydantoins. All b.p. and m.p. are corr. (III) and (IV) (as Na salts) are not satisfactory soporifics. H. B.

**Oxidation of 1-phenyl-3-methyl-5-pyrazolone.** G. PERRONCITO (Gazzetta, 1935, 65, 1254—1258).—This is oxidised by  $\text{H}_3\text{AsO}_4$  in AcOH, or  $\text{KMnO}_4$  in HCl, to 4-benzeneazo-1-phenyl-3-methyl-5-pyrazolone (cf. A., 1935, 1380). With  $\text{H}_2\text{O}_2$  in NaOH,  $\text{AcCO}_2\text{H}$  phenylhydrazine is formed; with dry  $\text{H}_3\text{AsO}_4$  at 190°, a substance, m.p. 180°, is also formed, with a product, m.p. > 300°, and 4-anilo-1-phenyl-3-methyl-5-pyrazolone, m.p. 198° (obtainable from the pyrazolone and  $\text{PhNO}$  in  $\text{C}_6\text{H}_6$ ), by oxidation with  $\text{PhNO}_2$ . E. W. W.

**Abnormal action of nitrous acid on hydrazides of organic acids.** (SIGNA.) M. FRERI (Atti R. Accad. Lincei, 1935, [vi], 22, 264—267; cf. A., 1934, 1372).—Citracondihydrazide (I) with  $\text{NaNO}_2$  and AcOH gives, with some azide, m.p. 114° (decomp.), 3:6-diketo-4-methyl-1:2:3:4-tetrahydropyrazine, m.p. 277° (synthesised from  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  and  $\text{Et}_2$  citraconate); (I) in conc. aq. solution with  $\text{NaNO}_2$  and HCl yields 4-oximino-3-methyl-1:2:5-pyrazolone (II) (cf. A., 1904, i, 533). This with  $\text{O}_3$  yields 4-nitro-3-methyl-1:2:5-pyrazolone (III), m.p. 276° ( $\text{NH}_2\text{Ph}$  and  $\text{NHPh}\cdot\text{NH}_2$  salts), which with  $\text{CH}_2\text{N}_2$  yields 4-nitro-1:3:4-trimethylpyrazolone, m.p. 127°, also obtained by action of  $\text{HNO}_3\text{--H}_2\text{SO}_4$  on trimethylpyrazolone. (II) [or (III)] is reduced ( $\text{SnCl}_2$ ) to 4-amino-3-methylpyrazolone hydrochloride (IV), m.p. 225°, which condenses with aldehydes to form Schiff's bases: 4-(p-nitrobenzylidene-, m.p. 257° (decomp.), 4-(anisylidene-, m.p. 202°, and 4-(piperonylidene-, m.p. 245°, amino-3-methylpyrazolone. When (IV) is neutralised, it condenses to form the compound  $\text{Me}\cdot\text{C}_3\text{H}_2\text{ON}_2\cdot\text{N}\cdot\text{C}_3\text{HON}_2\cdot\text{Me}$ , which is reduced ( $\text{SnCl}_2$ ) to 4:4'-bis-(3-methylpyrazolyl)ammonium chloride, m.p. 247°. E. W. W.

**Indoles and isatogens.** XXII. Benzodipyrroles. III. 2:6-Dimethyl-lin-m-benzodipyrrole. P. RUGGLI and O. STRAUB [with O. SCHMID] (Helv. Chim. Acta, 1936, 19, 326—330; cf. A., 1935,

759).—Hydrogenation (Ni or Pd-black) of 4:6-dinitro-1:3-diacetylbenzene in  $\text{EtOAc--EtOH--H}_2\text{O}$  gives slowly poor yields of 2:6-dimethyl-lin-m-benzodipyrrole [2:2'-dimethylpyrrolo-4':5'-5:6-indole] (I), m.p. 232°, sublimes at 310—320°/vac., stable to short heating in  $\text{Ac}_2\text{O}$ , and 2:6-dimethyldihydro-lin-m-benzodipyrrole [2:2-dimethyl- $\Delta^4$ -pyrrolo-4':5'-5:6-indole] (II) (Ac derivative, m.p. 279°).

(I.)

(II.)

$\text{Et}_2$  4:6-dinitrophenylene-1:3-diacetoacetate affords at 50—60°  $\text{Et}_2$  2:6-dimethyl-lin-m-benzodipyrrole-3:5-dicarboxylate [2:2'-dimethylpyrrolo-4':5'-5:6-indole-3:3'-dicarboxylate], m.p. 342° (decomp.).

R. S. C.

**Determination of active hydrogen atoms in organic compounds by H-D isotope analysis.** H. ERLÉNMEYER, A. EPPRECHT, H. LOBECK, and H. GÄRTNER (Helv. Chim. Acta, 1936, 19, 354—357).—Recrystallisation of BzOH from  $\text{D}_2\text{O--H}_2\text{O}$  (H:D = 1:007) gives a mixture, m.p. 118.5°, of BzOH:BzOD = 1:117. Crystallisation of barbituric acid from  $\text{H}_2\text{O--D}_2\text{O}$  gives a mixture, but from 99.6%  $\text{D}_2\text{O}$  nearly pure tetradeuterobarbituric acid. Phenacetin is converted by crystallisation from  $\text{H}_2\text{O--D}_2\text{O}$  into nearly pure  $\text{OEt}\cdot\text{C}_6\text{H}_4\cdot\text{NDAc}$ . R. S. C.

**Derivatives of piperazine.** D. E. ADELSON and C. B. POLLARD (J. Amer. Chem. Soc., 1936, 58, 532).—Piperazinium di(dichloroacetate), m.p. 181° (corr.), and di-(o-acetoxybenzoate), m.p. 112—113° (corr.), 1:4-di-( $\beta$ -dihydroxypropyl)piperazine, m.p. 176—177° (corr.) [tetrabenzoate, m.p. 150—150.5° (corr.)], and 1:4-di- $\beta$ -carbethoxyethylpiperazine dihydrobromide (free base, decomp. < 100°), are described. H. B.

**Pyrimidines.** CXLIX. Reactions of 2-ethanesulphonylpyrimidines. J. M. SPRAGUE and T. B. JOHNSON (J. Amer. Chem. Soc., 1936, 58, 423—426).—The 2-EtSO<sub>2</sub> group reacts like Hal and is (generally) readily replaced by OH, OAlk, and NH<sub>2</sub>. Thus, 4-chloro- (I) and 4-ethoxy- (II) 2-ethanesulphonyl-5-methylpyrimidines with EtOH-NaOEt at room temp. give 2:4-diethoxy-5-methylpyrimidine; 4-chloro-5-bromo- and 5-bromo-4-ethoxy- (III) 2-ethanesulphonylpyrimidines similarly afford 5-bromo-2:4-diethoxy-5-methylpyrimidine, whilst Et 4-amino-2-ethanesulphonylpyrimidine-5-carboxylate (IV) yields Et 4-amino-2-ethoxypyrimidine-5-carboxylate, m.p. 105—105.5°, hydrolysed (evaporation with conc. HCl) to the corresponding 2-OH-ester. Et 2:4-dichloro- (V) and 4-chloro-2-ethanesulphonylpyrimidine-5-carboxylates with EtOH-NaOEt give (probably) Et 4-hydroxy-2-ethoxypyrimidine-5-carboxylate, m.p. 186—186.5°; (V) also yields the 2:4-(OEt)<sub>2</sub>-ester, m.p. 33.5—34°. 2-Ethanesulphonyl-4-ethoxypyrimidine, (II), and (III) with 10% NaOH afford 2-hydroxy-4-ethoxy-, 2-hydroxy-4-ethoxy-5-methyl-, m.p. 212—213°, and 5-bromo-2-hydroxy-4-ethoxy-, m.p. 234°, -pyrimidine, respectively. (I) and (IV) with EtOH-NH<sub>3</sub> at 100—110° give 4-amino-2-ethanesulphonyl-5-

*methylpyrimidine*, m.p. 135.5–136.5° [hydrolysed (HCl) to 5-methylcytosine], and *Et* 2:4-diaminopyrimidine-5-carboxylate, m.p. 204–205°, respectively; (II) does not react at 100–130°. (II) and  $\text{NH}_2\text{Ph}$  at 100° (bath) or 130° in  $\text{CO}_2$  afford 2-anilino-4-ethoxy-5-methylpyrimidine, m.p. 120.5–121°, hydrolysed (conc. HCl) to the 4-OH-derivative, m.p. 254–255° (also obtained from 4-hydroxy-2-ethylthiol-5-methylpyrimidine and  $\text{NH}_2\text{Ph}$  at 100°). H. B.

**Indigotin.** *cis*-Indigotin. G. HELLER [with R. BARTHEL] (Ber., 1936, 69, [B], 563–565).—Indigotin (I), moistened with EtOH, is converted by  $\text{AgOAc}$  in  $\text{H}_2\text{O}$  at 100° into anhydroisatinantranilide; reaction is not purely catalytic and is never complete owing to the formation of anti-catalysts. Other acetates under similar conditions have no marked action whereas  $\text{Pb}(\text{OAc})_4$  in cold AcOH transforms (I) into dehydroindigotin diacetate with traces of isatin. References to the lit. prove that *cis*-indigotin is a stable material differing characteristically in properties from the *trans*-form. H. W.

**Mechanism of the reaction of pyridine and its derivatives with alkali amides.** M. KABATSOHN (Bull. Acad. Sci. U.R.S.S., 1935, No. 6–7, 971–978).—The formation of dipyridyl and diquinolyl derivatives in the reaction between  $\text{NaNH}_2$  and  $\text{C}_5\text{H}_5\text{N}$  derivatives in liquid  $\text{NH}_3$  is explained on the basis of entry of Na into the nucleus or side-chain of one mol., which then condenses with a second mol. R. T.

**Nitro- and amino-3-arylphthalaz-4-ones, and corresponding 1-methyl compounds.** F. M. ROWE, G. M. HEATH, and C. V. PATEL (J.C.S., 1936, 311–315).—Nitro-3-arylphthalaz-4-ones and corresponding 1-Me compounds have been prepared by condensing nitroarylhydrazines with *o*-phthalaldehydic acid and acetophenone-*o*-carboxylic acid, respectively, followed by ring-closure of the resulting hydrazones. Amino-3-aryl-1-methylphthalaz-4-ones are obtained by reducing the corresponding  $\text{NO}_2$ -compounds with  $\text{Na}_2\text{S}$ -EtOH- $\text{H}_2\text{O}$ , but usually compounds with  $\text{Na}_2\text{S}$ -EtOH- $\text{H}_2\text{O}$  are best prepared from the hydrazone and aq.  $\text{Na}_2\text{S}$ , which effects ring-closure and reduction. The following have been prepared: *o*-carboxybenzaldehyde-2'-nitro-, m.p. 229°, -4'-nitro-2'-methyl-, -2'-chloro-, m.p. 229°, -2':6'-dichloro-, m.p. 225–226°, -2'-bromo-, m.p. 204°, and -2':6'-dibromo-4'-nitro-phenylhydrazone, m.p. 220°; 2'-nitro-, m.p. 201°, 2'-amino-, m.p. 184° (Ac derivative, m.p. 237°), 3'-amino- (Ac derivative, m.p. 225°), 4'-amino-2'-methyl-, m.p. 187–188° (Ac derivative, m.p. 214°), 2'-chloro-4'-nitro-, m.p. 171°, and -4'-amino-, m.p. 186° (Ac derivative, m.p. 247°), 2':6'-dichloro-4'-nitro-, m.p. 225–226°, and -4'-amino-, m.p. 226° (Ac derivative, m.p. 281°), 2'-bromo-4'-nitro-, m.p. 154°, and -amino-, m.p. 203° (Ac derivative, m.p. 251°), and 2':6'-dibromo-4'-nitro-, m.p. 190°, and -amino-phenyl-3-phenylphthalaz-4-one, m.p. 255° (Ac derivative, m.p. 257°); *o*-carboxyacetophenone-2', -3', and -4'-nitro-, -4'-nitro-2'-methyl-, m.p. 145°, -2'-chloro-, m.p. 166°, -2':6'-dichloro-, m.p. 135°, -2'-bromo-, and -2':6'-dibromo-4'-nitro-phenylhydrazone, m.p. 237°, 2'-amino-, m.p. 239° (Ac derivative, m.p. 241°), 3'-amino-, m.p.

173° (Ac derivative, m.p. 220°), -4'-amino-, m.p. 206–207° (Ac derivative, m.p. 252°), 4'-nitro-, m.p. 178° and 4'-amino-2-methyl-, m.p. 191° (Ac derivative, m.p. 235°), 2'-chloro-4'-nitro-, m.p. 206° and -4'-amino-, m.p. 197° (Ac derivative, m.p. 247°), 2':6'-dichloro-4'-nitro-, m.p. 235°, and -4'-amino-, m.p. 279° (Ac derivative, m.p. 320°), 2'-bromo-4'-amino-, m.p. 130° (decomp.) (Ac derivative, m.p. 255°), and 2':6'-dibromo-4'-nitro-, m.p. 237°, and -amino-3-phenyl-1-methylphthalaz-4-one, m.p. 274° (Ac derivative, m.p. 315°). The stabilities of the hydrazones are compared. F. R. S.

**Phenacylhydrazine.** M. BUSCH and K. KÜSPERT (J. pr. Chem., 1936, [ii], 144, 273–290).—Phenacylhydrazine (A., 1928, 997) [phenylhydrazone diacetate, m.p. 103° (decomp.), readily hydrolysed by aq. mineral acid; semicarbazone hydrochloride (I)] and PhCHO in EtOH-AcOH give benzaldehydephenacylhydrazone, m.p. 94° [Ac derivative (II), m.p. 163°], which reacts with  $\text{NHPh}\cdot\text{NH}_2$  at its CO group to form its phenylhydrazone (III), m.p. 190° (decomp.) (sinters at 187°) [Ac derivative,  $\text{NHPh}\cdot\text{N}\cdot\text{CPh}\cdot\text{CH}_2\cdot\text{N}\cdot\text{Ac}\cdot\text{N}\cdot\text{CHPh}$ , m.p. 191°, formed with (II) by the action of  $\text{Ac}_2\text{O}$ ]. (III) and EtOH-HCl at 50° give  $\text{NH}_3$ , PhCHO, and (probably) the unstable  $\text{NPh}\cdot\text{N}\cdot\text{CPh}\cdot\text{CH}\cdot\text{NH}_2$ . Short treatment of (I) with alkali affords the carbazinic acid,  $\text{NH}_2\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CPh}\cdot\text{N}\cdot\text{NH}\cdot\text{CO}_2\text{H}$ , sinters about 200° and then decomp.; prolonged treatment gives 4-amino-3-keto-6-phenyl-2:3:4:5-tetrahydro-1:2:4-triazine, m.p. 200° [(4-)CHPh derivative (+EtOH), m.p. 203°], converted by  $\text{HNO}_2$  into 3-keto-6-phenyl-tetrahydro-1:2:4-triazine, m.p. 228° (softens at 224°). (I) and PhCHO in EtOH at 40–50° give 4-benzylideneamino-3:6-diphenyltetrahydro-1:2:4-triazine-2-carboxylamide, m.p. 205–206°. (III) and PhCHO in  $\text{CHCl}_3$  + a little EtOH-HCl afford 4-benzylideneamino-2:3:6-triphenyltetrahydro-1:2:4-triazine, m.p. 159°, converted by  $\text{NHPh}\cdot\text{NH}_2$  (2 mols.) in EtOH-AcOH into (III) and  $\text{NHPh}\cdot\text{N}\cdot\text{CHPh}$ , and by 12% EtOH-HCl into 2:3:6-triphenyl-2:3-dihydro-1:2:4-triazine, m.p. 164°, yellow (forming a red hydrochloride). Similarly, (III) and aq.  $\text{CH}_2\text{O}$  in EtOH- $\text{CHCl}_3$  give the (4-)benzylidene derivative (IV), m.p. 159–160°, of 4-amino-2:6-diphenyltetrahydro-1:2:4-triazine (V), m.p. 130° [from (IV) and  $\text{NHPh}\cdot\text{NH}_2$ ], converted by  $\text{HNO}_2$  into the 4-NO-derivative (VI), m.p. 109–110° (decomp.), of 2:6-diphenyltetrahydro-1:2:4-triazine (VII), m.p. 160° [obtained by reduction (Zn dust, AcOH) of (VI)]. (IV) or (V) and aq. EtOH-HCl give 2:6-diphenyl-2:3-dihydro-1:2:4-triazine, m.p. 94°, yellow [red hydrochloride, m.p. 152° (darkens > 145°)], reduced (Zn dust, AcOH) to (VII). 4-Benzylideneamino-2:6-diphenyl-3-methyl-, m.p. 126°, and -3:3-dimethyl-, m.p. 176°, and -2:3:6-triphenyl-3-methyl-, m.p. 153–154°, -tetrahydro-1:2:4-triazine are similarly formed from (III) and  $\text{MeCHO}$ ,  $\text{COMe}_2$ , and  $\text{COPhMe}$ , respectively. (III) and  $\text{COCl}_2$  in  $\text{C}_6\text{H}_6$  give 4-benzylideneamino-3-keto-2:6-diphenyltetrahydro-1:2:4-triazine, m.p. 199°. All the above tetrahydro-derivatives are 2:3:4:5. The production (*loc. cit.*) of 3-keto-2:5-diphenyl-3:4-dihydropyrazine from  $\text{COPh}\cdot\text{CH}_2\cdot\text{NH}\cdot\text{NH}_2$  is considered to involve loss of  $\text{NH}_3$  and subsequent reaction of 2 mols. of phenylglyoxalimide (as  $\text{OH}\cdot\text{CPh}\cdot\text{C}\cdot\text{NH}$ ). H. B.

**$\gamma$ -Triazines. XXXII. Catalytic hydrogenations in the  $\gamma$ -triazine group. I. Conversion of dihydroxymethyltriazine into the so-called trigenic acid of Liebig and Wöhler.** A. OSTROGOVICH and G. OSTROGOVICH (Gazzetta, 1936, 66, 48—57).—Dihydroxymethyltriazine is rapidly reduced catalytically (new type of vessel illustrated), or slowly by Al-Hg, Na-Hg, or Sn-HCl (but not by Zn), to dihydroxymethyltriazidine (cycloethylidenebiuret), m.p. 272—273° (decomp.) (acetate; semihydrochloride; semiaurichloride; semipicrate;  $Ac_2$  derivative, m.p. 171—172°), which is identical with the "trigenic acid" of Liebig and Wöhler (Annalen, 1846, 59, 296), but, apart from forming a Ag salt, has no acid properties.

E. W. W.

**1-Chloro-3:4-dinitrobenzene series. IV. A.** MANGINI (Gazzetta, 1935, 65, 1191—1200).—1:3:4- $C_6H_3Cl(NO_2)_2$  (I) reacts very slowly with *p*-nitrophenylhydrazine to give 5-chloro-2:4'-dinitrohydrazobenzene, m.p. 190.5—192° (decomp.), which is converted by  $Ac_2O$  into 5-chloro-2-*p*-nitrophenyl-1:2:3-benztriazole 1-oxide, m.p. 143—144°. (I) with allylamine forms 5-chloro-2-nitro-*N*-allylaniline, m.p. 52—53°; with *p*- $C_6H_4Br \cdot NH_2$  forms 5-chloro-4'-bromo-2-nitrodiphenylamine, m.p. 161—162°, which with Sn and HCl, followed by  $HNO_2$ , yields 6-chloro-1-*p*-bromophenyl-1:2:3-benztriazole, m.p. 209—210°; and with *p*- $C_6H_4Ph \cdot NH_2$  forms 5-chloro-2-nitro-*N*-*p*-diphenyl-aniline, m.p. 138—139°, reduced and converted by  $HNO_2$  into 6-chloro-1-*p*-diphenyl-1:2:3-benztriazole, m.p. 175—176°. (I) reacts more slowly with 2-aminopyridine than with  $NH_2Ph$  etc., and gives 2-(5'-chloro-2'-nitroanilino)pyridine, m.p. 152.5—153.5°. (I) with *p*-toluidine forms 5-chloro-2-nitro-4'-methyl-diphenylamine, m.p. 125—126° (cf. A., 1935, 1489), reduced to the hydrochloride, m.p. 187—189°, of the 2- $NH_2$ -compound, new m.p. 66.5—67.5° ( $Ac$  derivative, m.p. 126.5—127.5°), which is converted by  $AcOH$  and  $NaNO_2$  into 6-chloro-1-*p*-tolyl-1:2:3-benztriazole, m.p. 239—241°. Colour reactions of various diphenylamines with  $HNO_2$  and with  $HNO_3$  are tabulated; *NN'*-bis-(5''-chloro-2''-nitrophenyl)benzidine gives a reddish-violet colour with 1/64,000 of the former, or 1/130,000 of the latter.

E. W. W.

**Pyrimidines. CLI. Constitution of dibarbituric acid.** R. D. HOTCHKISS and T. B. JOHNSON (J. Amer. Chem. Soc., 1936, 58, 525—528).—Dibarbituric acid (I), now shown to be

$CO \begin{array}{c} \text{NH} \cdot CO \\ \text{NH} \cdot CO \end{array} \text{C}^5 = \text{C}^4 \begin{array}{c} \text{CH}_2 \cdot CO \\ \text{NH} \cdot CO \end{array} NH$  (cf. Conrad and Guthzeit, A., 1883, 314), formed when barbituric acid is heated at 150—170° in dry glycerol, is methylated ( $Me_2SO_4$ , aq. KOH, 25°) to the 1:1':3'- $Me_3$  (+ $H_2O$ ) (II), m.p. (anhyd.) 286—287° (corr.), or 1:3:1':3'- $Me_4$  (III), m.p. 271.5—272.5° (corr.) (*K* salt), derivatives. Reduction [ $H_2$  (130—140 atm.), Raney Ni, dioxan, 150°] of (II) results in fission at the C:C; 1:3-dimethylbarbituric acid and 1-methyl-4:5-dihydrouracil (IV), m.p. 129.5—131° (corr.), are isolated. (III) and an excess of  $Br \cdot H_2O$  give 2 mols. of 5:5-dibromo-1:3-dimethylbarbituric acid. 4-Phenyl-1-methyl-4:5-dihydrouracil, m.p. 149—151° (corr.), and (IV) are synthesised (cf. Fischer and Leuchs, A., 1903, i, 12) from  $MeNCO$  and  $NH_2 \cdot CHPh \cdot CH_2 \cdot CO_2H$

and  $NH_2 \cdot CH_2 \cdot CH_2 \cdot CO_2H$ , respectively. (I) is unaffected by boiling 6*N*-HCl or 2—20% KOH, or red P and  $AcOH$ -I. Contrary to von Baeyer (Annalen, 1864, 130, 145), the  $Br_2$ -derivative of (I) and  $AcOH$ -conc. HBr give Br and a reduction product.

H. B.

**Pyrazolone and indazole derivatives of diphenyl.** E. VOTTA (Gazzetta, 1936, 66, 16—19).—4:4'-Dihydrazinodiphenyl-3:3'-dicarboxylic acid (I) is converted by  $Ac_2O \cdot NaOAc$  into the 1:2:1':2'- $Ac_4$  derivative, m.p. < 300°, of 3:3'-diketotetrahydro-5:5'-di-indazolyl, m.p. < 300°, also obtained (impure) by heating (I).  $POCl_3$  and (I) at 120° yield 3:3'-dichloro-5:5'-di-indazolyl, m.p. < 330°, which is converted by  $EtI \cdot KOH$  in  $EtOH$  into its 2:2'- $Et_2$  derivative, m.p. 149°, and into decomp. products.

E. W. W.

**Mechanism of the lumichrome degradation of flavins.** P. KARRER, T. KÖBNER, and F. ZEHENDER (Helv. Chim. Acta, 1936, 19, 261—264).—That lumichrome degradation of flavins consists of oxidation of the side-chain is proved by synthesis of a typical reaction product. The  $\beta$ -position in the side-chain is particularly susceptible to this oxidation if it carries an OH. 9- $\gamma$ -Hydroxy-*n*-propylisoalloxazine, when kept in MeOH in daylight for 14 days, gives *Me*  $\gamma$ -9-isoalloxazinylpropionate, m.p. > 330°.  $\beta$ -o-Nitroanilinopropionic acid (prep. by condensation of  $NH_2 \cdot CHMe \cdot CO_2Et$  and *o*- $C_6H_4Cl \cdot NO_2$  in  $C_6H_5N$ , followed by hydrolysis), m.p. 152°, is hydrogenated (Ni; 90°/20—25 atm.) in  $EtOH$  to the  $(NH_2)_2$ -compound, which with alloxan in  $EtOH$  gives  $\gamma$ -9-isoalloxazinylpropionic acid.

R. S. C.

**Improved synthesis of lactoflavin and 6:7-dimethyl-9-1'-arabitylisoalloxazine.** P. KARRER and H. F. MEERWEIN (Helv. Chim. Acta, 1936, 19, 264—269).—The synthesis of lactoflavin (38% yield), m.p. 282°, and 6:7-dimethyl-9-1'-arabitylisoalloxazine, m.p. 294° (A., 1935, 1510), is improved by preparing the diazo-compounds with  $PhN_2Cl$  and using  $Na_2S_2O_4$  for the reduction. The good yields in the last stages prove the uniformity of the diazo-compounds.

[With A. SEEBACH.] *N*-*p*-Tolylglycamine, m.p. 139.5°, and  $PhN_2Cl$  give the benzenediazoamino-compound, decomp. about 146°, so that this method of synthesis of flavins is limited to those which start with 3:4-dialkylanilines.

R. S. C.

**Magnetic properties and structure of the haemochromogens and related substances.** L. PAULING and C. D. CORYELL (Proc. Nat. Acad. Sci., 1936, 22, 159—163).—The results indicate four unpaired electrons in  $Fe^{++}$  protoporphyrin, and five in the corresponding  $Fe^{+++}$  compound, showing that the Fe is linked to the four N by ionic linkings. Haemochromogens formed with globin,  $C_5H_5N$ , nicotine, cyanide, or Ni contain no unpaired electrons.

F. A. A.

**Optical absorption of porphyrins.**—See this vol., 545.

**Oximinoacetophenone.** F. ANGELICO and S. CUSMANO (Gazzetta, 1936, 66, 3—8).—This substance reacts with  $NH_2OH \cdot HCl$  to give not benzhydroxamic acid but aminophenylfurazan (I) (A., 1923, i, 857),

with phenylglyoxime and oximinophenylacetonitrile (II).  $\text{HNO}_2$  and (I) in AcOH yield 3:3'-diphenyl-4:4'-azoisminofurazan (cf. A., 1923, i, 854), m.p. 157—158° (explosive K salt), and (II). With  $\text{NH}_2\text{OH}$  in alkaline solution, (II) yields (I). E. W. W.

**Action of formaldehyde on hydroxyquinolines.** (SIGNA.) L. MONTI and (SIGNA.) V. CIRELLI (Gazzetta, 1936, 66, 42—48).—4-Hydroxyquinoline, its 8- and 6-Me derivatives, and 4-hydroxy-2-phenylquinoline are, respectively, converted by  $\text{CH}_2\text{O}$  in dil.  $\text{H}_2\text{SO}_4$  at 20—25° into 4-hydroxy-2-methyl-, m.p. 100—102° [picrate, m.p. 178—180° (decomp.)], -2:8-dimethyl-, m.p. 139—140° [picrate, m.p. 195—196° (decomp.)], -2:6-dimethyl-, m.p. 154—156° [picrate, m.p. 195—200° (decomp.)], and -2-phenyl-3-quinolylcarbinol cyclomethylene ether, m.p. 124—126° [picrate, m.p. 186—190° (decomp.)]. E. W. W.

**Action of nitric acid on unsaturated compounds. XII. Structure of products of the reaction of nitric acid with citraconic acid.** A. QUILICO (Gazzetta, 1935, 65, 1203—1213).—Eulite,  $\text{C}_6\text{H}_5\text{O}_7\text{N}_4$ , m.p. 102°, obtained by action of  $\text{HNO}_3$  on citraconic acid, is now prepared, with mesaconic acid and AcOH, from citraconic anhydride and  $\text{HNO}_3$ . With NaOEt it yields a Na salt (of an *aci*-form), which couples with  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{N}_2\text{Cl}$  to a substance, decomp. 70°, and similarly with  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{N}_2\text{Cl}$ . With PhCHO, piperonal, anisaldehyde, and cinnamaldehyde it gives compounds,  $\text{C}_{13}\text{H}_{10}\text{O}_7\text{N}_4$ , m.p. 146°,  $\text{C}_{14}\text{H}_{10}\text{O}_9\text{N}_4$ , m.p. 187°,  $\text{C}_{14}\text{H}_{12}\text{O}_8\text{N}_4$ , m.p. 157°, and  $\text{C}_{15}\text{H}_{12}\text{O}_9\text{N}_4$ , m.p. 172°, respectively. The  $\cdot\text{CH}_2\cdot\text{NO}_2$  group is therefore present. Reduction ( $\text{SnCl}_2$ ) of eulite yields two bases,  $\text{C}_6\text{H}_5\text{O}_2\text{N}_3$  ( $\text{Bz}_2$  derivative, m.p. 157°) and  $\text{C}_6\text{H}_{11}\text{ON}_3$  ( $\text{Bz}_2$  derivative, m.p. 177°).  $\text{KMnO}_4$  oxidation of eulite gives AcOH. Eulite thus probably contains the units,  $\begin{smallmatrix} \text{C}\cdot\text{N} \\ \text{C}\cdot\text{C} \end{smallmatrix} > \text{O}$ , Me, H,  $\cdot\text{C}(\text{NO}_2)_2$ , and  $\cdot\text{CH}_2\cdot\text{NO}_2$ . E. W. W.

**Thiophen series. XXXI. Preparation of thiophen analogues of acridone and fluorenone.** W. STEINKOFF and E. GÜNTHER (Annalen, 1936, 522, 28—34).—Thiophen (I),  $o\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{COCl}$ , and  $\text{AlCl}_3$  in  $\text{CS}_2$  give 60% of *o*-nitrophenyl 2-thienyl ketone (II), m.p. 97—98°, reduced ( $\text{Sn}$ , conc. HCl) to C-2'-thienyl-anthranil [2:2'-thienyl-4-benzoxazole] (III), m.p. 77—78°, which resembles phenylanthranil (Bamberger and Lindberg, A., 1909, i, 511). Reduction (Zn dust, 20% NaOH, EtOH) of (II) and subsequent treatment with conc. HCl affords 3:5-dichloroanthranilic acid, probably formed thus: (II)  $\rightarrow o\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CHO} \rightarrow o\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H} \rightarrow 2:3:5\text{-NH}_2\cdot\text{C}_6\text{H}_2\text{Cl}_2\cdot\text{CO}_2\text{H}$  (cf. Bamberger *et al.*, A., 1899, i, 341). (III) heated in paraffin oil passes into 2:3-*o*-benzo-5:6:2':3'-thiopheno-4-pyridone (IV), m.p. about 320° (decomp.), which exhibits slight blue fluorescence in conc.

$\text{H}_2\text{SO}_4$  or EtOH-alkali only. 2-*p*-Toluenesulphonamidobenzoyl chloride, (I), and  $\text{AlCl}_3$  in  $\text{CS}_2$  give the

$p\text{-C}_6\text{H}_4\text{Me}\cdot\text{SO}_2$  derivative, m.p. 125°, of *o*-aminophenyl 2-thienyl ketone (V), m.p. 53—54° (hydrochloride, m.p. 188—189°). When the diazo-solution from (V) is heated varying yields of *o*-phenylene 2:3-thienylene ketone (VI), m.p. 109—110°, and *o*-hydroxyphenyl 2-thienyl ketone, m.p. 21°, result. Attempted reduction (P-HI; Clemmensen) of (VI) causes decomp.

H. B.

**Isomerism of glycothiodiazolines.** H. WUYTS and R. VERSTRAETEN (Bull. Soc. chim. Belg., 1936, 45, 65—75).—*d*- or *l*-Arabinose with  $\beta$ -phenylthioacet- $\alpha$ -phenylhydrazine affords arabothiodiazolines, easily separable by fractional crystallisation. The more sol. have  $[\alpha]_{\text{D}}^{20} +650^\circ$  and  $+708^\circ$  for the *l*- and *d*-derivatives, respectively. The m.p. are: more sol. *l*-, 194.8—197.2°, *d*-, 194.8—197.2°; less sol. *l*-, 198°, *d*-, 197.6°. *d*-Galactothiodiazoline,  $[\alpha]_{\text{D}}^{20} +1109.6^\circ \rightarrow +106.6^\circ$  in several weeks, possibly as a result of mutarotation, is decomposed by light. Theoretical considerations are advanced to explain this isomerism.

J. L. D.

**Alkaloids of Senecio species. II.** R. H. F. MANSKE (Canad. J. Res., 1936, 14, B, 6—11; cf. A., 1932, 286).—12 *Senecio* species contain fumaric acid. *S. jacobaea* contains quercetin. *S. vulgaris*, L., contains 0.15—0.17% of senecionine, m.p. 222°, hydrolysed to retronecine and a cryst. acid. *S. mikanioides* (Walp.), Otto, yields a substance,  $(\text{C}_5\text{H}_8\text{O}_2)_n$  ( $n=12$ ), m.p. 64°, and 0.02% of amorphous mikanoidine,  $\text{C}_{21}\text{H}_{29}\text{O}_6\text{N}$ , hydrolysed to mikanecine (? dihydro-retronecine),  $\text{C}_8\text{H}_{15}\text{O}_2\text{N}$ , an oil (picrate, m.p. 186°), and mikanecic acid,  $\text{C}_{13}\text{H}_{16}\text{O}_5$ , m.p. 240°. *S. aureus*, L., yields 0.006% of aureine,  $\text{C}_{18}\text{H}_{25}\text{O}_5\text{N}$ , m.p. 238° (decomp.). An alkaloid was isolated from *Echium vulgare*, L.; none was obtained from *S. cineraria*, *clivorum*, *nemorensis*, *veitchianus*, *palmaris*, or *ledebouri*. Retrorsine methiodide and  $\text{Ag}_2\text{O}$  in hot  $\text{H}_2\text{O}$  give a methohydroxide, decomposed by cautious heating to give a substance,  $\text{C}_{13}\text{H}_{18}\text{O}_6$  (possibly lactaldehyde retronecate), m.p. 125° (with KOH gives retronecic acid), and a substance,  $\text{C}_9\text{H}_{13}\text{O}_3\text{N}$ , m.p. 256° (decomp.), probably a betaine. Benzoylretronecine behaves similarly. K retronecate,  $\text{CH}_2\text{Cl}\cdot\text{CO}\cdot\text{Me}$ , and a trace of KI in MeOH gives hydroxyacetone retronecate, m.p. 137°.

R. S. C.

**Alkaloids of Anabasis aphylla. XII. Attempted synthesis of anabesine; chemistry of 2:3'-dipyridyl.** G. MENSCHIKOV and A. GRIGOROVITSCH (Ber., 1936, 69, [B], 496—499).—Addition of MeI to 2:3'-dipyridyl (I) in abs. EtOH at room temp. affords exclusively 2-pyridyl-3'-pyridinium methiodide, m.p. 167—168°, converted by  $\text{Ag}_2\text{O}$  into the quaternary hydroxide (II) which is oxidised by  $\text{KMnO}_4$  to 2- $\text{C}_5\text{H}_4\text{N}\cdot\text{CO}_2\text{H}$  (III). Reduction of (II) with Sn and conc. HCl gives the base  $\text{C}_{11}\text{H}_{16}\text{N}_2$ , b.p. 120—122°/15 mm., oxidised to (III). 2-Pyridyl-3'-pyridinium hydriodide, m.p. 162—163°, and MeI in EtOH at 100° give a mixture of 2:3'-dipyridyl dimethiodide, m.p. 196—197°, and dihydriodide, m.p. 204—206°, also obtained directly from their components. Partial reduction of (I) in alkaline solution (Na-abs. EtOH) appears to affect both rings at approx. the same rate, the products being unchanged (I) and 2:3'-dipiperidyl (IV), m.p. 68—69°. Partial dehydrogenation of (IV)

by AgOAc in AcOH at 180° affects both rings simultaneously, giving a mixture of unchanged (IV) and (I). H. W.

**l-Ephedrine**, a degradation product of the alkaloids in *Aconitum napellus*. W. FREUDENBERG and E. F. ROGERS (J. Amer. Chem. Soc., 1936, 58, 533—534).—Destructive distillation of the total alkaloids (as hydrochloride) over cryst. Ba(OH)<sub>2</sub> gives hydrocarbons, NH<sub>2</sub>Me, and a basic oil containing l-ephedrine. H. B.

**Preparation of quinine aurothiosulphate**. Q. MINGOLA (Gazzetta, 1935, 65, 1258—1260).—A claim of prior prep. of this compound (cf. A., 1931, 1172), with different properties from the form described by Picon (A., 1935, 49, 366). E. W. W.

**Structural analogue of cinchene and its behaviour towards acid**. J. KENNER and B. K. NAND [with, in part, R. GRINDLEY] (Ber., 1936, 69, [B], 635—639; cf. A., 1935, 766).—Condensation of CH<sub>2</sub>Ph·CO<sub>2</sub>Et with the Et ester of *N*-benzoylmeroquinene (I) by NaOEt in C<sub>6</sub>H<sub>6</sub> at 100° affords the corresponding β-CO ester, the Cu compound, C<sub>26</sub>H<sub>28</sub>O<sub>4</sub>NCu, m.p. 226—227°, of which is converted by boiling 25% HCl into BzOH and 8-benzylidene-3-vinylquinuclidine (II), m.p. 158° (methiodide, m.p. 199°; tetrabromide, m.p. 117—119°). Hydrogenation of (II) in 5% HCl (PdCl<sub>2</sub>) gives 8-benzylidene-3-ethylquinuclidine, m.p. 182—183° [dibromide, m.p. 105—106° (decomp.)], the constitution of which follows from the similar hydrogenation of cinchene to dihydrocinchene, m.p. 144—145°. Hydrolytic fission of (II) with HBr (*d* 1.49) at 180—190° affords PhMe and meroquinene Et ester hydrochloride, m.p. 164—165°. With H<sub>2</sub>SO<sub>4</sub> of varied concns. PhMe is similarly obtained with a product which after basification and distillation gives an alkaline distillate with an odour of piperidine. The basic, salt-forming quinoline nucleus is therefore responsible for the production of apocinchene from cinchene and conc. acids and it must be assumed that this is due to prevention of the lepidine-meroquinene fission which occurs with more dil. acid. If the intermediate production of a ketone X·CO·CH<sub>2</sub>Ph be postulated the reaction is similar to the hydrolysis of substituted deoxybenzoins. Quinolyl-2-acetaldehyde (oxime, m.p. 201—202°, and the corresponding nitrile) is oxidised by KMnO<sub>4</sub> in alkaline solution to quinolyl-2-acetic acid (picrate, m.p. 236—237°), the Et ester, m.p. 68—69°, of which could not be condensed with Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub> or (I). Oxidation of 4-quinolyl Me ketone by SeO<sub>2</sub> in presence of PhMe affords cinchoninic acid, also obtained from 4-quinolyl CH<sub>2</sub>Br ketone. H. W.

[Synthesis of benzyltetrahydroisoquinoline bases under "physiological" conditions.] G. HAHN and O. SCHALES (Ber., 1936, 69, [B], 622—623; cf. A., 1935, 357).—A reply to Späth *et al.* (this vol., 489). H. W.

**Alkaloids of Chinese gelsemium**, Ta-ch'a-yeh. T. Q. CHOU (Chinese J. Physiol., 1936, 10, 79—84; cf. A., 1931, 871).—Koumine, kouminine, gelsemine, and kounidine (I), C<sub>21</sub>H<sub>24</sub>O<sub>5</sub>N<sub>2</sub>, m.p. 315° (hydrochloride, m.p. 318°), have been isolated from the leaves and stems of Ta-ch'a-yeh, which has been

identified as *G. elegans*. Tested on mice, (I) caused muscular weakness and had a marked inhibitory effect on the respiratory centre. J. N. A.

**Alkaloids of Ungernia Sewertzovii** (Rgl.), Fedsch. S. NORKINA and A. OREKHOV (Ber., 1936, 69, [B], 500—503).—Percolation of the dried bulbs with C<sub>2</sub>H<sub>5</sub>Cl<sub>2</sub> affords *ungernine* (I), C<sub>39</sub>H<sub>44</sub>O<sub>11</sub>N<sub>2</sub>, m.p. 210—211°, [α]<sub>D</sub><sup>25</sup> +148.9° in CHCl<sub>3</sub>, which is more freely present in the dark outer portions than in the white inner portions of the bulb. (I) contains 2 OH and 2 OMe and is a diacidic di-*tert.* base giving a *dimethiodide* (II), m.p. 220—223°, a *picrate*, m.p. 205—208° (decomp.), and a *perchlorate*, m.p. 105—108° (decomp.), [α]<sub>D</sub><sup>25</sup> +109.6° in MeOH. The function of the remaining O atoms is undecided. Hydrogenation (PtO<sub>2</sub>) of (I) affords *tetrahydroungernine*, m.p. 180—183°, [α]<sub>D</sub><sup>25</sup> +106.6° in CHCl<sub>3</sub> [*dihydriodide*, m.p. 223—224° (decomp.); *picrate*, m.p. 190—193° (decomp.); *methiodide*, m.p. 170—172°]. Successive treatment of (II) with Ag<sub>2</sub>O and boiling H<sub>2</sub>O yields the *substance* (III), C<sub>27</sub>H<sub>24</sub>O<sub>6</sub> (or C<sub>27</sub>H<sub>22</sub>O<sub>6</sub>), m.p. 113—115°, [α]<sub>D</sub><sup>25</sup> ±0°, which contains 2 OH but is free from OMe; basic compounds could not be isolated. (I) is stable towards boiling KOH-MeOH but is slowly transformed by boiling KOH-H<sub>2</sub>O into (III).

**Punarnava or Baerhaavia diffusa**, Linn. II. Isolation of punarnavine.—See this vol., 652.

**Organic compounds of gold. VI. Heterocyclic compounds**. A. BURAWOY and C. S. GIBSON (J.C.S., 1936, 324—327).—The Mg-CH<sub>2</sub>(CH<sub>2</sub>·CH<sub>2</sub>Br)<sub>2</sub> reaction product and HAuBr<sub>4</sub> give *ethylenediaminocyclopentamethylenegold bromide*, decomp. 150° (*n*-triacontane obtained in hydrocarbon by-products), which with HBr yields *cyclopentamethylenemonebromogold*, decomp. 80°. The Mg compound with pyridinetrichlorogold affords *ethylenediaminocyclo-decamethylenegold bromide*. Evidence of the formation of analogous compounds containing larger heterocyclic rings has also been obtained.

F. R. S.

**Germanium. XVI. Germanium phenyl**. R. SCHWARZ and M. SCHMEISSER (Ber., 1936, 69, [B], 579—585; cf. A., 1931, 1435).—GePhCl<sub>3</sub> is obtained in 75% yield by heating GePh<sub>4</sub> and GeCl<sub>4</sub> at 350° for 36 hr. Distillation of the product yields fractions, b.p. 105°/12 mm., 128°/12 mm., and 142°/12 mm., respectively; those of lower b.p. pass into those of higher b.p. when heated at appropriate temp. and polymeric forms appear to be indicated, but each fraction is unimol. in C<sub>6</sub>H<sub>6</sub> (GePh<sub>2</sub>Cl<sub>2</sub> and GePh<sub>3</sub>Cl have b.p. 223°/12 mm. and b.p. 285°/12 mm., respectively). GePhCl<sub>3</sub> reacts unsatisfactorily with Na in boiling xylene. Better results are obtained when Na is replaced by K. In presence of O<sub>2</sub> oxidation occurs but good yields are secured in CO<sub>2</sub> but not in N<sub>2</sub> or A. The course of the change is unexplained but the occurrence of intermediate reactions is established by the isolation of Ge and GePh<sub>4</sub>. (GePh)<sub>6</sub> is little affected by air. (GePh)<sub>6</sub> adds 8 Br or 8 I in CCl<sub>4</sub>, thus indicating an open-chain structure. The view is supported by the production of a *substance* Ge<sub>6</sub>Ph<sub>6</sub>O<sub>3</sub> from (GePh)<sub>6</sub> and O<sub>2</sub> in boiling xylene since the mol. wt. (about 2900) would require the formation of a

chain of about 18 Ge atoms from the ring, which is improbable. The reaction  $XPhCl_3 + 3K = XPh + 3KCl$  for the series C, Se, Ge, Sn occurs with increasing ease of removal of halogen. Under the chosen conditions it does not take place with  $CPhCl_3$ , is not quant. with  $SePhCl_3$ , occurs smoothly and relatively rapidly with  $GePhCl_3$ , and very easily with  $SnPhCl_3$ , but is then followed by disproportionation to  $SnPh_4$  and Sn.

H. W.

**Mercurated derivatives of thymol and carvacrol.** J. B. BURT (J. Amer. Pharm. Assoc., 1936, 25, 112—117).—Carvacrol with  $Hg(OAc)_2$  in EtOH yields mainly *mono-* and some *di-chloromercuricarvacrol*; in presence of AcOH, *acetoxymmercuricarvacrol*, decomp. 173—174°, is produced. The Me ethers of chloromercuri-thymol and -carvacrol are prepared similarly.

F. O. H.

**Thiophen series. XXXII. Mercuration of bromo- and iodo-thiophens.** W. STEINKOPF, R. RÖSLER, and L. SETZER (Annalen, 1936, 522, 35—40).—Mercuration is effected with  $HgO$  in AcOH (unless stated otherwise). The following are then prepared by the usual methods: 2-bromo-3:4:5-tri(chloromercuri)- and -3:4:5-tri-iodo-, m.p. 170°; 2:3-dibromo-4:5-di(chloromercuri)- (I), m.p. 300° (with darkening), and -4:5-di-iodo-, m.p. 142°; 2:5-dibromo-3:4-di(chloromercuri)-, m.p. 300—305° (darkens about 290°), and -3:4-di-iodo-, m.p. 147°; 3:4-dibromo-2:5-di(chloromercuri)- (II), m.p. 317° (previous sintering), and -2:5-di-iodo-, m.p. 145°; 2:3:4-tribromo-5-chloromercuri- (III), m.p. 236° (formed using  $HgCl_2$  in aq. EtOH-NaOAc); 2:3:5-tribromo-4-chloromercuri-, m.p. 270° (does not react with I-KI); 2-iodo-3:4:5-tri(chloromercuri)-, m.p. 290° (decomp.; darkens at 280°), and 2:5-di-iodo-3:4-di(chloromercuri)-thiophen. (I) and NaI in  $C_5H_5N$  give  $Hg_2$  4:5:4':5':4-tetrabromo-2:3:2':3'-dithienylene (cf. A., 1923, i, 125); (II) similarly affords  $Hg_2$  3:4:3':4'-tetrabromo-2:5:2':5'-dithienylene. (III) and NaI in  $COMe_2$  give  $Hg$  2:3:4:2':3':4'-hexabromo-5:5'-dithienyl, m.p. 291°.

H. B.

**Constitution of glutokyrin. III. Collagen.** W. GRASSMANN and K. RIEDERLE (Biochem. Z., 1936, 284, 177—188; cf. A., 1934, 271).—The basic  $NH_2$ -acid fraction (equiv. to 2/3 of the total N) from hydrolysates of glutokyrin is arginine and lysine (1:1); 1/3 of the  $(NH_2)_1$ -acid fraction is proline or hydroxyproline (which form peptides by linking of the  $:NH$  group), the remainder being acyclic  $NH_2$ -acids. The structures of the parent peptide chains and their bearing on those of gelatin and collagen are discussed.

F. O. H.

**Chemical groups of proteins which possess affinity for polysaccharides. VIII. Hydroxyproline, histidine, and lysine. IX. Rôle of  $\cdot CO \cdot NH \cdot$  linking.** S. J. VON PRZYŁĘCKI, J. CICHOCKA, and H. RAFAŁOWSKA (Biochem. Z., 1936, 284, 169—176; cf. this vol., 90).—Hydroxyproline, histidine, lysine, and creatinine do not form complexes with amylose (I) at  $p_H$  4, 7, or 8 as indicated by changes in  $\alpha$ ; arginine (II) + (I) at  $p_H > 7$ , however, show vals. of  $\alpha < \text{sum of the constituent vals.}$  The group  $\cdot CO \cdot NH \cdot$  does not appear to par-

ticipate in the phenomenon; glycyltyrosine, however, forms complexes. (II) and tyrosine appear to be the only constituent  $NH_2$ -acids concerned. F. O. H.

**Substituted proteins. II. Iodination of hæmoglobin and globin. III. Iodination of nitroglobin.** H. BAUER and E. STRAUSS (Biochem. Z., 1936, 284, 197—230, 231—237).—II. The coagulation of hæmoglobin (I) by heat,  $COMe_2$ ,  $CHCl_3$ , or  $CO(NH_2)_2$ , together with the properties of derived products, indicate that both (I) and globin are complexes of six units each of mol. wt. approx. 11,680. Iodination of (I), globin, paraglobins, etc. under various conditions shows that the linking of the units is by the glyoxaline groups of constituent histidine (II). Thus dissociation produces an increase in I val. from 4.17 to 9.56%. Hæmatin-free globin is more sensitive to lytic agents than is (I); hence the hæmatin complex has a stabilising influence on the coherence of the constituent units of the complex. Physical denaturation of (I) is not attended by dissociation. The orientation, affinity, and characteristics of the units are discussed.

III. Iodination of nitroglobin (III) in neutral, acid, and alkaline media give I vals. of 3.88—6.29%, indicating that (II) and not tyrosine is the I-carrier. The effective (II) in (I), globin, and (III) forms respectively 1/3, 1/2, and 2/3 of the total (II).

F. O. H.

**Pattern of proteins.** D. M. WRINCH (Nature, 1936, 137, 411—412).—Theoretical.

L. S. T.

**Method of introducing elementary arsenic, antimony, and bismuth into proteins.** P. MASCHERPA and L. CALLEGARI (Arch. ital. Biol., 1934, 91, 107—122; Chem. Zentr., 1935, ii, 401—402).—The powdered element is shaken with the protein solution in the absence of  $O_2$ .

H. N. R.

**Influence of  $p_H$  on the formation of salt-protein compounds between arsenic, antimony, bismuth, and albumin.** P. MASCHERPA and L. CALLEGARI (Arch. ital. Biol., 1934, 91, 115—122; Chem. Zentr., 1935, ii, 402; cf. preceding abstract).—With falling  $p_H$  the solubility of As and Sb in gelatin solutions diminishes, whilst that of Co increases.

H. N. R.

**Determination of organic nitrogen.** H. A. SCHUETTE and F. C. OPPEN (Trans. Wis. Acad. Sci., 1935, 29, 355—380).—A review.

**Identification of acids and esters.** D. V. N. HARDY (J.C.S., 1936, 398).—The acidic component of an ester is readily identified by conversion by  $NHR \cdot MgX$  into the anilide or substituted anilide.

R. S. C.

**Colour reaction of titanium with ascorbic acid and other molecules containing the group  $\cdot C(OH) : C(OH) \cdot$ .**—See this vol., 580.

**Application of copper salts of polyhydric alcohols to the detection and determination of reducing sugars.** V. M. PLATKOVSKAJA and T. I. VECHOTKO (J. Appl. Chem. Russ., 1936, 9, 177—181).—Glycerol and mannitol may be substituted for Na K tartrate in Fehling's solution.

R. T.

**Phospho- and silico-tungstates.** E. KAHANE and M. KAHANE (Bull. Soc. chim., 1936, [v], 3, 621—625).—Attention is directed to the suitability of the phospho- and silico-tungstates of org. bases for determination of the mol. wt. of the base. Such complexes have a const. composition and are free from  $H_2O$  of crystallisation. E. S. H.

**Quantitative investigations of amino-acids and peptides. I. Quantitative formaldehyde titration using a glass electrode.** M. S. DUNN and A. LOSIAKOV (J. Biol. Chem., 1936, 113, 359—369).—Details are given of a method for determination (error  $\pm 0.1\%$ ) of  $NH_2$ -acids and peptides by titration in 37.5% aq.  $CH_2O$  (freed from  $HCO_2H$  by basic Mg carbonate) with 0.3N-NaOH (mechanical stirring) using a glass electrode. Determination of  $NH_2$ -acids is unaffected by the presence of a foreign  $NH_2$ -acid if there is a  $10^4$ -fold difference between their apparent acid dissociation consts., but with peptides containing an  $NH_2$ -acid the no. of equivs. of NaOH is that required for the sum of the two constituents. Numerous examples are given, and other methods are briefly discussed. J. W. B.

**Some causes of error in the determination of  $\alpha$ -amino-acids by the ninhydrin reaction.** M. POLONOVSKI (Compt. rend. Soc. Biol., 1936, 121, 1103—1105).— $CO(NH_2)_2$  and creatine in large quantities interfere with the reaction. Proteins are removed by phosphotungstic acid for determination of  $(NH_2)_1$ -acids, and by saturation with  $(NH_4)_2SO_4$  for total  $NH_2$ -acids,  $(NH_2)_2$ -acids being calc. by difference.  $p_H$  must be made about 6.0 for the determination. R. N. C.

**Separation of amino-acids.**—See this vol., 561.

**Displacement of oxidation-reduction potential on illumination of methylene-blue solutions containing iron.**—See this vol., 566.

**Determination of pyridine according to the "Erganzungsbuch 5."** H. LEONHARDT and R. KLOCKMANN (Pharm. Ztg., 1936, 81, 345).—For the titration of  $C_5H_5N$  with HCl (the final concn. being approx. 0.5N), Me-violet 6B is a better indicator than Me-orange. With the latter, titration must be continued until a definite red colour is obtained. W. O. K.

**Phloroglucinol and diphenylbarbituric acid methods for determination of furfuraldehyde.** N. V. KOSCHKIN and V. P. TOKAREV (J. Appl. Chem. Russ., 1936, 9, 171—176).—*NN'*-Diphenylbarbituric acid (I) and furfuraldehyde (II) in aq. HCl afford practically insol. *furfurylidene-NN'-diphenylbarbituric acid*,  $+H_2O$ , decomp. at  $> 245^\circ$ . (II) is determined by steam-distilling the material under analysis in presence of 12% HCl, and adding a 4-fold excess of a 0.5% solution of the K salt of (I). The ppt. is collected after 12 hr., washed with boiling 2.5% NaOAc and with  $H_2O$ , dried at  $120^\circ$ , and weighed. The accuracy is of the same order as with the phloroglucinol method. R. T.

**Determination of alkaloids.** M. I. SMIRNOVA and G. N. SERBINA (Bull. Appl. Bot. U.S.S.R., 1934, [iii], No. 5, 309—314).—A suitable modification of the nephelometric method is described. Ivanov's micro-method gave good results with fractions of a mg. CH. ABS (p)

**Colorimetric determination of morphine and its derivatives.**—See this vol., 536.

**Micro-determination of morphine.**—See this vol., 652.

## Biochemistry.

**Regulation of respiration with oxygen-poor air mixtures.** A. J. ANTHONY (Pflüger's Archiv, 1935, 236, 435—439). R. N. C.

**Gaseous exchange in growing ducks.** A. K. DANILOVA and A. N. POSTNIKOVA (Bied. Zentr. [Tierernähr.], 1935, 7, B, 158—183).—Variations in catabolic rates with advancing age of ducks are examined. Max. vals. occur at approx. 10 days. A. G. P.

**Effects of inhalation of carbon dioxide on the carbon dioxide capacity of arterial blood.** H. E. HIMWICH, E. F. GILDEA, N. RAKIETEN, and D. DuBOIS (J. Biol. Chem., 1936, 113, 383—389).—Exposure to  $CO_2$  (5—8%) for approx. 0.5 hr. caused a decrease of  $CO_2$  capacity in all human subjects and in 3 out of 4 dogs examined. After  $< 55$  min. there was a rise of  $CO_2$  capacity in all cases. The compensatory increase of  $CO_2$  capacity which diminishes the fall in  $p_H$  is not the first response to inhalation of  $CO_2$ . The acid-base equilibrium of the serum showed no accumulation of unknown acid, neither was there a shift of fluid in the serum, which might have explained such changes. J. N. A.

**Diffusion of carbonic acid through the skin.** K. KRAMER and H. SARRE (Arch. exp. Path. Pharm. 1936, 180, 545—556).—Changes in  $[CO_2]$  of  $CO_2$ -containing or -free  $H_2O$  in contact with skin indicate a purely physical diffusion of  $CO_2$  dissolved (as in  $H_2O$ ) in the cutaneous tissue. The exchange depends on the blood supply. Exposure to an atm. of  $CO_2$  (when the uptake of  $CO_2$  averages 26 c.c. per 33 sq. cm. of skin) produces no change in the rate of subsequent diffusion, indicating a removal of penetrated  $CO_2$  by blood. F. O. H.

**Voluntary hyperpnea and behaviour of alveolar carbon dioxide, alkaline reserve, and blood-proteins in man.** W. JAROSZEWICZ (Compt. rend. Soc. Biol., 1936, 121, 917—920).—Alveolar  $CO_2$  and the alkaline reserve are always decreased. Blood-proteins decrease in all cases of pronounced, and in most cases of less pronounced, tetanic reflex action; in its absence they generally rise. R. N. C.

**Measurement of red-cell volume: conductivity measurements.** E. PONDER (J. Physiol., 1935, 85, 439—449). R. N. C.

**Permeability of erythrocytes. III. Cation content of erythrocytes of rabbit's blood in hyper- and hypo-tonic sera.** H. DAVSON (Biochem. J., 1936, 30, 391—393).—The changes in vol. of rabbit's erythrocytes in hyper- and hypo-tonic solutions are < those to be expected on the basis of complete cationic impermeability, but the anomalies are < those described by Ponder and Saslow (J. Physiol., 1930, 70, 169; 1931, 73, 267) and are not to be correlated with the penetration of  $K^+$  and  $Na^+$  (cf. A., 1934, 673). P. W. C.

**Hæmoglobin regeneration as influenced by diet and other factors.** G. H. WHIPPLE (J. Amer. Med. Assoc., 1935, 104, 791—793).—A summary.

CH. ABS. (p)

**Rôle of inorganic substances and amino-acids in the regeneration of hæmoglobin in the rat.** H. L. KEIL (Iowa State Coll. J. Sci., 1934, 9, 169—170).—Attempted replacement of Cu by other elements and various  $NH_2$ -acids as hæmotinics was unsuccessful. Intraperitoneal injection of Fe citrate or chloride or of dil. HCl gave temporary relief. Injection or feeding of sol. or insol. Cu compounds, with or without Fe, causes regeneration.

CH. ABS. (p)

**Isoelectric point of adsorbed hæmoglobin.** H. L. WHITE and B. R. MONAGHAN (J. Biol. Chem., 1936, 113, 371—374).—As the purity of adsorbed hæmoglobin increases, the isoelectric point approaches 6.8, the val. obtained by the moving boundary method. Using the microscopical method, a protein must be pure to get correct vals. of mobilities and isoelectric point, but the electrical properties are not altered by adsorption on quartz or glass.

J. N. A.

**Localisation of hæmoglobin and its derivatives in some aphrodites.** C. RAPHAËL (Compt. rend., 1936, 202, 588—590).—Hæmoglobin is present in the circulatory system and in the pigment of the pharyngeal sheath. Oxyhæmoglobin and hæmatin (I) occur in the papillæ which cover the edge of the sheath, and large quantities of (I), together with small amounts of bile pigments, in the cæcum.

J. N. A.

**Hepatic function. III. Effect of cholecystectomy.** A. CANTEROW, E. GARTMAN, and G. RICHUTI (Arch. Surg., 1935, 30, 865—874).—Changes in serum-bilirubin are recorded and discussed.

CH. ABS. (p)

**Colloid osmotic pressure of the blood in normal and pathological conditions. XIV. Effect of blood transfusion on colloid osmotic pressure in normal and anæmic rabbits.** N. ONOZAKI. XV. Effect of infusions of gum arabic. N. ONOZAKI and Y. SANADA. XVI. Effect of vegetative nerve poisons. N. ONOZAKI (Tôhoku J. Exp. Med., 1935, 25, 1—13, 120—130, 131—147).—XIV. The colloid osmotic pressure ( $P$ ) of blood after injection of physiological saline parallels the decreased protein (I) and hæmoglobin (II) content, the  $P$  per unit (I) remaining const. The increased  $P$  after transfusion is > that corresponding with the increased (I) content.

XV. Intravenous injection of 6—12% solutions of gum into rabbits decreased serum-(I) and blood-(II). The  $P$  increased by an amount > that of the gum introduced.

XVI. Ergotamine, pilocarpine, and choline produced significant changes. Atropine had no action.

CH. ABS. (p)

**Precipitation of serum-proteins by ammonium sulphate: [serum of] normal man.** A. ROCHE, M. DORIER, and L. SAMUEL (Compt. rend. Soc. Biol., 1936, 121, 1019—1021).—Globulins (I) are pptd. between 30% and 60%, and albumins between 60% and 70% of saturation with  $(NH_4)_2SO_4$ . (I) are not pptd. fractionally, as in horse serum. The (II)/(I) ratio obtained by 50% saturation is 1; the true ratio at 60% saturation is 0.5.

R. N. C.

**Effect of fasting on the serum-protein concentration of the rat: existence of an immediately utilisable circulating protein fraction.** H. C. TORBERT (J. Exp. Med., 1935, 62, 1—10).—No evidence of a circulating, available plasma-protein was obtained. The decline in serum-protein after fasting involves principally the albumin fraction.

CH. ABS. (p)

**[Electrical] conductivity of serum after administration of calcium and ultra-violet irradiation.** A. DELL'AQUILA and F. JAIA (Arch. Farm. sperim., 1935, 60, 578—586).—Intravenous injection of aq.  $CaCl_2$  has no effect on  $\kappa$  of blood or serum, but subsequent ultra-violet irradiation lowers  $\kappa$ . The phenomenon occurs *in vitro*, but to a smaller extent than *in vivo*.

F. O. H.

**Dispersion by blood-serum of a partly-flocculated serum-globulin fraction.** C. MOREL (Compt. rend. Soc. Biol., 1936, 121, 836—837).—The globulins are partly flocculated by dilution of the serum within a certain range of  $p_H$ . The dispersive power of the serum falls with  $p_H$ . It is increased by heating the serum at the upper limit of this  $p_H$  range, the effect of heating falling rapidly with  $p_H$  to zero at approx. the middle of the range, below which flocculation is increased by heat, the effect augmenting as  $p_H$  falls to the lower limit.

R. N. C.

**Stability of blood-serum.** R. JONNARD (Compt. rend. Soc. Biol., 1936, 121, 841—843).—The ratio of the serum concn. to the [EtOH] necessary for flocculation is inversely  $\propto$  the hydration of the serum-colloids, and increases with the serum concn., the curve being linear at acid reactions. The ratio increases with acidity for any fixed serum concn.

R. N. C.

**Micro-determination of serum-albumins and -globulins.** A. ROCHE (Compt. rend. Soc. Biol., 1936, 121, 1022—1023).—Globulins are pptd. from the serum by half saturation with  $(NH_4)_2SO_4$ ; albumins are determined in the filtrate and total proteins in the serum by the micro-Kjeldahl method after pptn. with tannin acetate or Hedin's reagent.

R. N. C.

**Determination of euglobulin.** R. GILLE (Compt. rend. Soc. Biol., 1936, 121, 906—908).—Dialysis of globulins previously separated from serum by pptn. with  $MgSO_4$  produces a euglobulin fraction > that from direct dialysis of the serum, and containing much pseudoglobulin. The  $(NH_4)_2SO_4$  technique of Porges and Spiro gives high vals., but pptn. with excess of 1/3-saturated  $(NH_4)_2SO_4$  solution or 14% of  $Na_2SO_4$  produces trustworthy results.

R. N. C.

**Volumetric micro-determination of phosphatides, free cholesterol, cholesteryl ester, neutral fat, and total lipins of blood, plasma, and corpuscles.** S. KATSURA, T. HATAKEYAMA, and K. TAJIMA (*Biochem. Z.*, 1936, 284, 312; cf. *A.*, 1934, 673).—Some improvements in the method are given.

F. O. H.

**Micro-determination of blood-sugar with hypiodite.** E. GUBAREV and M. RUTES (*Bull. Soc. Chim. biol.*, 1936, 18, 395—400).—The blood (0.2 c.c.) is freed from albumin with aq. AcOH and oxidised with NaOI.

A. L.

**Blood-sugar level after sectioning the pancreatic duct in rabbits.** T. DEGUCHI (*Tôhoku J. Exp. Med.*, 1934, 24, 368—373).—Bilateral ligation of the duct caused neither hyper- nor hypo-glycaemia in rabbits.

CH. ABS. (p)

**Determination of alcohol in blood by Widmark's method.** C. HEGLER (*Deut. med. Woch.*, 1935, 61, 288—291; *Chem. Zentr.*, 1935, ii, 729).—The Widmark test is usually, but not decisively, an evidence of alcoholic influence. In chronic alcoholism, low vals. are frequently found.

J. S. A.

**Technique of Widmark blood-alcohol determination for serial investigations.** H. R. KANITZ (*Deut. Z. ges. gerichtl. Med.*, 1935, 24, 273—274; *Chem. Zentr.*, 1935, ii, 729).—Improved procedure is described.

J. S. A.

**Chloropenic hyperazotæmia.** S. MARINO (*Arch. Farn. sperim.*, 1935, 60, 564—571).—The incidence of hyperazotæmia in chloropenia is discussed with reference to increased formation of urea and to changes in the re-absorption by the renal tubules.

F. O. H.

**Resection of the small intestine.** P. BARCO and S. L. PASTORINO (*Pathologica*, 1935, 27, 285—293).—Blood-Ca, -K, -P, -glucose, and -cholesterol increased immediately after resection and subsequently decreased to normal in 30—60 days.

CH. ABS. (p)

**[Blood-]bromine problem.** I. SCHMITT and H. KIRCHHOFF (*Deut. tierärztl. Woch.*, 1935, 43, 227—230; *Chem. Zentr.*, 1935, ii, 1053).—The blood-Br vals. for a no. of animals are given.

R. N. C.

**Velocity of intra-hepatic blood circulation.** I. ENESCO and C. ISAC (*Bull. Acad. Méd. Roumanie*, 1936, 1, 168—178).—Following intravenous and oral administration of KI, I appears in the saliva within 1—2.5 and 7—15 min., respectively. With oral and rectal administration, the difference in time of appearance, 2—5 min., represents the time of intra-hepatic circulation. The influence of disease is discussed.

F. O. H.

**Potassium and calcium in the blood of pigeons after resection and electrical excitation of the wing nerves.** R. CERNATESCU and A. MEYER (*Vol. Jubilaire C. I. Parhon*, Sep., 8 pp.).—Excitation disturbed the equilibrium of K<sup>+</sup> and Ca<sup>++</sup> in serum. The effect varied with the individual, the change in [K<sup>+</sup>] appearing first and being > that in [Ca<sup>++</sup>].

CH. ABS. (p)

**Extraction of lead by means of diphenylthiocarbazone.** L. ELLIS (*Analyst*, 1936, 61, 178—179).—For the determination of Pb in blood the "titri-

metric extraction" method of Wilkins *et al.* (*A.*, 1935, 531) is simpler and more convenient than that involving complete oxidation of the dithizone (I). The first Pb-(I) complex is extracted with 1% HNO<sub>3</sub> and, after removal of CHCl<sub>3</sub>, the combined extracts are used directly for the colorimetric comparison.

E. H. S.

**Soap hæmolysis as a fatty acid hæmolysis.** A. MEDVECZKY and L. VOTIN (*Biochem. Z.*, 1936, 284, 244—246).—Hæmolysis by Na oleate is due to liberated oleic acid, the reaction for both not occurring at  $p_H$  8.5—9.0, but increasing as  $p_H$  decreases from 8.0 to 4.5.

F. O. H.

**Venom of *Lachesis (Bothrops)* snakes. II. Preparation of bothropotoxin.** D. VON KLOBU-SITZKY (*Arch. exp. Path. Pharm.*, 1936, 180, 479—481).—The highly purified toxin (free from N, P, Fe, and halogens; min. lethal dose 0.055—0.060 mg.) (cf. *A.*, 1935, 1394) is prepared from aq. NaCl extracts of the dried venom by acid-heat-coagulation of proteins, removal of impurities by dil. alkali, pptn. with EtOH, and dialysis.

F. O. H.

**Chemical aspects of immunity.** A. SORDELLI (*Anal. Asoc. Quím. Argentina*, 1935, 23, 106—125).—A lecture.

**Antigenic character of proteins heated in sucrose media.** W. MUTSAARS and J. ALEXANDER (*Compt. rend. Soc. Biol.*, 1936, 121, 898—899).—Sucrose in high concns. prevents the destruction of the antigenic power of serum-proteins by heating to 75°.

R. N. C.

**Influence of nutrition on the natural immunity reactions of the blood and on skin reactions to bacterial toxins.** E. M. J. ANDERSON and A. H. H. FRASER (*J. Immunol.*, 1934, 27, 1—16; *Chem. Zentr.*, 1935, ii, 396).—Caloric dietary deficiency decreased the hæmolytic activity of sheep serum to rabbit red-cells but increased its agglutinating power with *Br. abortus*. Cod-liver oil and Ca had no effect on the natural immunity reactions.

G. H. F.

**Immunological study of the reduction of disulphide groups in proteins.** D. BLUMENTHAL (*J. Biol. Chem.*, 1936, 113, 433—437).—The influence of reduction of serum- (I) and ov-albumin (II) by thioglycolic acid and cysteine, respectively, and re-oxidation by H<sub>2</sub>O<sub>2</sub> on their antigenic properties is determined by injecting them into rabbits and measuring the N content of the ppts. formed with the antisera. Reduction and re-oxidation of (I) decreases the N pptd. in the cross reaction as compared with the homologous pptn., and prevents the usual inhibition of pptn. by excess of antigen. Similar treatment of (II) has no influence on its immunological behaviour.

H. D.

**Effect of concentration of ammonia and of the time factor on the antigenic properties of a deformalised anavaccine.** A. A. KLIMENTOVA and E. S. AVTONOMOVA (*Arch. Sci. biol. U.S.S.R.*, 1934, 35, B, 837—842).—Treatment of typhoid (formalised) vaccine with aq. NH<sub>3</sub> to remove excess of CH<sub>3</sub>O, followed by neutralisation to  $p_H$  7.1 with HCl, did not lower the antigenic potency. Prolonged treatment (24 hr.) with NH<sub>3</sub> lowered the titre.

CH. ABS. (p)

**Effect of phenol on the antigenic and immunising properties of formalinised vaccines.** L. A. TSCHERNAJA and N. P. IVANOV (Arch. Sci. biol. U.S.S.R., 1934, 35, B, 821—823).—Neither  $\text{CH}_2\text{O}$  treatment nor the further addition of 0.5% PhOH affected the potency of typhoid vaccines.

CH. ABS. (p)

**Dynamics of the transformation of diphtheria toxins of various types into anatoxins.** T. I. IVANOVA and V. N. KALNINA (Arch. Sci. biol. U.S.S.R., 1934, 35, B, 631—640).—The mechanism of the change is examined.

CH. ABS. (p)

**Purification of antidyenteric serum with sodium sulphate.** O. GARCIA, R. VILLAMIL, and C. PAÑGANIBAN (Philippine J. Sci., 1935, 58, 471—479).—To the dil. serum is added  $\text{Na}_2\text{SO}_4$  to produce a final concn. of 20 g. per 100 c.c. The ppt. is washed and dissolved in  $\text{H}_2\text{O}$ , and the solution is dialysed.

A. G. P.

**Rôle of the toxin in staphylococcal infection.** F. C. O. VALENTINE (Lancet, 1936, 230, 526—531; cf. *ibid.*, 1932, 222, 506).—Methods of preparing the toxin and of determining the leucocidin (I) in toxin and the anti-(I) in serum are described. Fresh evidence that  $\alpha$ -hemolysin and (I) are distinct substances is provided.

L. S. T.

**Chemioaccine producing in the rabbit immunity against tubercle infection.** M. MACHEBEUF and J. DIERYCK (Compt. rend., 1936, 202, 164—166).—Tubercle bacilli, treated with  $\text{H}_2\text{O}$  and then with  $\text{COMe}_2$  and  $\text{Et}_2\text{O}$  to remove toxic non-antigenic substances, possess high immunising activity.

W. O. K.

**Crystal orientation in tooth-enamel.** W. F. BALE and H. C. HODGE (Naturwiss., 1936, 24, 141—142).—The cryst. substance of tooth-enamel is identical with that of the dentine, but differences in the X-ray diffraction diagrams arise owing to preferential crystal orientation in the enamel, which is seldom found in the dentine.

A. J. M.

**Dissolution rate of apatite in an average mouth.** P. J. BREKHUS and W. D. ARMSTRONG (J. Dental Res., 1934, 14, 455—456).—Slow dissolution confirms that the inorg. matter of tooth enamel is apatite.

CH. ABS. (p)

**Histo-chemical localisation of chlorine in the gastric mucosa.** L. LISON (Compt. rend. Soc. Biol., 1936, 121, 900—902).—The lining cells of the mucosa of laboratory animals contain no Cl.

R. N. C.

**Changes in potassium and calcium content in the gravid uterus.** H. WINKLER (Monatsschr. Geburtsh. Gynäkol., 1935, 100, 211).—The K content of the non-pregnant human uterus (mean 1.61% of dried musculature in 9 cases) is very variable. It rises slowly during the earlier part of pregnancy and very rapidly during the last few months (to 2.5%). Ca is much more uniform (0.5%), but drops below the non-pregnant val. near term.

NUTR. ABS. (m)

**Determination of  $\alpha$ -amino-acids by the ninhydrin reaction.**—See this vol., 620.

**Biogenic amines in toxicological investigations.** A. VERDINO (Deut. Z. ges. gerichtl. Med.,

1935, 25, 74—78; Chem. Zentr., 1935, ii, 889).—Tyramine and a base, probably  $\text{C}_{10}\text{H}_{18}\text{O}_2\text{N}_2$ , were isolated from a corpse 3 months after interment.

J. S. A.

**Total glutathione in tissue: determination and distribution in normal animals.** L. BINET and G. WELLER (Bull. Soc. Chim. biol., 1936, 18, 358—378).—The author's method for the determination of glutathione (I) (A., 1935, 1153) is applied to the tissue of *Carassius auratus* and to various animal organs. Large variations in the oxidised (I) content of the individual tissues are observed; in the intestine there is none, but the val. rises to 20—50% of the total (I) in lung and brain. The total (I) content shows less individual variation, and is characteristic of each tissue.

A. L.

**Amino-acids of the mixed proteins of ox muscle. Basic amino-acids.** H. G. REES (Analyst, 1936, 61, 160—164).—Arginine (6.18%), histidine (0.52%), and lysine (7.18%) have been determined in the mixed proteins [N 15.87% (amide, 7.2%; humin, 1.6%; basic, 24.3%;  $\text{NH}_2$ , 66.6%; non- $\text{NH}_2$ , 0.8%)] of ox muscle by Vickery's modification of Kessel's procedure.

E. H. S.

**Determination of the fatty acids in monoaminophosphatides.** M. FLATTER (Bull. Soc. Chim. biol., 1936, 18, 406—413).—Attempts are made to avoid low vals. in the determination of the fats resulting from hydrolysis of monoaminophosphatides. A modification of the method of Lemeland (A., 1922, ii, 666) and hydrolysis in AcOH solution with 3N-HCl were best, giving almost theoretical results with lecithin.

A. L.

**Seasonal differences in the fat and protein content of nerve tissue of the frog.** J. ROSENBERG (Arch. internat. Physiol., 1935, 41, 429—433).—In the cerebrospinal tracts the N content was 14.7—16.0 mg. (mean 15.3 mg.) and in the sciatic nerves 18.0—20.2 mg. (mean 19.1 mg.) per g. of fresh material, being highest in May and June and lowest in Feb. and July. The corresponding fatty acid contents were 46.9—67.6 mg. (mean 61.9 mg.) and 88.1—130.0 mg. (mean 119.2 mg.), being highest in summer and autumn and lowest during hibernation.

NUTR. ABS. (m)

**Bio-organic chemistry of the proteins.** V. SADIKOV (Arch. Sci. biol. U.S.S.R., 1934, 35, A, 297—331).—A theoretical discussion of the structure of constituent groups which are components of living protein systems.

CH. ABS. (p)

**Influence of method of preparation and of cations on the isoelectric point of ovalbumin.** E. R. B. SMITH (J. Biol. Chem., 1936, 113, 473—478).—The isoelectric point of ovalbumin is independent of the salt used for recrystallisation; it decreases linearly with the ionic strength of the buffers used, and the slope of the ionic strength against isoelectric point varies with the ions in the OAc' buffer mixtures.

H. D.

**Proteins of muscle in rigor.** A. E. MRSKY (J. Gen. Physiol., 1936, 19, 571—575).—No activation of -SH groups accompanies the formation of insol. protein in rigor, but occurs in subsequent denaturation.

H. G. R.

### Thiol and disulphide groups of proteins.

IV. Thiol groups of the proteins of muscle. A. E. MIRSKY (J. Gen. Physiol., 1936, 19, 559—570).—Denaturation or increased  $p_H$  causes a rise in the no. of active -SH groups in the proteins of minced muscle (halibut, *Rana catesbiana*, rabbit), except that of the crust. lens. Little denatured protein is present in minced muscle. H. G. R.

Formation of myelin studied in polarised light. G. LEBOUcq (Compt. rend. Soc. Biol., 1936, 121, 875—877).—Myelin appears very late in the embryonic life of the rat, but crystals of cholesterol or its esters are observed at earlier stages. R. N. C.

Proteins of hen egg-yolk. M. PIETTRE (Compt. rend., 1936, 202, 699—701).—An albumin and a myxoprotein are isolated and examined. The fatty matter contains cholesterol. Bilirubin is also present. A. G. P.

Gravimetric determination of total body- and organ-protein. T. ADDIS, L. J. POO, W. LEW, and D. W. YUEN (J. Biol. Chem., 1936, 113, 497—504).—The general method is to drop the fresh tissue into boiling OAc' buffer at  $p_H$  5 which prevents autolysis, ppts. the proteins, and removes  $H_2O$ -sol. compounds. Fats are removed by hot EtOH, and the residual protein is dried in a vac. and weighed. Detailed procedures for the different organs are given, together with data obtained on normal rats. F. A. A.

Iodination of hæmoglobin, globin, and nitroglobin.—See this vol., 619.

Visual cycle and protein denaturation. A. E. MIRSKY (Proc. Nat. Acad. Sci., 1936, 22, 147—149).—Visual purple is considered to consist of a protein conjugated with a carotenoid (retinene), and this complex is reversibly denatured by light. The denatured complex (visual yellow) is in equilibrium with its constituents. The energy requirements found approx. agree with those expected of such a reaction. F. A. A.

New forms of visual purple found in sea fishes: visual cells of origin. L. E. BAYLISS, R. J. LYTHGOE, and K. TANSLEY (Proc. Roy. Soc., 1936, B, 120, 95—113).—A no. of new forms of visual purple, found in sea fishes, with max. of absorption between 505 and 545  $m\mu$ , are described. Absorption curves, obtained by a null-point photo-electric spectrophotometer, are given. The instrument gave accurate results using only 0.5 c.c. of solution and with a light intensity not high enough to bleach the visual purple. E. A. H. R.

Anomalies in the absorption spectrum and bleaching kinetics of visual purple. A. M. CHASE (J. Gen. Physiol., 1936, 19, 577—599).—During bleaching of visual purple by light, winter extractions show an intermediate yellow colour not observed in summer extractions; these conditions can be simulated by variation in the  $p_H$ , since an indicator (yellow in acid, colourless in alkali) is formed as an intermediate in the decomp. Temp. has no effect on the bleaching of alkaline solutions, but acid solutions at low temp. approximate to winter conditions and at higher temp.

to summer. No variation of  $p_H$  is observed during bleaching or in summer or winter extractions. H. G. R.

Erythrocrucorin (hæmoglobin) of the nervous system of *Aphrodite*. J. ROCHE and C. RAPHAËL (Compt. rend. Soc. Biol., 1936, 121, 1024—1026).—The pigment (I) shows bands at 576.4 and 539.5  $m\mu$ , whilst the reduced form shows one band at 557  $m\mu$ . CO forms a compound with bands at 570.6 and 538  $m\mu$ .  $C_5H_5N$  and  $Na_2S_2O_4$  produce a hæmochromogen spectroscopically identical with protohæmatin. The isoelectric point of (I) is  $p_H$  5.8, showing that (I) is related to both muscular hæmoglobins and erythrocrucorins. R. N. C.

Muscular hæmoglobin and cytochrome. J. ROCHE (Compt. rend. Soc. Biol., 1936, 121, 1026—1028).— $N_2H_4$  reduces muscular methæmoglobin to a hæmochromogen (bands at 525, 552—554, and 570—572  $m\mu$ ), and to hæmoglobin, which forms oxyhæmoglobin with atm.  $O_2$ . There is no evidence of a reversible transformation to cytochrome. R. N. C.

Nature and permeability of chitin. II. Permeability of the uncalcified chitin lining the foregut of *Homarus*. C. M. YONGE (Proc. Roy. Soc., 1936, B, 120, 15—41).—The bounding cuticle of the integument is removed by prolonged treatment with  $N$ -alkali. The permeabilities of fresh and treated membranes to fatty acids, mineral acids, alkalis, and  $Cl'$  are very different. Rigidity is conferred on chitin by impregnation with scleroproteins or Ca salts, and its high permeability is limited by the cuticle. E. A. H. R.

X-Ray investigations of chitin.—See this vol., 414.

"Adrenosterone."—See this vol., 605.

Separation of hæmatopoietic principles from liver. B. EISLER, E. HAMMARSTEN, and H. THEORELL (Naturwiss., 1936, 24, 142—143).—During cataphoresis of active liver extracts at  $p_H$  4.5—6.6, substances  $R$  and  $E$  migrate to the anode and cathode, respectively.  $R$  increases reticulocytes but not erythrocytes and is stable to heat or changes in  $p_H$ , whilst  $E$  does not change the blood picture;  $R+E$ , however, increase reticulocytes and subsequently erythrocytes.  $R$  can be replaced by substances such as  $Na_4$  thymonucleate. F. O. H.

Dietary requirements for lactation. IV. Nature of factor  $L$ , a specific dietary factor for lactation. W. NAKAHARA, F. INUKAI, and S. UGAMI (Bull. Agric. Chem. Soc. Japan, 1936, 12, 1—8).—The factor is separated from liver extracts by making use of the facts that it is not adsorbed by fuller's earth, that it is pptd. from the non-adsorbable fraction by  $Ba(OH)_2$  and MeOH, and from the decomposed Ba ppt. by phosphotungstic acid. The final ppt. was active in doses of < 50 mg. per rat. H. D.

Hæmocyanin in heavy water.—See this vol., 563.

Determination of diffusion constants of proteins by a refractometric method.—See this vol., 563.

Rôle of coacervation in the resorption of fats.—See this vol., 563.

**Blood-coagulation-accelerating properties of maternal milk.** W. KRASZEWSKI and L. LINDENFELD (Klin. Woch., 1935, 14, 863—864).—The acceleration is due to a cytozyme.  
R. N. C.

**Heating of human milk and its nutritional results: converging point for human milk.** W. CATEL (Deut. med. Woch., 1935, 61, 985—988).  
R. N. C.

**Inhibition of coffee diuresis by milk and milk products.** K. HITZENBERGER and D. ROLLER (Wien. Arch. inn. Med., 1935, 27, 133—141; Chem. Zentr., 1935, ii, 874).—The inhibition is probably due to lecithin.  
R. N. C.

**Tyndall light of milk.**—See this vol., 562.

**Permeability of the mammary gland.** M. PIETTRE (Compt. rend., 1936, 202, 166—169).—Low secretory activity of the mammary gland associated with low lactose content of the milk results in high [Cl] in consequence of a more complete equilibrium with serum-Cl being established. Thus the apparent compensation of osmotic pressure frequently observed is accidental and not essential.  
W. O. K.

**Colloid osmotic pressure of the hæmolymphs of some terrestrial invertebrates.** P. MEYER (Nature, 1936, 137, 401—402; cf. A., 1935, 1516, 1524).—The colloid osmotic pressure of the body fluids of marine and terrestrial gastropod molluscs is practically identical, but rises steadily from crustaceans to arachnids and insects.  
L. S. T.

**Composition of saliva from the separate glands in children.** A. I. MACHTINGER and A. J. FEDOROV (Arch. Sci. biol. U.S.S.R., 1934, 34, 587—590).—Parotid saliva in children of 12—14 years is richer in amylase and org. matter than that of the submaxillary. The parotid is the chief digestive gland in children.  
CH. ABS. (*p*)

**Human saliva. II. Procedure for calcium analysis.** W. W. WAINWRIGHT (J. Dental Res., 1934, 14, 425—434).—The centrifuged sample is treated with  $\text{CCl}_3 \cdot \text{CO}_2\text{H}$  and again centrifuged. Ca is determined by pptn. as  $\text{CaC}_2\text{O}_4$  and titration with  $\text{KMnO}_4$ .  
CH. ABS. (*p*)

**Bile pigments. I. Ehrlich's test for urobilinogen and Schlesinger's reaction for urobilin.** H. N. NAUMANN (Biochem. J., 1936, 30, 347—351).—The Ehrlich test for urobilinogen with  $p\text{-NMe}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{CHO}$  in HCl is most satisfactory when carried out at 20° with a final [HCl] of 2.5%; the more important interfering substances in urine are detailed. The Jaffé-Schlesinger test for urobilin is quite sp.  
H. D.

**Role of coacervation in the formation of biliary calculi.** A. DE KUTHY (J. Chim. phys., 1936, 33, 180—182; cf. A., 1935, 580, 1006).—The pptn. of cholesterol in the gall-bladder is attributed to coacervation by protein.  
R. S.

**Effect of jejunal feeding on gastric acidity.** A. A. APPELL (Arch. Surg., 1935, 30, 875—880).—Gastric contents had a lower  $p_{\text{H}}$  and more acid after a milk-syrup diet given by jejunum than when given by mouth. The jejunal content was slightly more alkaline after jejunal than after oral feeding. Gastric

secretion was increased by food constituents in the (ascending) order, sucrose, peptone, butter, glucose, cream, meat extract, glycine, cottonseed oil, casein.

CH. ABS. (*p*)

**Hydrochloric acid and gastric motility.** C. C. DIMITRIU and T. TANASOKA (Bull. Acad. Méd. Roumanie, 1936, 1, 212—218).—The motility and HCl secretion of the human stomach are independent.

F. O. H.

**Therapeutics of [gastric] hyperacidity.** G. WALLBACH (Arch. Farm. speriment., 1935, 60, 587—594).

F. O. H.

**Composition of the gastric mucosa.** M. BEREND and E. FARKAS (Magyar orvosi Arch., 1935, 36, 72—74; Chem. Zentr., 1935, ii, 65).—Neither esters of HCl nor enzymes which can hydrolyse them occur in the gastric juice. Commercial pepsin preps. contain bound sugar, whilst cryst. pepsin is sugar-free. A powerful reducing substance can be extracted by EtOH from the gastric mucosa of the horse, after previous extraction with  $\text{COMe}_2$  and  $\text{Et}_2\text{O}$ ; its purification and properties are described.  
R. N. C.

**Osmotic pressure of the contents of the stomach compartments of the sheep.** D. G. DAVEY (J. Agric. Sci., 1936, 26, 328—330).—Vals. for the abomasum were almost identical with those for blood.  
A. G. P.

**Oxygen and nitrogen content of the urine.** A. SIMON (Pflüger's Archiv, 1935, 236, 705—709).—Urinary  $\text{O}_2$  and  $\text{N}_2$  are dependent on the concn. and  $\alpha$  the  $d$  of the urine. The  $\text{O}_2$  tension is independent of the concn. and is of the order of those of arterial and pre-capillary blood.  $\text{O}_2$  and  $\text{N}_2$  are increased in urine excreted at high atm. pressure; the  $\text{O}_2$  tension is then  $>$  that of 100% saturated hæmoglobin, but  $<$  the alveolar  $\text{O}_2$  tension.  
R. N. C.

**Paths of excretion and mineral balance in animals drinking saline and alkaline waters.** V. G. HELLER and M. HADDAD (J. Biol. Chem., 1936, 113, 439—447; cf. A., 1934, 1020).—90% of injected Cl<sup>-</sup> was excreted in the urine of rats; increasing the S and P intake increased the retention and urinary excretion.  $\text{CaCl}_2$  is better absorbed than other Ca salts; 3% of ingested  $\text{CaCl}_2$  is eliminated in the urine as compared with 10% of  $\text{MgCl}_2$ .  
H. D.

**Urinary excretion of silica in non-silicotic humans.** L. J. GOLDWATER (J. Ind. Hyg., 1936, 18, 163—166).—In non-silicotic humans, even on a const. diet, the urinary  $[\text{SiO}_2]$  shows very wide fluctuations, correlated with the urinary  $d$ . Caution is therefore required in the interpretation of urinary  $\text{SiO}_2$  findings.  
W. O. K.

**Knoop's histidine reaction in urine.** P. E. SIMOLA and V. MÄNTYLÄ (Suomen Kem., 1936, B, 9, 4—5).—The test is modified by adjusting the acidity of the urine to  $p_{\text{H}}$  4.5—5.5, by heating the reaction mixture for a short time only, and by adding amyl alcohol which extracts the coloured product. A positive reaction was obtained with 62% of the pregnancy urines examined. The reaction is not due to histidine.  
A. G. P.

**Simplified detection of defence enzymes in urine.** E. ABDERHALDEN (*Fermentforsch.*, 1936, **15**, 93—120; cf. A., 1935, 1268).—Further simplification is attained by heating the sample (0.5 c.c.) at 100° in an oven instead of boiling. 7.5—25 c.c. (usually 10 c.c.) of urine are required. W. McC.

**Chemical detection of pregnancy.** W. HECKSTEDEN (*Deut. Z. ges. gerichtl. Med.*, 1935, **24**, 253—257; *Chem. Zentr.*, 1935, ii, 889).—The Kapeller-Adler detection of histidine in urine is untrustworthy. J. S. A.

**Liver injury by chloroform, nitrogen metabolism, and conservation. Liver function and hæmoglobin production in anæmia.** F. S. DAFT, F. S. ROBSCHT-ROBBINS, and G. H. WHIPPLE (*J. Biol. Chem.*, 1936, **113**, 391—404).—The fasting anæmic dog when given Fe by vein forms new hæmoglobin, whether the liver is normal or injured by  $\text{CHCl}_3$  anæsthesia, except in the final stages of liver injury. The liver still forms urea, and there is an increase in the amount of uric acid, urinary N, and creatine. The creatine is probably derived from muscle-tissue injured by toxic products from dead and autolysing liver cells. J. N. A.

**Blood-sugar content and blood pressure during anaphylactic shock in non-anæsthetised and non-fastened dogs.** M. OHGURI (*Tôhoku J. Exp. Med.*, 1935, **25**, 437—444).—A transitory decrease in blood-sugar was followed by hyperglycæmia with a return to normal in 1.0—1.5 hr. CH. ABS. (p)

**Adrenaline discharge, blood-sugar, and blood pressure during anaphylactic shock in non-anæsthetised and non-fastened dogs.** H. SATO, M. OHGURI, and M. WADA (*Tôhoku J. Exp. Med.*, 1935, **25**, 504—519).—Adrenaline output increased during shock and preceded hyperglycæmia by 2—10 min. CH. ABS. (p)

**Gas protection. I. Treatment of phosphorus burns.** O. MUNTSCHE (*Gasschutz u. Luftschutz*, 1935, **5**, 103—104; *Chem. Zentr.*, 1935, ii, 880).—Repeated immersion in 5% aq.  $\text{NaHCO}_3$  is recommended. H. N. R.

**Chemistry and cancer. Chemical carcinogenic agents.** R. LEROUX (*Chim. et Ind.*, 1936, **35**, 520—524).—A lecture.

**Effect of hormones on the development of tumours.** W. JEZERSKI (*Endokrinol.*, 1935, **15**, 250—253; *Chem. Zentr.*, 1935, ii, 65). R. N. C.

**Carcinogenic activity and substantivity.** W. BRADLEY (*Nature*, 1936, **137**, 404—405).—An analogy between the dyeing properties and the carcinogenic activity of certain anthracene derivatives is discussed. L. S. T.

**Rôle of ultra-violet rays in the development of cancer provoked by the sun.** A. H. ROFFO (*Lancet*, 1936, **230**, 472—474).—The sun's rays can produce malignant tumours in man and in rats without the intervention of other agents. Irradiation produces a local excess of cholesterol before histological changes are observed. L. S. T.

**Differentiation between the principle of the urine of cancer active on the adrenal cortex,**

**and the principle active on the ovary.** M. ARON (*Compt. rend. Soc. Biol.*, 1936, **121**, 973—975).—Theoretical. R. N. C.

**Absence of bile salts from blood-serum in cancer.** D. ABRAGAM (*Compt. rend. Soc. Biol.*, 1936, **121**, 950—951).—The vanillin- $\text{H}_3\text{PO}_4$  reaction is negative. R. N. C.

**Blood colouring matter of cancerous subjects.** E. SEHRT (*Münch. med. Woch.*, 1935, **82**, 624—625; *Chem. Zentr.*, 1935, ii, 866—867).—A confirmatory blood-test for cancer is described. H. N. R.

**Total sulphur and iodine in normal and malignant tissues.** H. TOYODA, S. KISHI, and W. NAKAHARA (*Gann*, 1935, **29**, 29—39).—The total S content of Fujinawa rat sarcoma, Bashford mouse carcinoma, or Rous chicken sarcoma was  $\approx$  that of normal kidney or spleen but  $>$  that of skeletal muscle, blood, heart, or liver. Tumour tissue contains more I than does normal liver or muscle. In sarcoma-bearing rats the total S of various tissues was  $>$  normal and generally paralleled by increased I contents. The I content of the thyroid was  $<$  normal. CH. ABS. (p)

**Metabolism of malignant tumour. I. Influence of amino-acids on the tissue respiration of tumour.** S. MIYAO (*Gann*, 1935, **29**, 10—28).—Effects of a no. of  $\text{NH}_2$ -acids on tumour tissue are compared with those on normal spleen and liver tissues. CH. ABS. (p)

**Production of carcinoma of the liver by feeding o-aminoazotoluene.** T. SASAKI and T. YOSHIDA (*Virchows Arch.*, 1935, **295**, 175—200). NUTR. ABS. (m)

**Formation of sarcoma by repeated injections of highly concentrated glucose solutions in rats fed with o-aminoazotoluene.** Y. NISHIYAMA (*Gann*, 1935, **29**, 1—9). CH. ABS. (p)

**Soluble organo-metallic complexes of dehydroascorbic acid. Increase of their effects on cancers by variation of the metal.** F. ARLOING, A. MOREL, and A. JOSSERAND (*Compt. rend.*, 1936, **202**, 598—600; cf. A., 1935, 1526).— $\text{Fe}^{\text{III}}$ -Pb-Na and  $\text{Fe}^{\text{III}}$ -Ba-Na complexes of dehydroascorbic acid can be used for the treatment of gastric cancer, but with buccopharyngeal cancers they are less active than the  $\text{Fe}^{\text{III}}$ -Na complex. Cu-Na, Cu-Pb-Na, and Cu-Ba-Na complexes have actions  $<$  those of the  $\text{Fe}^{\text{III}}$  complexes. The effect of a complex decreases after a time, but is renewed by using another complex containing the same fundamental metal. J. N. A.

**Aqueous extracts of enamel and dentine in relation to dental caries.** M. KARSHAN, R. WEINER, and N. STOFKY (*J. Dental Res.*, 1934, **14**, 445—454).—Aq. extracts contained Ca, Mg, P, and a substance reacting with lactic acid to give  $\text{CO}_2$ . First extractions contained Na and Cl. After 5 extractions only apatite dissolved. Extracts of enamel reacted positively to Folin's PhOH reagent and gave a negative biuret test. Dentine contains a sol. protein which was relatively smaller in amount in carious teeth. CH. ABS. (p)

**Effect of vitamin-C on the causative agent of diphtheria.** P. POLONYI (*Wien. med. Woch.*, 1935,

85, 685—686).—Vitamin-*C* has a favourable action in diphtheria, and reduces the virulence of the bacilli.

R. N. C.

Di-iodotyrosine and Lugol's solution in the treatment of hyperthyroidism. H. GOTTA (*Z. klin. Med.*, 1935, 128, 1—11; *Chem. Zentr.*, 1935, ii, 72—73).—The therapeutic effects are the same.

R. N. C.

Jaundice due to phenobarbital. C. A. BIRCH (*Lancet*, 1936, 230, 478—479).

L. S. T.

Reduced glutathione in leprosy. R. O. PRUDHOMME (*Compt. rend. Soc. Biol.*, 1936, 121, 1167—1169).—Reduced glutathione of the liver and spleen is normal if the organs themselves are not affected. The val. is reduced when there is considerable penetration of leprosy tissue.

H. G. R.

Six-day treatment with atebriane, atebriane+plasmoquine-simplex, plasmoquine-compositum, quinoplasmine, and quinine. A. KIRILOV-DRENOVSKI (*Arch. Schiffs- u. Tropen-Hyg.*, 1935, 39, 243—252; *Chem. Zentr.*, 1935, ii, 1058).—The atebriane-plasmoquine is most effective.

H. N. R.

Rôle of the liver in the mechanism of uranium glycosuria. R. WEEKERS (*Compt. rend. Soc. Biol.*, 1936, 121, 868—870).—Liver-glycogen is reduced in acute and sub-acute U nephritis in the rat. Glycogen storage of the liver is reduced only in sub-acute nephritis with intermittent glycosuria, which is hence not due to liver disorder.

R. N. C.

Composition of plasma and red blood-cells in nephropathy. A. FIESCHI and P. LARIZZA (*Minerva Med.*, 1935, 1, 629—630).—In renal sclerosis the Na, K, inorg. S, and P of red cells increases and protein-S decreases. Similar conditions occur in acute nephritis and there is an accompanying hypochloræmia.

CH. ABS. (*p*)

Calcium and phosphorus metabolism in osteomalacia. IV. Acute parathyroid hormone poisoning. H. I. CHU, S. K. CHOU, K. C. CHEN, S. H. WANG, S. H. LIU, and R. R. HANNON (*Chinese Med. J.*, 1936, 50, 1—16).—In a male showing marked skeletal deformities indicative of osteomalacia, serum-Ca and -inorg. P were normal and relatively insensitive to treatment with vitamin-D and ultra-violet irradiation. 80 units daily of parathyroid hormone for four days resulted in marked hypercalcaemia, vomiting, collapse, and death.

F. A. A.

Tyrosine index of polypeptidæmia in malaria therapy [of paralysis]. P. TOMESCO, N. G. IONESCO, and P. CONSTANTINESCO (*Compt. rend. Soc. Biol.*, 1936, 121, 1209—1211).—The val. decreases at first and then rises, generally to > the original.

H. G. R.

Pregnancy tests. S. ASCHHEIM (*J. Amer. Med. Assoc.*, 1935, 104, 1324—1329).—The mouse test and Friedman's method are described.

CH. ABS. (*p*)

Inorganic composition of blood serum in schizoprenics. E. T. MINKER-BOGDANOVA, S. A. POVORINSKAJA, and J. A. POVORINSKI (*Arch. Sci. biol. U.S.S.R.*, 1934, 36, B, 339—343).—Variations in serum-Na, -K, -Ca, -Mg, -inorg. P, and -Cl in schizoprenics were > in normal individuals. In general

vals. for Ca were > and for Na and Cl < normal. The K/Ca and Na/Ca ratios were markedly < normal.

CH. ABS. (*p*)

Impregnation of the organism by dust. IV. Laboratory animals. R. FABRE and E. KAHANE (*J. Pharm. Chim.*, 1936, [viii], 23, 217—232).—Examination of various organs of rabbits, guinea-pigs, and rats exposed to dust-laden (coal, sandstone) air indicates that the particles (even when 0.1—0.2 mm. diameter) are transported (at least partly by the blood) to various tissues, where they remain chemically unchanged.

F. O. H.

Mechanism of the protective action of bismuth in experimental syphilis. C. LEVADITI, G. HORNUS, A. VAISMAN, and Y. MANIN (*Bull. Acad. Méd.*, 1934, 112, 306—317; *Chem. Zentr.*, 1935, ii, 1059; cf. A., 1935, 1159).—Bivotol is more effective than trépol against experimental syphilis in rabbits.

H. N. R.

Nitrogen and mineral metabolism in *T. congolense* disease. M. H. FRENCH (*Ann. Rep. Dept. Vet. Sci. Tanganyika*, 1934, (1935), 59—64).—Infected oxen and sheep show an increased rate of excretion of N, Ca, K, and P. Mg balances appear not to be disturbed. The effect on Na and Cl metabolism appears to depend on the level of intake.

NUTR. ABS. (*m*)

Variations in the catalase content of human blood. D. DERIBAS and J. KORNMAN (Bull. Soc. Chim. biol., 1936, 18, 418—423).—The blood-catalase in tuberculosis varies with the nature of the therapeutic treatment, the temp., and the mental state of the individuals.

A. L.

Effect of prolonged muscular exercise on metabolism. F. C. COURTICE and C. G. DOUGLAS (*Proc. Roy. Soc.*, 1936, B, 119, 381—439).—Confirmatory evidence is obtained that a high-carbohydrate diet taken on the day preceding the exercise may have an effect on some aspects of metabolism > that of an ingestion of easily assimilable carbohydrate shortly before exercise. During rest after exercise, very little conversion of fat into carbohydrate occurs. The principal factor causing low R.Q. and ketosis is the low ratio of carbohydrate to fat oxidised. Blood-sugar level remains normal but evidence of a reduced sugar-tolerance is obtained.

A. G. P.

Metabolism of nerve-tissue of the frog during (A) rest and (B) stimulation. J. ROSENBERG (*Arch. internat. Physiol.*, 1935, 41, 434—445, 446—455).—(A) In resting isolated tissues in Ringer's solution the cerebrospinal (white) tracts consume more O<sub>2</sub> and lose more nitrogenous (I) and fatty substances (II) than do the sciatic nerves. The loss of (II) is > and about = that of (I) in the cerebrospinal tracts and sciatic nerves, respectively. Hibernation causes an increase in N and fat metabolism and a decrease in O<sub>2</sub> consumption. Possibly the disappearance of (I) and (II) from nerve-tissue occurs without the intervention of free O<sub>2</sub>.

(B) Electrical stimulation causes an increase, which  $\propto$  the strength and frequency of the current, in the metabolism of nerve-tissue.

NUTR. ABS. (*m*)

Changes in living substance involved in the reversible transition into the dead state. D.

NASONOV and V. ALEXANDROV (Arch. Sci. biol. U.S.S.R., 1934, **36**, A, 95—112).—The authors' work on adsorption phenomena at cell surfaces as influenced by chemical agents is reviewed. CH. ABS. (p)

**Adsorption and bioelectric potential in frog skin.** K. MOTOKAWA (Japan. J. Med. Sci., III, 1935, **3**, 177—201).—The e.m.f. across frog skin is measured by bathing one side in Ringer's and the other in test solutions. With low [NaCl] non-electrolytes in the test solution lowered the e.m.f. in the order glucose > sucrose > urea. The order is reversed when the [NaCl] is higher. The NaCl in the adsorption layer of the skin causes the e.m.f. and is displaced by added non-electrolytes. CH. ABS. (p)

**Influence of valency and concentration of ions on the potential difference of frog skin.** K. MOTOKAWA (Japan. J. Med. Sci., III, 1935, **3**, 203—209).—Frog skin has an inner asymmetry which is increased by anions and decreased by cations (cf. preceding abstract). CH. ABS. (p)

**Membranes as models of physiological objects. (Permeability and salt absorption.)** R. HOBER (Naturwiss., 1936, **24**, 196—202).—A lecture.

**Nutrition question.** R. HUTCHISON (Lancet, 1936, **230**, 583—585).—A discussion. L. S. T.

**Problems of animal nutrition and animal husbandry in Northern Nigeria.** A. W. ANDERSON and O. T. FAULKNER (Imp. Bur. Animal Nutrition Tech. Comm., 1933, No. 4, 52 pp.).—Nigerian pasture contains less N, Ca, P, and K than does European pasture. Supplements of steamed bone flour and NaCl had no beneficial action. Pica (controlled by  $\text{Na}_2\text{CO}_3$ ) was not associated with shortage of Ca or P in the diet. CH. ABS. (p)

**Diet and colour of birds.** H. L. RATCLIFFE (Nature, 1936, **137**, 402).—Inclusion in the diet of a greater variety of proteins, more fat-sol. vitamins, and more mineral salts, especially of Ca and P, restores much of the natural colouring lost in captivity. L. S. T.

**Effect of alkali and vegetable feeding on blood-uric acid and urate excretion.** W. MORACZEWSKI, S. GRZYCKI, T. SADOWSKI, and W. GUCWA (Klin. Woch., 1935, **14**, 557—562).—Feeding with purine-rich substances together with apples lowers blood- and urinary urates, whereas potatoes or alkali instead of apples increase them.  $\text{H}_2\text{O}$  lowers blood-urate by accelerating its renal excretion. R. N. C.

**Increase in weight due to [feeding of] wheat, oats, and barley to rats on a vitamin-A-free diet.** M. MALMBERG and H. VON EULER (Biochem. Z., 1936, **284**, 238—243).—The three cereals have a growth-promoting action possibly due to xanthophyll and other carotenoids present. F. O. H.

(A) Influence of acid- or base-forming diet on metabolism of rabbits at work and rest. J. M. HEFTER and E. L. GLINKA-TSCHERNORUTZKAJA. (B) Influence of myolysate on metabolism of rabbits kept on an acid- or base-forming diet. (C) Action of myolysate on blood-sugar content on an acid- or base-forming diet, at rest or at work. E. L. GLINKA-TSCHERNORUTZKAJA (J. Physiol.

U.S.S.R., 1935, **18**, 78—83, 84—88, 89—92).—(A) The alkali reserve decreased on acid-forming and increased on base-forming diets. Work had no effect on metabolism with either diet.

(B) Injection of myolysate (I) increased the total N excretion, urinary  $\text{NH}_3$ , and the total and reduced glutathione, and decreased the alkali reserve. Effects were more marked with a base-forming than with an acid-forming diet.

(C) Injection of 0.1 c.c. of standard (I) caused an increase in blood-sugar which was greater with a base-forming than with an acid-forming diet and greater at rest than at work. 0.01 c.c. of (I) produces the opposite effect. CH. ABS. (p)

**Comparative influence of hay and grass, ensiled without mineral acid, on the acid-base equilibrium of cattle.** E. BROUWER and N. D. DIJKSTRA (Bied. Zentr. [Tierernähr.], 1935, **7**, B, 361—371).—The  $p_{\text{H}}$  of urine and the total  $\text{CO}_2$  were somewhat lower when silage was fed, but the corresponding vals. for blood-plasma were the same as when hay was used. Org. acids in silage were utilised and showed no tendency to accumulate at any stage of metabolism. A. G. P.

**Effect of progressive ripening of fodders on the mineral nutrition of cattle.** I. Mineral composition and mineral balance. A. V. IYER. II. Urine characteristics. N. K. AYYAR. III. Blood characteristics. N. C. DAS GUPTA (Indian J. Vet. Sci., 1935, **5**, 129—139, 140—147, 148—157).—I. The mineral composition of various types of hay was determined. In bullocks the stage of maturity had a marked effect on mineral assimilation. The digestibility of the protein apparently bore no relationship to the  $\text{P}_2\text{O}_5$  content of the fodder.

II. Feeding early cut fodders resulted in the elimination of large vols. of urine because of the high alkali content. With more mature fodder, the vol. of the urine and the total fixed bases fell and the  $p_{\text{H}}$  tended to decrease. As the urine became more acid there was an increased deflexion of CaO and MgO to this path of excretion.

III. The serum-Ca level was unrelated to the Ca content or the Ca : P ratio of the fodder. It was most influenced by the stage of maturity. The serum-P level was affected by the nature of the fodder and the dietary P level. NUTR. ABS. (m)

**Effect of yeast on malnutrition of rats caused by a high sucrose diet.** H. ARIYAMA (J. Agric. Chem. Soc. Japan, 1936, **12**, 1—10).—The factor in yeast which enables rats to thrive on high-sucrose diets containing all the known vitamins is extracted by dil. aq. EtOH, adsorbed on acid clay, and is completely destroyed by autoclaving at  $p_{\text{H}}$  8; EtOH extracts of ox liver or green vegetables have a smaller potency than the yeast extracts. H. D.

**Effects of uncomplicated phosphorus deficiency on oestrus cycle, reproduction, and composition of tissues of mature dairy cows.** C. H. ECKLES, L. S. PALMER, T. W. GULLICKSON, C. P. FITCH, W. L. BOYD, L. BISHOP, and J. W. NELSON (Cornell Vegetarian, 1935, **25**, 22—43).—Over a period of 2—3 years. P deficiency did not cause abnormal

cestrus, but breeding efficiency declined somewhat. In muscle-tissue Ca increased, and P and Mg decreased. Ill effects observed in cattle in P-deficient areas cannot be attributed to P deficiency alone (cf. B., 1934, 859).

CH. ABS. (p)

**Carbohydrate feeding.** E. BAUER (Z. Kinderheilk., 1935, 57, 116—123; Chem. Zentr., 1935, ii, 1054).—The result of a sugar-charging test depends on the carbohydrate (I) uptake as well as the time. The depression of the blood-sugar curve increases to a limiting val. of (I) uptake; an increase of insulin secretion to the max. capacity of the pancreas is responsible.

R. N. C.

**Relation of rate of absorption of glucose to body-weight and surface, intestinal weight, and content of intestinal phosphatase in rats. Influence of diet on the phosphatase content of the intestine.** H. G. K. WESTENBRINK (Arch. Néerl. Physiol., 1936, 21, 18—37).—The rate of absorption of glucose is independent of the wt. and surface of the body and the phosphatase (I) content of the small intestine; its relation to the wt. of the small intestine (which is independent of the body-wt.) is indefinite. Starting from the stomach, after a slight increase the (I) content of the small intestine decreases to  $\frac{1}{3}$  of the max. Variations in protein, carbohydrate, and fat in the diet do not alter the (I) content of the small intestine.

E. P.

**Gaseous metabolism of small animals.** G. HÜNERFELD (Arch. exp. Path. Pharm., 1936, 180, 509—517).—The application of the apparatus of Hecht (*ibid.*, 1932, 166, 5) and its testing by combustion of EtOH are described.

F. O. H.

**Anoxia and experimental catatonia.** J. JONGBLOED (Arch. Néerl. Physiol., 1936, 21, 144—161).—Diminution of the atm. pressure, dilution of the atm. with indifferent gases, inhibition of the  $O_2$  transport in the blood by respiration of CO or injection of methylene-blue or  $Na_2S_2O_3$ , and poisoning of the respiratory enzymes by injection of KCN or  $HgCl_2$  produce catatonia, possibly due to anoxia of the central nervous system. The restriction of the  $O_2$  supply of the brain following obstruction of the capillaries by injection of lycopodium produces similar phenomena.

E. P.

**Metabolism of isolated fat-tissue. III. Respiratory quotient and the influence of nutrients *in vitro* and *in vivo*.** W. HENLE and G. SZPINGER (Arch. exp. Path. Pharm., 1936, 180, 672—689).—Isolated surviving fat from rat's testis has  $Q_{O_2}$  0.06—0.07 [measured by a modified Dickens and Simer technique (A., 1932, 644)] and R.Q. approx. 0.75, the latter being increased by addition of 0.2%, and decreased by that of 0.01%, of glucose; the increase due to  $AcCO_2H$  is  $>$  that due to glucose. The fat of carbohydrate-fed rats has a high initial R.Q. of approx. 1.25 which rapidly sinks to vals. found in starving animals. The bearing of the data on sugar-fat metabolism is discussed.

F. O. H.

**Metabolism of normal and tumour tissue.**

**XIV. Metabolism of medulla of kidney.** F. DICKENS and H. WEIL-MALHERBE. **XV. Respiratory quotient of brain cortex.** F. DICKENS (Biochem. J., 1936, 30, 659—660, 661—664).—XIV. The

general vals. for aerobic and anaerobic glycolysis of medulla of kidney of György (A., 1928, 1396) are confirmed, showing the tissue to be very strongly glycolysing. That aerobic glycolysis disappears in serum was not confirmed, the vals. in serum and Ringer's solution being the same. The R.Q. was approx. 1 and kidney, like retina, has an anaerobic type of metabolism due probably to disparity between blood ( $O_2$ ) supply and energy requirements of the tissue *in vivo*.

**XV. The R.Q. vals. of rat-brain cortex** were those expected on statistical grounds for a tissue of R.Q. 1. The lower vals. of Elliot and Baker (A., 1935, 1529) are probably due not to prolonged action of salt solution but to inadequate gas equilibrium resulting from the large amount of tissue used.

P. W. C.

**Co-operation of plant and animal proteins in active and general metabolism.** A. BICKEL (Biochem. Z., 1936, 284, 297—307).—Determinations of C : N and "vacate"  $O_2$  : N ratios in the urine of rats fed on various proteins indicate that, in addition to each protein having a more or less characteristic metabolic action, modifications occur on admixture. A balance of animal and plant proteins in diets is therefore of importance.

F. O. H.

**Growth and development. XXXVII. Interrelations between protein intake, endogenous nitrogen excretion, and biological value of protein.** U. S. ASHWORTH (Missouri Agric. Exp. Sta. Res. Bull., 1935, No. 228, 14 pp.).—Endogenous N excretion was not appreciably affected by the nature of the protein fed, unless the reserve body-protein was considerably depleted by a prolonged preliminary period on a N-free diet.

A. G. P.

**Parenteral administration of nitrogenous substances in artificial feeding.** K. TSUDA (Tōhoku J. Exp. Med., 1934, 24, 380—404).—Parenteral administration of mixed  $NH_2$ -acids or protein degradation products partly prevents autogenous protein catabolism in fasting dogs. Intraperitoneal injection of milk has the same effect. A positive N balance may be set up by such injections.

CH. ABS. (p)

**Constituents of mulberry leaves. IX.** K. KISHI (J. Agric. Chem. Soc. Japan, 1935, 11, 232—241).—The principal protein of the leaves is sol. in alkaline EtOH. The ratio of sol. to total protein increases with maturation. The quantities of silk-protein and of body-protein are influenced by the quality and quantity of protein and sol. carbohydrates in leaves (cf. A., 1935, 1146).

CH. ABS. (p)

**Physiology of sulphur in exogenous protein metabolism.** R. RAZAFIMAHERY (Ann. Physiol. Physicochim. biol., 1935, 11, 327—353).—In the pig sudden changes from a strict carbohydrate diet to a diet rich in protein or in the reverse direction are accompanied first by the anabolism or catabolism of reserve protein having S content  $<$  that of tissue-protein. During growth the N : S ratio of the material retained on a mixed diet is  $\approx 20$ . The coeff. of utilisation of protein, calc. on the basis of S, is  $<$  that of N. The corresponding changes in neutral and ethereal S are discussed.

NUTR. ABS. (m)

**Cystine deficiency of lucerne proteins. Effect of heat and incubation on their growth-pro-**

moting value. J. H. KELLERMANN (Onderstepoort J. Vet. Sci., 1935, 4, 437—452).—The deficiency from which young rats suffer when fed on a ration with lucerne meal as the sole source of protein is made good by the addition of 0.1% of *l*-cystine. A combination of yellow maize and lucerne or of maize and teff gave a protein adequate for growth. Incubation of lucerne meal with the "ruminal juice" of a sheep at 37° for 2 days or heating with H<sub>2</sub>O at 120° for 1 hr. did not improve the growth-promoting val. of lucerne meal proteins. NUTR. ABS. (m)

**Mechanism of the synthesis of thymonucleic acid during the development of the sea-urchin's egg.** J. BRACHET (Bull. Soc. Chim. biol., 1936, 18, 305—317).—The unfertilised eggs contain a pentose-nucleic acid similar to zymonucleic acid. This supports the view that there is a partial synthesis of thymonucleic acid, which appears as the eggs develop. A. L.

**Effect of food phosphatides on the chemical composition of the body.** A. K. PICKAT, O. I. KURTZINA, and N. S. SJENIN (Problems of Nutrition, Moscow, 1935, 4, 68—77).—In white rats receiving a mixed or a fat-free diet additions of 50 mg. of lecithin (I) per 100 g. of body-wt. to either diet led to a storage of lipin chiefly as neutral fat in the whole body and in the individual organs, and to increased glycogen in liver and muscle. The (I) and cholesterol were  $\times$  those of control animals. NUTR. ABS. (m)

**Fat metabolism.** P. E. VERKADE and J. VAN DER LEE (Chem. Weekblad, 1936, 33, 163—172).—A review. S. C.

**Fat metabolism in fishes. IX. Fats of some aquatic plants.** J. A. LOVERN (Biochem. J., 1936, 30, 387—390).—The compositions of the mixed fatty acids of several fresh-H<sub>2</sub>O and marine algæ, a pondweed, and a marine diatom are tabulated. The plant fats do not show the difference previously noted (A., 1935, 653) for fats of fish, plankton crustacea, etc. (viz., that the fat of fresh-H<sub>2</sub>O species contains more C<sub>16</sub>—C<sub>18</sub> and less C<sub>20</sub>—C<sub>22</sub> acids). Algal fats fall into groups agreeing with their botanical relationships and no difference between salt- and fresh-H<sub>2</sub>O forms was detected. The diatom and the pondweed had fats similar to those of green algæ. Whilst fresh-H<sub>2</sub>O plankton crustacea deposit ingested fat unchanged in type, the corresponding marine species appear to modify it considerably. P. W. C.

**Absorption of fat through the large intestine.** R. KITAGAWA (Tôhoku J. Exp. Med., 1934, 24, 329—349).—Finely dispersed fat is absorbed through the large, and the lower part of the small, intestine of dogs without preliminary lipolysis. CH. ABS. (p)

**Deuterium as an indicator in the study of intermediary metabolism. V. Desaturation of fatty acids in the organism.** R. SCHOENHEIMER and D. RITTENBERG (J. Biol. Chem., 1936, 113, 505—510).—Unsaturated D-containing fatty acids are found in the body-fatty acids of mice fed with a D-containing saturated acid; thus desaturation takes place in the organism. F. A. A.

**Rendering liver completely free from glycogen.** Y. OTOMO and S. NAGAO (Tôhoku J. Exp.

Med., 1935, 25, 63—79).—Intravenous injection of an emulsion of cod-liver oil and lecithin causes complete disappearance of hepatic glycogen. CH. ABS. (p)

**Conversion of glycogen into lactic acid by muscle extracts of normal and diabetic dogs.** T. CAHN and J. HOUGET (Compt. rend., 1936, 202, 354—356).—Muscle extracts of normal dogs when incubated with glycogen (I) at 37° and  $p_H$  8.14 show rapid glycogenesis at first; the rate then decreases rapidly. 60—65% of the (I) which disappears is converted into lactic acid; MeCHO, AcCHO, and AcCO<sub>2</sub>H are present only in traces. Extracts of the muscles of pancreatectomised dogs behave similarly, but have a feebler glycogenic power. J. L. D.

**Rôle of glucose in muscle biochemistry.** M. CAMIS (Arch. ital. Biol., 1934, 91, 35—59; Chem. Zentr., 1935, ii, 550).—CH<sub>2</sub>I·CO<sub>2</sub>H (I) inhibits lactic acid (II) formation from glycogen (III) in the isolated perfused rabbit's heart, but not from glucose (IV) in the perfusion liquid. The cat's heart untreated with (I) can form (II) from (III), but not from (IV). R. N. C.

**Initial transformations of glycogenolysis: function of hexosemonophosphoric ester.** P. OSTERN, J. A. GUTHKE, and J. TERSZAKOWEC (Compt. rend. Soc. Biol., 1936, 121, 1133—1136).—Previous conclusions (this vol., 370) are confirmed. H. G. R.

**Glycolysis in the retina.** G. POSSENTI (Riv. Patol. sper., 1935, 15, 183—194).—The lactic acid (I) production from glucose (II) by the retina is much > that from hexosediphosphoric acid (III). From  $\alpha$ -glycerophosphoric (IV) and phosphoglyceric acid (V), although they are actively attacked, the (I) production is very small and is not increased by mixing (IV) and (V) or by addition of AcCO<sub>2</sub>H to (IV). (III), (IV), and (V) show an induction period for (I) production, due probably to dephosphorylation. There is no liberation of H<sub>3</sub>PO<sub>4</sub> from the retina during (II) fermentation. NUTR. ABS. (m)

**Fructose metabolism in the intact animal.** J. N. DAVIDSON, W. O. KERMACK, D. M. MOWAT, and C. P. STEWART (Biochem. J., 1936, 30, 433—441).—After ingestion or injection of fructose (I) in rabbits, there is a disappearance of (I) and an increase in the secretion of insulin (II). (II) has no effect on the rate of removal of (I) from blood, and it is concluded that (I) is converted into glucose, which is then metabolised under the influence of (II). Two methods for the determination of (I) in blood are described. J. N. A.

**Metabolism of *d*-xylose.** N. R. BLATHERWICK, P. J. BRADSHAW, O. S. CULLIMORE, M. E. EWING, H. W. LARSON, and S. D. SAWYER (J. Biol. Chem., 1936, 113, 405—410; cf. Miller and Lewis, A., 1932, 1282).—Feeding of xylose to white rats increased the content of non-fermentable reducing substances in the liver, muscles, blood, and kidneys. There were no changes in the glycogen or lactic acid content of liver and muscles, nor in blood-lactic acid. Blood-glucose was increased. The availability of xylose to the animal is probably low. J. N. A.

**Destruction of 1:2:5:6-dibenzanthracene in the mouse.** I. BERENBLUM and L. P. KENDAL

(Biochem. J., 1936, 30, 429—432; cf. A., 1934, 1127).—A method for determination of 1:2:5:6-dibenzanthracene (I) in the mouse is described. 2 mg. of (I) given intraperitoneally in lard or in colloidal solution had nearly all disappeared after 3 weeks. (I) was not found in the excreta. Hence the mouse can metabolise (I). J. N. A.

Effect of inspiration of oxygen and of air rich in carbon dioxide or poor in oxygen on the energy level and intermediate carbohydrate metabolism. V. Changes in lactic acid resynthesis in nephrectomised animals. K. KODERA (Tōhoku J. Exp. Med., 1934, 24, 21—36; cf. A., 1935, 520).—Blood-lactic acid (I) in rabbits increases after nephrectomy without change in blood- $\text{CO}_2$  (II) but with slight decrease in  $\text{O}_2$  consumption. These effects are unchanged by inhalation of  $\text{O}_2$ : air containing 5—10% of  $\text{CO}_2$  intensifies the change in (II), whereas air containing < 10% of  $\text{O}_2$  increases and accelerates the change in (I). The return of (I), (II), and  $\text{O}_2$  consumption to normal is delayed by nephrectomy whatever the composition of the air inhaled.

CH. ABS. (p)

Metabolism of pyruvic acid in the retina. G. POSSENTI (Riv. Patol. sper., 1935, 15, 229—234).—Anaerobically the retina produces little or no  $\text{CO}_2$  from  $\text{AcCO}_2\text{H}$ , but aerobically the  $\text{O}_2$  consumption is markedly increased, the R.Q., normally 0.8—0.9, being > 1.

NUTR. ABS. (m)

Metal catalysts in biological oxidations. I. The simple system: thioglycollic acid, buffer, metal, dithioglycollic acid. II. Tissue inhibitors. M. S. KHARASCH, R. R. LEGAULT, A. B. WILDER, and R. W. GERARD (J. Biol. Chem., 1936, 113, 537—555, 557—569).—I. The results of varying the  $\text{O}_2$  tension, temp., and  $p_{\text{H}}$  on the rate of oxidation of  $\text{SH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  by  $\text{O}_2$  and of the catalytic influence of  $\text{Mn}^{++}$ ,  $\text{Cu}^{++}$ , and  $\text{Fe}^{++}$  on this reaction, are given. Catalysis by the metal ions depends on  $p_{\text{H}}$  and on the nature of the buffer ions present. In  $\text{CO}_3^{--}$  buffers the activity of  $\text{Fe}^{++}$  with  $\text{Cu}^{++}$  or  $\text{Mn}^{++}$  is additive, but  $\text{Cu}^{++}$  and  $\text{Mn}^{++}$  together show greatly increased activity. Phosphate ions inhibit catalysis by  $\text{Fe}^{++}$  and  $\text{Mn}^{++}$  but accelerate that by  $\text{Cu}^{++}$ ; org. phosphates do not affect catalysis by  $\text{Fe}^{++}$  and  $\text{Mn}^{++}$ . Catalysis by  $\text{Cu}^{++}$  in phosphate buffers is decreased by  $\text{Mn}^{++}$  and increased by  $\text{Fe}^{++}$ . The reaction product, dithioglycollic acid, accelerates the reaction in all buffers and by all three metals.

II. A no. of substances, tested for their action on the catalytic activity of metals on the oxidation of  $\text{SH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ , show inhibitory action approx.  $\propto$  the stability of complexes formed with the metals. No influence attributable to the colloidal state appears. Beef and chicken muscle extracts inhibit catalysis by  $\text{Fe}^{++}$  but slightly accelerate that by  $\text{Cu}^{++}$  and  $\text{Mn}^{++}$ . Sarcoma extracts behave similarly, but less powerfully. Chicken liver extracts are inactive to  $\text{Fe}^{++}$ , accelerate  $\text{Mn}^{++}$ , and inhibit  $\text{Cu}^{++}$ . This latter inhibition is approx. parallel to the efficacy of the extracts in pernicious anaemia. F. A. A.

Brain metabolism. I. Glutamic acid. H. WEIL-MALHERBE (Biochem. J., 1936, 30, 665—676).—l(+)-Glutamic acid (I) is the only  $\text{NH}_2$ -acid oxidised

by brain and yields  $\alpha$ -ketoglutaric acid (II) (2:4-dinitrophenylhydrazones, m.p. 224°) and  $\text{NH}_3$  and later gives  $\text{H}_2\text{O} + \text{CO}_2$ . d(-)-Glutamic acid (III) is not attacked so long as it is bound in the cell or to some constituent of the cell, but in solution only (III) is oxidised. The  $\text{NH}_3$  derived from (I) disappears in secondary reactions leading to and beyond glutamine (IV). The reaction  $(\text{I}) \rightleftharpoons (\text{II})$  is reversible. An increased amount of  $\text{NH}_2\text{-N}$  is found in presence of glucose,  $\text{AcCO}_2\text{H}$ , and (II). It appears that (II) is intermediate in the oxidation of  $\text{AcCO}_2\text{H}$ , and the same reactions which lead to the disappearance of  $\text{NH}_3$  and formation of (IV) in presence of (I) can be arrived at from (II),  $\text{AcCO}_2\text{H}$ , or glucose. *In vivo* the glutamic acid deaminase is probably concerned rather with synthesis than breakdown of (I). P. W. C.

Neo-formation of ethyl alcohol in the human corpse during putrefaction. M. NICLOUX (Compt. rend. Soc. Biol., 1936, 121, 975—978).—EtOH is present in all the tissues 17 days after death.

R. N. C.

Metabolism of organic sulphur in infants. J. SURANYI (Nourrisson, 1934, 22, 377—383).—Human or cow's milk does not contain enough free cysteine (I) to be determined colorimetrically. Very small quantities are detected in colostrum. Neutral S (0.02—0.03 mg. per 100 ml.) occurs in colostrum and increases later. Human milk contains 8—120 mg. per 100 ml. and cow's milk 60—80 mg. of (I) after acid hydrolysis. Faeces of normal infants do not contain significant amounts of (I). Diarrhoeal faeces contain  $\geq$  100 mg. per 100 g., so that the loss is not sufficient to cause a negative (I) balance. (I) is frequently found in urine, in amounts < 25 mg. per 100 ml. in breast-fed and < 10 mg. in artificially fed infants. The excretion is higher in marasmus, acute infections, and toxicosis.

NUTR. ABS. (m)

Sulphur metabolism in inanition. E. F. TERROINE and R. RAZAFIMAHERY (Ann. Physiol. Physicochim. biol., 1935, 11, 354—387).—When complete fasting replaced a period of protein starvation during which excretion of endogenous N had reached a min., a sharp rise in N excretion first occurred, followed by a rapid fall. The rise in S excretion was slight compared with that of N. Later, N and S excretions rose slightly with slow fall in N:S ratio. In the premortal period there was a sudden and marked rise in N and S excretion and further fall in the N:S ratio, due to preferential catabolism of muscle and/or to degradation of S-containing  $\text{NH}_2$ -acids. Changes in neutral and ethereal S are also described. NUTR. ABS. (m)

Iodine metabolism of the adult rat in relation to trauma, thyroid activity, and diet. V. V. COLE and G. M. CURTIS (J. Pharm. Exp. Ther., 1936, 56, 351—358).—The I balance, thyroid- and body-I of rats were uninfluenced by injected thyrotropic hormone or by the myxoedema following thyroidectomy; increasing the I intake from  $3 \times 10^{-6}$  to  $5 \times 10^{-5}$  g. per day left the thyroid-I unchanged but doubled the body-I. H. D.

Chlorine requirements of farm animals, with especial reference to the effect of chlorine on the metabolism of the pig. G. A. MORR (Diss. Aberdeen, 1934—1935).—In pigs an increased intake

of Cl tends to improve N retention, possibly because of better digestion. There was a tendency to better live-wt. increase and a better return per lb. of food consumed when NaCl was added to the diet than when Na citrate and CaCl<sub>2</sub> were added. The effect of these salts on blood constituents was negligible.

NUTR. ABS. (m)

**Assimilation of iron during the development of the chick embryo.** A. SZEJNMAN-ROZENBERG (*Acta Biol. exp.*, 1933—1934, 8, 3244).—Fe assimilation appeared to be retarded during the periods of max. wt. increase around the 12th and 18th days of development. The amount of Fe in the liver was relatively  $\frac{1}{2}$  in the entire embryo. The developing embryo assimilated 96% of the available Fe in the egg.

NUTR. ABS. (m)

**Sodium metabolism. Influence of sodium deficiency on blood-urea and -amino-acid in pigs.** P. SONHOORL (*Arch. Néerl. Physiol.*, 1936, 21, 130—143; cf. A., 1934, 803).—Blood-urea and -NH<sub>2</sub>-acid increase, the rise in NH<sub>2</sub>-acid being due to restricted synthesis of protein.

E. P.

**Sodium requirement of chicks: results of an almost sodium-free diet.** B. SJOLLEMA (*Bied. Zentr. [Tierernähr.]*, 1935, 7, B, 184—197).—Deficiency of Na in the ration (< 0.013%) retards the growth of chicks by restricting the formation of body-fluids. The Na requirement is met by approx. 0.4—0.5% of Na in the diet.

A. G. P.

**Total electrolyte content of animals and its probable relation to the distribution of body-water.** H. E. HARRISON, D. C. DARROW, and H. YANNET (*J. Biol. Chem.*, 1936, 113, 515—529).—Whole bodies, and various organs, of dogs, monkeys, and rabbits were analysed for H<sub>2</sub>O, Na, K, Cl, P, N, and fat. Assuming that the extra-cellular H<sub>2</sub>O contains all the Cl<sup>-</sup>, and that its electrolyte content is similar to that of the serum, the relative vols. of intra- and extra-cellular H<sub>2</sub>O in the body and tissues, and the concn. of solutes in them, are calc. Extra-cellular H<sub>2</sub>O comprises about 27% of the body-wt., intra-cellular H<sub>2</sub>O varying from 29 to 45%, being lower in the fat animals. The proportion varies in different tissues, but analogous tissues of different animals show similar vals. 25% of the Na in the body exists in bone and cartilage in an insol. or non-ionised form.

F. A. A.

**Aluminium. II. Storage of intravenously injected aluminium in the dog.** D. F. EVELETH and V. V. MYERS (*J. Biol. Chem.*, 1936, 113, 467—471; cf. this vol., 652).—Al is stored primarily in the liver, spleen, and kidney, and appears immediately in the bile and urine.

H. D.

**Dependence of the change in irradiated caseinogen on the intensity of irradiation.** W. OLBRICH (*Biochem. Z.*, 1936, 284, 308—311).—Data for urinary C, N, and "vacate"-O<sub>2</sub> of rats fed on caseinogen exposed to two different intensities of  $\gamma$ -irradiation from meso-Th indicate a parallel difference in the action on metabolism.

F. O. H.

**Physico-chemical action of X-rays on the organism.** V. G. D. LIEBER (*Strahlenther.*, 1935,

52, 497—511; *Chem. Zentr.*, 1935, ii, 387).—The influence of X-rays on bone growth is discussed.

H. N. R.

**Biological action of neutron rays.** J. H. LAWRENCE and E. O. LAWRENCE (*Proc. Nat. Acad. Sci.*, 1936, 22, 124—133).—Irradiation of rats by high-speed neutrons, obtained by deuteron bombardment of a Be target, lowers the lymphocyte count and finally produces death. The effectiveness, per Roentgen unit of ionisation produced in air, is 10 times that of X-irradiation; per ion produced in the rat, the ratio is probably about 5.

F. A. A.

**Relative effectiveness of X-rays and fast neutrons in retarding growth.** R. E. ZIRKLE and P. C. AEBERSOLD (*Proc. Nat. Acad. Sci.*, 1936, 22, 134—138; cf. preceding abstract).—The effectiveness of fast neutrons in retarding the growth of wheat seedlings is 20 times that of X-rays.

F. A. A.

**Excitation and accommodation in nerve.** A. V. HILL (*Proc. Roy. Soc.*, 1936, B, 119, 305—354).—A theory of the electrical stimulation of nerves is advanced, and equations and curves for currents of various forms, applied in different ways, are deduced. The time const. of accommodation,  $\lambda$ , decreases with rising temp., and is affected by [Ca<sup>++</sup>].

**Measurement of accommodation in nerve.** D. Y. SOLANDT (*Proc. Roy. Soc.*, 1936, B, 119, 355—379).—Increase of [Ca<sup>++</sup>] or [K<sup>+</sup>] lowers  $\lambda$  (cf. preceding abstract); Mg<sup>++</sup>, Sr<sup>++</sup>, and Ba<sup>++</sup> produce similar but smaller effects. Decrease of [Ca<sup>++</sup>] increases  $\lambda$ , its val. tending to  $\infty$  at [Ca<sup>++</sup>]=0. The effect of varying [Ca<sup>++</sup>] on the time const. of excitation,  $k$ , is much < that on  $\lambda$ , showing that these const. are independent of each other.

**Redistribution of calcium and potassium in blood and muscles.** I. R. BACHROMEYEV and L. N. PAVLOVA (*J. Physiol. U.S.S.R.*, 1935, 18, 69—77).—Irritation of the central end of the sciatic nerve increases the ionised and total Ca and P in blood, plasma, and erythrocytes, and decreases the vals. in muscle. Irritation after removal of the thyroid increases the total K in plasma and erythrocytes, but Ca vals. are unchanged. Irritation of the upper laryngeal nerve increases blood- and plasma-Ca and decreases that in muscles. Changes in K vary with time.

CH. ABS. (p)

**Action of heavy water on isolated organs.** F. VERZAR and C. HAFTER (*Pflüger's Archiv*, 1935, 236, 714—716).

R. N. C.

**Are free gases in thermal waters absorbed by the skin during bathing?** A. MOUGEOT and AUBERTOT (*Arch. med. Hydrol.*, 1934, 12, 292—293).—The CO<sub>2</sub> content of the exhaled air in man is increased during bathing in a carbonated thermal bath, and in the case of a radioactive bath the exhaled air becomes radioactive.

R. N. C.

**Action of Lurisia waters on uric acid and on uric urinary calculi.** L. FRANCESCONI and R. BRUNA (*Annali Chim. Appl.*, 1936, 26, 34—38).—Various mineral waters from the Lurisia district of Italy are analysed, and their solvent action on uric acid and on urinary calculi, both before and after

the removal of the radioactive emanation which they contain, is examined. E. W. W.

**Fluorine and mottled enamel.** M. C. SMITH, E. M. LANTZ, and H. V. SMITH (J. Amer. Dent. Assoc., 1935, 22, 817-829).—In Arizona, in communities with mottled enamel the  $H_2O$  supply contained 1-6 p.p.m. of F, whereas in non-endemic communities the val. was < 1. If F was present in toxic amounts in the food or  $H_2O$ , mottling could not be prevented by increased intakes of Ca, P, or vitamin-D. F intake interferes with the calcification of the teeth, causing a decrease in size, wt., and ash content, and an increase in the Ca:P ratio. In young rats F feeding impaired ability to metabolise Ca and P, interfered with body growth, and retarded the rate of eruption of incisors. Girls with mottled teeth (4 p.p.m. of F in the  $H_2O$ ) showed no significant variation from normal in the retention of Ca or P, but the amount excreted in the urine was greater. NUTR. ABS. (m)

**Clinical manifestations of high and low plasma-magnesium. Danger of Epsom salt purgation.** A. D. HIRSCHFELDER and V. G. HAURY (J. Amer. Med. Assoc., 1934, 102, 1138-1141).—Normally 40% of ingested Mg is excreted in the urine in 24 hr. A clinical syndrome of high plasma-Mg may be induced in patients with renal insufficiency by doses of  $MgSO_4$ . CH. ABS. (p)

**Possible lipotropic action of alkylammonium compounds.** E. H. MAWSON and A. DEM. WELCH (Biochem. J., 1936, 30, 417-418).— $NHMe_3Cl$  had no lipotropic action, and increased the amount of fat in rat liver, whilst  $NMe_3EtCl$ ,  $NMe_4Cl$ , and  $NMe_3PhCl$  were inactive, but exerted a powerful toxic effect of the curare type. J. N. A.

**Effect of sodium glutamate on digestion.** P. C. HSÜ and W. H. ADOLPH (J. Chinese Chem. Soc., 1936, 4, 42-44).—Na *d*-glutamate does not affect the rate of digestion of carbohydrates, fed as steamed rice to rats. R. S. C.

**Action of benzene in leucæmia.** I. KALAPOS (Klin. Woch., 1935, 14, 864-867; Chem. Zentr., 1935, ii, 1057).— $C_6H_6$  may be useful, alone or in conjunction with X-rays. H. N. R.

**Mode of action of picrotoxin.** H. SCHRIEVER and G. PERSCHMANN (Pflüger's Archiv, 1935, 236, 497-514). R. N. C.

**Experimental influencing of liver-lipase.** G. DELL'ACQUA (Z. klin. Med., 1935, 128, 95-97; Chem. Zentr., 1935, ii, 62-63).—Liver-lipase in mice is depressed by feeding with lard or sugar, by insulin, adrenaline, and particularly by P poisoning. R. N. C.

(A) Fraxin, a fraction of *Fraxinus borealis*, Nakai. (B) Effect of fraxin on uric acid excretion. (C) Mechanism of diuresis caused by fraxin. G. IIDA (Tôhoku J. Exp. Med., 1935, 25, 454-470, 471-475, 26, 1-8).—(A) The glucoside is obtained from the cortex of the tree. Physiological activities are described.

(B) Increased urinary excretion of uric acid caused by fraxin is > that effected by atophan. CH. ABS. (p)

**Methylene-blue therapy and its scientific foundation.** O. EICHLER (Fortschr. Ther., 1935, 11, 336-344; Chem. Zentr., 1935, ii, 880).—The use of methylene-blue is based on its capacity for reversible reduction, although certain conclusions based on this are not borne out in practice. H. N. R.

**Effect of creatine on muscle tonus.** F. M. CHIANCONE (Arch. ital. Biol., 1933, 90, 22-25; Chem. Zentr., 1935, ii, 550). R. N. C.

[Pharmacology of] choline and certain analogues. II. Cationic exchange as a means of reaction of choline, acetylcholine, and their analogues with cells. M. H. ROEPKE and A. D. WELCH (J. Pharm. Exp. Ther., 1936, 56, 319-326; cf. A., 1935, 1411).—The rate of esterase hydrolysis of acetylcholine (I) is identical with those of its P and As analogues. The exchange adsorption of choline with Na and Ca zeolites is > that of arsenocholine and equal to that of (I). H. D.

**Peripheral circulatory activity of histamine.** D. MATEFF and M. SCHNEIDER (Pflüger's Archiv, 1935, 236, 606-635). R. N. C.

**Mechanism of the action of di-iodotyrosine.** M. WACHSTEIN (Wien. klin. Woch., 1934, 47, 1579-1580).—Di-iodotyrosine in large quantities increases the resistance of the mouse to MeCN, and does not antagonise the similar action of thyroxine. R. N. C.

**Action of di-iodotyrosine in thyrotoxicosis.** M. YRIAT, A. DAGNINO, and A. E. BIANCHI (Rev. assoc. med. Argentina, 1935, 49, 309-318).—Basal metabolism was decreased. Effects observed were identical with those produced by an equiv. dosage of inorg. I. CH. ABS. (p)

**Pharmacodynamics of bile acids. Influence of active groups. I. Cardio-vascular and respiratory action.** I. MANTA and P. VANCEA (Arch. exp. Path. Pharm., 1936, 180, 631-638).—The action of cholic and deoxycholic acids and their Ac derivatives, and of dehydro- and dehydrodeoxy-cholic acids and their oximes and semicarbazones on the dog's carotid blood pressure was determined. Introduction of  $\cdot OH$  or, to a greater extent, of  $\cdot OAc$  produces vascular activity in cholanic acid. Oxidation of  $\cdot CH_2\cdot OH$  to  $\cdot CO\cdot$  diminishes the action, which is further modified (to different degrees) by formation of oxime or semicarbazone. F. O. H.

**Action of low-molecular autoclave hydrolysates.** I. N. KASAKOV (Arch. exp. Path. Pharm., 1936, 180, 482-497).—Injection of extensively hydrolysed liver, kidney, adrenal, etc. into normal and diseased rats produces increases in oxidation processes and absorptive power of the reticulo-endothelial system, and changes in the dispersivity of colloid systems, metabolism, and tonus of the nervous system. Therapeutic applications are indicated. F. O. H.

**Physiological and pathological actions of some fresh and autolysed organ extracts, especially pancreas extracts.** L. MICHELAZZI (Arch. ital. Biol., 1934, 90, 157-164; Chem. Zentr., 1935, ii, 393). G. H. F.

Action of the vagus on the frog's heart maintained in absence of potash. W. HERZ (Pflüger's Archiv, 1935, 236, 298—300). R. N. C.

Life-saving action of ovarian preparations in severe bleeding from hæmophilia. K. FRANKE and S. LITZNER (Med. Klinik, 1935, 31, 520—521; Chem. Zentr., 1935, ii, 872). R. N. C.

Effects of sodium ethyl-*n*-hexylbarbiturate (ortal sodium) and of sodium ethylisoamylbarbiturate (sodium amytal) on excised smooth muscle. C. M. GRUBER, R. SCHOLTEN, A. DENOTE, and J. F. WILSON (J. Pharm. Exp. Ther., 1936, 56, 341—350).—Na amytal and, to a greater extent, ortal decrease the tonus and the amplitude of the rhythmic contraction of excised intestine and uterus. Both lower the  $p_H$  of Locke's solution. H. D.

Alkoxymethylhydantoins.—See this vol., 613.

Influence of the combined acid on the anæsthetic power of various salts of novocaine. J. RÉGNIER, R. DELANGE, and R. DAVID (Compt. rend., 1936, 202, 591—592).—Phthalic, hippuric, and nicotinic acids completely annul the anæsthetic activity (rabbit's cornea), whilst phenylbutyric, undecic, and  $\alpha$ -phenylvaleric acids increase the activity 50, 55, and 63 times, respectively. In general the activity of the salt increases with the no. of C in the acid, and decreases if the latter is substituted with  $\cdot\text{CO}_2\text{H}$ ,  $\cdot\text{OH}$ ,  $\cdot\text{NH}_2$ , or  $\cdot\text{Br}$ . The phenylpropionate and isobutyrate are most suitable for clinical use. J. N. A.

Relation between constitution and anæsthetic activity of 2-alkoxyquinoline derivatives.—See this vol., 482.

Changes of blood-proteins in salyrgan diuresis. A. O. SCHALLY (Deuts. Arch. klin. Med., 1935, 177, 368—376; Chem. Zentr., 1935, ii, 79). H. J. E.

[Pharmacognosy of] *Lacinaria* species. B. V. CHRISTENSEN and G. M. HOCKING (J. Amer. Pharm. Assoc., 1936, 25, 15—18).—Constituents of *L. spicata* and *tenuifolia* include a sterol, m.p. 116°, and possibly coumarin. Extracts have a stimulant and cardiac action in man, but no distinct diuretic effect. F. O. H.

Mydriatics and myotics from the Brazilian flora. F. W. FREISE (Süddeut. Apoth.-Ztg., 1935, 75, 333—335; Chem. Zentr., 1935, ii, 719—720).—Various preps. are described. A substance,  $\text{C}_{15}\text{H}_{22}\text{ON}$ , m.p. 112—114°, b.p. 172°, is the active principle of "itua," a *Gnetum* species, whilst the active principle of *Moringa aptera*, Gaertn., is a substance,  $\text{C}_{15}\text{H}_{23}\text{O}_3\text{N}_2$ . H. N. R.

Pharmacological action of *Erythrina corallo-dendron*. I. SIMON (Arch. Farm. speriment., 1935, 59, 193—209). R. N. C.

Identity of the sympathomimetic action of broom and adrenaline: effects on the yohimbine-ised rabbit. H. BUSQUET and C. VISCHNIAC (Compt. rend. Soc. Biol., 1936, 121, 1151—1152). H. G. R.

Acridine compounds and their antimalarial action.—See this vol., 613.

Importance of the kidneys in standardisation of digitalis [in cats]. B. BOUCEK (J. Amer. Pharm. Assoc., 1936, 25, 97—99).— $\text{UO}_2(\text{NO}_3)_2$ -induced or naturally-occurring inflammation of the kidneys increases the resistance of cats to lethal doses of digitalis extracts. F. O. H.

Rate of elimination and accumulation of digitalis glucosides and strophanthin. L. LENDLE (Arch. exp. Path. Pharm., 1936, 180, 518—538).—Crit. infusion velocities in cats and rabbits indicate a rapid detoxication of digitoxin (I) in the body; thus 20% of the lethal dose of (I) or strophanthin (II) is destroyed by rabbits in  $\geq 1$  hr. With cats, the action is not so marked [6% of (II) and 2% of (I)]. The basic accumulative doses [shown by the response to *g*-(II)] are digitoxin 3, *k*-strophanthin 7.5—10, and digilanid 6.5% of the min. lethal dose. F. O. H.

Influence of ergotamine on thermal regulation in the organism. S. FORSTER (Med. Doswicz. Spol., 1935, 19, 152—175).—Ergotamine depresses gaseous exchange by inhibiting  $\text{O}_2$  consumption, and counteracts the increased exchange induced by thyroxine and 2:4-dinitronaphthol in rats, pigeons, and rabbits. Urinary and faecal N diminishes on the 1st and 2nd days after administration. Blood-sugar is decreased in rabbits and pigeons and increased in guinea-pigs. CH. ABS. (p)

Antagonism between curarine and prostigmine, and its relation to the myasthenia problem. G. BRISCOE (Lancet, 1936, 230, 469—472).—Either prostigmine or curarine can produce acute depressant effects (not identical). Their mutual antagonism is such that normal muscular action can be maintained when poisonous doses are administered together. A theory of chemical transmission of excitation explains the results. L. S. T.

Bulbocapnine. RAYMOND-HAMET (Compt. rend., 1936, 202, 357—359).—The hypotensive effect of small doses of  $\beta$ -3:4-dihydroxyphenylethyl- $\beta$ -hydroxyethylamine (I) is accentuated by true sympatholytic substances, but is diminished by bulbocapnine (II), which, however, paralyses the renal vasoconstrictors, a reaction used hitherto as a criterion of sympatholytic activity. (II) has only a slight effect in diminishing hypertension due to adrenaline. Hypotension due to (I), which stimulates the vasodilators  $>$  does adrenaline, is abolished by (II). J. L. D.

[Pharmacology of] morphine, codeine, and their derivatives. IX. Methyl ethers of the morphine and codeine series. N. B. EDDY (J. Pharm. Exp. Ther., 1935, 55, 127—135; cf. A., 1933, 965).—Methylation of the alcoholic OH in morphine, dihydromorphine, codeine, dihydro- and  $\mu$ -codeine increases the toxicity to mice; analgesic and stimulatory effects are increased in the cat and the depressant action in the rat. H. D.

Local irritant action of quinine preparations. G. JOACHIMOGLU and N. KLISSIUNIS (Praktika, 1934, 9, 127—130; Chem. Zentr., 1935, ii, 1057).—Injection of quinine causes disturbance of the gastro-intestinal tract. H. N. R.

Diabetogenic action of some derivatives of phloridzin. A. LAMBRECHTS (Compt. rend. Soc.

Biol., 1936, 121, 870—872).—Phloretin, phlorin, and phloridzin hepta-acetate all produce glycosuria in the dog, but the Me ethers of phloridzin are devoid of action. Free phenolic  $\cdot\text{OH}$ , but not a glucose residue, is apparently necessary for the activity. R. N. C.

**Antioxidant properties of medicaments used as antipyretics.** A. BOUTARIO and J. A. GAUTIER (Compt. rend., 1936, 202, 596—598).—The effect of phenols, arylamines, semicarbazide, pyrazolone, and some alkaloids on the oxidation of  $\text{PhCHO}$  and  $\text{FeSO}_4$  and the reduction of methylene-blue by hepatic tissue has been studied. Antipyretics behave generally as negative catalysts towards oxidation and oxidation-reduction, the intensity of their action varying with the conditions and amount used. J. N. A.

**Increase in the hæmolytic power of lecithin by saponin: detection of small quantities of saponin.** B. S. LEVIN (Compt. rend. Soc. Biol., 1936, 121, 1181—1183).—The reaction will detect saponin at a concn. of 1 in  $25 \times 10^6$ . H. G. R.

**Snake poisons.** F. MICHEEL and K. KRAFT (Nachr. Ges. Wiss. Göttingen, Math.-phys. Kl., III, 1935, 1, 85—93; Chem. Zentr., 1935, ii, 545).—The venom of the cobra, *Naja flava*, ultra-filtration of which is compared with that of peptone and albumin, loses its activity in  $\frac{1}{2}$  hr. at  $95^\circ$  and  $p_H$  13, but is more stable in acid media. Acid hydrolysates are inactive, but activity is restored to the filterable portion by adding proteins of high mol. wt. (e.g., albumose or gelatin); peptones of low mol. wt., or non-protein colloids, e.g., starch or agar, are ineffective. The poison is apparently active only when adsorbed on a colloidal protein mol. H. J. E.

**Selenium in proteins from toxic foodstuffs.**—See B., 1936, 344.

**Toxicity of organ lipins. Poisoning by polypeptides.** P. ÉTIENNE-MARTIN (Presse méd., 1935, 43, 361—363; Chem. Zentr., 1935, ii, 880).—Both lipins and polypeptides may show some toxicity. H. N. R.

**Toxicity of perchlorates.** E. KAHANE (Bull. Soc. Chim. biol., 1936, 18, 352—357).—Intravenous injection of 0.5 g. and intramuscular injection of 1.0 g. of  $\text{NaClO}_4$  have little toxic effect on the rabbit. The min. toxic dose for *Carassius auratus* is 1% in the  $\text{H}_2\text{O}$ .  $\text{ClO}_4^-$  is therefore only feebly toxic. A. L.

**Chronic carbon monoxide poisoning.** H. GERBIS (Deut. med. Woch., 61, 991—994; Chem. Zentr., 1935, ii, 1059).—Polemical against Süpfle (A., 1935, 530); chronic CO poisoning can occur. H. N. R.

**Changes in carbohydrate metabolism due to carbon monoxide poisoning.** E. SCHULZE (Arch. exp. Path. Pharm., 1936, 180, 649—655).—The changes (normally diminutions) in blood-sugar and liver-glycogen (I) are abnormal [e.g., initial hyperglycæmia and, with small doses, subsequent (I) formation] in CO-poisoned mice: these changes and the parallelism between the increased resistance to MeCN poisoning and fall in (I) indicate a rapid initial adrenal, and a slow subsequent thyroid, action. F. O. H.

**Lead content of duodenal juice in cases of saturnism.** N. ALIAVDIN and E. PEREGOOD (J. Ind. Hyg., 1936, 18, 139).—In a considerable proportion of patients suffering from Pb poisoning, the duodenal juice contains Pb (up to 1.8 mg. per 100 c.c.). W. O. K.

**Normal absorption and excretion of lead.** A. A. KEHOE, F. THAMANN, and J. CHOLAK (J. Amer. Med. Assoc., 1935, 104, 90—92).—Spectrographic data for the Pb content of urine, fæces, and blood are given. Chemical methods give low vals. CH. ABS. (p)

**Comparison of histological and quantitative spectrographic investigations of mercury poisoning.** R. MÜLLER and K. SCHEINER (Arch. exp. Path. Pharm., 1936, 180, 718—730).—There was no parallelism between extent of tissue injury and Hg content in the large intestine and kidney of Hg-poisoned guinea-pigs. F. O. H.

**Urinary excretion of phosphorus during experimental poisoning by uranium nitrate.** R. WEEKERS (Compt. rend. Soc. Biol., 1936, 121, 866—868).— $\text{UO}_2(\text{NO}_3)_2$  increases urinary excretion of  $\text{PO}_4'''$  in the dog. The action does not affect blood-P, but is a direct one on the kidney. R. N. C.

**Effect of various therapeutic agents in animals with hepatic damage caused by phosphorus.** S. NAGAO (Tôhoku J. Exp. Med., 1934, 24, 529—554).—Rabbits poisoned by P can synthesise glycogen (I) from carbohydrates if large amounts are administered. Fructose (II) is more effective in this respect than glucose or sucrose. Synthesis of (I) is accompanied by a decrease in hepatic fat deposition. Insulin and lecithin are of no val. Adrenaline, in clinical doses, is ineffective and may inhibit the action of (II). CH. ABS. (p)

**Enzymes in yellow tobacco.** T. NITO and E. KITAMURA (J. Agric. Chem. Soc. Japan, 1936, 12, 87—95).—The distribution of enzymes in the fresh, fermented, flue-dried, and unfermented leaves of yellow tobacco was determined. H. D.

**Properties of glyoxalase. Effect of  $p_H$ , temperature, and amino-acids on dried glyoxalase.** J. GIRŠAVIČIUS, P. H. EFENDI, and A. P. RYZHOVA (Fermentforsch., 1936, 15, 32—43; cf. A., 1935, 1026).—The activity of dried glyoxalase (I) preps. is measured by titrating the acid produced from the substrate. The rate of the reaction, which is of zero order,  $\propto$  the amount of (I). Glutamic acid, tryptophan, and, to a smaller extent, histidine, arginine, tyrosine, aspartic acid, and indicators retard the reaction, whilst glycine, alanine, leucine, and  $\text{PO}_4'''$  have no effect. The temp. coeff. at  $10^\circ$  is 2—2.5 and decreases as temp. rises. At  $> 50^\circ$  the rate of reaction decreases with time whilst increasing inactivation of (I) with time occurs as the temp. is raised. W. McC.

**Effect of ascorbic acid on the action of tyrosinase on *l*-tyrosine, *l*-3:4-dihydroxyphenylalanine, and *l*-adrenaline.** E. ABDERHALDEN (Fermentforsch., 1936, 15, 24—31; cf. A., 1934, 1138).—The production of 3:4-dihydroxyphenylalanine (I) from tyrosine (II) by tyrosinase (III) and the action

of (III) on (I) and adrenaline (IV) are not inhibited by ascorbic acid (V), (V) with  $O_2$ , cysteine (VI) (but not cystine), and reduced glutathione. (V) produces (I) from (II), the action being accelerated by (III), but no (I) is produced by (VI) if (III) is absent.  $Fe^{+++}$  inhibits the action of (III). The spontaneous colouring of (I) and (IV) is inhibited by glycine (VII), (VI), and aspartic and glutamic acids and retarded by asparagine, histidine, and alanine. (VII) retards the colouring when (III) is present.

W. McC.

**Oxidising enzyme.** M. GHIRON (J. Trop. Med. Hyg., 1935, 38, 108—109).—Aq. extracts of dried liver contain an enzyme which oxidises fatty acids to  $CO_2$  and  $H_2O$ . Its activity is weakened at  $60^\circ$  and is destroyed at  $70^\circ$ .

CH. ABS. (p)

**Oxidation of neutral salicylates in alkaline medium, and particularly sodium salicylate in presence of sodium hydrogen carbonate.** U. B. MARTINS (Tribuna farm., 1934, 8, 8—10, 30—31).—Moulding and blackening of Na salicylate- $NaHCO_3$  solutions is prevented by addition of KI, KCN,  $CH_2O$ , or  $CuSO_4$ . An oxidase is probably responsible for the formation of the black substances.

CH. ABS. (p)

**Peroxidase reaction.** LIV. Prolongation of the rapid peroxidase reaction of blood-leucocytes as a sign of avitaminosis-B. LV. Prolongation of minimum peroxidase staining time as an early sign of avitaminosis-B: mechanism of the prolongation. T. SUZUKI. LVI. Constancy of the Arakawa reaction in milk of a lactating woman during a year. Y. UGA. LVII. Effect of urine of lactating women on leucocyte peroxidase: relationship with avitaminotic urine. T. SUZUKI. LVIII. Effect of urine extract on leucocyte peroxidase: early laboratory finding of avitaminosis-B. T. SUZUKI and A. TAKAMATSU (Tōhoku J. Exp. Med., 1935, 25, 186—200, 201—217, 564—574, 575—587, 588—595; cf. A., 1935, 1266).—LIV. The retardation of the reaction is due to an  $Et_2O$ -sol. substance in blood.

LVII. Urine of women secreting milk showing a negative Arakawa test retards the peroxidase staining time of normal blood neutrophils.

LVIII. The urinary constituent which retards peroxidase staining is removed by  $Et_2O$ -extraction and resembles  $AcCHO$ .

CH. ABS. (p)

**Mechanism of the action of peroxidase.** M. PADOA and D. GARILLI (G. Biol. appl. Ind. chim., 1935, 5, 1—16; Chem. Zentr., 1935, ii, 704).—Beet- and castor-peroxidase (I) are activated by  $Ca^{++}$  in the  $p_H$  range 6.5—7.2.  $Mg^{++}$  has a smaller effect on castor-(I). Activation by  $\alpha$ -alanine occurs in the same  $p_H$  range. An e.m.f. is set up by interposing a collodion membrane between a (I)- $CaSO_4$  solution and a  $CaSO_4$  solution of similar concn. Oxidase preps. are activated by  $Mn^{++}$ .

A. G. P.

**Determination of catalase.** D. DERIBAS and J. KORNMAN (Bull. Soc. Chim. biol., 1936, 18, 414—417).—The method, a modification of that of Bach and Zonkova (A., 1922, i, 392), gives the "potential activity" of the blood-catalase, and involves the

determination of the  $H_2O_2$  decomposed in 24 hr. at  $25^\circ$ .

A. L.

**Action of dyes and other substances on milk dehydrogenase. Identity of Schardinger enzyme with xanthine oxidase.** K. P. BASU and S. P. MUKHERJEE (J. Indian Chem. Soc., 1936, 13, 11—18).—Oxidation of xanthine,  $MeCHO$ , and  $o$ - $OH-C_6H_4-CHO$  by xanthine oxidase (cf. Dixon *et al.*, A., 1924, i, 1380) is inhibited to the same extent for each compound by 12 out of 14 basic dyes, pyrogallol, and gallic acid, and by 10 out of 12 acidic dyes.  $CO(NHEt)_2$  and  $CO(NHPh)_2$ , ethyl- and phenyl-urethane, and  $Na_2S_2O_4$  are without effect. Only one enzyme is involved.

F. R. G.

**Effect of enzymic dephosphorylation of cozymase on its action in the dehydrogenase system of peas.** N. LICHTENSTEIN (Fermentforsch., 1936, 15, 44—48; cf. A., 1935, 1277).—The action of cozymase is not inhibited by veronal- $NaOAc$ , borate, and  $NH_3-NH_4Cl$  buffers but is considerably diminished when  $H_3PO_4$  is liberated from cozymase by phosphatase.

W. McC.

**$\alpha$ -Glycerophosphate dehydrogenase.** D. E. GREEN (Biochem. J., 1936, 30, 629—644).—The enzyme (occurring in rabbit's tissues, especially brain) oxidises only (—) $\alpha$ -glycerophosphate (I) (cf. Meyerhof and Kiessling, A., 1933, 1080), the natural muscle isomeride, the products being mainly glycer-aldehyde phosphate and possibly some dihydroxy-acetone phosphate;  $AcCHO$  is a decomp. product. The enzyme, which is not involved in the reaction between (I) and  $AcCO_2H$ , is inhibited by octyl alcohol and ethylurethane but not by KCN,  $NaN_3$ ,  $NaF$ , or  $CH_3I \cdot CO_2Na$ . The reaction between the dehydrogenase system and mol.  $O_2$  is catalysed by cytochrome c (which is reduced and oxidised approx. 300 times per min.) but not by flavoprotein, flavin, ascorbic acid, or adrenaline.

F. O. H.

**Conditions of determination of the reducing activity of tissues.** A. CHEVALLIER and H. ROUX (Compt. rend. Soc. Biol., 1936, 121, 1017—1019).—The time of reduction of methylene-blue by sections of guinea-pig liver tissue is inversely  $\propto$  the surface area if thin sections are used; with thick sections the relation does not hold. The reducing power of the sections is decreased by prolonged washing in Ringer's solution.

R. N. C.

**Liver glycogenase.** T. H. HODGSON (Biochem. J., 1936, 30, 542—548).—The prep. of rabbit liver glycogenase (I) is described. (I) converts glycogen and maltose quantitatively into glucose, the action, unlike that of amylase, being unaffected by  $NaCl$ . The activity of (I) is optimal on the alkaline side of neutrality and is but little altered over a range of  $p_H$  encountered under physiological conditions. No significant decrease in the (I) content of liver results from administration of convulsive doses of insulin. (I) is destroyed by dialysis. The bearing of the results on the problem of glycogenolysis is discussed.

P. W. C.

**Mechanism of degradation of starch by amylases.** I. Nature of the early fission products. II. Kinetics of action of  $\alpha$ - and  $\beta$ -amylases on

starch, its components and partial degradation products. G. G. FREEMAN and R. H. HOPKINS (Biochem. J., 1936, 30, 442—445, 446—450).—I.  $\alpha$ -Malt- and -pancreatic amylase produce some maltose (I) in the early stages of hydrolysis of sol. starch (II), but most of the reducing material consists of dextrans.  $\beta$ -Malt-amylase and the amylase of ungerminated barley produce (I) in the early stages, the remaining material resembling (II). It is confirmed that  $\alpha$ -amylases hydrolyse (II) into dextrans whilst  $\beta$ -amylases remove successive mols. of (I).

II. The rates of hydrolysis of sol. (II), amylo-amylose (III), erythroamylose (IV),  $\alpha$ -amylodextrin (V), achroodextrin (VI), and glycogen (VII) by  $\alpha$ -malt-amylase and  $\beta$ -malt- or barley-amylase have been determined. A mixture of the  $\alpha$ - and  $\beta$ -enzymes in low concn. acts additively in the hydrolysis of sol. (II), whilst a high concn. of  $\beta$ - promotes hydrolysis at rates  $>$  the sum of the component rates. Mixtures of  $\alpha$ - and  $\beta$ - behave similarly towards (V) and (VII). (VI) is hydrolysed by  $\beta$ - more rapidly than by  $\alpha$ -amylase, (III) yields nearly 100% of (I) by the action of  $\beta$ -, whilst (IV) is hydrolysed with greater difficulty than sol. (II). Both amylases hydrolyse the same non-(V) portion of sol. (II), whilst only the  $\alpha$ - can attack (V).

J. N. A.

Degradation of starch by amylases. III. Mutarotation of fission products. G. G. FREEMAN and R. H. HOPKINS (Biochem. J., 1936, 30, 451—456).—The sense of the mutarotation is characteristic of the enzyme and independent of the substrate. In the early stages,  $\alpha$ -amylase produces reducing dextrans and a little  $\alpha$ -maltose, the latter increasing later, whereas  $\beta$ -amylase produces  $\beta$ -maltose only.

H. G. R.

Influence of alcohol on maltase. R. J. VUARAMBOY (Arch. Sci. phys. nat., 1935, [v], 17, Suppl., 209—214).—The inactivation of maltase by EtOH increases with the time of contact. Variations in the  $p_H$  of the EtOH from 5.2 to 8.4 have no effect on this inactivation. Invertase is but little affected by EtOH.

E. A. H. R.

$\beta$ -Glucosidase action.—See this vol., 593.

Specificity of galactosidases. R. WEIDENHAGEN and A. RENNER (Z. Wirts. Zuckerind., 1936, 86, 22—56).—The non-identity of the maltose- and melibiose-splitting enzymes of bottom-fermentation yeast is confirmed; each enzyme can be obtained free from the other. The ratio of the rates of hydrolysis of melibiose and  $\alpha$ -phenylgalactoside by the  $\alpha$ -galactosidase of bottom-fermentation yeast is practically unaffected by adsorption and elution of the enzyme, but different ratios apply to the  $\alpha$ -galactosidases of malt, taka-diastase, and sweet and bitter almonds. A study of the relative rates of hydrolysis of salicin and lactose by the emulsin of almonds at different stages of purification throws doubt on the identity of  $\beta$ -glucosidase with  $\beta$ -galactosidase.

J. H. L.

Action of esterase in presence of organic solvents. E. A. SYM (Biochem. J., 1936, 30, 609—617).—Esterification (determined in the solvent phase by decrease in acidity and alcohol concn.) by pig's pancreatic esterase of  $\text{Bu}^n\text{OH}-\text{PrCO}_2\text{H}$  (and other acids) in presence of  $\text{COMe}_2$ ,  $\text{C}_6\text{H}_6$ , and  $\text{CCl}_4$

was investigated. The velocity of reaction rises with increasing concn. of acid and, up to a max. val., following which it decreases, of alcohol; this phenomenon is partly explained by the partition coeffs. of substrates between  $\text{H}_2\text{O}$  and org. solvent.

F. O. H.

Lipolytic enzyme of *Galleria mellonella*. N. FRIESSINGER and A. GAJDOS (Compt. rend. Soc. Biol., 1936, 121, 1152—1154).—A glycerol extract of the larvæ contains an enzyme which hydrolyses tributyrin.

H. G. R.

Proteinase in the milky juice of *Calotropis gigantea*. Its purification and activation by ascorbic acid and glutathione. K. P. BASU and M. C. NATH (J. Indian Chem. Soc., 1936, 13, 34—39).—The juice contains glutathione 2.094 mg., ascorbic acid 0.211 mg., and cysteine 0.180 mg. per c.c., all of which activate the enzyme previously isolated (A., 1933, 876).

F. R. G.

Proteolytic enzymes of sprouted wheat. J. D. MOUNFIELD (Biochem. J., 1936, 30, 549—557).—Aq. extracts of sprouted wheat contain a protease (I) having an optimum  $p_H$  of 4.1 for decomp. of edestin. The substrate concn. for half the max. velocity (which occurs in  $> 2\%$  solution at  $40^\circ$ ) is 0.5%. The course of the early stages of the reaction appeared to follow the Schutz-Arrhenius rule but no const. val. for  $K_m$  was attained. (I) shows a crit. inactivation temp. of  $54^\circ$  at  $p_H$  6 and is spontaneously inactivated on keeping at  $18^\circ$  for 4—5 weeks with PhMe. The activity of (I) is considerably reduced by citrate or  $\text{Cl}'$ . The extract also contains a dipeptidase which attacks leucylglycine optimally at  $p_H$  7.3 and glycylglycine at  $p_H$  7.9 and is completely inactivated by keeping for 5 days at  $18^\circ$  in presence of PhMe.

P. W. C.

Specific defence proteases in the study of inheritance. I. Tests with pure breeds [of guinea-pigs]. E. ABDERHALDEN (Fermentforsch., 1936, 15, 49—92).—The high degree of breed specificity (usually also sex specificity) observed when the defence enzyme test is applied to pure breeds indicates that the blood and tissues of the separate breeds contain proteins which are distinguishable by means of the test.

W. McC.

Manganese salts as activators of arginase. G. KLEIN and W. ZIESE (Klin. Woch., 1935, 14, 205—206; Chem. Zentr., 1935, ii, 704).— $\text{MnSO}_4$  activates arginase (purified or otherwise) in cell suspensions, tissue sections, sarcoma cells, and tumours. This action occurs *in vitro* in the presence of CO or HCN and is unrelated to the redox potential.

A. G. P.

Occurrence of prolinase.—See this vol., 596.

Urease in the mucous membrane of the intestine of the foetus. A. CARDIN (Arch. ital. Biol., 1934, 91, 96—100; Chem. Zentr., 1933, ii, 869).—Urease occurs in the foetal intestine after 4 months and is probably concerned in the mechanism of HCl secretion. None occurs in cats and dogs.

A. G. P.

Activators of glycolysis. H. VON EULER and G. GÜNTHER (Z. physiol. Chem., 1936, 239, 83—88; cf. A., 1935, 1278).—Comparison of the activating effects of animal adenylic acid (I) and cozymase (II)

on the production of lactic acid from glycogen in presence of hexose diphosphate proves the greater efficiency of (II) in the natural state or after inactivation by heat. The rate of elimination of adenine is approx. the same with (I) and (II) whereas (II) loses  $\text{PO}_4'''$  more rapidly than does (I). This is attributed to loss of  $\text{PO}_4'''$  from (II) by two concurrent reactions. H. W.

**Lipochromes and glycolysis.** C. FRISCH, E. LEDERER, and R. WILLHEIM (Bull. Soc. Chim. biol., 1936, 18, 401—405).—Like carotene, lutein and zeaxanthin increase glycolysis by muscle extract.

A. L.

**Specificity of the adenylpyrophosphatase of liver extract.** A. HAASE (Z. physiol. Chem., 1936, 239, 1—14).—Extracts of rabbit and swine liver liberate  $\text{H}_3\text{PO}_4$  from adenylpyrophosphoric acid (I), adenylic acid (II), lactacidogen (III), and  $\text{Na}_4\text{P}_2\text{O}_7$ . The optimum condition for the dephosphorylation of (I) and (II) is  $p_{\text{H}}$  9 and for the fission of  $\text{Na}_4\text{P}_2\text{O}_7$  is  $p_{\text{H}}$  7.0. At  $p_{\text{H}}$  7.0 fission of (III) is scarcely appreciable, but attains about 20% after 4 hr. at 38° and  $p_{\text{H}}$  9. Dephosphorylation of (II) is more rapid than that of (I). Selective damage to adenylpyrophosphatase (IV) does not occur when the liver extract is warmed with  $\text{NH}_4\text{Cl}$ , the fission of (I) and (II) being decreased in the same proportion; the action of phosphatase on  $\text{Na}_4\text{P}_2\text{O}_7$  is, however, very much weakened. (IV) probably affects all three phosphoric groups of (I). By treatment of liver extracts with  $\text{NH}_4\text{Cl}$  (IV) loses so much activity that the process is unsuitable for the establishment of small displacements between free and combined pyrophosphate.

H. W.

**Fission of natural laevorotatory phosphoglyceric acid by muscle extract.** T. ROHLER (Z. physiol. Chem., 1936, 239, 15—29).—An enzyme can be extracted from muscle by physiological NaCl solution or by 2%  $\text{NaHCO}_3$  which hydrolyses phosphoglyceric acid (I) to  $\text{H}_3\text{PO}_4$  and  $\text{AcCO}_2\text{H}$  (usually in equiv. quantities). A large difference in the velocities of isomerisation of (I) to phosphopyruvic acid and of fission of the latter is unlikely. Fission of (I) proceeds most rapidly between  $p_{\text{H}}$  6.8 and 8.0. Isomerisation and fission of (I) is very slight in acid solution. H. W.

**Mechanism of lysozyme action.** K. MEYER, J. W. PALMER, R. THOMPSON, and D. KHORAZO (J. Biol. Chem., 1936, 113, 479—486).—Lysozyme, prepared from *Sarcina*, had no protease, kinase, amylase, lipase, or phosphatase activity; it liberated reducing sugars from the mucins or polysaccharides from *Sarcina*, and also one from a mucin from egg-white. No action was observed with a variety of naturally occurring mucins and polysaccharides.

H. D.

**Lacto-mannitic enzymes. II. Lactic acid in the mannitic fermentation of fructose.** V. BOLCATO (Annali Chim. Appl., 1936, 26, 24—30).—The proportion of lactic acid (I) to  $\text{AcOH}$  in the mannitic fermentation of fructose (cf. A., 1933, 1333) after different intervals shows no regularity, and on addition of (I) to the system the quantity produced is reduced

only slightly. Formation of (I) is regarded as an independent enzymic activity. E. W. W.

**Hydrogenlyases. IV. Synthesis of formic acid by bacteria.** D. D. WOODS (Biochem. J., 1936, 30, 515—527).—When washed suspensions of *B. coli* and other organisms are shaken in  $\text{H}_2 + \text{CO}_2$ ,  $\text{HCO}_2\text{H}$  is produced. The distribution of the enzyme effecting this reaction is identical with that of formic hydrogenlyase (I). The presence of the enzyme in the washed cells is conditioned, as with (I), by the presence of  $\text{HCO}_2'$  in the culture medium, and both systems are sensitive to the same poisons. The same enzyme therefore probably catalyses both synthesis and breakdown of  $\text{HCO}_2\text{H}$ , the action of (I) being reversible. This view is confirmed by the free energy and heat calc. for the reaction. P. W. C.

**Galactozymase as an adaptive enzyme.** M. STEPHENSON and J. YUDKIN (Biochem. J., 1936, 30, 506—514).—Galactozymase (I) of *S. cerevisiae* is an adaptive enzyme, adaptation occurring in aq. solutions of galactose (II) and without cell multiplication. A study of total and viable counts suggests that it is not only viable cells which are capable of adaptation. The activity of (I) and of glucozymase is independent of cell viability. Adapted cells lose their (I) completely after fermenting glucose and regain it in presence of (II). P. W. C.

**Preparation of intermediary enzyme from yeast.** E. NEGELEIN and W. GERISCHER (Biochem. Z., 1936, 284, 289—296).—The enzyme (this vol., 380) (isoelectric point,  $p_{\text{H}}$  4.82) in yeast press-juice is purified by successively removing protein at  $p_{\text{H}}$  4.6, adding NaOH to  $p_{\text{H}}$  9 (which ppts. inert matter and stabilises the solution), fractionally pptg. with  $(\text{NH}_4)_2\text{SO}_4$ , pptg. by EtOH, and finally isoelectrically pptg. from  $\text{H}_2\text{O}$ . The product (102 mg. from 5 litres of press-juice) contains 8.5% of the initial activity. F. O. H.

**Influence of monochromatic light on (A) proteolytic enzymes in yeast, (B) oxidation-reduction enzymes of yeast, (C) yeast amylase. I, II.** R. MURAKAMI (J. Agric. Chem. Soc. Japan, 1936, 12, 19—20, 20, 21—22).—(A) Proteolysis is most marked in red light.

(B) The  $\lambda$  of illumination has but little effect on oxidation-reduction processes in yeasts; the reactions are possibly faster in red light.

(C) i. Amylase activity is most marked in red light.

(C) ii. The extent of reaction increases with increasing intensity of a monochromatic source of light.

E. A. H. R.

**Respiration-increasing action of potassium cyanide.** P. E. LINDAHL and Å. ÖRSTRÖM (Naturwiss., 1936, 24, 142).—The gaseous metabolism of top yeast in presence of dihydroxyacetone (I) is increased by 40% by 0.0015M-KCN; 0.002M- and 0.005M-KCN produce no effect and a decrease, respectively. Fermentation of (I) is accelerated by 0.001M-KCN; CO has a similar effect. The phenomenon is due to the dual action of KCN or CO, viz., acceleration of an anaerobic reaction common to respiration and fermentation and inhibition of the Fe-containing respiratory enzyme. F. O. H.

**Stimulation of yeast proliferation by pantothenic acid.** O. W. RICHARDS (J. Biol. Chem., 1936, 113, 531—536).—The stimulation of the growth of yeast by pantothenic acid (I) is more marked with old (7-day) than with fresh, rapidly growing cultures. The effect is most marked 18—24 hr. after seeding, and there is little effect on the final yield. The observations suggest that the effect of (I) is in stimulating the recovery of the budding rate of older, differentiated, yeast cells. F. A. A.

**Preservation and rate of respiration of yeasts in the presence of glucose.** F. CHODAT and A. MIRIMANOFF (Arch. Sci. phys. nat., 1935, [v], 17, Suppl., 189—194; cf. A., 1935, 1538).—The addition of glucose (I) to the culture medium inhibits the ageing effect shown by *Endomyces anomalus* at low temp. (6°), the respiration rate remaining almost unaltered for days. The normal decrease in rate of respiration cannot be attributed to toxic products formed in the medium. Addition of (I) to the medium by increasing the osmotic pressure decreases the ease of extraction of diffusible substances from the cells. Diffusion of cozymase would thus be inhibited, and the maintenance of the respiratory powers of the yeast be explained. E. A. H. R.

**Effect of aëration on alcoholic fermentation.** Y. TOMODA (J. Soc. Chem. Ind. Japan, 1936, 39, 56B).—Aëration depresses the formation of EtOH but increases considerably the amounts of MeCHO and glycerol (10% on sugar converted). S. C.

**Succinic acid and glycerol in alcoholic fermentation.** L. GENEVOIS (Bull. Soc. Chim. biol., 1936, 18, 295—300).—A study of the glycerol (I), succinic acid (II), and AcOH (III) content of various Italian, German, French, and Swiss wines shows that  $g = (5s + 2a)$ , where  $g$ ,  $s$ , and  $a$  are the no. of mols. of (I), (II), and (III), respectively, is always positive. A. L.

**Detection of adenosinetriphosphoric acid in bottom yeast.** N. DAS (Svensk Kem. Tidskr., 1936, 48, 22—24).—This acid was obtained as the Ba salt from a  $\text{CCl}_3\cdot\text{CO}_2\text{H}$  extract of fresh, pressed brewers' yeast. Its identity with that obtained from top yeast and from muscle (cf. A., 1931, 418) was established. J. N. A.

**Squalene as a constituent of yeast fat.**—See B., 1936, 378.

**Hydrogenation of conjugated double linkings by fermenting yeast.**—See this vol., 588.

**Nickel nitroprusside reaction for reduced glutathione.**—See this vol., 597.

**Biochemistry of moulds.** P. W. CLUTTERBUCK (J.S.C.I., 1936, 55, 55—61T).—A summary of recent work.

**Sporulation of *Helminthosporium avenae* and *Alternaria solani* in artificial culture.** W. A. R. D. WESTON (Trans. Brit. Mycol. Soc., 1936, 20, 112—114).—Sporulation of these moulds occurs only after exposure to visible light of high intensity for 10—15 min. E. B. H.

**Some root fungi.** S. RENNER (Phytopath. Z., 1935, 8, 457—487).—Fungi developing on roots of

*Salix repens* and *Acer pseudoplatanus* do not provide a factor necessary for the germination of seeds. No evidence of N fixation by the organism was obtained. A. G. P.

**Thermogenesis in hay-inhabiting fungi.** J. W. HARRISON (Iowa State Coll. J. Sci., 1934, 9, 37—59).—Increased temp. produced by various species of fungi is most marked during active germination, and is not paralleled by the rate of evolution of  $\text{CO}_2$ . CH. ABS. (p)

**Mechanism of fermentation of arabinose by *Aspergillus oryzae*.** I. T. TADOKORO (J. Agric. Chem. Soc. Japan, 1935, 11, 167—173).—The products of fermentation included citric, formic, glycollic, and kojic acids, but not malic or lactic acid, EtOH, MeCHO, AcOH, or  $\text{COMe}_2$ . The mechanism of the changes is discussed. CH. ABS. (p)

**Degradation of fatty acids by mould fungi.**—See B., 1936, 284.

**Production of hydroxylamine from ammonia by *Aspergillus niger*.** M. LEMOIGNE, P. MONGUILLON, and R. DESVEAUX (Compt. rend., 1936, 202, 696—698).—Small amounts of  $\text{NH}_2\text{OH}$  occur when  $\text{NO}_3^-$  or  $\text{NH}_4^+$  provide the N source.  $\text{NH}_2\text{OH}$  probably represents a definite stage in the N metabolism of the mould. A. G. P.

**Structure of the chitin of fungi.** K. H. MEYER and W. LOTMAR (Arch. Sci. phys. nat., 1935, [v], 17, Suppl., 287—288).—Chitin from *Phycomyces blakesleeanus* possesses the same structure as that from animal sources. R. S.

**Incorporation of deuterium into living organisms. III.** K. H. GEIB and K. F. BONHOEFFER (Z. physikal. Chem., 1936, 175, 459—468; cf. this vol., 256).—In solutions of glucose in 95%  $\text{D}_2\text{O}$  *Aspergillus niger* and *Penicillium glaucum* grow only about half as rapidly as in solutions in  $\text{H}_2\text{O}$ . About 30% of the H content of the mould is rapidly exchangeable for D from  $\text{D}_2\text{O}$ , and the proportion of D in the hydrogen incorporated into the mould and not removable by washing with  $\text{H}_2\text{O}$  is about half that in the water of the solution. The proportion of D in the hydrogen of moulds grown in  $\text{AcCO}_2\text{H}$  solution is  $>$  this. There is no growth in solutions of deuteropyruvic acid in  $\text{D}_2\text{O}$ . R. C.

**Concentration of foodstuff as the quantitative factor in the growth of a population of infusoria.** J. MONOD and G. TESSIER (Compt. rend., 1936, 202, 162—164).—The rate of multiplication of *Glaucoma piriformis*  $\propto$  the concn. of the nutrient when this is small, but asymptotically approaches an upper limit when the concn. is large. W. O. K.

**Mechanism of chemotherapeutic action. XII.** Comparison of the binding of some chemotherapeutic agents by normal and resistant trypanosomes. J. T. PEDLOW and L. REINER (J. Pharm. Exp. Ther., 1935, 55, 179—199).—The binding of As by normal and As-resistant strains of *Trypanosoma equiperdum in vitro* from solutions of neosarsphenamine and Mapharsen solutions in concns. such that they would kill both strains in the same time was the same; factors influencing the killing time were without

effect on the binding. *In vivo* normal trypanosomes bind more As than As-resistant strains, whilst the latter bind less acriflavine (I) than do normal strains, the difference *in vivo* being  $>$  *in vitro*. Previous treatment of the rats with (I) was without influence on the binding of As by trypanosomes. Hence the theory that acquired resistance to As compounds is due to a loss of binding groups is incorrect. H. D.

**Changes in acidity during biological processes.** F. SANDER (Biochem. Z., 1936, 284, 189—196).—The resulting changes in  $[H^+]$  of the systems  $SiO_2$ , starch, C, humic acid,  $NH_4$  and Na zeolites, and  $AlCl_3$  with  $H_2O$  and various concns. of aq. KCl, NaOAc,  $(NH_4)_2SO_4$ , NaCl,  $Na_2SO_4$ , and NaOH were determined. The data and their correlation with natural or artificial culture media and with bacterial ( $NO_2^-$ ,  $NO_3^-$  and N-forming) systems are discussed. F. O. H.

**Biochemistry of bacteria.** T. K. WALKER (J.S.C.I., 1936, 55, 61—66r).—A review of recent developments.

**Deamination of alanine.** E. AUBEL and F. EGAMI (Compt. rend., 1936, 202, 675—676).—The action of various narcotics shows that the bacterial system effecting the deamination of *l*-alanine (I) differs from that acting on *d*-alanine but resembles that producing  $AcCO_2H$  from lactic acid (II) (in presence of  $NO_3^-$ ). The latter system is not identical with that effecting the same transformation in presence of methylene-blue as H-acceptor. Hence dehydrogenation of (I) cannot proceed by way of (II) (cf. A., 1935, 1282). A. G. P.

**Soil microbiology. VIII. Nodule bacteria of Leguminosae.** S. VINOGRADSKY [with H. VINOGRADSKY] (Ann. Inst. Pasteur., 1936, 56, 221—250: cf. A., 1933, 537, 989).—In N-free cultures growth of the nodule organisms is poor. Addition of N as  $NH_4^+$ , amides, or amines improves development, sugar consumption increasing with the amount of N supplied. Fixation of N is, however, very small. Org. sources of N (extracts of yeast, leaves, roots, etc.) further increase development and initiate N fixation. Elimination of  $NH_3$  by the organisms occurs only during N fixation. Evolution of  $NH_3$  by nodules is not prevented by  $CHCl_3$  or PhMe, or by drying ( $50^\circ$ ) and prolonged storage. The  $NH_3$  produced is derived from atm. sources. A. G. P.

**Root nodule bacteria of leguminous plants. XVIII. Breakdown of proteins by the root nodule bacteria.** A. I. VIRTANEN and T. LAINE (Biochem. J., 1936, 30, 377—381).—Incubation of strains of *Rhizobium* with milk-proteins (I), gelatin (II), and the cell-proteins of the bacteria produced a very slow hydrolysis. Small amounts of  $NH_3$  were produced from (I) and (II) in the absence of PhMe. H. D.

**Biology of Azotobacter. I. Filterability of Azotobacter. II. Nitrogen content of filtrates from Azotobacter cultures.** M. ROBERG (Jahrb. wiss. Bot., 1935, 82, 1—27, 65—98).—I. No form of the organism passed a bacterial filter.

II. Filtrates from cultures contained N compounds. No  $NH_3$  was formed until the energy source was exhausted. The amount of sol. N produced varied

with the species. *Aspergillus niger* and *B. mesentericus* utilised these N compounds. A. G. P.

**Origin and significance of ammonia formed by Azotobacter.** D. BURK and C. K. HORNER (Soil Sci., 1936, 41, 81—122).—Extracellular  $NH_3$  produced by *A. vinelandii* and *A. chroococcum* is derived from normal cell constituents and not by direct synthesis from atm.  $N_2$ . Under suitable conditions (optima,  $p_H$  7.8—8.0 and  $30$ — $40^\circ$ ) 50% of the cellular N may appear as  $NH_3$ . The influence of  $O_2$  on oxidation of cell material is independent of the pressure (0.01—1.0 atm.). Aerobic production of  $NH_3$  is closely related to the oxidation of cell-protein. Anaerobically,  $NH_3$  is formed by hydrolytic processes not involving production of  $CO_2$ . The mechanism of these changes is discussed. A. G. P.

**Oxidation of mannose to mannonic acid by B. gluconicum (Hermann).** S. HERMANN and P. NEUSCHUL (Bull. Soc. Chim. biol., 1936, 18, 390—394).—Yields of 60—70% are obtained, the mannonic acid being identified as the Ca salt  $(C_6H_{11}O_7)_2Ca \cdot H_2O$ . A. L.

**Mechanism of glucose dissimilation by propionic acid bacteria.** H. G. WOOD and C. H. WERKMAN (Biochem. J., 1936, 30, 618—623).—Quant. data of the products of  $EtCO_2H$  fermentation indicate the formation (possibly from 2 mols. of AcOH) of succinic acid, which is decarboxylated to  $EtCO_2H$ . The possibility of formation of  $EtCO_2H$  from a 3-C intermediate or by 4- and 2-C cleavage of glucose (cf. Virtanen, B., 1924, 687; 1925, 1007) is discussed. F. O. H.

**Activation of lower fatty acids by propionic acid bacteria.** R. W. STONE, H. G. WOOD, and C. H. WERKMAN (Biochem. J., 1936, 30, 624—628).—Determinations of  $E_h$  of systems of lower fatty acids and resting bacteria indicate that AcOH,  $EtCO_2H$ , and, to a smaller extent,  $HCO_2H$  are caused to donate  $H_2$  to methylene-blue (and, with AcOH, to nitrates and *o*-chlorophenol-indophenol) at  $p_H$  5—7;  $PrCO_2H$  and  $BuCO_2H$  are not thus activated. The bearing of the data on  $EtCO_2H$  fermentation is discussed. F. O. H.

**Optical properties of the fermentation lactic acids. II. Behaviour of lactic acid bacteria on addition of inactive and active lactic acids to the fermentation liquids.** H. KATAGIRI and K. KITAHARA (J. Agric. Chem. Soc. Japan, 1936, 12, 96—100).—*S. lactis bulgaricus* produces more *d*-lactic acid (I) than normally when *dl*-(I) is added to the incubation mixture (aq. glucose); *L. pentosaceticus* gives a final product of *dl*-(I) even when *d*- or *l*-(I) is added during fermentation. H. D.

**Fermentation of cellulose by thermophilic bacteria. V. Colloidal substances produced. VI. Formation of lactic acid.** Y. TOMODA (J. Soc. Chem. Ind. Japan, 1936, 39, 57b).—V. Colloidal substances reported by Scott *et al.* (A., 1930, 1218) are proteins, and not formed directly from the cellulose (I); only very small amounts of colloidal substances are real degradation products of (I).

VI. The yield of lactic acid (II) is  $> 10\%$  of the

(I). In analysing the products  $\text{AcOH}$  and  $\text{PrCO}_2\text{H}$  are removed by steam-distillation, and (II) and  $\text{H}_2\text{SO}_4$  in the residue are partly separated by extraction with amyl alcohol.  $\text{AcOH}$  and  $\text{PrCO}_2\text{H}$  are partly separated by extraction with  $\text{Et}_2\text{O}$ .

A. G.

Action of 2:4-dinitrophenol on respiration and oxidation of *Aerobacter cloacae*. F. H. JOHNSON (J. Tenn. Acad. Sci., 1934, 9, 288—291).—In concns. of 4—6 mg. per 100 c.c., 2:4-dinitrophenol is toxic and effects some oxidation of the cell. Smaller proportions are stimulative. CH. ABS. (p)

Nucleoproteins from *B. anthracis*. R. FERRA-MOLA (Anal. Assoc. Quím. Argentina, 1935, 23, 93—105).—*B. anthracis* gives at  $p_{\text{H}}$  3.8—4 an insol. nucleoprotein, separated by  $\text{AcOH}$  into an insol. protein (elementary analysis) and a sol. nucleic acid which with 15%  $\text{H}_2\text{SO}_4$  yields guanine and adenine. The biological activity (immunised horse serum) resides in the protein fraction. F. R. G.

Biochemical and serological differentiation of the *Brucella* group: its significance for epidemiology. P. A. VERSCHLOVA (Arch. Sci. biol. U.S.S.R., 35, B, 513—541).—Bovine and porcine but not *melitensis* forms produce  $\text{H}_2\text{S}$  under conditions in which  $\text{CO}_2$  accumulation is prevented, porcine types yielding the greater quantity. The bacteriostatic dye technique gives better differentiation. CH. ABS. (p)

Comparative value of the method of Koser, the Voges-Proskauer test, and the methyl-red reaction to differentiate *B. coli* of faecal and telluric origin. F. VAN DEN BRANDEN and J. GEENS (Compt. rend. Soc. Biol., 1936, 121, 893—895). R. N. C.

Nature of diphtheria toxin. Purified, powdered toxin. S. HOSOYA, A. MOMMA, T. TANAKA, and K. KAGABE (Compt. rend. Soc. Biol., 1936, 121, 1191—1192). H. G. R.

Meningococcus infection. VIII. Type I specific substance. H. W. SCHERP and G. RAKE (J. Exp. Med., 1935, 61, 753—769).—Isolation of the type-sp. substance is described. It is probably the Na salt of a polysaccharide acid, yields 45% of reducing sugars on hydrolysis, is unaffected by tryptic digestion, and does not give a biuret test. CH. ABS. (p)

Use of sodium deoxycholate for the identification of pneumococci. E. LEIFSON (J. Amer. Med. Assoc., 1935, 104, 213).—In media of  $p_{\text{H}}$   $\leq$  6.5 pneumococcus but not streptococcus cultures are cleared by the reagent. CH. ABS. (p)

Existence of a staphylococcal paratoxin. P. NÉLIS (Compt. rend. Soc. Biol., 1936, 121, 808—810). R. N. C.

Cellular reactions to acetone-soluble fat from mycobacteria and streptococci. Effect of neutralisation on the biological activity of the tuberculo-lipin and of the phthioic acid derived from it. K. C. SMITHBURN and F. R. SABIN (J. Exp. Med., 1935, 61, 771—782).—The reaction induced by  $\text{COMe}_2$ -sol. fat of the tubercle bacillus is simpler and

less extensive if the material is neutralised. Neutralisation of the fat or of phthioic acid does not lower the tuberculogenic potency. The fat from streptococci is similarly irritating but does not produce tuberculous tissue. CH. ABS. (p)

Diacetyl as tubercle-bactericidal constituent of Finnish wood-tar. Y. W. JALANDER (Arch. exp. Path. Pharm., 1936, 180, 628—630).— $\text{Ac}_2$  (synthetic or from wood-tar), especially as vapour, has a bactericidal action on tubercle bacilli.

F. O. H.

Effect of concentration of glycerol and asparagine on the weight-yields of *B. tuberculosis* and on the  $p_{\text{H}}$  of cultures in Sauton's medium. R. K. GOYAL (Compt. rend. Soc. Biol., 1936, 121, 1165—1167).—Optimum yields are obtained with 1.2% asparagine and 6% (vol.) glycerol.

H. G. R.

Sterilising action of acids. VI. Sterilising action of halogenated fatty acids on putrefactive bacteria, *B. typhosus*, and *V. cholerae*. S. TETSUMOTO (J. Agric. Chem. Soc. Japan, 1936, 12, 22—26). E. A. H. R.

Mechanism of bactericidal action of radioactive radiations. I. Theoretical. II. Experimental;  $\alpha$ - and  $\beta$ -particles. D. R. LEA, R. B. HAINES, and C. A. COULSON (Proc. Roy. Soc., 1936, B, 120, 47—63, 63—76).—I. Possible mechanisms of the bactericidal action of  $\alpha$ - and  $\beta$ -radiations are discussed. The "target" hypothesis seems best to fit the facts.

II. Bacteria in thin gelatin films are exposed to radiations of small penetrating power. The fraction surviving is an exponentially diminishing function of the time of irradiation. The rate of disinfection is independent of temp. and  $\propto$  the intensity of radiation. The results are expressed in terms of mean ionisation dosage required to produce death, and by "target areas." E. A. H. R.

Antiseptic action of certain 2-furyl mercurials. N. M. PHATAK and C. D. LEAKE (J. Pharm. Exp. Ther., 1936, 56, 265—268).—Furyl Hg salts have antiseptic powers  $<$  those of Ph Hg<sup>II</sup> salts, and substitution of halogens or alkyl in the Ph or furan nuclei lowers the toxicity of the compounds. H. D.

Bactericidal action of mercury. M. LISBONNE and R. SEIGNEURIN (Compt. rend., 1936, 202, 169—171).—The addition of Hg to  $\text{H}_2\text{O}$  renders the latter bactericidal. W. O. K.

Adsorption of foot and mouth disease virus on alumina. A. HANSEN and S. SCHMIDT (Compt. rend. Soc. Biol., 1936, 121, 1239—1242).—The virus is completely adsorbed and may be eluted to a small extent with dil.  $\text{PO}_4'''$  buffer at  $p_{\text{H}}$  7.6. H. G. R.

Complex of foot and mouth disease virus with alumina and its pathogenic and immunising properties. S. SCHMIDT and A. HANSEN (Compt. rend. Soc. Biol., 1936, 121, 1236—1239).—Guinea-pigs, which show no signs of fever, are rapidly immunised by intracutaneous introduction of the complex. H. G. R.

**Determination of the dimensions of ultra-viruses by ultrafiltration: virus of herpes.** C. LEVADITI, M. PAÏC, and D. KRASSNOFF (*Compt. rend. Soc. Biol.*, 1936, **121**, 805—808).—The virulence of the ultravirus is inversely  $\propto$  the size of the particles. R. N. C.

**Physicochemical characterisation of the filterable viruses of mosaic.** K. S. SUCHOV (*Virus Dis. Plants, Crimea and Ukraine*, 1934, 31—38).—The virus of tomato fern-leaf is not killed by  $\text{CO}_2$  or EtOH or destroyed by pepsin. Tomato "streak" tissues exerted a mitogenetic action on yeast.

CH. ABS. (p)

**Action of hormones on the plumage of birds.** G. MONTALENTI (*Rass. Clin. Terap.*, 1934, **33**, 6—21; *Chem. Zentr.*, 1935, ii, 711). R. N. C.

**Influence of different hormones on the hydrogen-ion concentration of blood-plasma.** II. Relation between thyroid and insulin. III. Influence of adrenals. IV. Relation between adrenaline and thyroid and between adrenaline and insulin. V. Influence of the gonads. N. NAKATSUGAWA (*Folia Endocrinol. Japon.*, 1933, **8**, 105—106; **9**, 24—25, 43—44, 45—46; cf. A., 1934, 1409).—II. Injection of insulin (I) in rabbits with slight hyperthyroidism causes an increased acidotic and a decreased alkalotic phase. In severe hyperthyroidism both phases decrease. Thyroidectomised animals show increased acidosis but no alkalosis after injection. When glucose is given with (I) acidosis was insignificant but alkalosis increased.

III. Injection of adrenaline (II) lowers the plasma- $p_H$ . Cortex extract causes slightly increased vals. Ingested thyroid and adrenals are antagonistic. Insulin is synergistic with adrenals.

IV. Acidosis following injection of (II) is decreased by feeding thyroid powder and by insulin, and augmented by thyroidectomy. Initial acidosis after (I) was diminished by injecting (II), but the following acidosis was unchanged.

V. Plasma- $p_H$  of female animals is lowered by feeding interstitial tissue from cow ovaries and raised by feeding corpus luteum and by oöphorectomy.

CH. ABS. (p)

**Lipæmia caused by absorption of the products of intestinal putrefaction of proteins and effects of the various hormones on this condition.** III. Effect of extirpation of adrenals. IV. Effect of insulin and of insulin plus glucose. M. MITANI (*Folia Endocrinol. Japon.*, 1933, **8**, 94; cf. A., 1934, 1398).—III. Extirpation of adrenals in rabbits results in an increase in blood-fat, -lipin, and (notably) -cholesterol. Lipæmia produced by assimilation of products of protein decomp. in the intestine is more marked in adrenalectomised than in normal animals.

IV. Lipæmia following the feeding of decomp. products of proteins is reduced by insulin (I) and further reduced by (I) + glucose. CH. ABS. (p)

**Passage of hormones (choline, adrenaline, posterior pituitary hormone) from the mother through the placenta to the foetus.** L. CATTANEO (*Arch. ital. Biol.*, **90**, 100—110; *Chem. Zentr.*, 1935, ii, 71). R. N. C.

**Action of adrenaline in the monkey.** C. J. STORM (*Acta Brev. neerl. Physiol.*, 1935, **5**, 57—60). R. N. C.

**Use of adrenaline in intravenous injections of atebirin.** C. J. STORM (*Acta Brev. neerl. Physiol.*, 1935, **5**, 60—63). R. N. C.

**Intra-vascular injection of adrenaline into dogs. Hyperglycæmia and dosage by different methods of administration.** A. BAUDOUIN, H. BÉNARD, J. LEWIN, and J. SALLET (*Compt. rend. Soc. Biol.*, 1936, **121**, 1157—1159).—Hyperglycæmia is more readily produced when adrenaline is administered through the portal system. H. G. R.

**Sensitisation by cocaine of the hypertonic effects of adrenaline.** H. HERRMANN, G. MORIN, and J. VIAL (*Compt. rend. Soc. Biol.*, 1936, **121**, 998—1000). R. N. C.

**Sparteine, an antagonist of yohimbine in adrenaline hyperglycæmia.** R. HAZARD (*Compt. rend.*, 1936, **202**, 345—347).—Sparteine (10—20 mg. per kg.) largely antagonises the effect of 7 mg. of yohimbine chloride in suppressing the hyperglycæmic effect of adrenaline (0.1 mg. per kg.) in young rabbits. J. L. D.

**Effect of endocrine gland secretions on the adrenaline formation and content of the adrenals.** O. RICHTER (*Endocrinol.*, 1935, **15**, 305—320; *Chem. Zentr.*, 1935, ii, 1052).—Adrenaline (I) discharge from the adrenals in the rat is increased by feeding with thyroid or thymus, or injection of insulin or posterior pituitary hormone, (I) formation showing a preliminary increase, which is soon negated by the discharge, the medulla exhausting itself. Thyroidectomy increases (I) formation without affecting discharge, splanchnicotomy prevents (I) discharge, whilst ovariectomy increases both formation and discharge of (I). R. N. C.

**Does administration of adrenaline alter the adrenaline content of the adrenals in rabbits?** J. KANOWOKA (*Tôhoku J. Exp. Med.*, 1934, **24**, 572—579).—No change results from intravenous injection. CH. ABS. (p)

**Adrenaline content of adrenal glands of dogs.** J. KANOWOKA (*Tôhoku J. Exp. Med.*, 1934, **24**, 463—467).—Various methods of assay are compared. CH. ABS. (p)

**Adrenaline content of the adrenal capsules after destruction of the dorso-lumbo-sacral marrow in the dog.** H. HERRMANN, J. DECHAUME, and G. MOREN (*Compt. rend. Soc. Biol.*, 1936, **121**, 1000—1002).—Adrenaline is depressed by destruction of the marrow, but tends to recover during the survival period. R. N. C.

**Anaphylactic shock and adrenaline content of adrenal glands.** J. KANOWOKA and S. KANOWOKA (*Tôhoku J. Exp. Med.*, 1935, **25**, 249—257).—In sensitised rabbits shock induced by injection of horse serum caused a decrease in adrenaline (I) content of the glands, unaffected by sectioning the splanchnic nerve, and probably due to destruction, rather than increased liberation, of (I).

CH. ABS. (p)

**Adrenaline content of adrenal glands of rabbits in peptone poisoning.** J. KANOWOKA (Tôhoku J. Exp. Med., 1935, 25, 244—248).—Vals. decreased slightly in animals showing signs of peptone poisoning except when death immediately followed the injection.

CH. ABS. (p)

**Identification of the muscle-active adrenal cortex hormone.** K. LANG and B. STUBER (Biochem. Z., 1936, 284, 256—269).—Adrenal cortex contains a hormone [not identical with that of Swingle *et al.* (A., 1933, 320)] characterised by its ability in suitable doses to delay fatigue in active muscle; large doses, however, accelerate fatigue. The isolated principle is mainly a fatty acid ester (Me stearate?) and its action is typical of esters of higher fatty acids which, like adrenal cortex extracts, enhance phosphagen synthesis in muscle.

F. O. H.

**Adrenal cortex. II. Factors diminishing blood-lipins.** K. LANG and B. STUBER (Biochem. Z., 1936, 284, 270—278).—The principles contained in adrenal cortex extracts responsible for the lowering of blood-phosphatides and -cholesterol in rabbits are esters of fatty acids with low and high no. of C atoms, respectively; thus the effects are produced by Me undecate and oleate, respectively. Injection of Me oleate increases sterol excretion. The factors of Schmitz and Kühnau (A., 1933, 642) are probably similar substances.

F. O. H.

**Adrenal cortex. IV. Effect of sodium salts in sustaining the adrenalectomised dog.** G. A. HARROP, L. J. SOFFER, W. M. NICHOLSON, and M. STRAUSS (J. Exp. Med., 1935, 61, 839—860).—Bilaterally adrenalectomised dogs are maintained in apparently normal condition by administration of NaCl and NaHCO<sub>3</sub>. Adrenal hormone is concerned in regulating renal excretion of Na. CH. ABS. (p)

**Action of cortical hormone on choline metabolism.** G. MARANON and S. A. COLLAZO (Rev. franç. Endocrinol., 1935, 13, 1—23; Chem. Zentr., 1935, ii, 71).—Blood-cholesterol (I)  $\propto$  the activity of the adrenal cortex. Cortical hormone in man increases (I) and also bile-cholesterol, and is probably associated with the increased excretion of cholesterol in the bile.

R. N. C.

**Action of cortical hormone on blood-cholesterol.** C. V. MEDVEI (Z. klin. Med., 1935, 128, 58—67; Chem. Zentr., 1935, ii, 71—72).—Blood-cholesterol in healthy men is depressed by the cortical extract of Swingle and Pfiffner, is high in Addison's disease, and low in cases of cortical hyperfunction.

R. N. C.

**Secretion of the pituitary.** E. KYLIN (Acta med. Scand., 1935, 85, 457—472).

R. N. C.

**Diabetogenic, thyrotropic, adrenotropic, and parathyrotropic factors of the pituitary.** J. B. COLLIP (J. Amer. Med. Assoc., 1935, 104, 827—832, 916—921).—A review.

CH. ABS. (p)

**Growth hormone of the anterior pituitary.** M. EVANS (J. Amer. Med. Assoc., 1935, 104, 1232—1237).—A review.

CH. ABS. (p)

**Anterior pituitary and carbohydrate metabolism.** F. HÖGLER and F. ZELL (Wien. Arch. inn.

Med., 1935, 27, 141—159; Chem. Zentr., 1935, ii, 872—873).—Tonephin (I) causes an increase of blood-sugar in rabbits which reaches a max. in 20—60 min.; temp. rises slightly. Pharmacological or operative exclusion of the cerebrum and brain-stem does not affect the action of (I), which is probably one of glycogen mobilisation.

R. N. C.

**Chromatophorotropic principle (intermedin) of the pars intermedia of the pituitary.** B. ZONDEK (J. Amer. Med. Assoc., 1935, 104, 637—638).—Intermedin is thermo- and psycho-stable but easily destroyed by proteolytic enzymes and ultra-violet rays. Distribution of the hormone in cattle pituitaries is examined.

CH. ABS. (p)

**Purification of the pressor and oxytocic hormones of the pituitary gland: chemistry of the products.** R. L. STEHLE and A. M. FRASER (J. Pharm. Exp. Ther., 1935, 55, 136—151).—The crude hormone prep. was purified by the method of Stehle (A., 1934, 117) and fractionated with MeOH and AcOEt. The activities of the pressor and oxytocic preps. were 100 and 125 times those of standard pituitary powders; both appeared to be polypeptides containing tyrosine, cystine, and arginine. Phenylalanine, glutamic and aspartic acids, and leucine appeared to be absent from the pressor prep.

H. D.

**Physiological variations in the internal secretion of the pancreas. XIV. Action of posterior pituitary extract and of its hypertensive and oxytocic fractions on secretion of adrenaline and insulin.** E. ZUNZ and J. LA BARRE (Arch. internat. Physiol., 1935, 41, 538—568).—Pitressin (but not pitocin) in doses of 3 units per kg. cause hyperglycaemia in chloralised dogs with and without ligation of the adrenal veins, by stimulating adrenaline secretion. Later, both substances increased insulin secretion shown by hypoglycaemia. These effects persisted after thyroidectomy. Pituitrin caused hyperglycaemia not so marked as that produced by the pressor factor alone. Chloretone produced slight hypoglycaemia.

NUTR. ABS. (m)

**Hormones and external sex organs.** O. O. FELLNER (Endocrinol., 1935, 15, 232—243; Chem. Zentr., 1935, ii, 67).

R. N. C.

**Gonadotropic hormones in the treatment of sterility in man.** V. E. LLOYD (Lancet, 1936, 230, 474—475).—Administration of antuitrin-S effected a cure.

L. S. T.

**Effect of progestin on the mammary gland of the rat.** J. FREUD and S. E. DE JONGH (Acta Brev. neerl. Physiol., 1935, 5, 47—48).

R. N. C.

**Effect of sex and adrenal cortex hormones on serum-lipase.** J. BAUER and F. FEIL (Z. klin. Med., 1935, 128, 90—94; Chem. Zentr., 1935, ii, 62).—Follicular hormone causes a fall of serum-lipase (I) in rabbits of both sexes, followed occasionally by a rise to > normal. The male hormone does not depress (I) in male animals and can even increase it. Cortical hormone depresses (I) in male animals after an interval of some weeks, but does not affect it in females.

R. N. C.

**Spectrographic detection of the oestrogenic hormone in human pregnancy urine.** H. BERRY and B. GOUZON (*Compt. rend.*, 1936, 202, 686—687).—The hormone, separated from acid-hydrolysed urine by adsorption and elution, is dissolved in  $\text{CHCl}_3$  and shaken with  $\text{H}_2\text{SO}_4$ . The brownish-green, fluorescent colour obtained shows on spectrographic examination the band characteristic of folliculin or dihydrofolliculin. Urine from males or non-pregnant females yields the fluorescence but not the characteristic band. A. G. P.

**Corpus luteum hormone and its purification.** E. FELS (*Arch. Gynäkol.*, 1934, 158, 364—391; *Chem. Zentr.*, 1935, ii, 67—68). R. N. C.

**Ovarian hormones and carbohydrate metabolism. I. Ovarian hormones and blood-sugar.** E. DE AMILIBIA, M. M. MENDIZÁBAL, and J. BOTELLA-LLUSIÁ. **II. Effect of ovarian hormones on liver-glycogen.** J. BOTELLA-LLUSIÁ, E. DE AMILIBIA, and M. M. MENDIZÁBAL (*Arch. Gynäkol.*, 1935, 159, 453—460, 461—464).—I. In fasting immature guinea-pigs folliculin (I) raised and corpus luteum hormone (II) lowered the blood-sugar level during the 6 hr. following injection. Thyroidectomy abolished these effects.

II. In male albino rats, daily injections of (I) and (II) produced, respectively, a 50% decrease and increase in the glycogen content of the liver.

Nutr. Abs. (m)

**Gonadotropic factors of climacteric urine.** A. LIPSCHÜTZ (*Klin. Woch.*, 1935, 14, 532—533; *Chem. Zentr.*, 1935, ii, 391).—The gonadotropic complex contains  $\approx 3$  factors: oestrogenic (I), luteinising (II), and a third (III) which sensitises the follicles to (II). Anterior pituitary of male rats contains (II) and (III), and causes luteinisation of ovaries of infantile rats but (III) is absent from pituitaries of female rats. Climacteric urine contains (III), and therefore, administered in combination with anterior pituitary from female rats, causes luteinisation.

G. H. F.

**Effectiveness of theelol by oral administration.** L. W. ROWE and A. E. SIMOND (*J. Amer. Pharm. Assoc.*, 1936, 25, 201—205).—When orally administered, theelol (from human urine) is 5 times as active as theelin (from mare's urine of pregnancy). Oral dosage to rats of oestrogenic substances in amounts sufficient to produce oestrus in spayed rats reduces by 75% the time necessary for attainment of sexual maturity. Discrepancies between international standard and experimental rat units are discussed.

F. O. H.

**Effect of follicular hormone on ossification in castrated dogs.** M. TAUSK and P. DE FREMERY (*Acta Brev. neerl. Physiol.*, 1935, 5, 19—22; *Chem. Zentr.*, 1935, ii, 390).—Administration of folliculin to castrated fox terriers caused precocious ossification of the epiphysis.

G. H. F.

**Relation between creatine metabolism and the function of the sex glands.** R. USUI, T. MIWA, and K. AOKI (*Klin. Woch.*, 1935, 14, 720—721).—Administration of male sex hormone to old men and patients with Addison's disease lowers urinary creatine.

Ch. Abs. (p)

**Male sex hormone. IV. Hormone from testis of swine. II.** A. OGATA and S. HIRANO (*J. Pharm. Soc. Japan*, 1933, 53, 869—890).—The hormone (I) is sparingly sol. in hexane, is not oxidised by cold  $\text{KMnO}_4$ , and is partly adsorbed by C. 70% EtOH separates a cholesterol-free fraction. Cock's comb tests are described. Ch. Abs. (p)

**Testis hormone.** C. R. MOORE (*J. Amer. Med. Assoc.*, 1935, 104, 1405—1411).—The hormone is probably a keto-alcohol. Only animal tests are serviceable for its detection. Ch. Abs. (p)

**Assay and effect of testosterone on rats compared with those of other sexual hormones.** V. KORENCHESKY, M. DENNISON, and I. BROVINS (*Biochem. J.*, 1936, 30, 558—575).—The biological properties of artificial testosterone (I) and the combined effect of (I) with oestrone (II) or oestradiol (III) are investigated. With castrated male rats, the relationship between dose of (I) and the effect on the genital organs is investigated statistically. The sexual glands, atrophied during 51 days after castration, were not completely restored by injections for 23 days (except in the case of the preputial glands). The wts. of somatic glands and organs were, however, generally restored to normal vals. Injection of (II) or (III) caused considerable increase in the seminal vesicles, small increases in the prostate and preputial glands, but no change in the penis. (II) or (III) injected with (I) showed only slight co-operative effect on the wts. of the atrophied seminal vesicles and prostate. With ovariectomised female rats, (I) produced enlargement of the atrophied sexual organs but not to normal wt. (except for the preputial glands) and decrease in wt. of the thymus. There was marked co-operative effect between (I) and (II) in restoring atrophied organs. Androsteronediol (IV) and (I), unlike androsterone, bring about normal development of the male organs; both (IV) and (I) produce changes similar to those after injection of progesterone, and if injected along with (II), produce changes resembling those in pregnancy. P. W. C.

**Action of testicular hormone on development of the hen's comb.** E. RAMIREZ and M. D. RIVERO (*J. Amer. Pharm. Assoc.*, 1936, 25, 99—102).—Enlargement of the comb following administration of testicular hormone occurs in normal hens, which could therefore be substituted for Leghorn capons for standardisation purposes. F. O. H.

**Sterols as precursors of hormones, vitamins, and other physiologically important compounds.** A. WINDAUS (*Nachr. Ges. Wiss. Göttingen, Math.-physik. Kl.*, III, 1935, [ii], 1, 59—83; *Chem. Zentr.*, 1935, ii, 702).—A lecture. H. N. R.

**Preparation of 17-ethyltestosterone and 3-trans-17-cis-diols of androstane and androstene. Specificity of the sex hormones.**—See this vol., 606.

**Effect of zinc salts on the action of insulin.** D. A. SCOTT and A. M. FISHER (*J. Pharm. Exp. Ther.*, 1935, 55, 206—221; cf. A., 1934, 1267).—Addition of 0.01% of Zn to insulin (I) solutions decreases the activity by 60%. 0.1% of Zn delays the hypoglycaemic action of (I) in rabbits although

the quantity of glucose metabolised is unchanged.  $\text{CoCl}_2$  and K alum are without influence on the activity of (I), whilst Ni has a similar effect to that of Zn.

H. D.

Microscopic observation of the absorption of insulin and protamine insulinate. H. K. BEECHER and A. KROGH (*Nature*, 1936, 137, 458).—The rate of absorption and the distribution of particles of insulin and protamine insulinate dyed with methylene-blue in the lymphatics and tissue spaces of rabbits' ears are recorded.

L. S. T.

Has insulin thrombokinase-like properties or is it contaminated with the latter? G. SANT (*Pharm. Tijdschr. Nederl.-Indië*, 1934, 11, 335—337; *Chem. Zentr.*, 1935, ii, 545).—One of the above alternatives is probably the case.

R. N. C.

Has insulin an important effect on serum-albumins? G. SANT (*Pharm. Tijdschr. Nederl.-Indië*, 1934, 11, 274—276; *Chem. Zentr.*, 1935, ii, 545).—Insulin decreases  $\alpha$  and  $\eta$  of serum and increases the turbidity produced by  $\text{EtOH}$ . The  $\text{NaCl}$  present in commercial insulin is only slightly responsible.

R. N. C.

Individuality of vegetable insulinoids and vitamin-B. H. LABBÉ and E. DONARD (*Bull. Acad. Méd.*, 1935, 113, 625—626).—The insulin-like extract exhibits neither a preventive nor a curative effect on avitaminosis-B in rats. The insulin-like action is hence not due to -B.

R. N. C.

Physiology of the thyro-activator in amphibia. I. Acceleration of metamorphosis in the larvæ of salamanders. E. UHLENHUTH and S. S. SCHWARTZBACH (*Endokrinol.*, 1935, 15, 329—341; *Chem. Zentr.*, 1935, ii, 1050—1051).—Metamorphosis in normal and thyroidectomised salamanders is accelerated by thyrotropic hormone.

R. N. C.

Effect of hormones on the dynamics of cardiac stimulants. I. Action of thyroxine. R. AGNOLI and G. MARAGLIANO (*Arch. Sci. biol.*, 1934, 20, 498—514; *Chem. Zentr.*, 1935, ii, 711).

R. N. C.

Relationship between the iodine content of the diet and the thyroxine content of blood. U. G. BJLSMA, J. W. LE HEUX, and M. A. B. TOXOPEUS (*Nederland. Tijdschr. Geneesk.*, 1935, 79, 3159).—In dogs on a diet poor in I the thyroxine (I) content decreased; on giving 0.000025 mg. of I it returned to the normal level: 100 mg. did not produce any further rise. With diet rich in I the (I) content was slightly > normal and 0.025 mg. of I per day lowered it.

NUTR. ABS. (*m*)

Effect of thyroid and thyroxine on the chloride content of muscle. M. CAHANE (*Bull. Soc. Chim. biol.*, 1936, 18, 424—427).—The Cl' content of the muscle-tissue of rats receiving thyroid powder and thyroxine daily was > that of normal animals.

A. L.

Depression of serum-lipase by thyroxine and its inhibition. IV. J. BAUER and L. FEIL (*Z. klin. Med.*, 1935, 128, 77—89; *Chem. Zentr.*, 1935, ii, 62).—Repeated injection of lipid extract of the pancreas in rabbits inhibits the depression of serum-lipase (I) by thyroxine (II) and also its toxic action.

The extract alone causes an increase of (I) in rabbits, and a temporary fall, followed by a rise, in healthy and hyperthyroidian men of (I).

R. N. C.

Effect of the thyroid on body-weight and nitrogen excretion. A. FIORI (*Rass. Clin. Terap.*, 1934, 33, 40—46; *Chem. Zentr.*, 1935, ii, 711).—There is no correlation between the amount of thyroid fed to animals and the loss of body-wt. Thyroid preps. cannot be evaluated by determination of N excretion by guinea-pigs.

R. N. C.

Detoxicating hormone of the liver. LV. Anti-thyroid action of yakriton. I. HORIUCHI and F. OHSAKO. LVI. Effect of yakriton on blood-calcium. Y. UGA. LVII. Inhibiting effect of yakriton on the hypoglycæmic action of insulin. A. TAKAMATSU and Y. UGA. LVIII. Effect of yakriton in one-fifth R.A.U. on blood picture including nuclear shift. R. SHIBATA. LIX. Inhibiting effect of yakriton on the hyperglycæmic [?] action of insulin. A. TAKAMATSU. LX. Correlation between sedimentation rate of blood and detoxicating power of liver. M. YOSHIDA (*Tôhoku J. Exp. Med.*, 1934, 24, 505—515, 516—520, 521—528; 1935, 26, 31—45, 46—51, 52—59).—LV. Yakriton (I) antagonises the effect of dried thyroid and thyroxine on tadpoles.

LVI. (I) inhibits hypercalcaemia caused by injection of Ca gluconate in rabbits.

LX. Intraperitoneal injection of  $\text{NH}_4\text{Cl}$  has no effect on the sedimentation rate in rabbits having actively detoxicating livers (cf. A., 1935, 538).

CH. ABS. (*p*)

Stimulating action of pig's stomach powder on secretion of vagotonin by the pancreas. D. SANTENOISE, P. L. DROUET, C. FRANCK, and M. VIDACOVITCH (*Compt. rend. Soc. Biol.*, 1936, 121, 927—928).—The powder is effective when given orally to the dog.

R. N. C.

Stimulating action of secretin on the secretion of vagotonin by the pancreas. L. MERKLEN, C. FRANCK, and R. GRANDPIERRE (*Compt. rend. Soc. Biol.*, 1936, 121, 925—926).

R. N. C.

Absorption-spectral analysis especially as applied to vitamins and hormones. L. FUCHS (*Oesterr. Chem.-Ztg.*, 1936, 39, 43—47).—A lecture.

Vitamin content of different forms of diet. H. SCHROEDER and V. WITTMANN (*Münch. med. Woch.*, 1935, 82, 988—990).—The vitamin contents of a no. of diets are given; many are deficient in -B<sub>1</sub> and -B<sub>2</sub>, and to a lesser extent in -C, but -A and -D are seldom low.

R. N. C.

Storage of vitamin-A in the guinea-pig. A. CHEVALLIER and Y. CHORON (*Compt. rend. Soc. Biol.*, 1936, 121, 1015—1016).—Guinea-pigs cannot store vitamin-A (I) when fed with carotene (II) or with livers of (I)-deficient rats, but (I) is stored in the liver on feeding with the livers of rats fed with green vegetables. The factor transforming (II) into (I) either is not present in rat liver or cannot be utilised by the guinea-pig.

R. N. C.

Vitamin-A content of pasture plants.—See B., 1936, 346.

**Determination of vitamin-A.** J. F. WARD and R. T. M. HAINES (*Nature*, 1936, **137**, 402—403; cf. this vol., 390). L. S. T.

**Determination of vitamin-A.** ANON. (*Nature*, 1936, **137**, 383—384; cf. this vol., 390).—A summary of the Medical Research Council's report. L. S. T.

**Determination of vitamin-A in body-fluids.** M. VAN EEKELLEN (*Klin. Woch.*, 1934, **14**, 829—830; cf. Rosenthal, this vol., 253).—The  $\text{SbCl}_3$  colour reaction is sufficiently accurate to be used for vitamin-A determination. The Rosenthal reaction is only feebly sensitive and is also given by cholesterol, so that it cannot be used for determination of -A in blood. R. N. C.

**Nature of the sugar in diet and the onset of avitaminosis-A.** L. RANDOIN and S. QUEUILLE (*Compt. rend. Soc. Biol.*, 1936, **121**, 1172—1177).—No difference was noted when the sugar was varied. H. G. R.

**Relation of the vitamin-B complex to the metabolism of keto-acids.** P. E. SIMOLA (*Suomen Kem.*, 1936, **9**, B, 4).—Urine of vitamin-B-deficient rats contained an acid resembling  $\alpha$ -ketoglutaric acid. The blood also contained increased proportions of carbonyl compounds. A. G. P.

**Efficacy of fats in decreasing vitamin-B requirements.** W. D. SALMON and J. G. GOODMAN (44th Ann. Rept. Alabama Agric. Exp. Sta., 1933, 22).—The effect of various fats in delaying the onset of beri-beri is examined. CH. ABS. (p)

**Ability of vitamin-B-deficient rats to utilise d-glucose.** G. A. SCHRADER (44th Ann. Rept. Alabama Agric. Exp. Sta., 1933, 20—22).—Rats suffering from beri-beri utilise d-glucose for both heat production and glycogen formation. Comparison is made with animals receiving adequate and insufficient supplies of vitamin-B. CH. ABS. (p)

**Use of various rat assay methods in comparing crystalline vitamin-B<sub>1</sub> preparations.** F. F. HEYROTH (*Biochem. J.*, 1936, **30**, 645—650).—The potency of three cryst. vitamin-B<sub>1</sub> preps. assayed by the rat method are, in order of decreasing activity; Peters', Ohdake (rice), and Ohdake (yeast), the differences being only slightly > the limits of accuracy. The min. curative dose for the rat is 1.2 times the pigeon day dose and 6.6 times the day dose required for prevention of severe symptoms. Different vals. are obtained for curative dose adopting different criteria for marking the return of symptoms but the order of activity of the different preps. is the same with any particular criterion. P. W. C.

**Chemical nature of vitamin-B<sub>1</sub> deduced from ultra-violet absorption spectra.** F. F. HEYROTH and J. R. LOOFBOUROW (*Biochem. J.*, 1936, **30**, 651—658).—The diversity of the ultra-violet absorption spectra of vitamin-B<sub>1</sub> is attributed to reversible dissociation of -B<sub>1</sub> into an aminopyrimidine (I) derivative and a thiazole derivative and to deamination of the (I), the two processes occurring independently and to varied extents according to the conditions used. The curves of Peters and Philpot for acid EtOH solutions most nearly represent -B<sub>1</sub>, those of Holliday in neutral EtOH the result of the breaking

of the quaternary linkages of the thiazole, whilst other curves represent intermediate stages accompanied by some deamination of the pyrimidine (II). The (II) component of -B<sub>1</sub> has one  $\text{NH}_2$ , one OH, and two Me (or one Et) groups and spectroscopic evidence suggests that the OH group is probably not in the 2-position. P. W. C.

**Action of vitamin-B<sub>1</sub> on carbohydrate metabolism.** S. LAJOS (*Biochem. Z.*, 1936, **284**, 279—288).—Intraperitoneal injection of glucose + vitamin-B<sub>1</sub> into fasting rats increases liver- and muscle-glycogen, an action resembling, but more prolonged than, that of insulin. The concomitant hypoglycaemia is not so marked as that due to insulin. F. O. H.

**Vitamin-B<sub>1</sub> and -B<sub>2</sub> in growth and lactation of rats.** Effects of extracts of vitamin-B<sub>1</sub> and -B<sub>2</sub>. Distribution of vitamin-B<sub>2</sub>. J. F. FEASTER (*Iowa State Coll. J. Sci.*, 1934, **9**, 147—149).—The -B<sub>1</sub> and -B<sub>2</sub> requirements for lactation were 3—5 times those for the young growing animals. Extracts of grain, liver, and yeast were less effective than the materials themselves. CH. ABS. (p)

**Growth-promoting action of flavinphosphoric acids.** R. KUHN and H. RUDY (*Z. physiol. Chem.*, 1936, **239**, 47—48).—The growth-promoting action of synthetic vitamin-B<sub>2</sub>-phosphoric acid (I) (A., 1935, 545) is approx. equal to that of the natural material (II). Differences in the rates of hydrolysis of (I), (II), and flavinphosphoric acid from yeast could not be detected. H. W.

**Correlation between avitaminosis-B<sub>4</sub> and the composition of the diet.** C. Y. CHEN and H. ARIYAMA (*J. Agric. Chem. Soc. Japan*, 1935, **11**, 250—254).—The extraction of vitamin-B<sub>4</sub> from yeast is described. Lack of dietary fat is unrelated to avitaminosis-B<sub>4</sub>. CH. ABS. (p)

**Synthesis of vitamin-C in the organism of the suckling infant.** II. P. ROHMER, N. BEZSSONOFF, and E. STOERR (*Bull. Acad. Méd.*, 1935, **113**, 669—674).—Synthesis of vitamin-C in the infant is rendered insufficient by various pathogenic factors; the cessation of excretion of -C in the urine indicates the need for its oral administration. R. N. C.

**Synthesis of ascorbic acid in young organisms.** G. MOURIQUAND, A. COEUR, and P. VIENNOIS (*Compt. rend. Soc. Biol.*, 1936, **121**, 1005—1006).—Ascorbic acid is not synthesised in the guinea-pig foetus or the young animal. R. N. C.

**Incapacity of the animal to store reserves of vitamin-C.** P. ROHMER, N. BEZSSONOFF, and E. STOERR (*Compt. rend. Soc. Biol.*, 1936, **121**, 988—991).—Ascorbic acid (I) is fixed in an unstable condition in certain tissues in the young guinea-pig, and is rapidly eliminated in avitaminosis. (I) in the cerebrospinal fluid of suckling infants is raised by feeding with (I), but falls rapidly in avitaminosis to the level at which it is maintained by synthesis. R. N. C.

**Storage of ascorbic acid in the intestinal wall of the guinea-pig.** E. JACOBSEN (*Acta med. Scand.*, 1935, **85**, 419—424).—The intestinal vitamin-C in guinea-pigs on a diet deficient in -C falls rapidly and

parallel with -C of the liver and adrenals. Storage of -C is independent of the route of administration, and the deposition is almost  $\propto$  the dose given if this is not large. -C when given in large doses is deposited first in the intestinal wall, and is removed in about 3 hr. to the other -C depôts; intraperitoneal administration supplies the liver more rapidly than oral administration.

R. N. C.

Effect of ascorbic acid on the vegetative system and on acid-alkaline equilibrium. R. TISLOWITZ (Compt. rend. Soc. Biol., 1936, 121, 916—917).—The alkaline reserve in the dog is increased.

R. N. C.

Vitamins and water metabolism: effect of ascorbic acid on diuresis. R. TISLOWITZ (Compt. rend. Soc. Biol., 1936, 121, 914—916).—Diuresis in the dog is increased, possibly as a result of dehydration of the tissues and increased hydrophilia of the blood.

R. N. C.

Diphtheria anatoxin and vitamin-C. M. PHILIPPE and E. HARDE (Compt. rend. Soc. Biol., 1936, 121, 940—942).—The anatoxin does not affect liver- or adrenal-ascorbic acid in the guinea-pig.

R. N. C.

Vitamin-C and blood-sugar. W. STEPP, H. SCHROEDER, and E. ALTENBURGER (Klin. Woch., 1935, 14, 933—934).—Injection of ascorbic acid causes a fall of blood-sugar (I) and the action of simultaneously-injected insulin is strengthened. In many cases, particularly in diabetes, (I) is not depressed.

R. N. C.

Vitamin-C and blood. A. BÖGER and W. MARTIN (Münch. med. Woch., 1935, 82, 899—901).—Vitamin-C in large quantities increases the thrombocyte count in thrombopenia.

R. N. C.

Alleged presence of dehydroascorbic acid in blood. A. E. KELLIE and S. S. ZILVA (Biochem. J., 1936, 30, 361—368).—The view that blood converts ascorbic acid (I) into its dehydro-derivative is investigated. After treatment with  $H_2S$ , the plasma of normal, scorbutic, and (I)-injected guinea-pigs acquires the property of reducing indophenol to the same extent.  $CCl_3 \cdot CO_2H$  extracts of plasma, erythrocytes, and whole blood behave similarly but to a smaller degree. The ultra-violet absorption spectra of normal and  $H_2S$ -treated plasma are the same. It is concluded that the increased reduction of the plasma on treatment with  $H_2S$  is an artefact, and that blood with its erythrocytes intact is incapable of dehydrogenating (I) *in vivo*.

H. D.

Particularly high vitamin-C content of the cerebrospinal fluid in the prematurely and normally new-born. P. ROHMER, N. BEZSSONOFF, and E. STÖRR (Compt. rend. Soc. Biol., 1936, 121, 987—988).—The normal val. is doubled in normally, and quadrupled in prematurely, new-born children, indicating that the foetus has an ascorbic acid-synthesising power that is lost at birth.

R. N. C.

Vitamin-C in the urine of healthy and diseased men. E. GABBE (Klin. Woch., 1935, 14, 613; cf. von Drigalski, this vol., 120).—The -C val. of Drigalski is due largely to thioneine, -C being present in the non-reactive oxidised form.

R. N. C.

Vitamin-C content of the liver of new-born infants. K. U. TOVERUD (Arch. Dis. Childhood, 1935, 10, 313—318).—The average amounts were 7.01 mg. per 100 g. (full term infants) and 6.05 mg. (premature infants). The extreme variations were 2.7—10.4 mg.

NUTR. ABS. (m)

Histochemistry. VI. Quantitative distribution of vitamin-C in the small intestine. D. GLICK and G. R. BISKIND (J. Biol. Chem., 1936, 113, 427—432; cf. this vol., 530).—The amounts of vitamin-C expressed as mg. per g. of tissue in the duodenum of the cow are: mucosa 0.20, Brunner's glands 0.24, submucosa 0.10, muscle 0.06; and in the jejunum: mucosa 0.26, submucosa 0.10, and muscle 0.03.

J. N. A.

Effect of oxidases on determination of ascorbic acid. M. VAN EEKELLEN (Acta brev. neerl. Physiol., 1935, 5, 78—80).—McHenry and Graham's observation (A., 1935, 1287) that there was more titratable vitamin-C (I) in cooked than in raw vegetables is attributed to the conversion of (I) into dehydro-ascorbic acid in the fresh food by an oxidase which, however, is destroyed by cooking. This is avoided by preliminary pptn. of the sample with  $Hg(OAc)_2$  and treatment with  $H_2S$ . An analogous phenomenon occurs in blood extracts due to unavoidable oxidation of (I) by the erythrocytes.

NUTR. ABS. (m)

Determination of vitamin-C in foodstuffs.—See B., 1936, 391.

Avitaminosis-A in presence of variable amounts of vitamin-D. L. ÉMERIQUE (Bull. Soc. Chim. biol., 1936, 18, 384—389).—Whilst small quantities (> the necessary min.) of vitamin-D increase the growth and survival of rats under avitaminosis-A, larger quantities do not further improve the growth, and the period of survival is shorter.

A. L.

Total metabolism trials with rats. Influence of vitamin-D. W. SCHOCH (Bied. Zentr. [Tierernähr.], 1935, 7, B, 382—443).—Vitamin-D has no influence on energy metabolism or protein digestibility. A method of determining the net energy val. of foods is described.

A. G. P.

Dermal absorption of vitamin-D. P. S. ASTROWE and R. A. MORGEN (Amer. J. Dis. Children, 1935, 49, 912—922).—Viosterol is absorbed in effective amounts through the skin of rats.

CH. ABS. (p)

Antirachitic cow's milk. Antirachitic value of irradiated cow's milk and milk produced by cows fed with irradiated yeast. H. J. GERSTENBERGER, A. J. HORESH, A. L. VAN HORN, W. E. KRAUSE, and R. M. BETHKE (J. Amer. Med. Assoc., 1935, 104, 816—826).—No difference in efficiency was observed when fed to infants at the same vitamin-D level.

CH. ABS. (p)

Antirachitic value of hay. Vitamin-D sparing action of magnesium.—See B., 1936, 346.

Antirachitic action of irradiated cholesterol for chicks. B. SJOLLEMA and W. C. BARBAS (Bied. Zentr. [Tierernähr.], 1935, 7, B, 235—263).—Calcification in rachitic chicks (examined radiographically)

became normal within 10 days of administration of irradiated cholesterol (I) with a sufficiency of Ca. Little improvement resulted from use of (I) without Ca; with cod-liver oil (II) recovery was slower. Changes in serum-Ca and -inorg. P were similar after treatment with (I) and (II). Mineral metabolism remained disturbed until calcification of the pituitary was complete. A. G. P.

**Antirachitic action of phosphorus and of inorganic and organic phosphorus compounds.** R. LECOQ (Bull. Acad. Méd., 1935, 113, 760—767).—A review. R. N. C.

**Constitution of dihydrovitamin- $D_2$ .**—See this vol., 603.

**Vitamin-E unit.** A. J. PACINI and D. R. LINN (J. Amer. Pharm. Assoc., 1936, 25, 206—207).—A convenient expression of the val. of a vitamin-E prep. is given by dividing  $10^3$  by the no. of mg. of the prep. required daily by pregnant rats on an -E-free diet to produce a normal litter. F. O. H.

**Carbonic anhydrase and photosynthesis.** G. O. BURR (Proc. Roy. Soc., 1936, B, 120, 42—47).—The observed rate of photosynthesis by green plants is far > the rate of uncatalysed  $CO_2$  hydration. As, in addition, carbonic anhydrase cannot be detected in ground leaf tissues, it seems doubtful that  $CO_2$  must be hydrated before reacting with chlorophyll. E. A. H. R.

**Determination of rates of photosynthesis [in plants] under natural conditions.** E. BAZUIRINA and V. TSCHESNOKOV (Trav. Soc. natural. Leningrad, Sect. bot., 61, 221—247).—Investigations carried out in a current of air give the most satisfactory results. CH. ABS. (p)

**Carbon dioxide factor in photosynthesis.** V. TSCHESNOKOV and E. BAZUIRINA (Trav. Soc. natural. Leningrad, Sect. bot., 61, 323—376).—Reported increases in photosynthesis due to artificially increased  $[CO_2]$  are attributed to experimental error. CH. ABS. (p)

**Causes of liberation of large quantities of carbon dioxide in light by leaves of green plants.** V. TSCHESNOKOV, O. GRETSCHUTSCHINA, and I. JERMOLAJEVA (Trans. Soc. natural. Leningrad, Sect. bot., 61, 377—400).—Respiration intensity of leaves of *Fragaria vesca* varies from 1.0 to 20.0 mg. of  $CO_2$  per sq. dm. per hr. CH. ABS. (p)

**Factors determining winter hardiness in lucerne.** C. R. MEGEE (J. Amer. Soc. Agron., 1935, 27, 685—698).—No direct relationship was apparent between winter hardiness and the heat of wetting, swelling,  $H_2O$  equiv., f.p., composition, respiration, or rate of loss of  $H_2O$  from roots of lucerne. Inheritable factors are probably concerned. A. G. P.

**Photosynthesis of carbohydrates.** F. N. KRASHENINIKOV (Uspek. Chim., 1935, 4, 138—164).—The structure of chlorophyll and the mechanism of carbohydrate synthesis are discussed. CH. ABS. (p)

**Winter hardiness of clover. I. Effect of cutting on carbohydrate reserves in red clover roots.** A. I. VIRTANEN and M. NURMIA (J. Agric.

Sci., 1936, 26, 288—295).—Cutting causes a rapid decrease in the insol. sugar content of roots, min. vals. being reached in 12—15 days irrespective of the time of cutting. Recovery of the initial carbohydrate level is attained more quickly in autumn than in June-July. Sol. sugars are not greatly affected by cutting. A. G. P.

**Physico-chemical properties of plastid stroma and imbibition.** A. MAIGE (Compt. rend., 1936, 202, 677—679).—The mechanism of formation of starch grains in plant cells is examined. A. G. P.

**Changes in the osmotic value of the expressed sap of leaves and small twigs of *Larrea tridentata* as influenced by environmental conditions.** T. D. MALLERY (Ecol. Monog., 1935, 5, 1—35).—Changes in the osmotic pressure of leaf saps are regulated by external and not by internal factors. Seasonal, climatic, and soil factors are examined. CH. ABS. (p)

**Cell size and structure in plants as affected by various inorganic elements.** B. F. LUTMAN (Vermont Agric. Exp. Sta. Bull., 1934, No. 383, 54 pp.).—Tissue examination of various species of plants grown in mineral-deficient cultures is described. A. G. P.

**Pathological changes in plant cells caused by the action of potassium iodide: nature of the X-bodies.** K. S. SUCHOV and M. N. LANSHINA (Virus Dis. Plants, Crimea and Ukraine, 1934, 122—124).—Watering beet seedlings with 0.01% aq. KI caused necrosis and formation of intracellular inclusions resembling X-bodies found in cells of virus-infected plants. CH. ABS. (p)

**Physiological importance of mineral elements in plants. VII. Effects of potassium and chloride ions on diastase of broad bean leaves.** W. O. JAMES and M. CATTLE. **VIII. Variation in potassium content of potato leaves during the day.** N. L. PENSTON (New Phytol., 1935, 34, 283—295, 296—309; cf. A., 1934, 217).—VII. The presence of K in the nutrient effects an increase in the diastatic activity of broad bean leaves but is probably without action on the extracted enzyme.  $Cl^-$  has no action when supplied in the nutrient but markedly activates the enzyme extract. Within the plant  $K^+$  possesses greater mobility than other cations except  $H^+$  but has no appreciable influence on the distribution of  $Cl^-$ . Colloidal ppts. from extracts of plant materials usually contain diastase but frequently no  $K^+$ .

**VIII. The K content of potato leaves showed daily variations with a max. at 3—4 p.m., variations being smaller when transpiration was low. Max. K vals. correspond with max. dry wt.,  $H_2O$  content, and residual ash wt.** A. G. P.

**Plasmolysis. Influence of alkali salts on deplasmolysis of plant cells.** H. KAHN (Acta Comment. Univ. Tartu., 1934, A, 26, No. 4, 61 pp.).—The effect of ions on the rate of diffusion of  $H_2O$  through protoplasm was in the order,  $Rb > Cs > NH_4$ ;  $K > Na > Li$ , and  $SCN^- > AcO^- > Br^- > NO_3^- > Cl^-$ ; tartrate > citrate >  $SO_4^{--}$ . Salts penetrate as

ions and all plasmolytes effect reversible changes in the colloid condition of the protoplasm.

CH. ABS. (p)

**Sulphur in biology : action on cell evolution.** G. ZIRPOLO (Pontif. acad. Sci. Nov. Lyncei, Sci. Nunc. Radiophon., 1935, No. 36, 9—10).—Treatment of seed with 1% aq.  $\text{Na}_2\text{S}_2\text{O}_3$  and  $\text{Na}_2\text{S}$  increased the growth of *Brassica oleracea*. Eggs of *Paracentrotus lividus* showed a negative effect. CH. ABS. (p)

**Action of glycerol on *Saprolegnia*.** F. MOREAU (Compt. rend., 1936, 202, 152—154).—*Achyla colorata* is unaffected by the presence of 3—4% of glycerol in the medium; higher concns. exert inhibitory and toxic effects, 10—20% preventing development though not causing death. W. O. K.

**Formation of nicotine in *Nicotiana* after feeding with proline.** A. GORTER (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 87—90).—Klein and Linser's results (A., 1933, 1344) are incorrectly interpreted. Feeding with proline causes a decrease in the nicotine content of the plants. A. G. P.

**Effect of gonadotropic hormones on plants.** C. SERONO and A. CRUTO (Arch. ital. Biol., 1934, 91, 93—95; Chem. Zentr., 1935, ii, 391).—The growth and flowering of beans (*Vicia faba*) was not affected by manuring with gonadotropic hormone. Treated plants fruited but the controls did not. G. H. F.

**Action of sodium nitrate on infection of lucerne root-hairs by nodule bacteria.** H. G. THORNTON (Proc. Roy. Soc., 1936, 119, B, 474—492).—Secretions of nodule bacteria increase the no. of root hairs in lucerne, and stimulate and produce irregular growth of the hairs. Solutions of  $\text{NaNO}_3$  (0.1%) inhibit these effects and prevent infection of roots by bacteria. The action of  $\text{NaNO}_3$  is mitigated by addition of glucose to media. A. G. P.

**Root nodule bacteria of leguminous plants.** XVII. **Effect of air content of the medium on the development and function of the nodule (continued).** A. I. VIRTANEN and S. VON HAUSEN (J. Agric. Sci., 1936, 26, 281—287; cf. A., 1935, 787).—Growth and nodulation of peas in a N-free medium were improved by aëration. Nodulation is prevented by passing a stream of  $\text{N}_2$  through the medium. No excretion of N compounds into the medium was observed in aërated  $\text{H}_2\text{O}$ -cultures of peas. In aërated sand-cultures considerable amounts of N were excreted. A. G. P.

**Fixation of nitrogen in root nodules.** A. I. VIRTANEN and T. LAINE (Suomen Kem., 1936, 9, B, 5).—Extracts of (initially) N-free media after growth of inoculated pea seedlings contain, in addition to aspartic acid (I) and lysine, small amounts of  $\text{NO}_3^-$  probably derived from  $\text{NH}_4\text{OH}$  (II). (I) may be formed from (II) and oxalacetic acid. A. G. P.

**Excretion of nitrogenous compounds from the root nodules of leguminous plants inoculated with different strains of the nodule organism.** A. I. VIRTANEN, S. VON HAUSEN, and T. LAINE (Suomen Kem., 1936, 9, B, 5).—The amount of N excreted varies widely with the strain of the organism concerned. A. G. P.

**Carbohydrate-nitrogen relation in symbiotic nitrogen fixation.** P. W. WILSON (Wisconsin Agric. Exp. Sta. Res. Bull., 1935, No. 129, 40 pp.).—The carbohydrate-N balance in plants effects a more or less sp. response in the no., size, and distribution of nodules, the amount of N fixed, the onset and duration of the N-hunger stage, and the influence of light, fixed N, and environmental conditions. Plants are classified into five groups on the basis of differences in carbohydrate-N balance. A. G. P.

**Changes in composition of sprouting mungo seeds.** P. ROCHANAPURANANDA (Univ. Philippines Nat. Appl. Sci. Bull., 1934, 4, 127—147).—As germination proceeds the % of  $\text{H}_2\text{O}$ , ash, fat, and protein (I) increases and that of carbohydrates (II) declines. Reducing sugars appear at the second day and increase gradually accompanied by a decrease in the amount of starch. Absence of light lowers the (I) : (II) ratio. CH. ABS. (p)

**Transformation of higher fatty acids into carbohydrate during germination of pumpkin seed.** I. A. ZELLER. II. **Determination of carbohydrates.** K. ENSER (Jahrb. wiss. Bot., 1935, 82, 123—157, 158—169).—I. During the early stage of germination (4—6 days) the fatty acid content of seeds decreases and additional carbohydrates appear. Infiltration of K sorbate also increases starch formation in the seedlings. The normal decomp. of starch in seedling autolysates is retarded by  $\beta$ -hydroxybutyric, succinic, or lactic acid, and is reversed to a starch-forming process by  $\text{AcOH}$ ,  $\text{MeCHO}$ ,  $\text{H}_2\text{C}_2\text{O}_4$ , sorbic acid, or  $\text{AcCO}_2\text{H}$ . The bearing of these results on the fatty acid  $\rightarrow$  carbohydrate change is discussed.

II. Detailed carbohydrate data from the above experiments are recorded and discussed. A. G. P.

**Plant respiration.** VI. **Relation of respiration of potatoes to the concentration of sugars and to the accumulation of a depressant at low temperatures.** [iii]. **Relation of respiration to concentration of sucrose.** J. BARKER. [iv]. **Relation between respiration in air and in nitrogen of certain seeds in which carbohydrates constitute the chief food reserve.** W. LEACH (Proc. Roy. Soc., 1936, B, 119, 453—473, 507—521).—VI. [iii]. The forms of the respiration/glucose, respiration/fructose, and respiration/total sugar relations vary widely with the sucrose (I)/hexose (II) quotient during sweetening and desweetening. On the other hand the respiration/(I) relation in these stages and also while the (I)/(II) quotient was changing conformed closely with the enzymic rectangular hyperbola for the rate of reaction/substrate relation for an enzyme reaction *in vitro*. These results are interpreted as showing that (I) is closely related to the substrate supply for respiration and that neither glucose nor fructose is associated with this function. In samples of low sugar content the (I)/(II) quotient is markedly affected by changes of temp. (cf. A., 1933, 435).

VI. [iv]. During anaerobiosis carbohydrate-storing seeds (like oil seeds) accumulate an easily oxidisable substance, which is rapidly respired during subsequent exposure of the seeds to  $\text{O}_2$ . Transference of seeds from air to an atm. of  $\text{N}_2$  decreases  $\text{CO}_2$  production

to 33% as is to be anticipated if (II) is then only partially oxidised to  $\text{CO}_2$  and  $\text{EtOH}$ . The mechanism of respiration is discussed (cf. A., 1934, 1271).

A. G. P.

Influence of heteroauxin on growth of root hairs and roots of *Agrostemma githago*, L. A. MEESTERS (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 91—97).—Root hairs are less sensitive than roots to the growth-inhibiting action of heteroauxin (I). Solutions of  $\text{AcOH}$  having the same  $p_H$  as that of (I) show no inhibitory action. (I) does not produce chemotropic curvature in root hairs.

A. G. P.

Synthesis of  $\delta$ -3-indolylvaleric acid. Effects of indole acids on plants.—See this vol., 612.

Factors affecting the formation of local lesions by tobacco mosaic virus. J. CALDWELL (Proc. Roy. Soc., 1936, B, 119, 493—507).—The action of trypsin in preventing virus infection is due to its effect on the virus rather than on the plant. Horse serum and  $\text{AgNO}_3$  produce similar effects.

A. G. P.

Mineral matter of certain leguminous crops.

I. Inorganic constituents of underground parts.

II. Nodule formation and titanium supply. K.

KONISHI and T. TSUGE (Mem. Coll. Agric. Kyoto, 1936, No. 37, 1—24, 24—35).—I. Spectrographic detection of traces of Li, Sr, Cr, Zn, Ni, Cu, Co, V, Mo, Bb, and B is recorded. Ba, Mn, and Ti were present in somewhat larger amounts. The Ti content of nodules was  $>$  that of roots. In acid-tolerant species (lupins, serratella, and soya bean) the P content of nodules was  $>$  that of roots, but in lucerne, clover, and other acid-sensitive species the nodules contained more Na and Ca. No differences in the % of other secondary elements in roots and nodules were apparent.  $\text{K}_2\text{TiO}_3$  and  $\text{Ti}(\text{SO}_4)_2$  increased nodulation and crop yields, the effective range of concn. of the latter being  $<$  that of the former.

A. G. P.

Variations in the contents of some of the constituents of the ash of potatoes. H. STEUDEL (Deut. med. Woch., 1935, 61, 872).— $\text{P}_2\text{O}_5$  and  $\text{SO}_3$  show considerable oscillations.

R. N. C.

Comparative boron contents of plants grown in the same soil. G. BERTRAND and H. L. DE WAAL (Compt. rend., 1936, 202, 605—609).—The B contents of several plant species varied considerably. A general relationship is probable between the capacity of a species to accumulate B and its position in the botanical classification.

A. G. P.

Comparative sulphur and nitrogen contents of plants grown in the same soil. G. BERTRAND and L. SILBERSTEIN (Compt. rend., 1936, 202, 261—264; cf. this vol., 395).—The N content of a wide variety of plants ranges from 2.04 to 5.32%. The S/N ratio is probably closely related to the quantities of  $\text{SO}_4^{--}$  used as fertiliser.

J. L. D.

Nitrogen distribution in tea. W. S. SHAW (United Planters Assoc. S. India, Bull. 7, 1934, 3 pp.).—No  $\text{H}_2\text{O}$ -sol. protein is present, 50—75% of the sol. N occurring as caffeine. The insol. N (40—47% of the total) occurs mainly as glutelin.

P. G. M.

Determination of sugars in the leaf of the mangold (*Beta vulgaris*). I. Fructose, glucose,

and sucrose. II. Use of basic lead acetate, charcoal, and yeast to avoid interference by substances other than sugars. III. Application of copper reagents to unclarified extracts. IV. Tests for raffinose, maltose, galactose, and pentose. J. E. VAN DER PLANK (Biochem. J., 1936, 30, 457—483).—I. The method of Harding and Downs (A., 1933, 964) has been modified to give reproducible results. Fructose (I) is determined, after oxidation of glucose (II) by alkaline I and removal of excess of I, by Cu or  $\text{Fe}(\text{CN})_6^{--}$  reagents. For determining sucrose (III), the sugar is inverted by invertase in conc. solution and the actual determination carried out after dilution, to minimise the reducing effect of the invertase.

II. In unclarified extracts, (III) is determined without interference; with the Cu reagent the error occurs in the determination of (II) and with the  $\text{Fe}(\text{CN})_6^{--}$  reagent in that of (I) and (II). Clarification is best carried out with dibasic Pb acetate after concn. and without neutralisation to avoid loss of (II), avoiding washing of the ppt.;  $\text{Na}_2\text{HPO}_4$  is used for removing excess of Pb. Yeast in conjunction with the Cu reagent may be used to allow for interfering matter in unclarified extracts and an empirical correction factor for this is given. The use of C for clarification is not recommended.

III. With a high concn. of impurities, the solution must be diluted before analysis.

IV. Raffinose, maltose, galactose, or pentoses could not be detected in extracts by selective fermentation.

H. G. R.

Determination of reducing sugars and sucrose in plant materials. W. Z. HASSID (Ind. Eng. Chem. [Anal.], 1936, 8, 138—140).—Small amounts of sugars are determined in plant extracts by treating the clarified and decolorised solution with excess of alkaline  $\text{K}_3\text{Fe}(\text{CN})_6$  solution and titrating the excess, after oxidation, with  $\text{Ce}(\text{SO}_4)_2$  (o-phenanthroline- $\text{FeSO}_4$  as indicator). The method is rapid and accurate over a wide range and gives slightly higher results than the Munson-Walker Cu method. Sucrose, if present, is hydrolysed by invertase before oxidation.

S. C.

Crystalline d-galacturonic acid from tobacco.—See this vol., 591.

Occurrence of amygdonitrileglucoside in the genus *Cotoneaster*, and in the leaves of *Cydonia vulgaris*, Pers. V. PLOUVIER (Compt. rend., 1936, 202, 352—354; cf. A., 1935, 1181).—Determinations of the glucose/HCN ratio in many species of *Cotoneaster* show that the HCN is usually, although not always, present as amygdonitrileglucoside (I). Amygdaloside probably occurs in some species. The prulaurasoside isolated by Hérissé (A., 1906, i, 31) is probably formed during its isolation. Leaves of *Cydonia vulgaris* also afford (I).

J. L. D.

Comparative velocities of hydrolysis of certain glucosides under the influence of ultra-violet rays, acids, and enzymes.—See this vol., 572.

Determination of starch in plant tissues. G. W. PUCHER and H. B. VICKERY (Ind. Eng. Chem. [Anal.], 1936, 8, 92—97).—The sample is dried rapidly

at 70–80°, extracted completely with 75% EtOH, redried, and finely milled. Starch (I) is then extracted with either 21% HCl at 20–22°, or with 46% aq.  $\text{CaCl}_2$  at 100°. After adjusting the acidity, (I) is pptd. with KI–I solution, the ppt. separated, decomposed with NaOH–EtOH, and (I) isolated by centrifuging. (I) is finally converted into starch–I and the colour measured in a Pulfrich spectrophotometer, calibrated with potato starch standards. The HCl method of extraction is preferred since aq.  $\text{CaCl}_2$  may destroy (I) especially at higher temp. in presence of traces of acid.  $\text{CaCl}_2$ -extracts will not keep but HCl-extracts are stable for long periods at 0°. Results are < those obtained by hydrolysis–sugar-reduction methods, but more trustworthy. The method is very sp. and results are accurate to 3% with 1–3 mg. of (I) and to < 10% with 0.1 mg. S. C.

**Fruit of *Lagenaria vulgaris*, Seringe (bitter variety).** I. Constituents of the oil from the seeds. R. R. AGARWAL and S. DUTT (Proc. Acad. Sci. Agra and Oudh, 1934–1935, 5, 227–233).— $\text{C}_6\text{H}_6$  extracts an oil (19.1%) which when hydrolysed (EtOH–KOH) affords, in nearly equal proportions, saturated (palmitic, stearic, and arachidic) and unsaturated (oleic and linoleic) acids. The unsaponifiable material (2%) is sitosterol. J. L. D.

**Seeds of *Hygrophyla spinosa*.** N. L. PHALNIKAR, K. S. NARGUND, and D. D. KANGA (J. Univ. Bombay, 1935, 4, Part II, 146–152).—The seeds contain an oil giving, when hydrolysed, 25% of solid (myristic 5.5, palmitic 73, and stearic 21.4%) and 75% of liquid acids (di- and mono-unsaturated), and containing 7.5% of unsaponifiable matter, including a little of a substance, m.p. 114–115°. R. S. C.

**Crystalline constituent of essential oil of matsubasa (*Shizandra nigra*, Maxim.).** I. T. SENGOKU (J. Pharm. Soc. Japan, 1933, 53, 947–951).—The substance  $\text{C}_{13}\text{H}_{26}\text{O}$ , m.p. 28°, is *Me undecyl ketone*, which is also prepared by dry distillation of Ba laurate and  $\text{Ba}(\text{OAc})_2$ . CH. ABS. (p)

**Chemistry of slash-pine (*Pinus caribaea*, Morelet).** II. Fats, waxes, and resins of the growing tips. J. A. HALL and O. GISVOLD (J. Biol. Chem., 1936, 113, 487–496; cf. A., 1935, 864).—A light petroleum extract of the young growing tips yielded paraffins ( $\text{C}_8$ – $\text{C}_9$ ),  $\alpha$ -pinene, melissic, palmitic, behenic, oleic, linoleic, and abietic acids, melissyl alcohol, *n*-nonacosan- $\kappa$ -ol, a sitosterol, and a sitosterolin. H. D.

**Isolation of carotene and sterols from the unsaponifiable matter of cocksfoot.** A. POLLARD (Biochem. J., 1936, 30, 382–386).—The unsaponifiable fraction of the light petroleum extract of dried cocksfoot contains carotene (only the  $\beta$ -isomeride), xanthophyll, and sterols consisting chiefly of sitosterol; ergosterol was separated as ergopinacol (acetate, m.p. 204°). H. D.

**Pigmentation of the ripening gourd blossom.** II. L. ZECHMEISTER, T. BÉRES, and E. UJHELYI (Ber., 1936, 69, [B], 573–574; cf. A., 1935, 1180).—The isolation of *petaloxanthin* (I),  $\text{C}_{40}\text{H}_{58}(\text{O})_3$ , m.p. 211–212° (corr.) in oil-bath, m.p. 202° (Berl), from the portion of the crude carotenoids most

sparingly sol. in  $\text{CS}_2$  is described. In m.p., spectroscopic behaviour, solubility, colour, and cryst. form (I) is nearly identical with antheraxanthin (Karrer *et al.*, this vol., 239) but chromatographic analysis with  $\text{Ca}(\text{OH})_2$  in  $\text{C}_6\text{H}_6$  shows the pigments to be distinct from one another. H. W.

**Flower colouring by a membrane pigment in *Leonotis*.** L. GEITLER (Oesterr. bot. Z., 1934, 83, 284–287; Chem. Zentr., 1935, ii, 871).—The orange-red colour of the flower crown of *L. leonurus* is conditioned exclusively by a membrane pigment which is neither anthocyanin nor carotenoid. A. G. P.

**Extraction and separation of the chlorophyll pigments.** H. M. JENNISON and L. M. COOLEY (J. Tennessee Acad. Sci., 1934, 9, 273–277).—Details of the separation of carotene, xanthophyll, and  $\alpha$ - and  $\beta$ -chlorophyll are given. CH. ABS. (p)

**Distribution of pigments in the testa of some varieties of soya beans.** V. G. ALEXANDROV and O. G. ALEXANDROVA (Bull. appl. Bot. U.S.S.R., 1934, Ser. 3, No. 4, 3–47).—The basic type of pigmentation consists of an anthocyanin (I) blue pigment in the cell juice and chlorophyll in plastids. Yellow cell walls contain phlobaphen. Absence of colour in the cell may result from total absence of the chromogene or the presence of a colourless isomeride of the (I) pigment. CH. ABS. (p)

**Fukugetin, the colouring matter of the bark of "Fukugi."**—See this vol., 610.

**Constituents of *Hydrangea paniculata*.** Hydragin. A. HASHIMOTO and T. KAWANA (J. Pharm. Soc. Japan, 1935, 55, 183–186).—Extraction of the dried flowers with  $\text{C}_6\text{H}_6$  affords *hydragin* (I),  $\text{C}_9\text{H}_6\text{O}_3$ , m.p. 224° (*Me ether*, m.p. 114°). A compound apparently identical with (I) is obtained from malic acid, resorcinol, and conc. HCl. CH. ABS. (r)

**Occurrence of furan derivatives in volatile oils.** III.  $\beta$ - and  $\gamma$ -Clausenan.—See this vol., 611.

**Telfairic acid.**—See this vol., 590.

**Existence of *d*-catechin in the bark of the peach tree.** A. M. COLLOT and J. RABATÉ (Compt. rend., 1936, 202, 1208–1210).—EtOH or Et<sub>2</sub>O extracts about 2% of *d*-catechin [ $\text{Ac}_5$ , m.p. 131°, and  $\text{Bz}_5$  derivatives, m.p. 165° (cf. A., 1921, i, 576)]. J. L. D.

**Aroma of tea.** W. S. SHAW (United Planters Assoc. S. India, Bull. 8, 1934, 12 pp.).—Evidence is given in support of the theory that oxytheotannin is largely responsible for the aroma of tea. P. G. M.

**Pectic substances in tea.** W. S. SHAW (United Planters Assoc. S. India, Bull. 6, 1934, 20 pp.).—The green leaf contains a smaller amount of  $\text{H}_2\text{O}$ -sol. pectin (I) (1.65% as Ca pectate) than most other leaves, but the  $\text{H}_2\text{C}_2\text{O}_4$ -sol. (I) content (4.91%) is > that of any except the potato leaf. Black tea contains a greater % (31.0) of the total as  $\text{H}_2\text{O}$ -sol. (I) than does the green leaf (25.3). (I) protects the theotannin from pptn. by salts of heavy metals during infusion and allows the formation of the caffeine salt. P. G. M.

**Constituents of *Dicranopteris glauca*, Nakai.**—See this vol., 610.

**Umbauba** ("imbauba"), *Cecropia peltata*. E. T. DA FONSECA (Rev. flora med., 1935, 1, 289—296).—The active principle of the leaves is a toxic saponin resembling ambain. No alkaloid is present.

CH. ABS. (p)

**Artemisia rigida** (Nutt.), Gray. H. C. VINCENT and R. L. McMURRAY (Amer. J. Pharm., 1936, 108, 107—109).—The flowering plants and leaves of this shrub give with ligroin 5.02, Et<sub>2</sub>O 3.51, dry EtOH 17.78, and 1% HCl 3.63% of extract (calc. on dry wt.), and yield 14.4% of ash (sand 10.55, SiO<sub>2</sub> 11.59, P<sub>2</sub>O<sub>5</sub> 4.57, Fe<sub>2</sub>O<sub>3</sub>+Al<sub>2</sub>O<sub>3</sub> 3.95, CaO 17.55, MgO 6.38, Cl 2.09, and SO<sub>3</sub> 8.67%). The roots contain inulin. Santonin is absent.

R. S. C.

**Action of *Nuphar luteum* on the heart.** M. BULAJEWSKI (Wiadom. farm., 1935, 62, 15—18, 29—32, 43—47, 52—62; Chem. Zentr., 1935, ii, 552).—Nymphalin (I) is present in *N. luteum*, and is obtained pure by crystallisation of an EtOH extract at -10° to -15°, dissolving in org. media, and freezing out. It is pptd. by NaCl from the EtOH extract together with wax, which is removed by saponification. The cryst. (I), m.p. approx. 40°, gives a violet colour with  $\alpha$ -C<sub>10</sub>H<sub>7</sub>OH and H<sub>2</sub>SO<sub>4</sub> and reduces Fehling's solution after hydrolysis. It occurs in the flowers and sap, but not roots, of *N. luteum*.

R. N. C.

**Mexican poppy, *Argemone mexicana*, L.** O. DE ALMEIDA (Rev. flora med., 1935, 1, 271—282).—The poppy contains protopine and berberine, but no morphine.

CH. ABS. (p)

**Punarnava or *Berhaavia diffusa*, Linn.** II. Isolation of punarnavine. R. R. AGARWAL and S. DUTT (Proc. Acad. Sci. Agra and Oudh, 1934—35, 5, 240—242; cf. this vol., 533).—Boiling EtOH extracts berhaavic acid and punarnavine (0.01%), m.p. 235° (decomp.) after sintering at 187° (hydrochloride, m.p. 135°), which exhibits many colour reactions of alkaloids.

J. L. D.

**Toxic principle of ragwort (*Senecio Jacobaea*, L.).** I. J. R. HOSKING and C. W. BRANDT (New Zealand J. Sci. Tech., 1936, 14, 638—644).—An alkaloid C<sub>18</sub>H<sub>25</sub>O<sub>6</sub>N is isolated. It is probably jacobine (A., 1932, 286) and is considered to be the cause of Winton disease. No saponins are present.

A. G. P.

**Alkaloids of Chinese gelsemium, Ta-Ch'a-Yeh.**—See this vol., 618.

**Alkaloids of *Senecio* species.**—See this vol., 617.

**Alkaloids of *Sinomenium* and *Cocculus*.**—See this vol., 491.

**Fractionation of barley and malt proteins.** R. C. ROSE and J. A. ANDERSON (Canad. J. Res., 1936, 14, C, 109—116).—The suitability of 5% aq. K<sub>2</sub>SO<sub>4</sub> for the separation of albumin and globulin from the less sol. proteins is confirmed. The insol. protein is probably a complex, only a portion of which is sol. in 70% EtOH. Use of the latter for fractionation of the complex is purely arbitrary. Malting produces no appreciable change in the proteins of hulls. In the kernel there is a general breakdown of protein. In the acrospire, non-protein-N, salt-sol. protein, and glutelin increase, the hordein

remaining practically unchanged. The glutelin of the acrospire and that of the kernel differ in amide- and arginine-N.

A. G. P.

**Micro-determination of morphine in urine, blood, and other biological fluids.** W. DECKERT (Arch. exp. Path. Pharm., 1936, 180, 656—671).—The method depends on determining the turbidity produced by aq. morphine (I) with (NH<sub>4</sub>)<sub>2</sub>MoO<sub>4</sub>·(NH<sub>4</sub>)<sub>3</sub>VO<sub>4</sub> and is applicable to 1—10 c.c. of urine or blood. After addition of NaHCO<sub>3</sub>, (I) is extracted from tissue-fluids etc. by EtOAc or HCO<sub>2</sub>Et. The urine of men receiving daily 0.015 g. of (I) contains determinable (accuracy  $\pm 10\%$ ) amounts of (I).

F. O. H.

**Chemical composition of *Aconitum napellus* and physiological evaluation of standardised dry extracts.** R. FREUDWEILER (Pharm. Acta Helv., 1935, 10, 51—58; Chem. Zentr., 1935, ii, 883).—A physiological method, based on toxicity to guinea-pigs, is preferred to chemical methods.

H. N. R.

**Pharmacological evaluation of *Allium* preparations.** U. HINTZELMANN (Fortschr. Ther., 1935, 11, 359—361; Chem. Zentr., 1935, ii, 883).—The method is based on the observation that garlic preps. prolong the life of mice given a lethal dose of vigantol.

H. N. R.

**Self-sealing vessels for storage of solutions used in the Van Slyke gasometric methods.** F. E. HOLMES (J. Biol. Chem., 1936, 113, 411—415).—The two vessels described eliminate the glass stop-cock in the alkaline stream of the vessel used by Van Slyke, *et al.* (A., 1933, 1314) and the modified Hempel pipette, and also provide an automatic Hg seal for the tip of the delivery tube of the Guest-Holmes vessel (A., 1935, 1218).

J. N. A.

**Determination of ethyl alcohol in body-fluids.** H. NEWMAN (J. Pharm. Exp. Ther., 1936, 56, 278—283).—1 mg. of EtOH may be determined in body-fluids with an error of 1.5% by vac. distillation into K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>-H<sub>2</sub>SO<sub>4</sub> and titration of the unoxidised K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> with KI and Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>.

H. D.

**Aluminium. I. Colorimetric determination of aluminium in biological material.** D. F. EVELETH and V. V. MYERS (J. Biol. Chem., 1936, 113, 449—465).—Al is determined in tissues by dry ashing, pptn. of the Al and Fe as phosphates, separation of these by means of NaOH, NH<sub>4</sub>CNS, or cupferron, and then colorimetrically with alizarin or aurin. Alizarin gave higher vals. in tissue digests than aurin due to the presence of Ca and interfering substances.

H. D.

**Micro-determination of titanium in the organism by extraction and photometry.** L. MAILLARD and J. ETTORI (Compt. rend., 1936, 202, 594—596).—The ashed tissue, dissolved in 5% H<sub>2</sub>SO<sub>4</sub>, is treated in presence of Fe with nitrosophenylhydroxylamine (I). The ppt. is dissolved in H<sub>2</sub>SO<sub>4</sub>, Fe removed by H<sub>2</sub>S, and the solution re-pptd. by (I) in presence of Zr, Ti being determined in the ppt. by oxidation with H<sub>2</sub>O<sub>2</sub> and photometric examination of the TiO<sub>3</sub> formed. Muscle and blood contain approx. 8 and 3  $\times 10^{-6}$  g. per 100 g., respectively.

J. N. A.

# BRITISH CHEMICAL ABSTRACTS

## A.—PURE CHEMISTRY

JUNE, 1936.

### General, Physical, and Inorganic Chemistry.

Excitation of the hydrogen lines  $H_\alpha$ ,  $H_\beta$ ,  $H_\gamma$  by ultra-short electric waves. H. NAGAOKA and T. MISHIMA (Proc. Imp. Acad. Tokyo, 1936, 12, 1—3).—Excitation of  $H_2$  in an electrodeless tube by means of 20-cm. waves, obtained from a magnetron, or for higher power a triode, is described. The method produces a steady excitation, without the presence of the Stark effect, and the fine structure of the lines can be readily photographed. A. J. M.

Limits of the continuous spectrum and line intensities for helium. H. O. JANKO (Z. Physik, 1936, 99, 169—188).—Spectral and probe electron energy measurements in the plasma of the He discharge indicate exchange interaction of highly excited neutral atoms with electrons in addition to ordinary recombination. A. B. D. C.

Paschen-Back effect. III.  $2S^2P$  multiplets in strong fields. IV. Mutual spin-orbit interaction in two-electron spectra. J. B. GREEN and R. A. LORING (Physical Rev., 1936, [ii], 49, 630—632, 632—634; cf. A., 1934, 137).—III. The theory is discussed and verified experimentally. The  $2S^2P$  multiplet of Li  $\lambda$  6708 was resolved in reversal and showed the fine structure predicted but not previously observed.

IV. Investigations for the Be triplet  $\lambda$  3321  $3P^3S$  gave patterns in good agreement with calculations which take account of the interaction between the spin of one electron and the orbit of the other. N. M. B.

Magnetic moment of  ${}^6\text{Li}$ . H. SOHÜLER and T. SCHMIDT (Z. Physik, 1936, 99, 285—287).—Assuming the mechanical moment to be 1, the magnetic moment is 0.6 nuclear magnetons. A. B. D. C.

Magnetic moment of the  ${}^7\text{Li}$  nucleus. J. H. BARTLETT, jun., and J. J. GIBBONS, jun. (Physical Rev., 1936, [ii], 49, 552).—The val. calc. from wave functions for Li is 4.58, disagreeing with 3.28 and 3.20 as calc. from experimental data (cf. Fox and Rabi, this vol., 1). N. M. B.

Absorption spectra of oxygen due to interaction forces. I. Absorption bands of the ( $\text{O}_2\text{-O}_2$ ) molecule. H. SALOW and W. STEINER (Z. Physik, 1936, 99, 137—158).—Bands observed between 6299 and 3150 Å. have been ascribed to ( $\text{O}_2\text{-O}_2$ ) mols. or collision pairs; they have been so allocated because of the variation of their shape and intensity with pressure between 40 and 160 atm., and foreign gas pressures up to 100 atm. A. B. D. C.

Stark effect in neon. W. STEUBING and H. KINDLER (Z. Physik, 1936, 99, 103—108).

A. B. D. C.

Mean lifetime of metastable neon atoms. E. W. PIKE (Physical Rev., 1936, [ii], 49, 513—515).—The concn. as a function of illumination intensity of excited atoms in the Townsend discharge in Ne, illuminated with red light from an auxiliary discharge in Ne, is computed from the electronic properties of Ne. The mean lifetimes of the metastable and resonance states are evaluated by comparison with direct measurements. N. M. B.

Penning's "new photo-effect" in pure neon. E. W. PIKE (Physical Rev., 1936, [ii], 49, 515—518; cf. preceding abstract).—The maintaining voltage of a Townsend discharge in pure Ne, measured as a function of the illumination of the discharge with light from a Ne arc, was, in contrast to the case for slightly impure Ne, almost insensitive to illumination over a wide range of pressure, current, tube form, and cathode material. With progressive cleaning of the gas the change in maintaining voltage passed from a small positive val. through zero to a small negative val. N. M. B.

Extinction of fluorescence of sodium. V. KONDRATEEV and M. SISKIN (Physikal. Z. Soviet-union, 1936, 8, 644—666).—The effect of various gases ( $\text{A}$ ,  $\text{N}_2$ ,  $\text{NO}$ , and  $\text{O}_2$ ) on the extinction of the  $D$  fluorescence of Na has been investigated. The effective cross-section, characteristic of the extinction capacity, of  $\text{A}$  was independent of the energy ( $e$ ) of the Na atoms within wide limits. In the case of  $\text{N}_2$  and  $\text{NO}$  there is dependence on  $e$  which is connected with the existence of two types of photochemical breakdown of the NaI vapour used for the fluorescence. The greatest extinction effect is given by  $\text{NO}$  and  $\text{O}_2$ ; this is not connected with the fact that with these mols. there is a resonance between the vibrational energy of the mols. and the energy of electron excitation of Na, but it is suggested that the principal factor determining the effectiveness of a gas in extinguishing the fluorescence is the chemical force of interaction between the mols. A. J. M.

A-Bands of sulphur. E. OLSSON (Z. Physik, 1936, 99, 114—118).—Predissociation limits were observed at 2825 Å. Odd rotation levels are absent from the ground state, indicating zero nuclear spin. A. B. D. C.

Polarisation of resonance radiation from calcium and the effect of weak magnetic fields.

A. STEINHÄUSER (Z. Physik, 1936, 99, 300).—Corrections (cf. A., 1935, 1183). A. B. D. C.

**Na I-like spectra of the elements titanium to copper (Ti XII—Cu XIX).** B. EDLÉN (Nature, 1936, 137, 531—532).—Using an improved vac. spark spectrograph, the outstanding lines of the K I- and A I-like spectra have been revealed in the spectra of the elements from Ti to Zn XII and XIII. Lines belonging to Na I-, Mg I-, and Al I-like spectra have also been identified, those of Na I being the most intense and complete. The two most persistent transitions  $3d^2D-4f^2F$  and  $3p^2P-4d^2D$  have been traced through Cu XIX. L. S. T.

**Iron arc spectrum in the infra-red.** N. R. TAWDE and V. S. PATANKAR (J. Univ. Bombay, 1935, 4, Part II, 65—69).—66 lines of the Fe arc in air have been measured in the region 7937—10,216 Å. and compared with previous data. J. W. S.

**Spectroscopic investigation of discharges at high gas pressure.** W. W. WATSON and G. F. HULL, jun. (Physical Rev., 1936, [ii], 49, 592—596).—Spectra of high-energy discharges between Cu, Al, C, Mg, In, and Be electrodes in  $N_2$ ,  $O_2$ ,  $H_2$ , and He at pressures up to 15 atm. were examined at high dispersion. With the continuous spectrum background, absorption bands due to AlH, MgH, BeO, and CN were observed. Data for broadening and shift, in each case to the red, and for the pressure-broadening of the Al resonance lines are given. The breadths and shifts of the emission lines are attributed mainly to interat. Stark effect and slight resonance broadening, and the contours and pressure shifts of the self-reversals correspond with those due to van der Waals forces between Al atoms and gas mols. N. M. B.

**Polarisation of the radiation  $\lambda = 2139$  Å. emitted by optical resonance of an atomic beam of zinc.** P. SOLEILLET and S. NIKITINE (Compt. rend., 1936, 202, 1046—1047).—In a magnetic field of 0.53 gauss in the direction of the exciting ray 2139 Å. the radiation emitted by an at. beam of Zn at right angles to the exciting ray is 74% polarised. R. S. B.

**New system of bands of  $Se_2$  in the red.** B. ROSEN and F. MONFORT (Bull. Acad. roy. Belg., 1936, [v], 22, 215—218).—The new system, ranging from 16,706—14,842  $cm^{-1}$ , has the same upper level as the principal system  $^1\Sigma-^2\Sigma$ . The lower level is at approx. 9250  $cm^{-1}$  above the normal of the  $Se_2$  mol. A. J. M.

**Spectrum of selenium in the red and photographic infra-red.** B. ROSEN and F. MONFORT (Physica, 1936, 3, 257—265).—The emission bands on the long- $\lambda$  side of the main  $^1\Sigma-^1\Sigma$  system of  $Se_2$  have been investigated. The results are discussed in relation to the heat of dissociation of  $Se_2$ . A new band system in the red is recorded. L. J. J.

**Origin of the broad bands in selenium and tellurium vapours.** B. ROSEN, M. DÉSIRANT, and L. NEVEN (Nature, 1936, 137, 498).—Broad bands observed in the absorption spectra of  $Se_2$  and  $Te_2$  for temp. up to 1000° confirm the interpretation previously given (A., 1935, 1291). L. S. T.

**Fluted bands of tellurium vapour.** M. DÉSIRANT and A. MINNE (Compt. rend., 1936, 202, 1272—1273).—The broad bands of  $Te_2$  at  $\lambda > 5250$  Å. consist of two series extending to 6100 Å. and 6500 Å., respectively. The bands are due to transitions between an electronic state with an ill-defined min., and the higher vibrational levels of the ground state. L. J. J.

**Magnetic moment of the nucleus and hyperfine structures in the spectrum of doubly ionised antimony; structure of the arc line 3723.** J. S. BADAMI (J. Univ. Bombay, 1935, 4, Part II, 86—93).—The hyperfine structures of two doublets of the Sb III spectrum have been measured. After reclassification of the terms of this spectrum by interchanging  $6s^2S$  and  $5s5p^2S$  terms, a val. of approx. 2.7 proton-magneton is obtained for the magnetic moment of the  $^{121}Sb$  nucleus. The structure of the 3723 Å. line is interpreted, taking the mechanical moment of the nucleus as  $(5/2)h/2\pi$  for both isotopes. J. W. S.

**Spectrum of doubly-ionised antimony.** S. G. KRISHNAMURTY (Indian J. Physics, 1936, 10, 83—90).—The analysis of the spectrum of Sb II due to Lang and Vestine (A., 1933, 2) has been modified and extended. A. J. M.

**Nuclear spin of iodine from the spectrum of  $I_2$ .** L. A. STRAIT and F. A. JENKINS (Physical Rev., 1936, [ii], 49, 635; cf. Tolansky, this vol., 262).—Measurements of the alternating intensities in the mol. spectrum confirm the val. 5/2 for the nuclear spin. N. M. B.

**F-Terms of Ce IV.** R. J. LANG (Physical Rev., 1936, [ii], 49, 552).—Preliminary data for the terms are given. N. M. B.

**Hyperfine structure of platinum isotopes. I. Isotopes of platinum and their centre of gravity.** (FRL.) B. JAECKEL and H. KOPFERMANN (Z. Physik, 1936, 99, 492—502).—Four isotopes, 194, 195, 196, and 198, are present in the intensity ratio 10 : 9 : 7 : 2.  $^{195}Pt$  has mechanical moment  $\frac{1}{2}$ . A. B. D. C.

**Effect of added inert gas on the high-pressure mercury discharge.** W. ELENBAAS (Physica, 1936, 3, 219—236).—The extra energy loss is due to an increase in heat conduction caused by the presence of inert gas atoms. L. J. J.

**Zeeman effect of the hyperfine structure components of the mercury resonance line 2537 Å.** A. ZVIRONAS (Nature, 1936, 137, 531). L. S. T.

**Application of the theory of the coherence of vibrations.** P. SOLEILLET (Compt. rend., 1936, 202, 1167—1168).—Theoretical. Polarisation of some excited Hg lines is considered. M. S. B.

**Theory of pressure-broadening of spectral lines.** E. GORA (Proc. Indian Acad. Sci., 1936, 3, A, 272—284).—Coupling between the energy levels of excited atoms and the virtual oscillators which determine the dispersion of the perturbing gas leads to a relation between the refractive index of the latter and the red shift of spectral lines. Other interactions affect width and violet shift. L. J. J.

**Pressure effects in band spectra.** H. MARGENAU (Physical Rev., 1936, [ii], 49, 596—597).—

A simple theory of pressure effects due to foreign perturbing mols. without permanent polarity shows that shift and broadening are similar to those in the case of at. lines as a result of van der Waals interactions. Calculations and formulæ for models of a rigid rotator and simple harmonic oscillator show that the effects are almost independent of vibrational and rotational quantum nos.

N. M. B.

**Mechanism in the positive column of a discharge.** L. S. ORNSTEIN, H. BRINKMAN, and T. HAMADA (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 315—324).—Theoretical. The shapes of the intensity curves for the bands of  $N_2$  and  $N_2^+$  over the tube radius are discussed.

R. S. B.

**A-Type doubling in  $^3\Pi$  states of diatomic molecules intermediate between Hund's cases a and b.** M. H. HEBB (Physical Rev., 1936, [ii], 49, 610—618).—Mathematical.

N. M. B.

**Temperature of helium in the high-frequency discharge.** J. ROIG (Compt. rend., 1936, 202, 1044—1046).—The temp. of He at 0.57—0.93 mm. in a high-frequency discharge running at 1760—2160 volts with  $\lambda=14$  m. is 187—250° as measured by an air thermometer. Calc. and observed interferometric measurements agree approx.

R. S. B.

**Helium-tungsten arc.** O. STÜBING (Helv. phys. Acta, 1935, 8, 165—196; Chem. Zentr., 1935, ii, 980).—Relations between current, voltage, arc length, and pressure have been investigated between 11 and 500 mm. pressure.

J. S. A.

**Preliminary stages of spark formation in various gases by the use of the Wilson chamber.** U. NAKAYA and F. YAMASAKI (Proc. Roy. Soc., 1936, A, 153, 542—554).—Using a modification of the previous apparatus (A., 1935, 557), cloud photographs have been taken of sparks in  $N_2$ ,  $O_2$ ,  $CO_2$ ,  $H_2$ , NO, and in air mixed with small amounts of org. vapours. The form and structure of the preliminary discharge are different for different gases, each gas showing a characteristic feature peculiar to itself.

L. L. B.

**Production of metallic spectra by shock waves.** H. MURAOUR and A. MICHEL-LEVY (Compt. rend., 1936, 202, 949—950).—Line spectra of various metals were excited by the passage of a shock wave from the detonation of a mixture of  $C(NO_2)_4$  and PhMe through A containing the metal or its oxide in suspension. They resembled the spark spectra.

H. J. E.

**Structure of the spark striking to the surface of a solution.** P. JOLIBOIS (Compt. rend., 1936, 202, 400—402; cf. A., 1935, 831).—When a spark is passed between a Pt electrode and aq.  $CuSO_4$  (10%) with the Pt positive, the latter becomes very hot, and the spectrum contains only the first and second negative bands of  $N_2$  and the 3064 Å.  $H_2O$  band. With the Pt negative, the latter is less heated and a spectrum of  $N_2$  is obtained throughout the length of the spark, the Cu spectrum from near the liquid, and a very intense H spectrum, containing the  $H_\alpha$  and  $H_\beta$  lines and the secondary H spectrum, from a luminous spot on the electrolyte. The observations suggest that the positively charged  $H_2$  at the surface of the

liquid forms the electrode and causes the pptn. of  $Cu(OH)_2$  on passage of the current.

J. W. S.

**Broadening of the lines in the radiation from hissing arcs.** T. PECZALSKI (Compt. rend., 1936, 202, 1040—1042; cf. this vol., 438).—With increased evaporation of fused salt in contact with the anode of a C arc the arc hisses and the spectral lines for NaCl and  $CaCl_2$  are wider than for a silent arc, the concn. of vapour being increased 20 times.

R. S. B.

**Rapid measurements of probe characteristics of a gas discharge by means of oscillograph tubes.** J. DÜRRWANG (Helv. phys. acta, 1935, 8, 333—369; Chem. Zentr., 1935, ii, 1138).—Dynamic characteristics of arc discharges have been investigated. The introduction of volatile salts (e.g., Na or Cu halides) into a C arc produces alterations in the discharge which may be correlated with the ionisation potential of the metal.

J. S. A.

**Electric arcs with liquid positive pole.** M. PIERUCCI (Nuovo Cim., 1935, [ii], 12, 1—3; Chem. Zentr., 1935, ii, 1138).—A short arc may be struck between a C electrode and the surface of an aq. electrolyte. With a.c., a rectifying action is observed, the electrolyte functioning as positive pole only. The arc spectrum comprises the continuum of the electrodes and the gas lines, with the Balmer H lines when  $H_2SO_4$  solutions are used. With shallow liquid layers the arc may strike through to the containing graphite crucible, then emitting strongly the spectra of the dissolved electrolytes.

J. S. A.

**Evaluation of ultra-violet solar radiation of short-wave lengths.** W. W. COBLENTZ and R. STAIR (Proc. Nat. Acad. Sci., 1936, 22, 229—233).—A summary of recent experimental investigations and results.

N. M. B.

**Bright line spectrum of Nova Herculis.** F. L. WHIPPLE and (Miss) C. P. GAPOSCHKIN (Proc. Nat. Acad. Sci., 1936, 22, 195—200).

**Spectra of early-type stars in the near ultra-violet region.** P. SWINGS and M. DESIRANT (Astrophys. J., 1936, 83, 31—46).—The spectra of three B and eleven A stars have been measured for  $\lambda\lambda$  between 3570 and 3930 Å. The behaviour of the elements is discussed.

L. S. T.

**K-Series for aluminium, manganese, and sodium.** V. KUNZL (Z. Physik, 1936, 99, 481—491).—New lines have been observed in  $\alpha$  and  $\beta$  groups (cf. A., 1935, 1292).

A. B. D. C.

**Excitation potential, relative intensities, and wave-lengths of the  $K\alpha''$  X-ray satellite line.** L. G. PARRATT (Physical Rev., 1936, [ii], 49, 502—507).—Data and ionisation curves of the line are given for S (16) to V (23). The excitation potential is 4070±250 volts, and the line is attributed to a  $KM \rightarrow LM$  transition. The relative intensity  $K\alpha''/K\alpha_1$  varies with at. no., reaching a max. of 2.3% at Ca (20).

N. M. B.

**Variation of the atomic structure factor of potassium with X-ray wave-length.** S. K. ALLISON and W. P. JESSE (Physical Rev., 1936, [ii], 49, 483—494).—Using a special vac. ionisation spectrometer the diffracted power in the Debye-Scherrer

rings from NaCl, NaF, LiF, and KF powders has been compared. For KF, with the range 1.538–4.146 Å., the expected decrease of the crystal structure factor on the short- $\lambda$  side was observed; beyond the  $K$  edge of  $K$  the factor rose again, but considerably more than predicted. It is concluded that HönI's computations based on the wave-mechanical theory of  $X$ -ray dispersion do not correctly give the observed structure factor differences for the (200) diffraction halo from powdered KF on the long and short  $\lambda$  sides of the  $K$  edge. The predicted invariance of the structure factor decrement due to  $K$  electrons with scattering angle for light elements is confirmed. N. M. B.

**Auger effect and relative intensity of  $L$ -emission lines.** D. COSTER and K. W. DE LANGEN (Physica, 1936, 3, 282–288).—The relative intensities of the  $L\beta_1$ ,  $\beta_2$ , and  $\beta_3$  lines of Ag, Sn, and Sb have been determined. With Ag, the Auger effect  $L_I \rightarrow L_{III}$  with ejection of an  $M$  electron can take place, and this leads to markedly smaller vals. of the intensity ratios  $\beta_3 : \beta_1$  and  $\beta_2 : \beta_1$ . L. J. J.

**Relativistic theory of the Auger effect.** H. S. W. MASSEY and E. H. S. BURHOP (Proc. Roy. Soc., 1936, A, 153, 661–682).—Calculations have been made of the probability of the internal conversion of the  $K$  series radiation for Au arising from the interaction of the  $L_I L_{II}$ ,  $L_I L_{III}$ , and  $L_{II} L_{III}$  shells, using Møller's method (A., 1932, 980). Less accurate calculations have also been made for Ag. Appreciable relativistic effects have been found for both metals, most marked in the case of Au. L. L. B.

**$K$  X-Ray absorption spectra of some compounds of bromine and rubidium.** S. T. STEPHENSON (Physical Rev., 1936, [ii], 49, 495–498).—Using powder absorbing screens with a double-crystal ionisation spectrometer and MeI in the ionisation chamber to eliminate the effect of Br in MeBr, the  $K$  X-ray absorption spectrum of Br in KBr, RbBr, CdBr<sub>2</sub>, and NaBrO<sub>3</sub> and of Rb in RbBr was obtained. The widths of the Br and Rb edges were about 9 and 11 volts, respectively. No discontinuity due to a possible simultaneous ejection of  $K$  and  $L$  electrons was observed. N. M. B.

**Ultra-soft X-ray absorption edges from the emulsion and sensitisers of photographic plates.** J. M. BAČKOVSKÝ and V. DOLEJŠEK (Z. Physik, 1936, 99, 42–51).—The intense absorption of ultra-soft X-rays gives inverted absorption edges of K, Cl, and Ca ( $L_{II-III}$  edges) as well as those of Ag and Br. A. B. D. C.

**Approximate method for the calculation of the work of emission of electrons from metals.** E. H. B. BARTELINK (Physica, 1936, 3, 193–204).—Mathematical. L. J. J.

**Relation between secondary emission and work function.** L. R. G. TRELOAR (Nature, 1936, 137, 579).—Secondary emission from a Mo filament with different degrees of Ba surface has been investigated. L. S. T.

**Electron emission of the cathode of an arc.** M. J. DRUYVESTEYN (Nature, 1936, 137, 580).—A new way in which electrons may escape from the cathode of an arc is suggested. L. S. T.

**Production of intense beams of slow electrons.** R. PLANTOL (Compt. rend., 1936, 202, 1267–1268).—A supplementary grid, at a high positive potential, is interposed between the emitting filament and the principal grid. L. J. J.

**Theoretical cross-section for  $K$ -electron ionisation by electron impact.** W. W. WETZEL (Physical Rev., 1936, [ii], 49, 531–534).—Mathematical. An expression is found for the cross-section as a function of the at. no., the ionisation potential of the  $K$  shell, and the energy of the colliding electron. N. M. B.

**Distribution of electron velocities in the magnetic field.** T. V. IONESCU and C. MIHUL (Compt. rend., 1936, 202, 1160–1162).—Electrons produced by a heated W filament were accelerated by different voltages (240–1920 volts) between two grids, under the action of a magnetic field (0–43.2 gauss). The resulting ionisation currents in the gas space between the second grid and a plate at different voltages were plotted against the plate voltage. M. S. B.

**Collision of slow electrons in pure oxygen. Electronic affinity.** L. GOLDSTEIN (Compt. rend., 1936, 202, 924–926).—Pure dry O<sub>2</sub> behaves towards electrons of energy 0.1–5.9 e.v. like rare gases. Electrons of greater energy dissociate O<sub>2</sub>, but they are not captured by mol. O<sub>2</sub>. H. J. E.

**Determination of the velocity distribution of electrons in a low-pressure discharge tube.** A. H. VAN GORCUM (Physica, 1936, 3, 207–218).—A method of applying Druyvesteyn's formula (A., 1930, 1490) is described. The velocity distribution in a Ne tube changes to a Maxwellian one as the positive column is approached from the cathode side. L. J. J.

**Motion of electrons in electric and magnetic fields taking into consideration the action of the space charge.** S. J. BRAUDE (Physikal. Z. Sovietunion, 1936, 8, 667–674; cf. A., 1935, 1294).—Theoretical. The motion of electrons in crossed electric and magnetic fields with space charge is investigated for a cylindrical condenser. A. J. M.

**Positron theory and proper energies.** R. SERBER (Physical Rev., 1936, [ii], 49, 545–550).—Mathematical. N. M. B.

**Production of positrons from bismuth.** H. P. DE (Indian J. Physics, 1936, 10, 103–108).—The production of positrons from Bi bombarded with neutrons and other radiations from a mixture of MsTh, Ra, and BeO was examined by the cloud-chamber method, using a stereo-camera. For 282 electron tracks there were 20 positron tracks. The energy of the positrons was  $10^5$ – $4.5 \times 10^6$  e.v. It is suggested that the positron emission is due to internal conversion of high-energy  $\gamma$ -radiation. A. J. M.

**Sign of the magnetic moment of the proton and of the deuteron.** J. M. B. KELLOGG, I. I. RABI, and J. R. ZACHARIAS (Nature, 1936, 137, 658).—Both moments are positive. L. S. T.

**Production of high-velocity ions for the disintegration of atomic nuclei.** R. J. MOON and W. D. HARKINS (Science, 1936, 83, 244). L. S. T.

**Kinetic energy of positive thermions of some halides.** (MLE.) C. TUDOR (Bull. Acad. Sci. Roumaine, 1935, 17, 111—115).—Positive ion emission has been studied with the chlorides of Sn, Zn, Sr, Cd, Cu<sup>I</sup>, and Li, Ba(NO<sub>3</sub>)<sub>2</sub>, SrBr<sub>2</sub>, KBr, CdI<sub>2</sub>, and ZnI<sub>2</sub>. The mean kinetic energy of the ions has been determined. R. S. B.

**Ionisation and luminescence of atomic beams in a high vacuum.** R. PLANIOL (Compt. rend., 1936, 202, 1032—1033; cf. A., 1935, 599).—An improved apparatus is described. The passage of electrons through an at. beam is marked by a luminescence which increases with the intensity of the beam and changes from violet to blue. The light is emitted in the visible and ultra-violet. R. S. B.

**Direct determination of the effective radius of strongly vibrating molecules by the molecular beam method.** N. SASAKI and E. NISHIBORI (Proc. Imp. Acad. Tokyo, 1936, 12, 10—12).—The mols. are strongly excited photochemically and their effective radius is found by the mol. beam method. For I<sub>2</sub> the ratio of the effective radius of the excited mol. to that of the unexcited mol. is 2.56. A. J. M.

**Ionisation of a molecular beam by electron collision and investigation of the ions produced by the mass spectrograph.** N. SASAKI and E. NISHIBORI (Proc. Imp. Acad. Tokyo, 1936, 12, 13—15).—The investigation of the primary products of a reaction by the mol. beam method is described. The beams of mols. are ionised and then examined by the mass spectrograph. The method can be used to study the ionisation of mols., or, by crossing beams, the products of reactions. A. J. M.

**Sixth Report of the Committee on Atomic Weights of the International Union of Chemistry.** G. P. BAXTER, O. HÖNIGSCHMID, and P. LEBEAU (J. Amer. Chem. Soc., 1936, 58, 541—548).—Changes have been made in the at. wt. of Ta (180.88) and Ra (226.05). Pa (at. wt. 231) has been added to the table. E. S. H.

**Relative at. wt. of oxygen in water and in air; atmospheric distribution of the oxygen isotopes and the chemical standard of at. wts.** M. DOLE (J. Chem. Physics, 1936, 4, 268—275).—Density measurements on H<sub>2</sub>O made from tank H<sub>2</sub> and O<sub>2</sub> from the air and from tank H<sub>2</sub> and O<sub>2</sub> from the H<sub>2</sub>O of Lake Michigan are recorded. The former is 6.0±0.6 p.p.m. heavier, corresponding with a difference of 0.000108±0.00001 at. wt. units between the at. wts. of O in air and H<sub>2</sub>O. The results are discussed in relation to existing data. The possibility of accounting for the observed difference by isotopic exchange and gravitational equilibria in the stratosphere, and its bearing on the basis of at. wt. standards, are considered. L. J. J.

**Eighth isotope of molybdenum.** J. DE GIER and P. ZEEMAN (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 327—329).—Using Mo(CO)<sub>6</sub>+50% O<sub>2</sub> in the discharge a new isotope <sup>102</sup>Mo has been detected, in agreement with Sitte's prediction (cf. A., 1935, 1295). The provisional abundance is 2—3%. R. S. B.

**At. wt. of rubidium.** E. H. ARCHIBALD and J. G. HOOLEY (J. Amer. Chem. Soc., 1934, 58, 618—619).—From determinations of the ratios RbBr:Ag and RbBr:AgBr, the at. wt. of Rb is 85.481.

E. S. H.

**At. wt. of germanium. II. Analysis of germanium tetrachloride.** O. HÖNIGSCHMID and K. WINTERSBERGER (Z. anorg. Chem., 1936, 227, 17—24; cf. this vol., 5).—The mean of nine nephelometric titrations of GeCl<sub>4</sub>, the prep. of which is described, gives Ge 72.59±0.006, in agreement with the val. previously obtained. F. L. U.

**Existence of <sup>5</sup>Li.** A. K. BREWER (Physical Rev., 1936, [ii], 49, 635).—The mass spectra for Li ions emitted thermally from an impregnated Pt source show a peak in the mass no. 5 position and evidence favours <sup>5</sup>Li as its origin. The abundance ratio for the new peak was <sup>7</sup>Li/<sup>5</sup>Li=20,000±1000. N. M. B.

**New data on isotopes.** F. W. ASTON (Nature, 1936, 137, 613; cf. this vol., 400).—Isotopic wts. obtained by the doublet method are <sup>10</sup>B 10.0161±0.0003, <sup>14</sup>N 14.0073±0.0005, <sup>19</sup>F 19.0045±0.0006, <sup>20</sup>Ne 19.9986±0.0006, <sup>27</sup>Al 26.9909, <sup>28</sup>Si 27.9860, <sup>29</sup>Si 28.9864±0.0008, and <sup>40</sup>A 39.9754±0.0014. The corresponding packing fractions are 16.1, 5.28, 2.36, -0.70, -3.3, -5.0, -4.7, and -6.15, respectively. The present position with regard to some doubtful isotopes is reviewed. The existence of <sup>58</sup>Fe and <sup>64</sup>Ni is supported by the work of de Gier and Zeeman (this vol., 5, 130), but evidence as to <sup>61</sup>Ni is still conflicting. If the lines 148 and 150 obtained by Dempster are due to isotopes of Nd, as is probable, the discrepancy between the physical and chemical at. wts. of Nd may disappear. Revised vals. for the percentage abundances of the various isotopes of Cd, Sn, and Pb are given. L. S. T.

**Periodic system of the elements and element 93.** M. CARRANZA (Bol. Soc. Quim. Peru, 1935, 1, 41—45).—A review. L. A. O'N.

**Radioactivity of samarium.** R. HOSEMANN (Z. Physik, 1936, 99, 405—427).—The range of α-rays emitted at the rate of 89 per sec. per g. is 1.13 cm. in air at 15° and 760 mm. A. B. D. C.

**Existence of the α<sub>5</sub> radiation and the separation of the magnetic spectrum of thorium-C into two series.** S. ROSENBLUM (Compt. rend., 1936, 202, 943—946; cf. A., 1932, 442).—A discussion. The existence of α<sub>5</sub> radiation is reaffirmed. Its intensity is low. H. J. E.

**Tracks of the α-particles of thorium and its products.** H. J. TAYLOR and V. D. DABHOLKAR (Proc. Indian Acad. Sci., 1936, 3, A, 265—271).—The tracks of α-particles emitted from atoms of the Th series in a photographic emulsion have been recorded (cf. A., 1935, 910). Single tracks and stars, characteristic of the individual atoms of the various members of the series, are obtained. L. J. J.

**Intensity of fine-structure groups in the α-ray magnetic spectra of radioactinium and its products.** S. ROSENBLUM, M. GUILLOT, and (MLE.) M. PEREY (Compt. rend., 1936, 202, 1274—1276).—Data are recorded for the relative intensities of

11 known lines of RdAc and 4 of Ac-X. Four new lines are recorded for actinon, and two new lines for Ac-C.

L. J. J.

**Tracks of swift nuclei in photographic emulsions.** H. J. TAYLOR (J. Univ. Bombay, 1935, 4, Part II, 70—73; cf. A., 1935, 910).—The photographic method is not so widely applicable as the cloud chamber method, but has greater sensitivity in recording the tracks of  $\alpha$ -particles, recoil protons, and tracks resulting from nuclear disintegration under neutron bombardment. Investigations can cover all tracks over longer periods, and being recorded in small area enable rare events, e.g., the reaction  $^{10}\text{B} + ^1_0\text{n} \rightarrow ^4\text{He} + ^4\text{He} + ^3\text{He}$ , to be observed.

J. W. S.

**Calorimetric measurements of the energy of disintegration in the actinium family.** A. SANIELEVICI (Compt. rend., 1936, 202, 1055—1057).—Using an adiabatic micro-calorimeter the following energy ( $E$ ) changes have been measured: for Ac in equilibrium  $E$  ( $\alpha$ +recoil) =  $7.15 \times 10^{-3}$  g.-cal. per g. per hr.; for Ac  $\rightarrow$  Ac-C''  $E$  ( $\alpha$ +recoil) represents 90.9,  $E$  ( $\beta$  primary) 2.4, and  $E$  ( $\gamma$ + $\beta$  secondary) 6.7% of the whole. The mean  $E$  of the  $\beta$ -rays of Ac-B is  $3.7 \times 10^5 \pm 3\%$  e.v.

R. S. B.

**Continuous  $\beta$  spectrum of actinium-B.** M. LECOIN (Compt. rend., 1936, 202, 1057—1059; cf. A., 1935, 1048).—The  $\beta$  spectrum of initially pure Ac-B has been studied. The curve for disintegration no. against energy shows a max. at  $5 \times 10^5$  e.v. after allowing for the influence of Ac-C''. The mean energy for the  $\beta$ -radiation of Ac-B is  $3.6 \times 10^5$  e.v., in agreement with Sanielevici (see above). The higher limit of the spectrum occurs at  $9.5 \times 10^5$  e.v.

R. S. B.

**Radiation from the active deposit of actinium.** J. SURUGUE (Compt. rend., 1936, 202, 410—411; cf. A., 1933, 659).—The energies of the  $\beta$ -rays from the active deposit of Ac, as compared with the  $F$  ray of Th-B, are found to be 0.4% > previously recorded. A new ray of high energy (813 e.kv.) is found and attributed to the transformation Ac-B  $\rightarrow$  Ac-C. The change Ac  $\rightarrow$  Ac-C'' yields only the  $\beta$ -ray of 350 e.kv., in accord with the fine structure of the  $\alpha$ -radiation.

J. W. S.

**Continuous  $\beta$ -ray spectrum of radium-C''.** L. GOLDSTEIN and M. LECOIN (Compt. rend., 1936, 202, 1169—1170).—The  $\beta$ -ray spectrum of Ra-C'' has been photographed using a Wilson expansion chamber. Under the experimental conditions positrons were distinguished from electrons and thus possible interferences from the disintegration of the synthetic element  $\text{R}_9\text{F}$ , produced by the bombardment of N by the  $\alpha$ -rays of Ra-C', could be eliminated. It is shown that at least two energy quanta, equal to a total of  $3.4 \times 10^6$  e.v., are emitted in the disintegration of Ra-C''.

M. S. B.

**Slow neutrons.** E. FERMI and F. RASETTI (Nuovo Cim., 1935, [ii], 12, 201—210; Chem. Zentr., 1935, ii, 1127).—Data are given for the absorption coeffs. of B and Cd for neutrons slowed by elastic collision with H atoms. The absorption mechanism may differ as an unstable radioactive isotope or a stable isotope is formed by neutron capture.

J. S. A.

**Absorption of slow neutrons.** C. H. COLLIE (Nature, 1936, 137, 614).—The absorption of slow neutrons from a Rn-Be source by several elements has been measured using an improved arrangement. The absorption band of Cd occurs in the range 0—1.5 e.v. and a very narrow absorption band (0—0.1 e.v.) is indicated. The band for In occurs in the same range and partly overlaps that of Cd. No effect due to the sp. absorption of Au or Ag could be found.

L. S. T.

**Capture of slow neutrons.** G. BREIT and E. WIGNER (Physical Rev., 1936, [ii], 49, 519—531).—Mathematical. Considerations are given to account for the contradiction of current theories of the large cross-section of slow neutrons by frequent absence of strong scattering in good absorbers and existence of resonance bands.

N. M. B.

**Retardation of neutrons by collision with protons.** E. LAMLA (Naturwiss., 1936, 24, 251—252).—Theoretical. The energy distribution of neutrons after collision with protons is calc., both particles being treated as elastic spheres.

A. J. M.

**Diffraction of slow neutrons by crystalline substances.** W. M. ELSASSER (Compt. rend., 1936, 202, 1029—1030).—Theoretical. Crit. angles of  $26^\circ$  have been calc. for Ni and Fe, and  $25^\circ$  for Cu.

R. S. B.

**Disintegration of boron.** D. ROAF (Proc. Roy. Soc., 1936, A, 153, 568—576).—Using  $\text{BF}_3$  in a Wilson chamber, the recoils from the disintegration of  $^{10}\text{B}$  by neutrons have been photographed and their energy has been measured. Most of the disintegrations were caused by neutrons of  $< 2 \times 10^4$  e.v., but one was observed due to a neutron of energy  $> 10^5$  e.v. The energy released in the reaction  $^{10}\text{B} + ^1_0\text{n} = ^7\text{Li} + ^4\text{He}$  is  $1.50 \pm 0.05 \times 10^{-3}$  units of at. mass. The  $^{10}\text{B}$  mass has been corr. to  $10.0136 \pm 0.0014$ .

L. L. B.

**Radioactivity and atomic theory.** (LORD) RUTHERFORD (J.C.S., 1936, 508—516).—Faraday lecture.

**Deviation in passing through magnetised iron of (I) high-energy charged particles, (II) cosmic-ray charged particles.** (I) W. F. G. SWANN, (II) W. E. DANFORTH, and W. F. G. SWANN (Physical Rev., 1936, [ii], 49, 574—582, 582—591).—I. Mathematical.

II. Investigations by means of Geiger counters of the deflexions of cosmic-ray electrons in passing through the saturated Fe core of an electromagnet are described. Observed effects are compared with calc. results to determine limits of the effective magnetic vector within the Fe.

N. M. B.

**Geomagnetic effect on cosmic radiation in the stratosphere.** M. G. E. COSYNS (Nature, 1936, 137, 616).

L. S. T.

**Structure of cosmic rays.** R. HILGERT and W. BOTHE (Z. Physik, 1936, 99, 353—362).

A. B. D. C.

**Nature and range of radiation particles (collision radiation) involved in Hoffmann collisions.** H. NIE (Z. Physik, 1936, 99, 453—480).—The effect of various thicknesses of Pb, Fe, and Al shields is described.

A. B. D. C.

**Relationship between Hoffmann collisions and showers.** J. BØGGILD (Naturwiss., 1936, 24, 280—281). A. J. M.

**Rôle of chemistry in the study of atomic transmutation.** F. A. PANETH (Nature, 1936, 137, 560—562).—A review. L. S. T.

**Artificially radioactive materials.** E. SEGRÈ (Nuovo Cim., 1935, [ii], 12, 232—239; Chem. Zentr., 1935, ii, 1129).—The life periods of a no. of artificial radio-elements are correlated with the hardness of the emitted  $\beta$ -radiation, as measured by absorption in Al. The variation in intensity of different activities of the same element on activation with fast and slow neutrons (e.g., comparison of the behaviour of the 20-min. and 23-hr. periods of Ga) is discussed.

J. S. A.

**Nuclear processes with the mean corpuscular energy of star centres.** R. DÖPEL (Naturwiss., 1936, 24, 237).—The nuclear reactions  ${}^2_1\text{D} + {}^2_1\text{D} = {}^3_1\text{H} + {}^1_1\text{H}$  and  ${}^2_1\text{D} + {}^2_1\text{D} = {}^3_2\text{He} + {}^1_0\text{n}$  have been observed at potentials < previously. The efficiency of the first reaction was  $10^{-16}$  at 5 kv., and  $10^{-14}$  at 15 kv. The efficiency of the second reaction was somewhat greater. 5000 e.kv. corresponds with the mean energy of the atoms in the centre of a star at a temp. of  $4 \times 10^7$ . Hence transmutation occurring in stars can now be investigated in the laboratory under similar conditions.

A. J. M.

**Radioactive elements of low atomic number.** W. A. FOWLER, L. A. DELSASSO, and C. C. LAURITSEN (Physical Rev., 1936, [ii], 49, 561—574).—Radioactive elements of low at. no. were produced by bombarding Li, B, C,  $\text{NaNO}_2$ , and  $\text{CaF}$  with high-velocity deuterons. The energy distribution of the electrons and positrons emitted was determined by a Wilson cloud-chamber and magnetic field. The electron and positron spectra max. energy ranges are 5—13 and 1—2 m.e.v., respectively. The form of the spectra agrees with the Konopinski theory (cf. A., 1935, 1048). Data are tabulated for the radioactive elements  ${}^3_1\text{B}$ ,  ${}^{11}_5\text{C}$ ,  ${}^{13}_6\text{N}$ ,  ${}^{15}_7\text{O}$ ,  ${}^{17}_8\text{F}$ ,  ${}^{7}_3\text{Li}$ ,  ${}^{10}_5\text{B}$ ,  ${}^{10}_5\text{N}$ , and  ${}^{19}_9\text{F}$ .

N. M. B.

**Radioactive argon.** A. H. SNELL (Physical Rev., 1936, [ii], 49, 555—560).—When bombarded with high-speed deuterons, A yields a radioactive product with decay period  $110 \pm 1$  min., and emitting negative electrons. The activity is shown chemically to be due to an A isotope, and the reaction is probably  ${}^{40}_{18}\text{A} + {}^2_1\text{H} = {}^{41}_{18}\text{A} + {}^1_1\text{H}$ . Absorption measurements of the  $\beta$ -particles show a max. energy of about 1.1 mv. (cf. Kurie, this vol., 542). The excitation function of the radioactivity favours the Oppenheimer-Phillips (cf. A., 1935, 1296) rather than the Gamow theory for this type of reaction. The same radioactive substance was made by intense bombardment of A by neutrons.

N. M. B.

**Time decay of atomic nuclear processes.** R. DÖPEL (Z. Physik, 1936, 99, 161—168).—Time decay of  $\alpha$ -ray artificial radioactivity was detected for In, Cs, and Ce.

A. B. D. C.

**Artificial radioactivity of tin.** M. E. NAHMIAS (Compt. rend., 1936, 202, 1050—1052).—Sn shows a feeble induced radioactivity after irradiation by

neutrons from Rn-Be in air and paraffin. Chemically pure and commercial Sn give the same result, probably due to the reaction  ${}^{123}_{50}\text{Sn} + {}^1_0\text{n} \rightarrow {}^{123}_{50}\text{Sn} \rightarrow {}^{123}_{51}\text{Sb} + e^-$ , the small % of the isotope 122 (5%) accounting for the feebleness of the induced radioactivity. The period is 5.3—7.1 min.

R. S. B.

**Induced radioactivity of nickel and tin.** R. NAIDU (Nature, 1936, 137, 578—579).—When irradiated by slow neutrons from a Rn-Be source, Geiger-Müller counters with walls of Ni and Sn show induced radioactivity. With Ni the half-life period is  $180 \pm 10$  min. and with Sn,  $8 \pm 2$  and  $18 \pm 2$  min.

L. S. T.

**Artificial radioactivity produced by bombardment with neutrons. VII—IX.** E. AMALDI, O. D'AGOSTINO, E. FERMI, B. PONTECORVO, F. RASETTI, and E. SEGRÈ (Ric. sci. Prog. tec., 1934, 5, II, 467—470; 1935, 6, I, 123—125, 435—437; Chem. Zentr., 1935, ii, 969—970).—VII. New activities and their respective half-life periods are recorded for K, Ga, Cd, In, Sb, Pr, Mn, As, and Rh. Separation of the active material by Szilard and Chalmers' method (A., 1934, 1152) has been applied to Cl, As, and Mn in org. and inorg. compounds. Effective collision areas for Cl, Co, Ag, Cd, In, I, Pr, Au, and Hg are recorded. Increase in the efficiency of activation by surrounding the neutron source with Pb, graphite, and basalt in place of H compounds is discussed.

VIII. Half-val. periods are recorded for Mg, Si, Ba, Gd and W (new activities), and for Si, P, V, Ga, Br, Ag, I, Pr, Re, Ir, and Au (more accurate data).  $\gamma$ -Ray activity has been detected with Rh, Br, V, Mn, Cu, Ga, In, Sb, I, W. For B, the nuclear reaction  ${}^{10}_5\text{B} + {}^1_0\text{n} = {}^7_3\text{Li} + {}^4_2\text{He}$  is advanced. Chemical separation of the active species produced from Sb, W, and Re show them to be isotopes of these elements.

IX. Accurate life periods are recorded for Al, S, Cl, Cu, Zn, Ga, Rh, Sb, and Th. Chemical separation of the active material from P, Cl, Cu, Ga, and Si shows the activity to belong to an isotope of the same element; the activity of Zn is due to a Cu isotope. The 10-sec., 13-min., and 100-min. activities of neutron-activated U are attributed to successive transformations, probably of the elements 92, 93, and 94, all of at. wt. 239. Co, Cu, and Au emit  $\gamma$ -rays.

J. S. A.

**Artificial radioactivity induced by neutron bombardment.** I. V. KURTSCHATOV, G. D. LATISCHEV, L. M. NEMENOV, and I. P. SELINOV (Physikal. Z. Sovietunion, 1936, 8, 589—594; cf. A., 1935, 1050).—The radioactivity produced in Pd, Re, and Os when bombarded with slow neutrons was investigated. In the case of Pd, the existence of two active substances of half-life 15 min. and 12 hr., respectively (Fermi, A., 1934, 1284), has been confirmed, and two further substances of half-life 3 min. and approx. 60 hr., respectively, have been found. With Re, two radioactive substances of half-life 20 and 85 hr., respectively, have been obtained. Os gives only a very weak activity of half-life approx. 40 hr.

A. J. M.

**Intensity of scattered radiation from moving free electrons.** E. C. G. STUECKELBERG (Helv. phys. Acta, 1935, 8, 197—204; Chem. Zentr., 1935, ii, 986).—Theoretical.

J. S. A.

**Electronic nature of light.** J. L. DESTOUCHES (Compt. rend., 1936, 202, 921—923).—Theoretical.

H. J. E.

**Concept of [chemical] element.** (MLLE.) C. RAMNOUX and J. MARTINET (Bull. Soc. chim., 1935, [v], 2, 1474—1485).—The present meaning of the word "element" is not sufficiently precise. Considerable restriction in its use is suggested, to avoid confusion and ambiguities.

R. C. M.

**Properties of the spin of a system of corpuscles.** J. L. DESTOUCHES (Compt. rend., 1936, 202, 387—389).—Mathematical.

J. W. S.

**Deviations from the Maxwell equations resulting from the theory of the positron.** N. KEMMER and V. WEISSKOPF (Nature, 1936, 137, 659).

L. S. T.

**Structure of atomic nuclei.** H. A. WILSON (Proc. Roy. Soc., 1936, A, 153, 493—504; cf. this vol., 266).—The energies of formation of several atoms have been calc. from nuclear reaction energies. Assuming that the energy is due to the formation of linkings between the neutrons and protons forming the atom, arrangements of neutrons and protons and linking energies are found which give the correct vals. of energies of formation.

L. L. B.

**Origin of mass in neutrons and protons.** M. N. SAHA (Indian J. Physics, 1936, 10, 141—153).—Theoretical.

A. J. M.

**Neutron-proton exchange interaction.** M. S. PLESSET (Physical Rev., 1936, [ii], 49, 551; cf. Breit, this vol., 134).—Mathematical.

N. M. B.

**Conservation of energy and momentum in atomic processes.** E. J. WILLIAMS (Nature, 1936, 137, 614—615).—The uncertainty principle is discussed in connexion with Shankland's results (this vol., 265).

L. S. T.

**Exchange rules in the neutrino theory of light.** P. JORDAN (Z. Physik, 1936, 99, 109—113).

A. B. D. C.

**Heisenberg's oscillator model and nuclear moments.** P. PAVINSKI (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 169—171).—Using a simplified Hartree method with the "eigen"-functions of the spatial harmonic oscillator to describe the states of the individual particles, in conjunction with the Lande assumption that only the unpaired proton is responsible for the mechanical and magnetic moments of a nucleus, it is possible to calculate these moments, in agreement with experiment.

A. J. M.

**Theory of the relativistic degenerate corpuscular gases and their employment in the atomistic theory of Brownian molecular motion.** M. SATÔ (Sci. Rep. Tôhoku, 1936, 24, 565—586).—On the basis of Glaser's theory (A., 1935, 679) the dynamics of the pressure of light and the atomistic theory of Brownian movement have been studied. Earlier work (A., 1934, 252) is discussed.

M. S. B.

**Oil-drop method and the electronic charge.** E. BACKLIN and H. FLEMBERG (Nature, 1936, 137, 655—656).—Preliminary results with an improved apparatus give  $e = 4.800 \times 10^{-10}$  abs. e.s.u. in good agreement with spectroscopic vals.

L. S. T.

**Measurement of  $e/m$  with a triode valve.** S. RAM (Indian J. Physics, 1936, 10, 127—132).—The val. of  $e/m$  has been found by observing the effect of a magnetic field on the grid current of a triode. Two formulæ gave mean vals. for  $e/m$  of  $1.77 \times 10^7$  and  $1.79 \times 10^7$ , respectively.

A. J. M.

**Relation between the fundamental constants of physics.** A. HAAS (Physical Rev., 1936, [ii], 49, 636).—Mathematical.

N. M. B.

**New electrodynamics and the fine structure constant.** L. INFELD (Nature, 1936, 137, 658).

L. S. T.

**Determination of the constant  $\alpha$  of fine structure by the unitary theory of the electromagnetic field.** S. A. DE MAYOLO (Bol. Soc. Quim. Peru, 1935, 1, 26—40).—The unitary theory, by which the electromagnetic field in a vac. is due to central forces exerted between two equal non-corpuscular quantities of electricity, of opposite sign, in dynamic equilibrium, moving with the velocity of light, is further developed.

L. A. O'N.

**Absorption spectra of iodine solutions. I. Solutions in mineral acids.** A. V. PAMFILOV and R. V. TEIS (J. Gen. Chem. Russ., 1935, 5, 1833—1838).—The absorption spectra of I in aq. HCl or H<sub>2</sub>SO<sub>4</sub> are of the same type as in org. solvents.

R. T.

**Ultra-violet absorption of ice.** E. J. CASSEL (Proc. Roy. Soc., 1936, A, 153, 534—541).—The thin films of ice used showed a continuous absorption with a long- $\lambda$  limit at about 1670 Å., which varied only slowly with the thickness of the film, indicating an abrupt rise in the coeff. of absorption. The absorption band of ice is shifted towards short waves relatively to that of vapour by 0.6—0.7 e.v. The absorption of heavy ice begins at a shorter  $\lambda$  than that of light ice, and the amount of the shift is of the same order of magnitude as that found for H<sub>2</sub>O vapour by Franck and Wood (A., 1934, 828).

L. L. B.

**New bands of nitric oxide.** M. DUFFIEUX and L. GRILLET (Compt. rend., 1936, 202, 937—939; cf. A., 1935, 1051).—Measurements of rotational fine structure are recorded for the bands about 6000 Å. previously described, which are attributed to ionised NO.

H. J. E.

**Absorption spectra of (A) the hydrogen chloride molecule, (B) the hydrogen bromide molecule, and their upper unstable states.** H. TRIVEDI (Proc. Nat. Acad. Sci. India, 1936, 6, 18—28, 29—34).—(A) The absorption coeffs. at temp. in the range 20—980° were obtained photographically in an investigation of the continuous absorption spectrum of HCl, and the contributions of individual vibrational levels to the total absorption were found. The vals. of the mol. consts. for the unstable state calc. from observational data at different sets of  $\lambda\lambda$  are in good agreement. The energy of dissociation of the mol. in its unstable state corresponds with the heat of formation of the mol. determined thermochemically.

(B) Investigations and results for HBr are reported similarly to the case of HCl. Analogous agreements are obtained.

N. M. B.

**Absorption spectra of hydrochloric acid and various chlorides in the far ultra-violet.** R. TRÉHIN (Ann. Physique, 1936, [xi], 5, 445—607; cf. A., 1935, 9, 805; 1934, 581; 1933, 111, 1226; 1932, 107; 1931, 19).—Results are given for investigations of the effect of temp. and concn. on the absorption of HCl liquefied, aq., and in Et<sub>2</sub>O, in the range 2816—1990 Å., and of the alkali and alkaline-earth chlorides in aq. solution, of NaCl in glycerol, and of rock-salt, in the range 2500—2170 Å. For the aq. solutions the absorption increases as  $\lambda\lambda$  decrease, the effect being more marked with rise of temp. and concn. For each  $\lambda$  and temp. the extinction coeff. increases with concn.; the mol. extinction coeff. increases considerably for low concns. For a given  $\lambda$  and concn. the absorption increases with rise of temp., particularly at higher temp. and shorter  $\lambda\lambda$ , and more rapidly for the acid than for the salts, and as the cation is less hydrated. Results are discussed in relation to the theory of strong electrolytes.

N. M. B.

**Rotation-vibration spectrum of ammonia.** N. VERLEGER (Naturwiss., 1936, 24, 237).—A new region of strong absorption has been found, extending from 11,600 to 12,400 Å. It has the same origin as the 10,230 Å. band recently observed and both probably consist of two separate bands, the stronger being that lying farther in the infra-red. A weaker absorption band has been observed at 12,660 Å. and consists of a series of strong lines between which is a definite fine structure. A similar weak absorption follows the 10,230 Å. strong band, at 10,900 Å.

A. J. M.

**Band spectra of PH and NH.** C. GILBERT (Physical Rev., 1936, [ii], 49, 619—624).—Formulae for the effect of mol. rotation on spin multiplets are considered for triplet cases, and mol. consts. are calc. Results are compared with experimental data for the  $\lambda$  3400 band of PH and the  $\lambda$  3360 band of NH.

N. M. B.

**Spectrum of SiF.** R. K. ASUNDI and R. SAMUEL (Current Sci., 1936, 4, 649).—A preliminary announcement of a revised vibrational analysis of the  $\alpha$ - and  $\beta$ -bands, and an analysis of the  $\gamma$ -bands. The consts. of the mol. in its various electronic states are given.

N. M. B.

**Isotope displacements in the band spectrum of mercury deuteride.** S. MROZOWSKI (Z. Physik, 1936, 99, 236—251).

A. B. D. C.

**Ultra-violet bands of beryllium oxide.** A. CICCONE (Ric. sci. Prog. tec., 1935, 6, 123; Chem. Zentr., 1935, ii, 976).—The BeO bands from a vac. arc between Be electrodes in O<sub>2</sub> are recorded.

**Absorption spectrum of lead oxide (PbO).** H. G. HOWELL (Proc. Roy. Soc., 1936, A, 153, 683—698).—The spectrum stretches from 2600 to 6000 Å. and contains 5 systems, 3 of which are found in emission. The vibrational consts. of all the levels involved have been determined. The ground state probably dissociates into 2 excited atoms. The spectra of the related mols. PbS, PbO, SnS, SnO, GeS, and GeO are compared; among other similarities, it is found that the vibrational frequency varies from

state to state in a similar manner with oxide and sulphide mols.

L. L. B.

**Absorption spectra of nitrates in the vapour state.** M. I. HAQ and R. SAMUEL (Nature, 1936, 137, 496).—The absorption spectra of K, Ag, Mg, and Pb nitrates, obtained by heating the salt in a vac. to approx. 100° > m.p., show a flat and diffuse max. of selective absorption between 270 and 260 m $\mu$ , indicating that the nitrates are covalently bound in the vapour state. Some nitrites and sulphates show a similar phenomenon.

L. S. T.

**Carbon monoxide bands  $A^1\Pi \rightarrow X^1\Sigma$  (IV Pos.).** L. GERÖ (Z. Physik, 1936, 99, 52—64).—Rotation analysis is given between 1950 and 2700 Å.

A. B. D. C.

**Predissociation in the  $A^1\Pi$  level of CO; dissociation energy of carbon monoxide at 6.9 volts?** R. SCHMID and L. GERÖ (Z. Physik, 1936, 99, 281—284).—The predissociation limits at 9.57, 11.06, and 11.54 volts are best co-ordinated by the assumption of a ground level dissociation energy of 6.9 volts. The reaction  $C_{solid} \rightarrow C(^5S)$  is given as 177 kg.-cal.

A. B. D. C.

**Transmission of visible light through artificial homogeneous clouds.** G. R. PARANJPE and N. N. BHAGVAT (J. Univ. Bombay, 1935, 4, Part II, 28—64).—The transmission of light through clouds of H<sub>2</sub>O, CHCl<sub>3</sub>, and CCl<sub>4</sub> agrees fairly well with Stratton and Houghton's theory (Physical Rev., 1931, [ii], 38, 159). With kerosene only partial agreement is obtained, and with EtOH, PhMe, and NH<sub>2</sub>Ph no agreement. No conclusions can be reached relating the effect with the refractive index of the liquid. For all liquids except EtOH and NH<sub>2</sub>Ph red light is transmitted better than blue by large drops, contrary to theory.

J. W. S.

**Ultra-violet spectra of bromine derivatives of aniline.** (MME.) M. P. RUMPF and P. RUMPF (Compt. rend., 1936, 202, 1063—1065).—The absorption of NH<sub>2</sub>Ph and its Br<sub>1</sub>-, Br<sub>2</sub>-, Br<sub>3</sub>-, and Br<sub>5</sub>-derivatives, *p*-C<sub>6</sub>H<sub>4</sub>Cl-NH<sub>2</sub>, 4-chloro- and 4-nitro-2:6-dibromoaniline have been determined in EtOH and C<sub>6</sub>H<sub>14</sub>. There is only one band in EtOH in contrast to the many bands in C<sub>6</sub>H<sub>14</sub>. Replacement of H by Br displaces the absorption max. towards the higher  $\lambda$ , the displacement increasing in the order *m*, *o*, and *p*, with the exception of *o*- and *m*-C<sub>6</sub>H<sub>4</sub>Br-NH<sub>2</sub>, for which the max. occur in the same position. Cl has the same influence as Br, but NO<sub>2</sub> is more effective in displacing the bands. On acetylation of the *p*-Br<sub>1</sub>- and the 2:4:6-Br<sub>3</sub>-derivatives the bands disappear, but in alcoholic NaOH intense absorption occurs. The Br<sub>1</sub>- and Br<sub>3</sub>-derivatives in aq. EtOH containing HCl give no bands, except for 2:6-C<sub>6</sub>H<sub>3</sub>Br<sub>2</sub>-NH<sub>2</sub>, which is a very weak base.

R. S. B.

**Influence of cyclisation on the "colour" of molecules. Ultra-violet absorption of derivatives of diphenylurethane and fluorene.**—See this vol., 726.

**Absorption spectra. I. Application to intermediate products of dyes.** (MLLE.) C. L. HARBERTS, P. M. HEERTJES, L. J. N. VAN DER HULST, and

H. I. WATERMAN (Bull. Soc. chim., 1936, [v], 3, 643—655).—The absorption spectra of  $\text{NH}_2\text{Ph}$ ,  $\text{NH}_2\text{Ph}\cdot\text{HCl}$ ,  $\text{PhN}_2\text{Cl}$ , *p*-toluidine, *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{N}_2\text{Cl}$ , and  $(\text{NPh})_2$  in  $\text{H}_2\text{O}$ ,  $\text{EtOH}$ , or hexane have been determined.

E. S. H.

**Spectrochemistry of organic nitrogen compounds.** (MME.) RAMART-LUCAS (Bull. Soc. chim., 1936, [v], 3, 723—738).—A preliminary discussion.

E. S. H.

**Absorption and deformation of valency angles.** (MME.) RAMART-LUCAS (Bull. Soc. chim., 1936, [v], 3, 738—745).—A preliminary discussion of work to be published on the absorption spectra of org. compounds.

E. S. H.

**State of the benzene molecule in solution.**—See this vol., 713.

**Absorption spectrum of dinaphthopyrone.** W. SATURNINA (Acta phys. polon., 1933, 2, 283—284; Chem. Zentr., 1935, ii, 1159).—Three max. (3540, 3375, and 3175 Å.) are shown. H. N. R.

**Optical absorption of porphyrins.** V. A. STERN and H. WENDERLEIN (Z. physikal. Chem., 1936, 176, 81—124; cf. this vol., 545).—In normal porphyrins with an oximated CO group the  $\text{:N}\cdot\text{OH}$  group has little effect on the optical absorption, whereas with porphyrins having one CO group only, and that in the isocyclic ring, the effect of the  $\text{:N}\cdot\text{OH}$  is greater, the absorption curve being of the rhodo-type. In general, the effect of the  $\text{:N}\cdot\text{OH}$  is in the direction of a curve of the rhodo-type. Porphyrins with a  $\cdot\text{CN}$  directly attached to one of the nuclei of the porphin framework have a curve of a pronounced rhodo-type. Various substitutions in the dihydroporphyrin system have a particularly marked effect on the mol. extinction coeff.,  $\epsilon$ , of the red band I; the influence on the other bands is relatively slight. A  $\cdot\text{CHO}$  in position 3 or, to a much smaller extent, a  $\text{:N}\cdot\text{OH}$  depresses  $\epsilon$ . Introduction of Mg raises  $\epsilon$  considerably, and shifts the band max.  $\beta\delta$ -Diminocoproporphyrin II  $\text{Me}_4$  ester (this vol., 86) appears to be a coproporphyrin II  $\text{Me}_4$  ester in which only the  $\beta$ - and  $\delta$ -C atoms are replaced by *tert.* N. The  $\cdot\text{CO}_2\text{Me}$  in the position 6 in the chlorins has little effect on the optical absorption. A  $\text{C}\cdot\text{OH}$  or similar group with a free CO group at the  $\gamma$ -C of the porphin system changes the type of the spectrum. The "green anhydride" of Fischer *et al.* (A., 1931, 431) appears to be an anhydride of rhodoporphyrin-XV- $\gamma$ -carboxylic acid. The phyllochlorin obtained by heating phylloporphyrin with  $\text{NaOEt}$  (A., 1929, 941) differs from natural dihydrophyllochlorin only in being optically inactive.

R. C.

**Ultra-violet spectrum of hæmoglobin derivatives and bile pigment.** G. A. ADAMS (Nature, 1936, 137, 578).—Many derivatives of hæmoglobin (enumerated) show an absorption band in the region of 4100 Å., due to the porphyrin ring system in the hæm radical, and independent of the nature of the globin present. With bilirubin there is no characteristic band at 4100 Å., but a somewhat indefinite absorption from 5000 to approx. 4300 Å. L. S. T.

**Ultra-violet absorption of Cellophane and of tissues and vegetable organs.** E. GILLES (Compt.

rend., 1936, 202, 968—970).—The transmission of Cellophane is variable. Absorption becomes considerable at approx. 2200—2600 Å. Vegetable membrane transmits light down to 2397 Å. Absorption by leaves is intense. Data for various species are given.

H. J. E.

**Infra-red reflexion spectra of silicates.** II. F. MATOSSI and H. KRÜGER (Z. Physik, 1936, 99, 1—23).—Spectra are given between 8 and 26  $\mu$  for 26 silicates: willemite, zircon, fayalite, olivine, sillimanite, chondrodite, thortveitite, hemimorphite, benitoite, cordierite, ænigmatite, anthophyllite, serpentine, antigorite, agalmatholite, nepheline, cancrinite, scapolite, sodalite, natrolite, danburite, datolite, axinite, epidote, zoisite, and leucite. The spectra fit the scheme already proposed (cf. A., 1934, 829).  $\text{Be}_2\text{SiO}_4$  and  $\text{Li}_2\text{WO}_4$  spectra are compared.

A. B. D. C.

**Infra-red absorption of organic compounds containing hydroxyl and imino-groups.**—See this vol., 718.

**Near infra-red bands of methane.** I. General survey, and a new band at 11,050 Å. W. H. J. CHILDS (Proc. Roy. Soc., 1936, A, 153, 555—567).—The near infra-red bands of  $\text{CH}_4$  in the region 10,000—12,000 Å. have been photographed under high dispersion. Much new detail has been observed in the bands at 11,350, 11,620, and 11,870 Å., and two new bands have been discovered at 11,050 and 11,230 Å. The latter is interpreted as the second harmonic of the fundamental at 3.3  $\mu$ , and is described in detail. Several inaccuracies in the consts. of the  $\text{CH}_4$  mol. derived from Cooley's measurements (A., 1926, 659) are indicated.  $I$  in the ground state =  $5.267 \times 10^{-40}$  g.cm.<sup>2</sup>, and the vibration moments of momentum in the 7.7 and 3.3  $\mu$  bands are 0.45 and 0.050, respectively.

L. L. B.

**Rotation-vibration spectrum of acetylene in the photographic infra-red.** G. W. FUNKE (Z. Physik, 1936, 99, 341—352).—Nine new bands are recorded in this region.

A. B. D. C.

**Near infra-red absorption of hydrocarbons.** II. Gaseous paraffins, olefines, and acetylene. P. GÄNSWEIN and R. MECKE. III. Halogen derivatives of methane, ethane, and ethylene. O. VIERLING and R. MECKE. IV. Anharmonic valency vibrations of polyatomic molecules. R. MECKE (Z. Physik, 1936, 99, 189—203, 204—216, 217—255).—II. Absorption is given between 10,000 and 7000 Å. for  $\text{C}_2\text{H}_6$ ,  $\text{C}_2\text{H}_8$ ,  $\text{C}_4\text{H}_{10}$ ,  $\text{C}_6\text{H}_{12}$ ,  $\text{C}_8\text{H}_{14}$ ,  $\text{C}_2\text{H}_4$ ,  $\text{C}_3\text{H}_6$ ,  $\text{C}_4\text{H}_8$ ,  $\text{C}_4\text{H}_6$ ,  $\text{C}_2\text{H}_2$ ,  $\text{C}_4\text{H}_2$ ,  $\text{C}_4\text{H}_4$ , and  $\text{MeCHO}$ . Different degrees of saturation give different absorption regions for the third CH overtone: paraffins absorb between 8950 and 9150 Å., olefines between 8600 and 8750 Å., and acetylenes from 7850 to 7900 Å. (cf. A., 1935, 1444).

III. The third CH overtone was examined for the 6 Cl- and Br-derivatives of  $\text{CH}_4$ , for 5 Cl- and 3 Br-derivatives of  $\text{C}_2\text{H}_6$ , for 3 Cl-derivatives of  $\text{C}_2\text{H}_4$ , and for  $\text{C}_3\text{H}_7\text{Cl}$  and  $\text{C}_3\text{H}_5\text{Cl}$ . The change in CH bands with halogen substitution is small compared with saturation of the C-C valency, except for unsymmetrical compounds (as  $\text{C}_2\text{H}_3\text{Cl}_3$ ) where bands are ascribed to larger groups (as  $\text{CHCl}_2\cdot$ ).

IV. Anharmonic vibration levels are investigated with Schrödinger's vibration equation taking into account perturbations of the second order. Various degrees of coupling and resonance are discussed, particularly in relation to ascribing frequencies to at. groups. The CH group has loose coupling, and its overtones can be described in terms of the fundamental frequency in the ordinary manner.

A. B. D. C.

**Residual ray bands of LiF and MgO.** K. KORTH (Nachr. Ges. Wiss. Göttingen, 1935, [ii], 1, 187—194; Chem. Zentr., 1935, ii, 976).—The proper frequencies of mols. on the surface of LiF and MgO crystals differ from those of mols. in the interior. The reflexion max.  $\beta$  and transmission min.  $\delta$  are due to interior mols.; the reflexion max.  $\alpha$  and transmission min.  $\gamma$  are due to surface mols. J. S. A.

**Isolation of the 4358 Å. triplet of the mercury arc for use in Raman spectra.** C. SANNIÉ, L. AMY, and V. POREMSKI (Compt. rend., 1936, 202, 1042—1044).—The ratio between the densities of the lines 4358 and 4046 Å. transmitted by  $\text{PhNO}_2$  is 60; the ratios for 4358 and 4916 Å. transmitted by gentian-violet, rhodamine-S and -5G extra are 10.8, 15.2, and 19. A filter for removing lines of the Hg arc other than 4358 Å. in the neighbourhood of this line consists of 6%  $\text{PhNO}_2$  and 0.01% rhodamine-5G extra in EtOH, the transmission being 1/1000 for 4046 and 4916 Å., and 0.95 for 4358 Å. The filter changes slowly under the influence of light.

R. S. B.

**Polarisation of the Raman bands of water and deuterium oxide.** R. ANANTHAKRISHNAN (Proc. Indian Acad. Sci., 1936, 3, A, 201—205).—In the three principal Raman bands of  $\text{H}_2\text{O}$  and  $\text{D}_2\text{O}$  the depolarisation increases with frequency shift. The bands 1235 and 175  $\text{cm}^{-1}$  of  $\text{D}_2\text{O}$  are 50—60% and 6/7 depolarised, respectively. The bands 175, 500, and 750  $\text{cm}^{-1}$  of  $\text{H}_2\text{O}$  are highly depolarised. The results are discussed.

L. J. J.

**Chlorotitanic acid. Raman spectrum.** (MME.) M. E. P. RUMPF (Compt. rend., 1936, 202, 950—952).—Mixtures of  $\text{TiCl}_4$  and HCl show new Raman lines at 251.7, 340, and 463  $\text{cm}^{-1}$  which, by analogy with corresponding lines for  $\text{H}_2\text{SnCl}_6$ , are attributed to  $\text{H}_2\text{TiCl}_6$ . The new lines are not observed in a dil. HCl solution of  $\text{TiCl}_4$ .

H. J. E.

**Raman spectrum of acetylene.** S. BHAGAVANTAM and A. V. RAO (J. Chem. Physics, 1936, 4, 293).—The frequencies given by  $\text{C}_2\text{H}_2$  gas are 589, 646, 1973, and 3371  $\text{cm}^{-1}$ . Glockler and Morrell's assumption of a bent mol. (this vol., 269) is unnecessary.

L. J. J.

**Raman spectra of deuteriochloroform and deuteromethyl alcohol. Vibration model of the type  $\text{XY}_3\text{Z}$ .** O. REDLICH and F. PORDES (Monatsh., 1936, 67, 203—212).—The prep. of  $\text{CDCl}_3$  (from  $\text{CCl}_3\text{CHO}$  and KOD) and  $\text{MeOD}$  [from  $\text{Mg}(\text{OMe})_2$  and  $\text{D}_2\text{O}$ ] is described. Their Raman spectra confirm previously found relations between the frequencies of isotopes. The relations between frequency and force consts. are deduced for the  $\text{XY}_3\text{Z}$ -type mol. and the consts. of a central and valency-energy model deduced. The data for  $\text{CDCl}_3$  can be inter-

preted either on a central energy model or on a central and valency energy model. J. W. S.

**Raman spectra and vibrations of mono-deuterobenzene and *p*-dideuterobenzene.** O. REDLICH and W. STRICKS (Monatsh., 1936, 67, 213—221; cf. this vol., 137).—Data recorded previously are expanded and discussed. J. W. S.

**Interpretation of the Raman spectra of formic acid and metallic formates.** J. GUPTA (Indian J. Physics, 1936, 10, 117—125).—The Raman spectra of  $\text{HCO}_2\text{H}$  (liquid and aq. solution), Na, Ba, and Cd formates (solid and aq. solution), and an aq. solution of  $\text{CCl}_3\cdot\text{CO}_2\text{Na}$  have been investigated. The line 2963  $\text{cm}^{-1}$  observed in the case of pure  $\text{HCO}_2\text{H}$  is also present in the aq. solution of the acid, but in the solid formates it is split into two lines, 2963 and 2574  $\text{cm}^{-1}$ ; the former is absent from the Raman spectra of solutions of the salts, its place being taken by a line at 2834  $\text{cm}^{-1}$ . The 1398  $\text{cm}^{-1}$  line in the spectrum of  $\text{HCO}_2\text{H}$  is also replaced by two (1353, 1375  $\text{cm}^{-1}$ ) in aq. solutions of the salts, and the two lines at 1675 and 1724  $\text{cm}^{-1}$  for the acid are replaced by one at 1650  $\text{cm}^{-1}$  in solutions of the salts. The shift of the 1398 line to 1353  $\text{cm}^{-1}$  cannot be explained as due to the deformation vibration of CH in the  $\cdot\text{CHO}$  (Venkateswaran, this vol., 268), which is responsible for the 1375 line. It is assumed to be due to the oscillation of the  $\text{O}\cdot\text{C}\cdot\text{O}$  group in the Hantzsch structure of formates. A. J. M.

**Constitution of formic acid and formates.** P. B. SARKAR and B. C. RAY (Nature, 1936, 137, 495—469; cf. A., 1934, 586).—Raman spectra of solutions of  $\text{HCO}_2\text{H}$  and formates, and the infra-red absorption curves of  $\text{HCO}_2\text{Na}$ , solid and in aq. solution, indicate that  $\text{HCO}_2\text{H}$  and solid formates are normal in structure for they show the  $\cdot\text{CH}\cdot$  linking. Prototropic change of the true formate ion,  $\text{H}\cdot\text{C}(\text{O})\cdot\text{H}$  into  $\text{C}(\text{O})\cdot\text{OH}$  is suggested to account for this. L. S. T.

**Constitution of formic acid and formates.** I. T. S. WHEELER. II. T. R. SESHADRI. III. R. M. HALASYAM (Current Sci., 1936, 4, 650—651).—I. The parachor vals. for  $\text{HCO}_2\text{H}$  are discussed (cf. Halasyam, this vol., 412).

II, III. Polemical.

N. M. B.

**Raman and infra-red spectra of stereoisomeric 1:3- and 1:4-dimethylcyclohexanes and of 1:1-dimethylcyclohexane.** J. LECOMTE, L. PIAUX, and O. MILLER (Bull. Soc. chim. Belg., 1936, 45, 123—129).—The Raman and infra-red spectra of the 1:3- and 1:4-stereoisomerides do not show any resemblance to those of 1:1-dimethylcyclohexane, nor yet to those of the 1:2-derivatives previously examined (A., 1934, 345, 716). As regards the relation between Raman and infra-red spectra for any one compound, in some cases the same bands appear in both types of spectra, but not with the same intensity. In other cases important bands in one spectrum never appear at all in the other. Investigation of one spectrum alone, therefore, is not sufficient to give all the modes of vibration of these mols. M. S. B.

**Raman effect of methylcyclopentano derivatives.** M. GODCHOT, (MLLE.) G. CAUQUIL, and R.

CALAS (Compt. rend., 1936, 202, 1129—1130).—Ketonic, alcoholic, and acetic ester derivatives possess the principal frequencies of the methylcyclopentane nucleus (cf. A., 1932, 559). Ketones and esters give the characteristic C:O frequency, 1744  $\text{cm}^{-1}$ . Corresponding optically active and racemic compounds have identical spectra. For the range 200—800  $\text{cm}^{-1}$  there is a strong resemblance between the spectra of *cis*- and *trans*-alcohols, but not of the corresponding esters. M. S. B.

**Raman spectrum and constitution of pyrazole and of some of its derivatives.** G. B. BONINO and R. MANZONI-ANSIDEI (Atti R. Accad. Lincei, 1935, [vi], 22, 438—443).—Raman lines for pyrazole (I) and its Me derivatives are recorded. The spectrum of (I) contains 11 lines, similar to those of thiophen and pyrrole, but there are no lines characteristic of the double linking. O. J. W.

**Raman spectrum of dimethylfurazan and of dimethyloxidiazole.** R. MANZONI-ANSIDEI (Atti R. Accad. Lincei, 1935, [vi], 22, 444—447).—The Raman spectra of dimethylfurazan and of dimethyloxidiazole contain 21 and 18 lines, respectively (cf. A., 1933, 886). O. J. W.

**Raman spectrum of some substituted pyrrole-aldehydes.** G. B. BONINO, R. MANZONI-ANSIDEI, and D. DINELLI (Atti R. Accad. Lincei, 1935, [vi], 22, 448—452).—The Raman spectra of the *C*-alkyl-pyrrolealdehydes investigated all show an intense diffuse line at 1620—1650  $\text{cm}^{-1}$ , which can be attributed to the strongly perturbed C:O group, and also a line at 1560—1570  $\text{cm}^{-1}$ , which does not occur in the spectrum of pyrrole-2-aldehyde and is probably due to a double linking. O. J. W.

**Light scattered by cloudy media and its polarisation.** H. VON DEM BORNE (Z. Physik, 1936, 99, 73—102).—Scattering was investigated for smokes and vapours by means of a  $\text{Cu}_2\text{O}$  cell at 0.55 and 1.0  $\mu$ . A scattering function was determined and applied to meteorological problems. A. B. D. C.

**Scattering of light in optical glasses.** R. S. KRISHNAN (Proc. Indian Acad. Sci., 1936, 3, A, 211—220).—The intensity and polarisation of the light scattered transversely by 17 optical glasses has been studied, with the incident light unpolarised, horizontally polarised, and vertically polarised. All the glasses gave a weak fluorescence. The depolarisation measurements indicate the presence of anisotropic mol. aggregates of size not small compared with the  $\lambda$  of light. L. J. J.

**Emission of ultra-violet radiation in the Reboul effect.** O. VIKTORIN (Compt. rend., 1936, 202, 941—943).—Very feeble radiation (2600—2000 Å.) was detected with a photo-counter. H. J. E.

**Radiation emitted in the dehydration and hydration of quinine sulphate.** R. AUDUBERT and M. PROST (Compt. rend., 1936, 202, 1047—1049; cf. A., 1935, 1055).—The ultra-violet radiation emitted on the dehydration on heating and hydration of quinine sulphate has been studied using a CuI photo-cell sensitive to 2000—2500 Å. The emission accompanying hydration is 6—8 times that given on dehydration. The radiation comes from the sur-

face layers, since it is independent of the thickness of the specimens used. A strong magnetic field has no effect. On dehydration of the salt the radiation is probably partly due to a modification in the crystal structure. The energy emitted on hydration is only 10<sup>-11</sup>—10<sup>-12</sup>% of the heat of hydration. R. S. B.

**Phosphorescent beryllium nitride.** S. SATOH (Sci. Papers Inst. Phys. Chem. Tokyo, 1936, 29, 41—46; cf. A., 1934, 741).— $\text{Be}_3\text{N}_2$  gives strong phosphorescence when mixed with  $\text{Al}_2\text{O}_3$  and excited by a Hg-vapour lamp. The phosphorescence increases with the % of  $\text{Al}_2\text{O}_3$  up to a max. at 30%, and does not occur without excitation. 2% of Ti and Zr confer no phosphorescence on  $\text{Be}_3\text{N}_2$ ; 2% of Mn gives a feeble effect. The cathode-ray spectrum of  $\text{Be}_3\text{N}_2 + 30\%$   $\text{Al}_2\text{O}_3$  is continuous at 4200—4900 Å., with a max. at approx. 4650 Å. The spectra of Be,  $\text{Be}_2\text{O}_3$ , and  $\text{Al}_2\text{O}_3$  are very faint. R. S. B.

**Relations between luminescent power and lattice structure. I. Layered-lattice crystals.** A. KUTZELNIGG (Angew. Chem., 1936, 49, 267—268).—A lecture. E. S. H.

**Fluorescence spectra of deuteroporphyrin and pyroporphyrin; fine structure, emission in the near infra-red.** C. DHÉRE and O. BIERMACHER (Compt. rend., 1936, 202, 442—444).—The fluorescence spectrum of deuteroporphyrin in  $\text{Et}_2\text{O}$  shows a principal band at 6230 Å. and six other bands in the orange and red region. Pyroporphyrin shows analogous bands. Copro-, deuter-, and pyro-porphyrin show supplementary bands in the near infra-red of shorter  $\lambda$  than those of protoporphyrin. The infra-red fluorescence is probably due to photo-porphyrins produced by the irradiation. J. W. S.

**Carcinogenic action and absorption and fluorescence spectra of 1:2-benzpyrene.** C. SANNIÉ (Biochem. J., 1936, 30, 704—706).—Ultra-violet absorption and fluorescence spectra of 1:2-benzpyrene, 4-keto-1':2':3':4'-tetrahydro-1:2-benzpyrene, and  $\beta$ -1-pyrenoylpropionic acid in different solvents and in different states of purity, and of various fractions of Schroeter mixture, are given. It is unlikely that the fluorescence spectra characteristic of purified hydrocarbons would be recognisable in complex mixtures. H. D.

**Fluorescence spectrum of 1:2-benzpyrene.** W. V. MAYNEORD (Biochem. J., 1936, 30, 707—708).—The fluorescence spectrum of 1:2-benzpyrene is determined and the influence of impurities alleged by Sannié (see above) is denied. H. D.

**Inhibiting action of alkaloids on the fluorescent power of uranine in relation to the antioxidant properties of these substances.** A. BOUTARIC and J. BOUCHARD (Ann. Soc. Sci. Bruxelles, 1936, 56, B, 35—40).—A method for the comparison of the intensity of fluorescence of two different solutions is described. The diminution of the fluorescent power of uranine (I) by the action of different alkaloids at const.  $p_H$  in aq. solution as salts, or in EtOH solution as free bases, is much < by the action of the corresponding amine oxides, or genalkaloids (II), which are no longer antioxidants. The diminution in inhibiting action on the fluorescence of (I)

apparently runs parallel with the disappearance of antioxidant properties in (II) and with the reduction in toxicity also observed. M. S. B.

**Becquerel effect and photochemical sensitivity of some fluorescent dyes.** (MLLE.) C. STORA (Compt. rend., 1936, 202, 408—410).—It is concluded that the Becquerel effect and the photochemical sensitivity of a dye depend both on oxidation-reduction phenomena and on the presence of certain groups in the mol. The recovery of photosensitivity at the expense of the medium indicates the essential rôle played by the solvent. The same relation to fluorescence exists for the photo-voltaic effect as for photochemical sensitivity. J. W. S.

**Contact potential measurements on tungsten films.** D. B. LANGMUIR (Physical Rev., 1936, [ii], 49, 428—435).—Changes in contact potential, produced by varying the amount of Th on the surface and by varying the temp., were measured for a W filament by using a tube containing two filaments. Electron emission with very low accelerating fields is compared with the contact potential on the same surface and at the same temp.; the theoretical law is obeyed but not for higher fields or with differences of temp. An increasingly negative contact potential is shown with rising temp., the activated surface having the larger rate of change. Pure W shows a temp. coeff. of opposite sign, indicating a decreasing work function with rising temp. N. M. B.

**Photo-electric electron yield with counter tubes.** W. CHRISTOPH (Physikal. Z., 1936, 37, 265—269).—Counter tubes fail to register all the electrons emitted from the cathode. Increase in field strength gives an increase in photo-electric yield, and this increase is greater when the irradiating light is of longer  $\lambda$ . The difference between electrons counted and those emitted is the greater, the smaller is the difference between the limiting  $\lambda$  of the metal concerned and the  $\lambda$  of the incident light. A. J. M.

**Surface photo-electric effect in metals. II.** K. MITCHELL (Proc. Roy. Soc., 1936, A, 153, 513—533).—Theoretical. Spectral distribution curves for (a) polarised and (b) unpolarised light, and (c) energy distribution curves are calc. (b) show excellent agreement with experimental results for alkali metals, and (c) agree with Brady's results (A., 1935, 4).

L. L. B.

**Electrical evidence on calcite imperfection.** F. C. FRANK (Nature, 1936, 137, 656—657; cf. this vol., 404).—Joffé's work on electrical conduction in calcite (Ann. Physik, 1923, 72, 473) indicates the existence of lattice spaces unfilled by  $\text{Ca}^{++}$  ions, affecting the val. of  $e$ . L. S. T.

**Influence of the nature and position of groups on the photo-potential of substituted aromatic amines.** (MLLE.) H. T. NGA (Compt. rend., 1936, 202, 1049—1050; cf. A., 1935, 1463).—The photo-potential given by 0.05N solutions of *o*-, *m*-, and *p*-Me,  $-\text{NO}_2$ , and -halogen derivatives of  $\text{NH}_2\text{Ph}$  in 0.005N aq. KI, KCl,  $\text{K}_2\text{SO}_4$ ,  $\text{CuSO}_4$ ,  $\text{HCO}_2\text{Na}$ , and  $\text{KClO}_3$  at 18° have been measured, using a Hg-vapour lamp for excitation. The quantities of energy absorbed by the various compounds are approx. the

same, and all, except  $\text{C}_6\text{H}_4\text{I}\cdot\text{NH}_2$ , are stable during the experiment. The photo-effect increases from *o* to *m*, but *m* and *p* are identical. A parallel is drawn between the photo-voltaic effect and chemical reactivity. R. S. B.

**Effects of heat and ultra-violet light on the rectifying action of some crystals.** B. K. SEN (Indian J. Physics, 1936, 10, 91—102).—The action of heat and ultra-violet light on the rectifying properties of pyrolusite, galena, Cu pyrites, zincite, "Master" crystal, and particularly Fe pyrites has been investigated. The rectifying power diminishes with rise of temp., but, contrary to Khastgir *et al.* (A., 1935, 12, 682), does not disappear entirely below 200°. Irradiation of the crystal with ultra-violet light causes an increase in conductivity of all crystals examined, but the effect on rectification was small. A. J. M.

**Photo-electric barrier layer effect.** R. DEAGLIO (Atti R. Accad. Sci. Torino, 1934, 70, I, 272—275; Chem. Zentr., 1935, ii, 1137).—A Ag-Cu<sub>2</sub>O single-crystal contact rectifier showed no photo-electric barrier-layer effect, indicating the independence of the photo-electric and the unidirectional conduction effects. J. S. A.

**Changes in absorption of weak high-frequency electric fields by liquids as a function of the voltage of the field.** E. K. SAVOJSKI and B. M. KOSIREV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 109—113).—The absorption curve for AcOH shows a series of step-like discontinuities with increasing field strength. They do not depend on temp. (18—25°) or on the [AcOH]. H. J. E.

**Changes of absorption of weak electric fields of high frequency in certain substances as a function of the strength of these fields. II.** E. K. SAVOJSKI and B. M. KOSIREV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 219—220).—The crit. strengths of the high-frequency field in the range 130—180 volts per cm. in liquid AcOH persist in the solid, indicating that their existence is due to some intramol. process. The no. and val. of crit. potentials in the range 375—480 volts per cm. are the same in solid AcOH and NaOAc. N. M. B.

**Electric spark discharge in insulating liquids.** F. KOPPELMANN (Z. tech. Physik, 1935, 16, 125—141; Chem. Zentr., 1935, ii, 979).—A comprehensive review of the phenomena and theory of the discharge. J. S. A.

**Spectral distribution of the depolarisation current for X-irradiated KCl crystals.** N. KALABUCHOV and J. KURSHEV (Z. Physik, 1936, 99, 254—258).—The spectral distribution curve has two max. at 570 and 630 m $\mu$ ; the first indicates a level 1.86 volts above the conducting zone, and the second is ascribed to a level associated with  $\text{K}^+$  ions. A. B. D. C.

**Electrical conductivity of thin films of rubidium on [Pyrex] glass surfaces.** A. C. B. LOVELL (Nature, 1936, 137, 493—494).—The resistivity of films a few atoms thick deposited at 64—90° abs. is somewhat > that of the metal in bulk, but different from that previously reported. L. S. T.

**Electret.** H. NUMAKURA (J. Electrochem. Assoc. Japan, 1935, 3, 89—92).—An electret is formed by solidifying a mixture of rosin with ceresin or beeswax, or of ceresin with mastic or dammar, etc., in an electric field of 2 kv. per cm. The charges on surfaces cut perpendicular to the electric field are due to orientation of the polar mols. during solidification. The property disappears on heating for 24 hr. at 55°.

H. J. E.

**Relation between electrical conductivity and the coefficient of internal friction in melted salts.** S. KARPATSCHEV and A. STROMBERG (J. Phys. Chem. U.S.S.R., 1934, 5, 1283—1291).—A theoretical relationship between the conductivity, internal friction, mol. wt., and  $d$  is derived. Experimental vals. for the alkali and Ag halides and nitrates are 1.4—2.2 times too large.

CH. ABS. (e)

**Theory of electrolytic conduction and diffusion in crystals. III. Calculation of energies of disarray and threshold energies. Effect of pressure on electrolytic conduction.** W. JOST and G. NEHLEP (Z. physikal. Chem., 1936, B, 32, 1—21; cf. A., 1934, 949).—The previous calculations of energy of polarisation and disarray (*ibid.*, 11) have, by taking account of the displacement of the ions in the vicinity of a point of disarray, been so far improved and rendered more precise that it is possible to decide in a particular case whether the disarray consists in the presence of ionic voids of one sign together with an equiv. no. of ions in the intra-lattice space or the presence of equiv. nos. of voids of both signs (cf. A., 1935, 1302, 1305). It appears certain that the disarray in lattices of salts with ions of similar size and polarisability and not too large dielectric consts. is of the second type. Owing to the considerable effect of repulsive forces on the threshold energy which must be exceeded for migration of a void to be possible, the conductivity must be measurably influenced by pressure, the magnitude of the effect depending on which type of disarray is involved.

R. C.

**Direct-voltage experiments with electrolytically produced aluminium oxide.** G. FRANCKENSTEIN (Ann. Physik, 1936, [v], 26, 17—54).—The dielectric properties of electrolytically produced films of  $Al_2O_3$  (thickness 10—100  $\mu$ ) were investigated using d.c. The surface conductivity does not depend on the structure or method of prep. of the film, but on the humidity of the atm. by an exponential law. The methods by which  $H_2O$  is taken up by the surface are discussed. The conductivity through the film depends on the method of prep. Conductivity increases exponentially with the voltage, and is diminished by drying. It is impossible to remove  $H_2O$  completely from thick films. The resistance varies linearly with thickness for thin layers, and exponentially for thick ones. For thin layers, electrical breakdown occurs across air in the pores of the film, but for thick films breakdown is thermal. The breakdown potential is not affected by humidity. Investigation of after-effects showed the existence of a considerable back-current and back-e.m.f., decaying exponentially with time.

A. J. M.

**Polarisation of liquids and their saturated vapours in the critical temperature region.**

J. MARSDEN and O. MAASS (Canad. J. Res., 1936, 14, B, 90—95; cf. this vol., 139).—The polarisations of the liquid and the saturated vapour of MeOEt and  $C_3H_8$  are identical at the crit. temp. The liquid polarisation is a const. below the crit. temp., whilst that of the saturated vapour decreases according to a characteristic curve.

R. S.

**Magnetic change of the dielectric constant of liquids.** A. PIÉKARA and M. SCHÉNER (Compt. rend., 1936, 202, 1159—1160; cf. A., 1935, 1192).—A correction. The apparatus previously employed has been altered to reduce condenser deformation and the vals. obtained for  $\Delta\epsilon \times 10^4$  are now all < the following:  $C_6H_6$  5,  $CCl_4$  3, PhMe 3,  $CS_2$  5.

M. S. B.

**Dielectric constant of a space containing electrons.** S. P. PRASAD and M. N. VERMA (Z. Physik, 1936, 99, 552—561).—The dielectric const. increases with electron concn. and with decreasing  $\lambda$ .

A. B. D. C.

**Molecular interactions and structure of liquids.** P. GIRARD and P. ABADIE (Compt. rend., 1936, 202, 398—400; cf. A., 1935, 1187).—The time of relaxation-concn. curves for solutions of  $H_2O$  in dioxan and of dichlorohydrin in  $C_6H_6$  show max. at low concns., suggesting that the semi-cryst. state appears when the ratio of electrostatic energy to thermal agitation attains a definite val. Applying Martin's equation (A., 1934, 1063) for the change in energy of a dipole in passing from one medium to another, to the max. of these curves, values of  $\Delta w$  are about  $3 \times 10^{-15}$  erg for most mols. The extrapolated val. for pure  $H_2O$  is  $4 \times 10^{-14}$  erg, equal to the energy of mol. agitation, whilst for other mols. it is less. Hence the semi-cryst. state of liquid  $H_2O$  is highly developed at room temp.

J. W. S.

**Anisotropy of the optical polarisation field in liquids. I, II.** B. S. R. RAO (Proc. Indian Acad. Sci., 1936, 3, A, 240—243, 244—248).—I. Data are recorded for the variation of refractive index with temp. for  $CS_2$ ,  $C_6H_6$ ,  $C_6H_{14}$ , and  $CCl_4$ .  $R_L$  is independent of temp. in the case of  $CCl_4$ , but in the other cases increases with rise of temp., showing that the optical polarisation field is anisotropic.

II. The consts. of anisotropy are calc., and the temp. dependence of the depolarisation of the scattered light deduced, from the above data.

L. J. J.

**Birefringence by mechanical deformation of pure liquids.** C. SADRON (Compt. rend., 1936, 202, 404—406; cf. Vorländer and Walter, A., 1926, 110).—Repetition of measurements on  $C_7H_{15}OH$  and  $C_8H_{17}OH$ , using velocities of drum rotation well below the crit. velocity, yielded vals. of 4.5 and 6.5 ( $\times 10^{-12}$ ), respectively, for their dynamic birefringences. Raman and Krishnan's theory (A., 1928, 573) predicts  $7.4 \times 10^{-12}$  for  $C_7H_{15}OH$ . The vals. for oleic acid, cinnamaldehyde,  $C_{12}H_{25}OH$ , and  $CH_3PhOH$  are 360, 51.6, 29.6, and  $17.5 (\times 10^{-12})$ , respectively.

J. W. S.

**Electro-optical Kerr effect in methane, ethylene, and ethane.** W. M. BREAZEALE (Physical Rev., 1936, [ii], 49, 625—626; cf. A., 1935, 1192).—Measurements of the Kerr effect were made at 6500 Å., pressures 30—100 atm., and temp. 15—55°.

Results, with the aid of the Langevin-Born theory, give for the Kerr const. at n.t.p. and 6500 Å, the vals.  $\times 10^{12}$ :  $\text{CH}_4$  3.66,  $\text{C}_2\text{H}_2$  16.3, and  $\text{C}_2\text{H}_4$  10.4.

N. M. B.

**Curves of constant affinity in the phase changes of single substances.** J. E. VERSCHAFFELT (Bull. Acad. roy. Belg., 1936, 22, [v], 252-264).—Theoretical.

D. R. D.

**Theory of homopolar valency. Significance of the fission rule for olefines and radicals.** O. SCHMIDT (Z. Elektrochem., 1936, 42, 175-184; cf. A., 1932, 716; 1935, 1286).—The wave-mechanical treatment of homopolar valency is inferior to the statistical method in which the direction of the electron spin is taken into account. The question is discussed with reference to the thermal decomp. of olefines and radicals.

F. L. U.

**Use of a Geiger-Müller counter for the study of the diffraction of X-rays by a gas.** W. VAN DER GRINTEN and H. BRASSEUR (Nature, 1936, 137, 657).—Replacement of the photographic plate by a Geiger-Müller counter gives good results for the Cl-Cl distance in  $\text{CCl}_4$ .

L. S. T.

**Peculiarities of water and aqueous solutions.** H. ULICH (Angew. Chem., 1936, 49, 279-282).—A discussion of the anomalies mainly linked with association.

E. S. H.

**Condensed helium at absolute zero.** F. LONDON (Proc. Roy. Soc., 1936, A, 153, 576-583).—The usual methods of lattice theory cannot be applied to the He lattice, owing to the fact that its zero point energy is of the same order of magnitude as the interaction energy, and has a decisive effect on the constitution of the lattice. The fact that closest packed structure is stable only under pressure explains why solid He can only exist, even at  $0^\circ$  abs., under pressure. If no external pressure is applied, a configuration with the co-ordination no. 4 is shown to have considerably lower energy, and gives a rough model of the liquid modification of He which is stable at  $0^\circ$  abs.

L. L. B.

**The liquid state and interatomic forces.** I, II. S. FRANCHETTI (Atti R. Accad. Lincei, 1935, [vi], 22, 433-438, 585-593).—Mathematical and theoretical.

O. J. W.

**Symmetry of a crystal lattice and its electron levels.** F. HUND (Z. Physik, 1936, 99, 119-136).—Qual. rules are deduced to determine whether or not a crystal is an insulator.

A. B. D. C.

**The three-centre problem.** II. G. S. GORDADSE (Z. Physik, 1936, 99, 287-299; cf. A., 1935, 1298).—Mathematical. The results are used to obtain energy formulæ for  $\text{H}_2^+$  and  $\text{H}_3^{++}$ .

A. B. D. C.

**Accommodation coefficient of deuterium.** W. B. MANN and W. C. NEWELL (Nature, 1936, 137, 662).—The accommodation coeffs. of  $\text{H}_2$ , 99.2%  $\text{D}_2$ , and He relative to a Pt wire at  $100.7^\circ$ , with the surrounding gas at approx.  $16^\circ$ , are 0.24(3), 0.30(8), and 0.29(4), respectively.

L. S. T.

**Hydrogen atoms.** V. BARGMANN (Z. Physik, 1936, 99, 576-582).—Pauli's matrix equation for H leads to Fock's results (cf. this vol., 266).

A. B. D. C.

**Concentration of deuterium in organic compounds.** II. General discussion with particular reference to benzene. M. DOLE (J. Amer. Chem. Soc., 1936, 58, 580-585; cf. A., 1934, 853).—A crit. review of published work. The at. wt. of H in org. compounds is considered to be more nearly normal than has been suspected hitherto.

E. S. H.

**Vibrations of tetrahedral pentatomic molecules.** V. General criteria for potential functions. (MISS) J. E. ROSENTHAL (Physical Rev., 1936, [ii], 49, 535-537; cf. A., 1934, 1293).—If the forces along the linkings of the  $\text{YX}_4$  mol. are fairly large compared with "interaction forces," the ambiguity in the vals. of the consts. in the potential energy function is removed. The ratio of the masses of the Y and X atoms determines the chemically correct set of force consts. Limiting vals. of the const. for the Y-X linking in  $\text{CH}_4$ ,  $\text{CCl}_4$ ,  $\text{TiCl}_4$ ,  $\text{SiCl}_4$ ,  $\text{SnBr}_4$ ,  $\text{SO}_4^{--}$ , and  $\text{ClO}_4^-$  are given.

N. M. B.

**Vibration-rotation energy levels of polyatomic molecules.** I. Mathematical theory of semi-rigid asymmetrical top molecules. E. B. WILSON and J. B. HOWARD (J. Chem. Physics, 1936, 4, 260-268).—Mathematical.

L. J. J.

**Minimum potential for ozone formation by electron collision.** F. KRÜGER and C. ZICKERMANN (Z. Physik, 1936, 99, 428-452).—This min. potential is 6.3 volts, and indicates that  $\text{O}_2$  has to be dissociated into one excited and one non-excited O atom for formation of  $\text{O}_3$ .

A. B. D. C.

**Significance of electron collision experiments with CO and bond energy values of C-C and H-C from the assumption  $D(\text{CO})=6.9$  volts.** R. SCHMID (Z. Physik, 1936, 99, 274-280).—The crit. potential of CO gives the dissociation energy of 6.9 volts, and this gives 3.76 volts per C-C linking, and 4.4 volts per C-H linking.

A. B. D. C.

**Dissociation products of the CN molecule assuming a dissociation energy of 6.9 volts for CO.** R. SCHMID (Z. Physik, 1936, 99, 562-568).—A dissociation energy of 6.9 volts for CO gives CN dissociating into  $\text{C}(^5S)+\text{N}(^4S)$  atoms at 8.15 volts.

A. B. D. C.

**Calculation of rotation energy constants of molecules from a formula and its application to the calculation of dissociation energies.** E. A. HYLLERAAS (Naturwiss., 1936, 24, 279-280).—A formula is derived and applied to the calculation of the dissociation energy of the CdH mol.

A. J. M.

**Rotation of molecules in fields of octahedral symmetry.** A. F. DEVONSHIRE (Proc. Roy. Soc., 1936, A, 153, 601-621).—Mathematical. The solution of Schrödinger's equation for a diat. mol. rotating in a field of octahedral symmetry is discussed.

L. L. B.

**Absolute value of C-H linking moment, and sign of charge of the hydrogen atom in organic carbon compounds.** H. G. TRIESCHMANN (Z. physikal. Chem., 1936, B, 32, 22-26).—From calculation of the approx. moments of the aliphatic C-H and C-Cl linkings it seems probable that the H in the C-H linking is negative (cf. this vol., 268).

R. C.

**Nature of the chemical binding of certain oxides and sulphides.** P. K. SEN-GUPTA (J. Univ. Bombay, 1935, 4, Part II, 74—82).—From the infra-red absorptions of ZnS, ZnO, CdS, CdO, HgS, CaO, SrO, and BaO it is concluded that the linking is ionic in nature (cf. A., 1934, 237). J. W. S.

**Ferromagnetic saturation moment.** L. NÉEL (Compt. rend., 1936, 202, 1269—1272).—Theoretical. The discrepancy between observed saturation moment and that calc. from the Curie const. can be explained by incomplete orientation of magnetic moments at saturation, due to coupling between atoms being intermittent and subject to statistical laws.

L. J. J.

**Cavitation and surface tension. II.** F. K. T. VAN IJERSON (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 330—339).—The theory of the appearance and disappearance of small bubbles when H<sub>2</sub>O containing air passes a convergent-divergent constriction in a tube is discussed. In the divergent portion the bubbles disappear suddenly and the resultant shock erodes the walls, as in pumps. It is shown that oil increases the contact angle for air-steel from 22.5° to 90°, the air bubbles becoming hemispherical on a greasy surface. Oil increases cavitation owing to the decrease in  $\sigma$  for air-H<sub>2</sub>O and the increase in  $\sigma$  for air-wall, both effects increasing the adhesion of the bubble to the wall.

R. S. B.

**Quantitative determination of scattering of X-rays by microcrystalline layers.** J. BRENTANO (Z. Physik, 1936, 99, 65—72).—Experimental details are discussed.

A. B. D. C.

**Scattering of X-rays from amorphous substances and their molecular distribution.** M. OGURA (Sci. Rep. Tôhoku, 1936, 24, 587—594).—The Debye-Menke method (A., 1930, 1350; 1932, 986) of calculating mol. distribution in amorphous substances is applied to polyat. compounds.

M. S. B.

**External form of the crystal and its effect on the interference phenomena of the space lattice.** M. VON LAUE (Ann. Physik, 1936, [v], 26, 55—68).—Theoretical. Effects of the external form of a crystal on the sharpness of the interference pattern are observed with electron diffraction, but not with X-rays. The elementary theory of space-lattice interference is extended to take this into account, and the general laws governing the intensity in the neighbourhood of the interference spots are derived. The theory is applied to the observations of Kirchner *et al.* (A., 1935, 1451).

A. J. M.

**Energy levels of electrons in a one dimensional lattice with localised defects ("Lockerstellen"). Application to electric discharge.** A. SOKOLOV and N. MACHALOVA (Z. Physik, 1936, 99, 503—517).—Localised defects give levels in the normally "forbidden" zone. These are dependent on the potential energy associated with the defects and the electron energy; they explain discharge through dielectrics.

A. B. D. C.

**Growth and structure of electrolytically prepared aluminium oxide layers.** T. RUMMEL (Z. Physik, 1936, 99, 518—551).—Highly insulating

layers > 1  $\mu$  thick have been obtained free from corrosion. Their dielectric properties are largely dependent on the hydroxide content.

A. B. D. C.

**Surface layers of crystals.** (Sir) J. LARMOR (Nature, 1936, 137, 575—576).

L. S. T.

**The Beilby layer.** G. I. FINCH and A. G. QUARRELL (Nature, 1936, 137, 516—519).—A review.

L. S. T.

**Influence of temperature on asterism of crystals.** S. DEMBICKA (Acta phys. polon., 1933, 2, 285—290; Chem. Zentr., 1935, ii, 1132).—The asterism of slightly deformed Al, NaCl, and CaSO<sub>4</sub> crystals was unaffected by temp. In the case of Al, asterism disappeared on recrystallisation at higher temp.

J. S. A.

**Röntgenographic detection of lattice deformation in cold-deformed nickel.** W. E. SCHMID and E. A. W. MÜLLER (Z. tech. Physik, 1935, 16, 161—164; Chem. Zentr., 1935, ii, 972).—From measurements of the intensity, line breadth, and lattice spacing of the (024) reflexion from Ni, a relation is derived between deformation, applied stress, and compressibility. Inner stresses are calc.

J. S. A.

**X-Ray diffraction study of liquid sodium.** L. P. TARASOV and B. E. WARREN (J. Chem. Physics, 1936, 4, 236—238).—The radial distribution of atoms about any atom in liquid Na at 103° has been determined by Fourier analysis of the scattering curve for monochromatic Mo K $\alpha$  radiation. The distribution curve is essentially a smoothed-out distribution curve for the cryst. phase, showing concns. at 4.0 and 7 Å., and a dip at 5.0 Å.

L. J. J.

**Distribution of impurities on crystallisation.** D. D. SARATOVKIN (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 323—326).—The conditions controlling the separation of impurities in the layers between crystallites are discussed and are applied to the slow melting of impure ice, the formation of Widmannstätten structures (system Fe-C), of etch figures, and of dendritic crystals. With the crystallisation of Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> in presence of CoCl<sub>2</sub> as added impurity the coloured intermediate layers of impurity could be observed.

R. S. B.

**Effect of naphthalene-2-sulphonic acid on the crystallisation of copper sulphate pentahydrate.** F. BARILLET (Compt. rend., 1936, 202, 1194—1195).—Crystallographic data are given for the CuSO<sub>4</sub>.5H<sub>2</sub>O crystals separated from solutions of const. Cu content containing varying proportions of 2-C<sub>10</sub>H<sub>7</sub>SO<sub>3</sub>Na.

M. S. B.

**Modifications of the crystal faces of uric acid by the addition of dyes to the mother-liquor.** P. GAUBERT (Compt. rend., 1936, 202, 1192—1194).—Considerable deviations from the original cryst. forms are produced and the character of the deviations varies with the dye. The polychroism of the crystals and the distribution of the dye between crystals and mother-liquor indicate that solid solutions are formed.

M. S. B.

**Structure of CuAl<sub>2</sub>.** A. K. TRAPEZNIKOV (J. Phys. Chem. U.S.S.R., 1934, 5, 1177—1185).—The structure proposed by Owen and Preston (A., 1924, ii, 111) is not supported by X-ray data. The lattice

consts. are  $a\ 6.054 \pm 0.003$ ,  $c\ 4.87_4$  A.; symmetry classes  $V^d$ ,  $C_4$ ,  $D_4$ . Bradley and Jones' data are confirmed (cf. A., 1933, 454). CH. ABS. (e)

**Crystal structure of  $\text{Fe}_3\text{Ti}$ .** W. JELLINGHAUS (Z. anorg. Chem., 1936, 227, 62—64).—X-Ray powder diagrams of Fe with 24% Ti gave  $a\ 5.19$  A.,  $c/a\ 1.57$ , and a tetragonal lattice. Since, assuming that the unit cell contains four mols. of  $\text{Fe}_3\text{Ti}$ , the calc.  $d$  agrees fairly with that of an alloy of the same composition, it is inferred that such alloys contain the compound  $\text{Fe}_3\text{Ti}$ . This conclusion is supported by the fact that the lattice of  $\text{Al}_3\text{Ti}$  is also tetragonal.

F. L. U.

**Crystal structure of chlorine.** W. H. KEESOM and K. W. TACONIS (Physica, 1936, 3, 237—242, and Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 314).—Data obtained at  $-185^\circ$  with the X-ray goniometer (A., 1935, 839) are recorded. They give a tetragonal lattice with  $a\ 8.56$  and  $c\ 6.12$  A.;  $d\ 2.09$ , 8 mols. per unit cell. Intensities of Debye-Scherrer lines agree with the space-group  $D_{2h}^{16}$ , and the Cl—Cl distance in  $\text{Cl}_2\ 1.99$  A.

L. J. J.

**Structure of ice III.** R. L. MCFARLAN (J. Chem. Physics, 1936, 4, 253—259).—X-Ray diffraction measurements at  $-155^\circ$  give a body-centred orthorhombic structure, with  $a\ 10.20$ ,  $b\ 5.87$ ,  $c\ 7.17$  A. The space-group is  $V_{2h}^{28}$ —*Ibam*, with 16 mols. in the unit cell, giving  $d\ 1.105$ . Each  $\text{O}''$  ion is surrounded by a distorted tetrahedron of  $\text{O}''$  ions;  $\text{H}^+$  ions are assumed to lie midway between pairs of neighbouring  $\text{O}''$  ions. The mechanism of the transition between the different forms of ice is discussed.

L. J. J.

**Nature of lattice disarray in silver bromide.** C. WAGNER and J. BEYER (Z. physikal. Chem., 1936, B, 32, 113—116).—Measurements of  $d$  and the lattice const. at  $410^\circ$  have indicated that the electrical conductivity is due to  $\text{Ag}^+$  ions moving into the spaces between the lattice points and leaving their normal positions vacant; there are no vacant positions in the anion lattice.

R. C.

**Basic salts. XIII. Constitution of solid basic salts of bivalent metals. I. Basic cobalt halides with single-layer lattice.** W. FEITKNECHT (Helv. Chim. Acta, 1936, 19, 467—474).—Lattice dimensions have been determined for  $\text{CoCl}_2 \cdot 3\text{Co}(\text{OH})_2$ ,  $\text{CoBr}_2 \cdot 3\text{Co}(\text{OH})_2$ , and the corresponding mixed basic halide. They all possess single-layer lattices, i.e., there is a statistical exchange of  $\text{OH}^+$  with halide ion. Replacement of  $\text{Cl}^+$  by  $\text{Br}^+$  causes a marked extension of the lattice. Replacement of  $\text{OH}^+$  by halide ion produces a small extension only in the single-layer lattice, but a large one in the double-layer type.

M. S. B.

**Structure of cupric ammonium bromide.** A. SILBERSTEIN (Compt. rend., 1936, 202, 1196—1197).—The vals. of the parameters  $u$ ,  $v$ , and  $w$  of the structure of  $\text{CuBr}_2 \cdot 2\text{NH}_4\text{Br} \cdot 2\text{H}_2\text{O}$  (cf. this vol., 143) have been calc. by comparison with the isomorphous  $\text{CuCl}_2 \cdot 2\text{NH}_4\text{Cl} \cdot 2\text{H}_2\text{O}$  and interat. distances are given. The salt is complex and  $\text{H}_2\text{O}$  enters into the formation

Y Y

of the complex ion  $[\text{CuBr}_4(\text{H}_2\text{O})_2]''$ , but in solution it reacts as a mixture of its constituent salts.

M. S. B.

**Structure and alterations of structure of  $\text{NiS}$  and  $\text{NiSe}$ .** G. R. LEVI and A. BARONI (Z. Krist., 1936, 92, 210—215).—Various forms of  $\text{NiS}$  have been prepared and studied by X-rays and electron diffraction methods.  $\gamma$ - $\text{NiS}$  is identical with millerite (rhombohedral);  $\beta$ - $\text{NiS}$  is the usual synthetic compound (hexagonal). The crystallinity is ill-defined, and grows with time.  $\alpha$ - $\text{NiS}$  is amorphous and unstable in air. The transition  $\gamma$ - $\text{NiS}$  to  $\beta$ - $\text{NiS}$  is studied. Analogous properties are shown by the selenides.

B. W. R.

**Structure determinations of the complex sulphides. I. Structure of tin sulphide  $\text{SnS}$  and teallite  $\text{PbSnS}_2$ . II. Crystal chemistry of the sulpho-salts of arsenic, antimony, and bismuth.** W. HOFMANN (Z. Krist., 1935, 92, 161—1xx, 1xx—185).—I.  $\text{SnS}$  is rhombic, 4 mols. in cell,  $a_0\ 3.98$ ,  $b_0\ 4.33$ ,  $c_0\ 11.18$  A., space-group  $V_{2h}^{16}$ . Parameters are determined completely from intensity measurements; the structure is a deformed galena structure. Teallite is rhombic,  $a_0\ 4.04$ ,  $b_0\ 4.28$ ,  $c_0\ 11.33$  A., with similar structure.

II. The position of the S with reference to the metal atom is discussed and the chains of  $\text{SbS}_3$  pyramids are further described. The existence in needle-like crystals of further chains of  $\text{SbS}_3$  and  $\text{BiS}_3$  pyramids,  $\text{PbS}_6$  octahedra, and  $\text{CuS}_4$  and  $\text{FeS}_4$  tetrahedra is suggested.

B. W. R.

**Crystallographic structure of isomorphous compounds  $(\text{M}^{\text{IV}})^+\text{P}_2\text{O}_7$ .** G. R. LEVI and G. PEYRONEL (Z. Krist., 1936, 92, 190—209).—The structure of compounds  $\text{M}^{\text{IV}}\text{P}_2\text{O}_7$  ( $\text{M}=\text{Si}, \text{Ti}, \text{Sn}, \text{Zr}, \text{Hf}$ ) has been determined in order to find the shape of the radical  $(\text{P}_2\text{O}_7)^{\text{IV}-}$ . All these pyrophosphates are cubic, space-group  $T_h^6$ , 4 mols. in cell. Vals. of  $a_0$  and  $d$  are given. Exact at. distances for the P and O atoms are given, based on intensity measurements.  $\text{Hf}^{\text{IV}+}$  is found to have a slightly smaller at. radius than  $\text{Zr}^{\text{IV}+}$ .

B. W. R.

**Rotation of anionic polyhedra in cubic crystals.**

**I. Perchlorates.** C. FINBAK and O. HASSEL (Z. physikal. Chem., 1936, B, 32, 130—134).—Examination of the high-temp. structures of  $\text{NaClO}_4$ ,  $\text{KClO}_4$ , and  $\text{NH}_4\text{ClO}_4$  by means of powder diagrams has yielded results which are irreconcilable with those of Herrmann and Ilge (A., 1930, 528) or of Braekken and Harang (A., 1931, 549) and are explained more satisfactorily by assuming that the  $\text{ClO}_4^-$  in these lattices are capable of rotation, than by supposing the O to occupy fixed positions.

R. C.

**Crystal structure of magnesium and nickel antimonates.** J. BEINTEMA (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 241—252).—X-Ray measurements indicate the structure  $[\text{M}(\text{H}_2\text{O})_6][\text{Sb}(\text{OH})_6]_2$ , where  $\text{M}=\text{Mg}$  or  $\text{Ni}$ . The following data are given for the Mg and Ni compounds, respectively:  $a\ 16.079$ ,  $16.019$ ,  $c\ 9.841$ ,  $9.768$  A.; vol. of unit cell (6 mols.)  $2203$ ,  $2171 \times 10^{-24}$  c.c.;  $d_{\text{calc.}}\ 2.633$ ,  $2.802$ ;  $d_{\text{obs.}}\ 2.598$ ,  $2.77$ ; space-group  $D_{2d}^{14}$ .

O. J. W.

**Structures and formulæ of the Prussian-blues and related compounds.** J. F. KEGGIN and F. D. MILES (Nature, 1936, 137, 577—578).—The at. arrangements in the cubic structures, obtained from X-ray analysis, are outlined. In Prussian-blues,  $\text{Fe}^{\text{III}}\text{RFe}^{\text{II}}(\text{CN})_6$  where R is Na, K, Rb, or  $\text{NH}_4$ ,  $a$  is 10.2 Å., and in "Ru-purple," in which Ru replaces  $\text{Fe}^{\text{II}}$ ,  $a$  is 10.4 Å. The white ferrocyanides  $\text{Fe}^{\text{II}}\text{R}_2\text{Fe}^{\text{II}}(\text{CN})_6$ , where R is Na, K, Rb, Cs, or  $\text{NH}_4$ , have  $a$  5.1 Å. and form a series closely related to the above. Berlin-green,  $\text{Fe}^{\text{III}}\text{Fe}^{\text{III}}(\text{CN})_6$ , the oxidation product of Prussian-blue, has  $a$  5.1 Å., and *cupriferricyanides*,  $\text{Cu}^{\text{II}}\text{RFe}^{\text{III}}(\text{CN})_6$  have  $a$  slightly < 10.2 Å. All structures are similar, but between the members of each class the difference in size of the alkali ions produces a slight variation in the lattice spacings. Blues containing no alkalis have been prepared, and the cubic  $\text{Fe}-(\text{CN})$  skeleton has  $a$  10.2 Å. approx.

L. S. T.

**Influence of structure on the explosive properties of organic compounds.** V. V. VASILEVSKI, F. I. BLOSCHTEIN, and B. D. KUSTRJA (J. Gen. Chem. Russ., 1935, 5, 1652—1667).—The space model of the mol. of 2:4:6-trinitrobenzazide (I) shows that its existence is compatible only with a ring structure for the  $\cdot\text{N}_3$  group. The prep. of (I),  $\text{BzN}_3$ , and *o*- and *m*-nitrobenzazide is described, and m.p.,  $d$ ,  $n$ , and solubility data are recorded. The above azides undergo thermal decomp. to yield carbimides, the heat of decomp. of the  $\cdot\text{N}_3$  group being 70.2 kg.-cal.

R. T.

**X-Ray investigation of the crystals of benzoin.** M. PRASAD and J. SHANKER (J. Indian Chem. Soc., 1936, 13, 123—127).—The unit cell, which contains 4 mols., has  $a$  18.75,  $b$  5.72,  $c$  10.46 Å.,  $\beta$   $106^\circ 50\frac{1}{2}'$ , space-group  $C_{2h}^2$ ; the axial ratio agrees fairly well with the val. recorded in Groth's treatise.

C. R. H.

**X-Ray diffraction intensity of the two liquid phases of *p*-azoxyanisole.** G. W. STEWART (J. Chem. Physics, 1936, 4, 231—236).—The intensity distribution curve for the liquid crystal at  $125^\circ$  resembles that of the transparent liquid at  $150^\circ$ , but has a narrower peak, with greater max. intensity and steeper slope on the zero-angle side. The regularity of structure in the liquid-crystal swarms of  $10^5$ — $10^6$  mols. is > that in the cybotactic groups of 25—50 mols. in the liquid. The swarms tend to set their mol. axes perpendicular to the temp. gradient.

L. J. J.

**Crystallographic relationships between isomerides (ephedrine and  $\psi$ -ephedrine) and between *dl*-compounds and their components.** B. GOSSNER and H. NEFF (Neues Jahrb. Mineral., A, 1935, 69, Beil.-Bd., 347—363; Chem. Zentr., 1935, ii, 997—998; cf. A., 1935, 152).—Crystallographic data are given for  $\alpha$ - $\psi$ -, *dl*- $\psi$ -, *l*-, and *dl*-ephedrine, *l*-, *dl*- (not a racemate but a *dl*-mixture), and  $\alpha$ - $\psi$ -methylephedrine.

H. N. R.

**Diffraction of X-rays by Bence-Jones protein.** A. MAGNUS-LEVY, K. H. MEYER, and W. LOTMAR (Nature, 1936, 137, 616—617).—The spacings and intensities recorded for the cryst. protein are similar to those of oxyhæmoglobin (A., 1935, 687). The

unit cell is large and should contain at least one "chemical" mol. of protein.

L. S. T.

**X-Ray studies of crystallite orientation in cellulose fibres. II. Synthetic fibres from bacterial cellulose membranes.** W. A. SISSON (J. Physical Chem., 1936, 40, 343—359; cf. A., 1935, 286).—From an X-ray study of cellulose membranes synthesised from various sugars by *Acetobacter xylinus*, and subjected to different kinds of mechanical treatment, it is inferred that the crystallites are oriented with the chain-axes parallel to the direction in which the sample is elongated, and that the (101) planes are oriented normal to the direction in which it is constricted. Further, the crystallites possess a major orienting tendency with reference to the chain-axis, and a minor or selective one with reference to the (101) plane.

F. L. U.

**Structure and properties of "byssus" or silk of oysters.** G. CENTOLA (Gazzetta, 1936, 66, 71—80).—The chemical and X-ray investigation of byssus (in its natural state, and stretched) shows that it consists of a mixture of chains of complex (keratin type) and chains of simple (silk fibroin type)  $\text{NH}_2$ -acids. It is the only natural fibre in which the mols. have no orientation, and this accounts for its physical properties.

O. J. W.

**Crystal orientation in tooth-enamel.**—See this vol., 623.

**Diffraction of rapid electrons in crystallised rock-salt. II.** S. G. PINSKER and L. I. TATARINOVA (Physikal. Z. Sovietunion, 1936, 8, 602—625; cf. A., 1935, 1309).—In the investigation of the scattering of rapid electrons at NaCl crystals obtained from solutions of different concn. (1%, 0.5%, 0.2%) the type of diagram obtained varied with the concn. of the solution. The normal Debye pattern was obtained from crystals from the 1% solution, but those from the more dil. solutions gave mainly point diagrams, corresponding with single crystals. Intermediate types of pattern, consisting of Debye rings and irregularly placed spots, were also obtained. The theory is discussed, and the application of the results to the study of thin crystal sheets is described.

A. J. M.

**Determination of atomic distances in the thallium and tellurium halides by electron diffraction.** W. GREYER (Ann. Physik, 1936, [v], 26, 1—16).—The separation of the atoms in  $\text{TlCl}$ ,  $\text{TlBr}$ ,  $\text{TlI}$ ,  $\text{TeCl}_2$ , and  $\text{TeBr}_2$  has been determined by electron diffraction experiments with their vapours. For  $\text{TlCl}$ ,  $\text{TlBr}$ , and  $\text{TlI}$  the respective distances are 2.55, 2.68, and 2.87 Å. For the distances  $\text{Te-Cl}$  and  $\text{Te-Br}$  the vals. are 2.36 and 2.49 Å., respectively. It is not possible to decide whether the mols. of  $\text{TeCl}_2$  and  $\text{TeBr}_2$  are linear or bent, but if they are bent the angle is  $> 150^\circ$ . There is good agreement with results obtained from band spectra.

A. J. M.

(A) Effects accompanying the diffraction of low-speed electrons. (B) Penetration of low-speed diffracted electrons. H. E. FARNSWORTH (Physical Rev., 1936, [ii], 49, 598—605, 605—609; cf. A., 1932, 789; 1933, 761).—(A) Investigation of the effect of density and arrangement of atoms in the

surface plane on the fine structure of electron diffraction beams from a Ag single crystal, made by observing the structure of the diffraction beams corresponding with Bragg reflexions from two sets of planes for two different boundary planes of the crystal, show that the changes in fine-structure characteristics due to a change in the surface at. layer are small compared with the differences in those of the beams from different sets of at. planes. A new type of directional effect, showing a dependence of beam structure on the direction of the diffracted beam in the crystal, was observed.

(B) A known no. of at. layers of Ag was deposited on the surface of single crystals of Cu and Au by evaporation in vac. The no. of at. planes responsible for diffracting low-speed electrons was investigated by results for depth of penetration obtained from measurements on diffraction as a function of surface layer thickness for electron beams of different energies.  $\pm 50\%$  of the max. of each diffraction beam from a thick Ag crystal is due to the surface at. layer, and  $\pm 90\%$  to a surface layer two atoms thick.

N. M. B.

**Molecular structure of nitromethane from electron diffraction by the vapour.** C. DEGARD (Compt. rend., 1936, 202, 1278—1280).—Two diffraction maxima are obtained, from which two mol. models are calc. The O—O distance does not correspond with the sum of the at. or ionic radii.

L. J. J.

**Variation with temperature of the piezo-electric effect in quartz.** A. PITT and D. W. R. MCKINLEY (Canad. J. Res., 1936, 14, A, 57—65; cf. A., 1935, 1197).—The piezo-electric activity of quartz has been studied by static and dynamic methods between  $4^\circ$  and  $813^\circ$  abs. The activity, which decreases sharply by  $10\%$  below  $5.5^\circ$  abs., is const. up to  $470^\circ$ , above which it diminishes to zero at  $813^\circ$  abs.

R. S.

**Magnetic behaviour in the chromium-sulphur system.** H. HARALDSEN and A. NEUBER (Naturwiss., 1936, 24, 280).—Investigation of the susceptibility of Cr-S preps. over the concn. range  $\text{CrS}-\text{Cr}_2\text{S}_3$  shows that there is a considerable increase in magnetism at a concn. corresponding with  $\text{CrS}_{1.75}$ . This is analogous to the behaviour of Fe pyrites, which shows a max. in magnetisation at  $\text{FeS}_{1.12}$ . The effect of temp. on the prep. of max. magnetisation was studied. Above  $165^\circ$  abs. it behaves as a ferromagnetic substance with a Curie point approx.  $310^\circ$  abs. There is a sudden decrease in magnetisation below  $165^\circ$  abs., a behaviour similar to, but more marked than, that of magnetite.

A. J. M.

**New magnetostriction experiment.** J. L. SNOEK (Physica, 1936, 3, 205—206).—Perrier's experiment (Helv. phys. Acta, 1935, 8, 427) depends on the presence of a film of oxide, and is a variant of the Wiedemann effect.

L. J. J.

**Arkadiev's method applied to elimination of skin effect and to investigation of dynamic magnetisation curves.** O. VELETZKAIA (Z. Physik, 1936, 99, 569—575).—Magnetic permeability and loss curves, freed from skin effects, agree with the

theory of magnetic viscosity for low field intensities and for audio and radio frequencies. A. B. D. C.

**Atomic theory of the magneto-caloric effect.** K. HONDA and T. HIRONE (Nature, 1936, 137, 492).—The temp. changes of Fe, Ni, and Co with magnetisation, calc. by means of the Honda-Okubo theory of ferromagnetism, agree with experimental vals. obtained by Okamura. L. S. T.

**Change of thermal energy due to magnetisation in ferromagnetic substances.** T. OKAMURA (Sci. Rep. Tôhoku, 1936, 24, 745—807).—The absorption and evolution of heat during magnetisation has been determined for Fe, Ni, Co, steel, K.S. magnet steel, Ni-Fe alloy, and single Fe crystals. Reversible (magneto-caloric) and irreversible (magnetic hysteresis) changes occur. In the initial magnetisation, starting from the magnetically neutral state, the curves of irreversible effect for all the ferromagnetics studied have the same form as the curve of magnetisation. The reversible heat curves, plotted against field, are similar for all but Co. In weak fields the heat is absorbed and absorption at first increases, reaches a max., decreases, and finally changes to heat evolution. For Co, absorption only is observed. In cyclic magnetisation, starting from max. fields, the irreversible effect does not appear until zero field is approached. On passing to the negative side heat evolution becomes marked and then approaches a saturation val. The irreversible heat effect is in satisfactory agreement with the val. calc. on the basis of the Honda-Okubo theory of ferromagnetic substances, and the reversible effect is that to be expected on thermodynamic grounds. M. S. B.

**Antiferromagnetic exchange problem at low temperature.** L. HULTHÉN (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 190—200).—Mathematical. O. J. W.

**Influence of the thermal variation of the molecular field on the Curie constant.** L. NÉEL (Compt. rend., 1936, 202, 1038—1040; cf. A., 1935, 1063).—Theoretical. The Curie const.  $C$  given by  $C/\chi = T - \theta$ , ( $\theta$  is at. magnetic susceptibility,  $T$  the abs. temp., and  $\chi$  the Curie point) is corr. for the influence of the mol. field. For Ni and Co the new const.  $C_0 = 0.379$  and  $0.99$ , respectively, corresponding with 1 and 2 uncompensated spins per atom and electron configurations  $3d^9 4s$  and  $3d^8 4s$ . By analogy Fe should have 3 uncompensated spins and an electron configuration  $3d^7 4s$ , and should have a val. of  $C_0 = 1.862$ ;  $C = 1.23$  and the val. of  $C_0 - C$  is considered reasonable when allowance is made for the mol. field.

R. S. B.

**Ferromagnetism of nickel.** J. C. SLATER (Physical Rev., 1936, [ii], 49, 537—545).—By using metallic energy levels extrapolated from Cu to Ni, the energy difference between a non-magnetic and a ferromagnetic state with permanent magnetic moment is calc. for Ni; the ferromagnetic state is the stable one. Saturation magnetic moment and Curie point are calc. in agreement with experiment. N. M. B.

**Adhesion of two metallic surfaces in a vacuum, and the diminution of the adhesion in certain**

gases. R. HOLM and B. KIRSCHSTEIN (Wiss. Veröff. Siemens-Werken, 1936, 15, 122—127).—The adhesion of metallic surfaces was investigated in connexion with the formation of a surface film on the metals. The inclination of a wire when the substance (in the form of a cylinder threaded on the wire) would just slide down was determined for the contacts Ni-Ni, Pt-Pt, Ni-Pt, and graphite-Ni. In vac. and in inert gases ( $N_2$  and A) the outgassed metals adhered so strongly that no sliding occurred even at an inclination of  $90^\circ$ , but for graphite-Ni, and in all cases in  $O_2$ ,  $H_2$ ,  $H_2O$  vapour, and some org. vapours, sliding occurred, pointing to the existence, under these conditions, of a surface film on the metals.

A. J. M.

Quantum mechanical calculation of the elastic constants of univalent metals. K. FUCHS (Proc. Roy. Soc., 1936, A, 153, 622—639).—The elastic consts. of Li, Na, K, and Cu have been calc. by means of an extension of the method used by Wigner and Seitz (A., 1933, 660) for calculating the lattice energy and compressibility of univalent metals. Good agreement with the observed vals. is obtained for Cu. As no experimental data exist for the alkalis, the Debye characteristic temp. are calc. for Li, Na, and K from the theoretical elastic consts., and compared with the vals. observed at low temp. The agreement is satisfactory. The Cauchy relations are not satisfied.

L. L. B.

New form of crystalline quartz at  $-183.5^\circ$ . H. OSTERBERG (Physical Rev., 1936, [ii], 49, 552—553).—Specially oriented Y cuts of quartz ceased abruptly to oscillate piezoelectrically near the b.p. of liquid air. The transformation to the new  $\delta$  form was at  $-183.5^\circ$ . The discontinuity in the optical rotatory power at the  $\alpha \leftrightarrow \delta$  transition was investigated; the changes were more abrupt at the  $\alpha \rightarrow \delta$  than at the  $\delta \rightarrow \alpha$  transition, but were much less rapid than the simultaneous piezoelectric changes. The  $\delta \rightarrow \alpha$  transition temp. must be above  $-182.4^\circ$ .

N. M. B.

Influence of mechanical deformation on the transformation velocity of polymorphic metals. II. The influence of metallic impurities. E. COHEN and A. K. W. A. VAN LIESHOUT (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 352—358; cf. A., 1935, 688).—1% of Bi, Pb, Sb, Cd, and Ag decreases and 0.01—1% of Al and Zn greatly increases the speed of transformation of mechanically deformed Sn at  $-50^\circ$ . The influence of Zn is a max. with 0.05% (also at  $0^\circ$ ). The influence of 0.05% of Al and Zn has also been studied at  $0^\circ$ ,  $-11^\circ$ , and  $-22^\circ$ .

R. S. B.

Localisation of the transition points of allotropic metals by means of the method of Saladin and Le Chatelier. E. ROSENBOHM and F. M. JAEGER (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 366—374).—When Ni is heated in a high vac. a transition  $\alpha \rightleftharpoons \beta$  occurs sharply at  $369-370^\circ$ . On cooling, the transition temp. ( $T$ ) is  $6^\circ <$  before, and this difference increases with the speed of cooling. In presence of 50—60 mm. of  $H_2$   $T = 363-364^\circ$  on heating and cooling, and at 2—60 mm. the change in  $T$  from the val. in a vac. is independent

of pressure. Discrepancies in the literature in the vals. for  $T$  are probably due to adsorbed gases. With  $AuSb_2$  transitions occur at  $355^\circ$  and  $404^\circ$ . The second,  $\beta \rightleftharpoons \alpha$ , occurs much more slowly and, unlike the first,  $\beta \rightleftharpoons \gamma$ , shows hysteresis on cooling. With the  $\beta \rightleftharpoons \gamma$  the temp. coeff. of  $c_p$  is the same for both forms.

R. S. B.

Polar isomorphism. A. E. FERSMAN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 119—122).—A discussion. Hahn's law is restated as follows: the ions of the elements are caught in another crystal lattice from dispersed solutions only if their size and type allow them to form with this lattice an isomorphous structure, and if this structure is more advantageous, as regards energy, than the pure crystal.

H. J. E.

Electrical conductivity of transition metals. N. F. MOTT (Proc. Roy. Soc., 1936, A, 153, 699—717; cf. A., 1935, 1063).—Mathematical. A formal theory of conductivity for metals, such as the transition metals, where the conduction electrons occupy two Brillouin zones, is developed. Certain anomalies in the resistance-temp. curves of the paramagnetic metals Pd, Pt, and Ta are explained. The resistance of ferromagnetic metals is discussed, and an expression obtained for the decrease of the resistance of Ni in a magnetic field. It is shown qualitatively why the alloy Cu-Ni has zero temp. coeff. at room temp.

L. L. B.

Measurement of the electrical resistance of metals as function of the temperature by means of a twin galvanometer with photographic recording. E. ROSENBOHM and F. M. JAEGER (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 374—383).—The increments in electrical resistance ( $R$ ) per  $10^\circ$  for Ni in a vac. increase regularly up to  $358^\circ$  and then rapidly decrease to a const. val. at  $380^\circ$ . At  $350-365^\circ$  an inflexion occurs in the  $R-T$  curve, perhaps associated with the change  $\alpha \rightarrow \alpha'$  (hexagonal). In presence of 60 mm. of  $H_2$   $R$  is  $>$  for the pure metal, but the temp. coeff. is unchanged up to  $345^\circ$ , when  $H_2$  begins to be released from the metal. At  $345-375^\circ$  there is indication of the formation of the  $\alpha'$  phase.

R. S. B.

Diamagnetic susceptibility of heavy water. F. E. HOARE (Nature, 1936, 137, 497—498).—The val. obtained by Gouy's method for 99.2%  $D_2O$  is  $0.648 \pm 0.001 \times 10^{-6}$  unit at  $20^\circ$ , corresponding with a mol. susceptibility of 12.96.

L. S. T.

Magnetic susceptibility of disubstituted benzene derivatives. K. KIDO (Sci. Rep. Tôhoku, 1936, 24, 701—706).—31 derivatives have been examined and most of the results are in satisfactory agreement with calc. vals. The mol. susceptibility of  $p$ -derivatives is generally  $<$  that of the corresponding  $o$ -derivatives.

M. S. B.

Magnetic properties and structure of the haemochromogens and related substances.—See this vol., 616.

Diffraction of light by ultrasonic waves. R. LUCAS (Compt. rend., 1936, 202, 1165—1166).—An apparatus for testing the validity of the different

theories relative to the diffraction of light by ultrasonic waves is described. M. S. B.

**Diffraction of light by progressive ultrasonic waves.** E. HIEDEMANN and E. SCHREUER (Z. Physik, 1936, 99, 363—368).—An extension of Raman and Nath's theory (cf. this vol., 148) to cover frequency changes and an ultrasonic field of finite width. A. B. D. C.

**Diffraction of light by ultrasonic waves.** S. M. RITOV (Physikal. Z. Sovietunion, 1936, 8, 626—643).—The theory of Debye and Brillouin is extended, the case of small angle of incidence being treated. To test the results, a goniometer was used to investigate the diffraction with ultrasonic waves in liquids ( $C_6H_6$  and PhMe) and in quartz. There is satisfactory agreement. A. J. M.

**Ultrasonic velocities in some organic liquids.** II. S. PARTHASARATHY (Proc. Indian Acad. Sci., 1936, 3, A, 285—289).—Data are recorded for ultrasonic velocities and adiabatic compressibilities of a no. of di-esters, *o*-, *m*-, and *p*-xylene, quinoline, and *o*-toluidine, for  $7.37 \times 10^6$  cycles per sec. and room temp. L. J. J.

**Heat capacities of quartz, cristobalite, and tridymite at low temperatures.** C. T. ANDERSON (J. Amer. Chem. Soc., 1936, 58, 568—570).—Data are recorded for the range 50—300° abs. The corresponding entropies are 10.06, 10.34, and 10.50, respectively. E. S. H.

**Heat capacities of vanadium, vanadium trioxide, vanadium tetroxide, and vanadium pentoxide at low temperatures.** C. T. ANDERSON (J. Amer. Chem. Soc., 1936, 58, 564—566).—Data are recorded for the range 55—300° abs. The corresponding entropies have been calc. E. S. H.

**Heat capacity of lead sulphate at low temperatures.** C. T. ANDERSON (J. Amer. Chem. Soc., 1936, 58, 567).—Data are recorded for 55—300° abs. The calc. entropy is 35.2. E. S. H.

**Limiting high-temperature rotational partition function of non-rigid molecules.** I. General theory. II.  $CH_4$ ,  $C_2H_6$ ,  $C_3H_8$ ,  $CHMe_3$ ,  $CMe_4$ , and *n*-butane. III. Benzene and its eleven methyl derivatives. L. S. KASSEL (J. Chem. Physics, 1936, 4, 276—282).—The theory of Eidinoff and Aston (A., 1935, 1064) is developed and applied to the calculation of mol. entropies, giving results in agreement with third-law data. L. J. J.

**Heat of evaporation of heavy hydrogen.** K. CLUSIUS and J. BARTHOLOMÉ (Nachr. Ges. Wiss. Göttingen, 1935, [ii], 1, 49—58; Chem. Zentr., 1935, ii, 961—962).—The latent heat of evaporation  $L$  of  $D_2$  (cf. A., 1935, 155) at 19.6° abs. has been directly measured in a liquid- $H_2$  calorimeter.  $L$ , corr. to the ideal gas state by means of the equation of state for  $H_2$ , is 304.7 g.-cal. per mol.  $L_0$  at 0° abs. is calc. as 274.0 g.-cal., giving a measured difference of 90.6 g.-cal. in zero-point energy between  $H_2$  and  $D_2$ . The entropy  $S_{\text{therm}}$  of  $D_2$  at 298.1° abs. = 33.927; total entropy = 39.02 in agreement with the calc. val. The following Trouton's consts. at low temp. are recorded: He 4.8,  $H_2$  10.6,  $D_2$  12.9, Ne 14.9. J. S. A.

**Variations of the physical properties of some liquids in the neighbourhood of the m.p.** A. BANCHETTI (Gazzetta, 1936, 66, 65—71).—The rate of cooling of anethole does not show any sudden change at the m.p. when the liquid is cooled slowly and remains supercooled (cf. A., 1900, ii, 465).

O. J. W.  
**Melting curve of a compound partly dissociated into its components.** J. J. VAN LAAR (Physica, 1936, 3, 255—256).—A claim of priority (cf. Młodziejowski, A., 1935, 582). L. J. J.

**Preliminary experiments on temperature equilibria at very low temperatures.** N. KÜRTI, B. V. ROLLIN, and F. SIMON (Physica, 1936, 3, 266—274).—The rate of establishment of temp. equilibrium at temp. obtained by the magnetic method has been examined. Equilibrium between  $Fe^{III} NH_4$  alum (I) and liquid He at 0.2° abs. is attained in 30 sec., so that the time-const. for the equilibrium spin system-lattice is < this. The thermal conductivities of (I) and  $Cr^{III} K$  alum between 0.07° and 0.16° abs. are  $\sim 10^{-5}$  c.g.s.; hence attainment of equilibrium within the salt is slow. L. J. J.

**Universal expression for the limits of physico-chemical relations.** G. A. KORSHENOVSKI (J. Phys. Chem. U.S.S.R., 1934, 5, 1321—1331).—Theoretical. CH. ABS. (e)

**Quantum statistics of melting.** L. TARSCHISCH (Z. Physik, 1936, 99, 259—273).—A theory of melting is deduced from Debye's theory of sp. heats and Born's dynamics of crystals, using the Fermi-Debye statistics. A. B. D. C.

**Liquid densities of propylene and methyl ethyl ether as determined by a modified dilatometer method.** D. B. PALL and O. MAASS (Canad. J. Res., 1936, 14, B, 96—104).—An improved dilatometric apparatus is described and with it the  $d$  of  $C_3H_6$  and MeOEt have been determined from 20° to 80° and 70° to 120°, respectively. The law of corresponding states is obeyed to within < 0.96° of the crit. temp. R. S.

**Vapour pressures of the xylenes and mesitylene.** L. S. KASSEL (J. Amer. Chem. Soc., 1936, 58, 670—671).—For *o*-xylene (0—80°)  $\log_{10} P = -2830.0/T - 5 \log_{10} T + 22.7480$ ; *m*-xylene (0—80°)  $-2876.3/T - 5 \log_{10} T + 22.9424$ ; *p*-xylene (0—80°)  $-2930.0/T - 5 \log_{10} T + 23.1000$ ; mesitylene (0—100°)  $-3104.5/T - 5 \log_{10} T + 23.1929$ . The calc. entropies of vaporisation to a perfect gas at 25° and 1 atm. are 24.35, 25.24, 25.96, and 26.39 e.u., respectively. E. S. H.

**Calculation of van der Waals  $a$  and  $b$ .** J. E. VERSCHAFFELT (Wis. nat. Tijdschr., 1935, 7, 149—154; Chem. Zentr., 1935, ii, 1143).—A crit. review. J. S. A.

**General constant of van der Waals.** R. LAUTÉ (Compt. rend., 1936, 202, 1059—1061).—Theoretical. The van der Waals const.  $a$ , defined by  $\log P_c/P = a_1 \{(T_c/T) - 1\}$ , where  $P_c$  and  $T_c$  are the crit. pressure and temp., is replaced by  $a_2 = \lambda/[4.571 T_c (1 - 1/P_c)]$ , where  $\lambda$  is the mol. latent heat of vaporisation at the b.p. ( $T_1$ ). The agreement between  $a_1$  and  $a_2$  is good even for "abnormal" liquids, for which  $a_1 < 2.8$

or  $> 3.2$ . With sufficient accuracy  $\lambda = 4.3a_2T_c$ . The empirical relation  $\lambda/T_c = 3.589 \log T_c + 1.13 + 0.00559T_c$  has also been derived, and using this and writing  $T_c/T_1 = 3/2$  a third const.  $a_3$ , agreeing sufficiently well with  $a_1$  and  $a_2$ , is deduced.  $a_3 = 0.7621 \times \log T_1 + 0.5822 + 0.001322T_1$ . R. S. B.

**Thermodynamic equilibrium in the gravitational field.** F. O. KOENIG (J. Physical Chem., 1936, 40, 373—378).—Mathematical. F. L. U.

**Variation in volume of heavy water on freezing.** J. TIMMERMANS, M. HENNAUT-ROLAND, and D. ROZENTAL (Compt. rend., 1936, 202, 1061—1063; cf. A., 1935, 815).—Vals. of  $d$  for pure  $D_2O$  have been determined.  $d^{4.3} = 1.10573$ ,  $d^{11.6} = 1.10621$ ,  $d^{20} = 1.10556$ , giving by extrapolation  $d^{3.82} = 1.1057$ , and sp. vol. at  $3.82^\circ = 0.9044$ . For the solid  $d^0 = 1.01475$ , and  $d^5$  for  $H_2O = 0.9159$ . The sp. vols. of solid and liquid  $D_2O$  at approx.  $0^\circ$  differ by 0.0811, which agrees sufficiently with published vals.;  $dT/dp$  as calc. using the Clausius-Clapeyron equation also agrees with published vals. and is approx. the same for  $D_2O$  and  $H_2O$ , viz., 0.00705° per kg. per sq. cm. R. S. B.

**Thermal expansion of water.** I. V. IPATOV (J. Phys. Chem. U.S.S.R., 1934, 5, 1230—1231).—Experimental vals. ( $0$ — $100^\circ$ ) are expressed by equations. CH. ABS. (c)

**Thermal expansion of solids at low temperatures** (Cu, Ni, Fe, zinc blende, LiF, calcite, aragonite,  $NH_4Cl$ ). H. ADENSTEDT (Ann. Physik, 1936, [v], 26, 69—96).—The thermal expansion was investigated over the range  $0^\circ$  to  $-195^\circ$  by an interference method. A metal thermostat operating between these temp. is described. The coeff. of expansion ( $\alpha$ ) of Cu, Ni, and Fe over this range agrees with vals. obtained from the formula of Grüneisen for regular monat. substances. The anomalies recorded by Simon *et al.* (A., 1930, 986) were not observed. Zn blende was investigated down to  $-253^\circ$ , and gives at the lower temp. a negative val. for  $\beta [(1/V_0)(\delta l/\beta T)]$ . For LiF,  $\alpha$  agrees with the Grüneisen formula except at the lower temp. With falling temp.  $\alpha$  for aragonite approaches the val. for a monat. solid, but calcite shows a negative vol. expansion at  $-172^\circ$ . In the case of  $NH_4Cl$  the transition point at  $-31^\circ$  was verified. The behaviour of  $\beta$  for  $NH_4Cl$  indicates that the transition is homogeneous. A. J. M.

**Negative expansion coefficient of silver iodide.** E. COHEN and H. L. BREDÉE (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 358—360).—The val. for the expansion coeff. of AgI determined by Jones and Jelen (cf. this vol., 279) is considered to be in error, since these authors used a mixture of  $\alpha$ - and  $\beta$ -AgI, and  $\beta \rightarrow \alpha$  during the experiment. Pure  $\alpha$ -AgI has the coeff. found by Fizeau, viz.,  $-4.1 \times 10^{-6}$  at  $40^\circ$ . R. S. B.

**Viscosity of gaseous oxygen at low temperatures; effect of pressure.** A. VAN ITTERBEEK and (MLLE.) A. CLAES (Physica, 1936, 3, 275—281).—Data obtained by the oscillating-disc method are recorded for  $293.8^\circ$ ,  $90.1^\circ$ ,  $79.8^\circ$ , and  $72.0^\circ$  abs., and  $10^{-5}$ — $760$  mm. pressure.  $\eta$  is independent of pressure

down to about 5 mm. The calc. ratios of the mean mol. velocities at the temp. studied agree with the Maxwell-Boltzmann distribution. L. J. J.

**New comparison of the viscosity of  $D_2O$  with that of  $H_2O$ .** W. N. BAKER (J. Chem. Physics, 1936, 4, 294—295).—Between  $5^\circ$  and  $35^\circ$ ,  $\eta$  for  $D_2O$  is approx. equal to  $\eta$  for  $H_2O$  at a temp.  $8.5^\circ$  lower. L. J. J.

**Viscosity of liquid metals.** D. V. COLGATE (J. Univ. Bombay, 1935, 4, Part II, 83—85).—Formulae are derived relating the viscosity of a monat. liquid with (a) the at. wt., m.p., and at. vol. at the m.p., and (b) with  $d$ , the at. wt., the Debye characteristic temp., and a const. dependent on the cryst. structure of the metal. The calc. vals. are in fair accord with experiment for Cd, Hg, Cu, Sn, and Pb. J. W. S.

**Diffusion isotherms for binary mixtures.** H. LEMONDE (Compt. rend., 1936, 202, 468—470).—Diffusion coeffs. ( $D$ ) have been determined for the following mixtures:  $H_2O$  with MeOH, EtOH, PrOH,  $Pr^2OH$ ;  $CHCl_3$  with  $Et_2O$ ,  $COMe$ , EtOH;  $C_6H_6$  with  $CHCl_3$ , MeOH, EtOH,  $C_6H_{14}$ ; PhMe with EtOH.  $D \times$  viscosity ( $\eta$ ) is const. only for very dil. solutions. In general the  $D\eta$  curves show a max. or min. or both, the deviations apparently depending on the tendency to association.  $D$ -composition curves for homologous compounds in the same solvent have the same form. In dil. solution  $D \propto$  vol. concn. F. L. U.

**Viscosities of aqueous solutions of nitric acid at low temperatures.** D. SCHOFIELD (Bol. Soc. Quim. Peru, 1935, 1, 7—25).—At  $-17^\circ$ , the fluidity-concn. curve shows max. deviation from the ideal mixture curve at  $HNO_3.H_2O$ . A thermostat suitable for temp. below  $0^\circ$  is described. L. A. O'N.

**Viscosity and conductivity in the system: fused  $KCl$ - $LiCl$ .** S. V. KARPATSHEV, A. G. STROMBERG, and V. N. PODTSCHAINOVA (J. Gen. Chem. Russ., 1935, 5, 1517—1526).—Conductivity and viscosity data for the range  $400$ — $900^\circ$  indicate that Stokes' law is not applicable to the system. R. T.

**Thermal conductivity of liquids. Binary mixtures of water and glycerol.** O. K. BATES (Ind. Eng. Chem., 1936, 28, 494—498).—In a modification of the apparatus previously employed (B., 1933, 415) thermal conductivity measurements have been made for a complete range of mixtures of  $H_2O$  and glycerol (I) at  $10$ — $80^\circ$ . The coeff. of thermal conductivity of pure (I) is independent of temp. over the range considered. M. S. B.

**Vaporisation equilibria in the binary salt mixture  $HgCl_2$ - $HgBr_2$ , and in the reciprocal salt-pair (Na, K) (Cl, Br).** H. HINTZ and K. JELLINEK (Z. Elektrochem., 1936, 42, 187—200; cf. A., 1933, 770).—Comparison of the total v.p. of liquid  $HgCl_2$ - $HgBr_2$  mixtures with the partial pressures of the components, measured at  $238^\circ$ , indicates that the liquid behaves as an ideal mixture, that no compound is formed, and that only single mols. are present. Similar measurements at  $1250^\circ$  for the mixtures  $NaCl$ - $KCl$ ,  $NaBr$ - $KBr$ ,  $NaCl$ - $NaBr$ , and  $KCl$ - $KBr$  lead to the same conclusions with regard

to these mixtures. A diagram of the vapour equilibria of the reciprocal salt-pair NaCl-KBr is given.

F. L. U.

**Vapour pressure of the binary system,  $\text{PbCl}_2$ -AgCl.** D. N. TARASENKOV and A. V. BOGOSLOVSKAJA (J. Gen. Chem. Russ., 1935, 5, 1687-1689).—V.-p. data are recorded for the interval 500-800°. It is concluded that  $\text{PbCl}_2$  may be separated from AgCl by distillation at 700-800°.

R. T.

**Heat of vaporisation in the system carbon disulphide-methyl alcohol.** S. I. TSCHERBOV (J. Gen. Chem. Russ., 1935, 5, 1645-1651).—Vrevski's equation connecting the latent heat of vaporisation of a liquid mixture with those of its components, the composition of the vapour phase, and the differential heat of dilution of the components (A., 1930, 404) is shown to hold for the system  $\text{CS}_2$ -MeOH at 20°.

R. T.

**Phase equilibria in hydrocarbon systems. XII. Specific heats of some mixtures of propane, *n*-butane, and *n*-pentane.** B. H. SAGE, H. S. BACKHUS, and T. VERMEULEN (Ind. Eng. Chem., 1936, 28, 489-493).—Sp. heats at const. pressure have been determined for binary mixtures of  $\text{C}_3\text{H}_8$ ,  $\text{C}_4\text{H}_{10}$ , and  $\text{C}_5\text{H}_{12}$  at 21-104° in the condensed liquid phase. The mixtures follow closely the laws of ideal solutions as was indicated by determining pressure-vol.-temp. relations for  $\text{C}_3\text{H}_8$ - $\text{C}_5\text{H}_{12}$  mixtures and calculating heat content and entropy.

M. S. B.

**Diffusion and azeotropism in binary mixtures.** H. LEMONDE (Compt. rend., 1936, 202, 1069-1071; cf. this vol., 674).—The diffusion coeff. ( $D$ ) increases or decreases with concn. in a binary mixture according as the v.p. decreases or increases, provided that the v.p. departs sufficiently from the linear law. Mixtures may be classified in terms of the function  $D\eta$  which seems to be very sensitive to variations in the magnitude of the intermol. forces.

R. S. B.

**Orthobaric azeotropes. Esters-halides.** M. LECAT (Ann. Soc. Sci. Bruxelles, 1936, 56, B, 41-54; cf. this vol., 280).—Data are given for 434 binary systems formed by 80 esters and 63 halogenated hydrocarbons. These include 148 cases of azeotropism (23 negative).

M. S. B.

**Solubility in liquids of gas mixtures under pressure. II. Thermodynamical calculation of solubility in water of a mixture of nitrogen and hydrogen under pressure.** I. R. KRITSCHESKI and J. S. KASARNOVSKI (Z. physikal. Chem., 1936, 176, 48-54; cf. this vol., 29, 30).—Assuming that a 1:3 mixture of  $\text{N}_2$  and  $\text{H}_2$  is equiv. to an infinitely dil. solution of  $\text{N}_2$  in  $\text{H}_2$ , the partial mol. vols. and fugacities of  $\text{N}_2$  in a mixture containing 76.42%  $\text{H}_2$  and the solubility in  $\text{H}_2\text{O}$  of  $\text{H}_2$  and  $\text{N}_2$  from this mixture have been calc. for pressures of 50-1000 atm. at 25°. The results agree with published experimental data.

R. C.

**Solubility of lanthanum in mercury from 0° to 50°.** W. G. PARKS and J. L. CAMPANELLA (J. Physical Chem., 1936, 40, 333-341).—The solubility of La in Hg between 0° and 50° is low, and is given by:  $\log N = -1020/T' - 0.4575$  ( $N$ =at. fraction of

La,  $T'$ =abs. temp.). La amalgam is considered unsuitable for precise c.m.f. measurements.

F. L. U.

**Solubility of lead bromate and its activity coefficients in solutions of electrolytes.** F. H. MACDOUGALL and E. J. HOFFMAN (J. Physical Chem., 1936, 40, 317-331; cf. A., 1930, 699).—The solubility of  $\text{Pb}(\text{BrO}_3)_2$  in  $\text{H}_2\text{O}$ , and in presence of nitrates of K, Na, Li, Ca, Sr, and Pb, has been determined at 25°. The theory of Debye and Hückel is not valid for these solutions if complete ionisation is assumed. Activity coeffs. are calc. assuming the stages: (1)  $\text{Pb}(\text{BrO}_3)_2 \rightleftharpoons \text{PbBrO}_3 + \text{BrO}_3^-$ ; (2)  $\text{PbBrO}_3 \rightleftharpoons \text{Pb}^{++} + \text{BrO}_3^-$ .

F. L. U.

**Solubility of lead sulphate in aqueous sulphuric acid at high concentrations.** H. D. CROCKFORD and J. A. ADDLESTONE (J. Physical Chem., 1936, 40, 303-305; cf. A., 1935, 159).—Solubilities of  $\text{PbSO}_4$  at 0°, 25°, 35°, and 50° are given for  $[\text{H}_2\text{SO}_4] > 80\%$ . At 0°  $\text{H}_2\text{SO}_4$  and  $\text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$  may exist as solids. At the higher temp. the only solid phase is  $\text{PbSO}_4$ . The  $\text{PbSO}_4$ - $\text{H}_2\text{SO}_4$  eutectic is at 5.4°.

F. L. U.

**Solubility in water and aqueous sodium chloride of  $\alpha$ -naphthylaminemonosulphonic acids and their sodium salts.** P. I. SOKOLOV (Anilinokras. Prom., 1935, 5, 149-153).—Solubility data are recorded for  $\alpha$ -naphthylamine-2-, -4-, -5-, -6-, -7-, and -8-sulphonic acids and their Na salts at 25°.

R. T.

**Influence of degree of dispersion on physico-chemical constants. VI.** E. COHEN and J. J. A. BLEKKINGH (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 154-163; cf. this vol., 20).—The solubility of salicylic acid at 25° has been studied under various conditions. The previously recorded high and discrepant vals. are attributed to the high degree of dispersion of the solid phase and to the presence of about 0.2% of  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ .

O. J. W.

**Solidification diagram of copper-zinc alloys.** W. BRONIEWSKI, J. T. JABLONSKI, and S. MAJ (Compt. rend., 1936, 202, 411-414).—The m.-p. diagram of Cu-Zn alloys indicates the presence of the compounds  $\text{CuZn}$ ,  $\text{CuZn}_2$ , and  $\text{CuZn}_6$ .  $\text{CuZn}$  and  $\text{CuZn}_6$  show allotropic changes at about 460° and 600°, respectively.

J. W. S.

**Study of copper-tin alloys by X-ray analysis.** E. A. OWEN and E. WILLIAMS (J. Inst. Metals, 1936, 58, Advance copy, 153-167).—The  $\delta$ -phase in Cu-Sn alloys is a solid solution with a range varying from zero at the eutectoid point (67.45% Cu, 330°) to 0.48% at 550°. The  $\eta$ -phase is also a solid solution extending from 61.68 to 62.10% at 250° and from 61.68 to 62.20% Cu at 530°. Below 330°  $\delta$  decomposes into  $\alpha + \eta$ .

A. R. P.

**Orientation in peritectic structures.** A. B. GRENINGER (Nature, 1936, 137, 657-658).—X-Ray investigation of the reaction  $\alpha + \text{liquid} \rightarrow \beta$  in the Cu-Zn system shows that the orientations assumed by the  $\beta$ -phase are definitely related to the orientation of the  $\alpha$ -phase. Seeding the crystallisation of a pure  $\beta$ -alloy (52% Cu) with a Cu single crystal gives the sequence Cu crystal seed, primary cryst.  $\alpha$ -phase

having the same orientation as the Cu seed, large  $\beta$ -grains having a narrow rim of segregated  $\alpha$ -phase and originating in the peritectic reaction  $\alpha + \text{liquid} \rightarrow \beta$ .  
L. S. T.

**Electrical conductivity and equilibrium diagram for binary alloys. XIX. System sodium-thallium.** G. GRUBE and A. SCHMIDT (Z. Elektrochem., 1936, 42, 201—209; cf. this vol., 151).—In addition to NaTl and NaTl<sub>2</sub>, the existence of compounds Na<sub>2</sub>Tl and Na<sub>6</sub>Tl is established by thermal analysis and conductivity measurements. Solid solutions occur over a wide range in systems rich in Tl. NaTl melts without decomp. at 305°, whilst the other compounds are formed as a result of solid reactions. Alloys with Na 17—24 at.-%, after quenching from 200°, undergo considerable hardening at room temp.  
F. L. U.

**Constitution of tin-rich antimony-tin alloys.** D. HANSON and W. T. PELL-WALPOLE (J. Inst. Metals, 1936, 58, Advance copy, 79—90).—The system up to 14% Sb has been examined by thermal analysis, micrographically, and by the electrical resistance method. The liquidus consists of two branches, the first corresponding with the separation of the  $\alpha$ -Sn solid solution and the second with the separation of cuboid- $\delta$ ; at 246° a peritectic reaction occurs between  $\delta$  and liquid (9% Sb) to form  $\alpha$  (10.5% Sb). The solubility of Sb in Sn decreases from 10.5% at 246° to 4% at 190° and to 3.5% at 100°. Characteristic microstructures are illustrated.  
A. R. P.

**Over-structure phenomena in nickel-arsenic alloys.** F. LAVES (Fortschr. Min., 1935, 19, 33—37; Chem. Zentr., 1935, ii, 972—973).—Rotation photographs obtained with tetragonal Ni<sub>3</sub>As<sub>2</sub> (maucherite) give  $a$  3.45,  $c$  21.7 Å., with a superposed two-dimensional overstructure having  $a$  6.9 Å.  
J. S. A.

**Mixed crystal problem.** H. O'DANIEL (Fortschr. Min., 1935, 19, 48—52; Chem. Zentr., 1935, ii, 1126).—The possible ratios of mixed crystal components which permit the development of a perfect overstructure are discussed.  
J. S. A.

**New method of separation of radium by rapid reduction in barium content.** (MME.) B. E. MARQUES (J. Chim. phys., 1936, 33, 306—316).—Previous experimental evidence (this vol., 421) indicates that, by slow evaporation at 20° of saturated aq. BaBr<sub>2</sub> containing Ra, until about 60% of the BaBr<sub>2</sub> has crystallised out, practically the whole of the RaBr<sub>2</sub> present may be conc. in the BaBr<sub>2</sub> crystals. By successive dissolution and partial recrystallisation a product rich in Ra may be obtained with comparatively little loss.  
M. S. B.

**Radon hydrate.** B. A. NIKITIN (Z. anorg. Chem., 1936, 227, 81—93).—Rn left in contact with snow at -3.5° remains entirely in the gas phase, but if SO<sub>2</sub> is introduced into the latter, the Rn is transferred to the solid phase SO<sub>2</sub>.6H<sub>2</sub>O. The distribution of Rn between the gaseous and solid phases has been measured, for different relative amounts of the phases, and when equilibrium is reached, both from SO<sub>2</sub>+Rn in contact with snow and from Rn in contact with preformed SO<sub>2</sub>.6H<sub>2</sub>O. Under these conditions the

partition factor  $D = [\text{Rn}]_{\text{cryst}}/[\text{Rn}]_{\text{gas}} - [\text{SO}_2]_{\text{gas}}/[\text{SO}_2]_{\text{cryst}}$  is const. = 0.57. Similar experiments with H<sub>2</sub>S.6H<sub>2</sub>O give  $D = 2.4$ . The results afford conclusive evidence of the existence of Rn.6H<sub>2</sub>O isomorphous with the hexahydrates of SO<sub>2</sub> and H<sub>2</sub>S, and occupying an intermediate position with regard to stability. All experiments were carried out at -3.5°, below the eutectic temp. of H<sub>2</sub>O and the respective hydrates  
F. L. U.

**Adsorption of nitrogen on tungsten.** J. K. ROBERTS (Nature, 1936, 137, 659—660).—Amounts of N<sub>2</sub> insufficient to cover a W wire are rapidly and completely adsorbed, leaving a negligible residual pressure. N<sub>2</sub> thus resembles H<sub>2</sub> (cf. this vol., 282).  
L. S. T.

**Diffusion of hydrogen through copper.** E. O. BRAATEN and G. F. CLARK (Proc. Roy. Soc., 1936, A, 153, 504—512).—The rate of diffusion of H<sub>2</sub> through Cu has been determined for several temp. and pressures. The rate varies with the pressure in a manner consistent with the equation of Smithells and Ransley (A., 1935, 692); the adsorption factor causes a slight departure from the equation at about 2 mm. The effect of temp. is given by the usual exponential relation.  
L. L. B.

**Adsorption of radon by glass.** S. C. LIND and R. LIVINGSTON (J. Physical Chem., 1936, 40, 419—420; cf. A., 1933, 564).—Rn in Pyrex glass bulbs undergoes slow irreversible adsorption on the walls, amounting to 16% in 68 hr. The need for taking account of this effect in quant. work is emphasised.  
F. L. U.

**Pre-Gibbs adsorption by surface rearrangement.** J. W. MCBAIN (Nature, 1936, 137, 659).—The possible existence of a preliminary factor contributing to the lowering of  $\eta$ , viz., an interchange of positions between mols. of solute and solvent within a few mol. diameters of the surface, is discussed in relation to the low vals. of  $\eta$  shown by soap solutions.  
L. S. T.

**Method of studying conditions within diffusion layers.** T. TEORELL (J. Biol. Chem., 1936, 113, 735—748).—An apparatus is described for measuring diffusion gradients by the use of a no. of membranes in series separated by well-stirred solutions so that the diffusion gradients occur exclusively in the membranes. Analysis of the solutions in the chambers bounded by these membranes permits the plotting of these gradients.  
H. D.

**Sorption of iodine by polyvinyl alcohol.** W. GALLAY (Canad. J. Res., 1936, 14, B, 105—113).—The adsorption isotherms of I on polyvinyl alcohol polymerides pptd. by NaCl and by MgSO<sub>4</sub> have been studied. When MeOH and EtOH are the pptg. agents, the adsorption follows the simple distribution law. Adsorption of NaHCO<sub>3</sub> on the NaCl-pptd. alcohol is also linear, but the I adsorption is not affected by pretreatment with electrolytes. It is suggested that a certain colloidal size and a certain type of linking are necessary for the formation of blue I compounds.  
R. S.

**Adsorption of proteins. Influence of hydrogen-ion concentration on the adsorption of hæmoglobin by kaolin.** M. PAÍĆ and (MLLE.) V.

DEUTSCH (Compt. rend., 1936, 202, 1283—1285).—The adsorption isotherms in presence of various buffer solutions show a discontinuity at low concns. With varying  $p_H$ , the adsorption passes through a max., the position of which depends on the buffer concn.

L. J. J.

**Inner adsorption in salt crystals. III. Nature of inclusion of ZnS in CuS.** D. BALAREV (Z. anal. Chem., 1935, 102, 408—411; cf. A., 1927, 925).—Polemical against Kolthoff (A., 1932, 481). The ease with which ZnS, copptd. with CuS, is extracted by HCl is held to point to its true inner adsorption in the CuS lattice.

J. S. A.

**Coprecipitation and after-precipitation. Ageing of precipitates. I.** M. KOLTHOFF (Z. anal. Chem., 1936, 104, 321—333).—Polemical against Balarev (preceding abstract). The author's views are summarised.

J. S. A.

**Gas-solid equilibria. VI. Adsorption from binary gas mixtures by silica gel.** B. LAMBERT and H. S. HEAVEN (Proc. Roy. Soc., 1936, A, 153, 584—600).—The pressure-concn. equilibria at 0° between SiO<sub>2</sub> gel and O<sub>2</sub>-A, O<sub>2</sub>-N<sub>2</sub>, and O<sub>2</sub>-He mixtures (containing equal proportions of the two gases in each case) have been investigated. A procedure is described by means of which it is possible to determine the vols. of the two gases X and Y adsorbed and the partial pressures of X and Y in the equilibrium gaseous phase: (a) when either X or Y is given priority of contact with the solid adsorbent; and (b) when X and Y in equal concns. reach the adsorbent simultaneously. With O<sub>2</sub>-A mixtures, when the O<sub>2</sub> is given priority of contact, the adsorbed phase at equilibrium contains 3 times as much O<sub>2</sub> as A; when A is given priority of contact, the adsorbed phase contains half as much O<sub>2</sub> as A; and when the two gases reach the gel simultaneously, equal amounts of O<sub>2</sub> and A are found in the adsorbed phase. A theory of adsorption is suggested, involving the assumption of an adsorbed phase consisting of two layers of gas mols. With O<sub>2</sub>-N<sub>2</sub> mixtures, O<sub>2</sub> is adsorbed more, and N<sub>2</sub> less, than each would be in the absence of the other. With O<sub>2</sub>-He mixtures, O<sub>2</sub> is adsorbed as it would be in the absence of He, provided that the gel has previously been thoroughly "washed out" with O<sub>2</sub>. The adsorptive power for He at 0° is negligible.

L. L. B.

**Active oxides. XCIV. Sorptive capacity of goethite during dehydration.** J. HAMPEL (Z. Elektrochem., 1936, 42, 185—187).—From expts. with Congo-red, acid fuchsin, and eosin in MeOH solution the relation between the sorptive capacity of artificially prepared goethite in various stages of dehydration and the ratio H<sub>2</sub>O/Fe<sub>2</sub>O<sub>3</sub> has been determined and is interpreted in accordance with conclusions previously reached (A., 1935, 1204; this vol., 441).

F. L. U.

**Solution state of film-forming substances.** J. SCHREIBER and O. BAUER (Kolloid-Beih., 1936, 43, 363—416).—The viscosity of solutions of many resins, highly-polymerised substances, such as rubber and its derivatives, and cellulose nitrate in a large no. of org. solvents has been determined. The effects

of changing and mixing the solvents are discussed for the several systems, but wider generalisations have not been deduced.

E. S. H.

**Wettability of quartz, calcite, and gypsum by molten sulphur.** K. N. SAMOCHVALOV and N. A. HELD (Kolloid-Z., 1936, 75, 89—74).—Wetting by S at 120° and 140° in H<sub>2</sub>O, air, and H<sub>2</sub>O vapour has been investigated by autoclave procedure. Addition of Na<sub>2</sub>CO<sub>3</sub>, Na<sub>2</sub>SiO<sub>3</sub>, or oak-bark extract reduces the wettability of CaSO<sub>4</sub>·0.5H<sub>2</sub>O or CaCO<sub>3</sub> by S, and of SiO<sub>2</sub> by bituminous S.

E. S. H.

**Laminar systems. III. Formation of thin layers of bismuth and lead sulphides on the surface of bismuth and lead salt solutions.** S. G. MOKRUSCHIN, R. B. GINSBURG, and N. M. DEM-JANOVA (Kolloid-Z., 1936, 75, 10—14; cf. A., 1935, 1317).—The prep. of films of Bi<sub>2</sub>S<sub>3</sub> or PbS, with a max. thickness of 1500—2000 Å., on the surface of aq. Bi(NO<sub>3</sub>)<sub>3</sub> or Pb(OAc)<sub>2</sub> by the action of H<sub>2</sub>S is described.

E. S. H.

**Mechanical resistance of the skin of alumina and its influence on the surface tension of the fused metal.** A. PORTEVIN and P. BASTIEN (Compt. rend., 1936, 202, 1072—1074).—The mechanical resistance of the skin of Al<sub>2</sub>O<sub>3</sub> formed on Al by heating for approx. 1 min. at 700° is 1960 dynes per cm. The thickness of the film is 10<sup>-5</sup> cm., giving a tensile strength of 2 kg. per sq. mm., which is much > that for cryst. Al<sub>2</sub>O<sub>3</sub>. The surface tension of Al fused in air is 840 dynes per cm., but for Al fused in A it is 300 dynes per cm.

R. S. R.

**Surface activity and absorption of amino-acids. V. Diamino-acids. VI. Position isomerides of monoamino-acids.** T. ITO (J. Agric. Chem. Soc. Japan, 1936, 12, 204—207, 208—215).—V. Histidine (I), lysine (II), and arginine (III), over the range  $p_H$  1—13, have very little influence on the  $\gamma$  of H<sub>2</sub>O; both neutral mols. and ions are surface inactive. The max. adsorption of (I) on charcoal occurs at  $p_H$  7.5, whilst for (II) and (III) the max. are at  $p_H$  9.5. The order of adsorption for (II) and (III) is neutral mol. < anion > cation, and for (I) neutral mol. > anion = cation.

VI. The reduction of  $\gamma$  by various NH<sub>2</sub>-acids follows the order  $\alpha$ -aminohexoxic >  $\alpha$ -aminovaleric >  $\epsilon$ -aminohexoxic >  $\gamma$ -aminovaleric >  $\delta$ -aminovaleric acid (IV). On charcoal the cations are adsorbed as strongly as the neutral mols. but the anions are less readily adsorbed. In the case of (IV) the adsorption of the cation is > that of the neutral mol.

J. N. A.

**Surface tension of systems containing a tautomeric substance.** R. V. MERTZLIN (J. Phys. Chem. U.S.S.R., 1934, 5, 1210—1214).—Surface tension measurements for the system PhNO<sub>2</sub>-o-OH·C<sub>6</sub>H<sub>4</sub>·NO<sub>2</sub> at 20—130° show the existence of two tautomeric forms of the latter. The surface tension isotherms are convex. to the concn. axis at temp. above, and concave below, the region of tautomeric change.

CH. ABS. (e)

**Influence of denaturation on spreading of proteins on a water surface.** H. NEURATH (J. Physical Chem., 1936, 40, 361—368).—Pressure-area

relations for films of ovalbumin (I) and serum-albumin (II) on  $H_2O$  have been determined. Spreading is greater at the isoelectric point ( $p_H$  4.8) than at  $p_H$  4.4. (II) spreads to an area (1.05 sq. m. per mg.) 15% > for (I). Previous denaturation by heat completely prevents, and irradiation with ultra-violet light partly inhibits, spreading. Fully spread films can be caused to collapse by irradiation. An explanation of the observations is given. F. L. U.

**Formation of Liesegang rings in presence of precipitates.** B. N. SEN (J. Physical Chem., 1936, 40, 369—372).—The formation of Liesegang rings of Prussian-blue by diffusion of aq.  $K_3Fe(CN)_6$  into magmas of  $CaSO_4$  or  $BaSO_4$  and aq.  $FeCl_3$  has been studied. F. L. U.

**Dependence on temperature of the apparent molecular volume of dissolved electrolytes.** I. B. PESCE (Gazzetta, 1936, 66, 99—104).—Measurements of  $d$  for KCl and NaCl solutions of varying concn. at 0.06°, 25°, 45°, 65°, and 85° are recorded. The apparent mol. vol. of both salts is a max. at 65°. O. J. W.

**Measurement of coefficient of diffusion of electrolytes.** L. J. KURTZ and A. G. SAMARTZEV (J. Phys. Chem. U.S.S.R., 1934, 5, 1424—1428).—Changes of concn. of the layers near the electrodes during electrolysis were measured with a polarising microscope and Lebedev interferometer. Vals. for the diffusion coeff. of  $ZnSO_4$  are given.

CH. ABS. (e)

**Viscosity of aqueous solutions of electrolytes as a function of concentration. III. Caesium iodide and potassium permanganate.** G. JONES and H. J. FORNWALT (J. Amer. Chem. Soc., 1936, 58, 619—625; cf. this vol., 22).—Determinations have been made at 0° and 25° over a wide range of concn. The variation of  $d$  with concn. can be expressed by Root's equation. CsI is more effective than any other known salt in lowering the  $\eta$  of  $H_2O$ ; the effect is an additive property of the ions.  $KMnO_4$  reduces the  $\eta$  of  $H_2O$ . The influence of interionic attraction on  $\eta$  is discussed. E. S. H.

**Abnormal vapour pressures in potassium chloride solutions.** A. R. WEIR (Coll. Czech. Chem. Comm., 1936, 8, 149—169).—The v.p. of aq. KCl solutions has been studied by (a) determination of the rate of distillation or condensation of  $H_2O$  in the capillary limb of an inverted U-tube, the wide limb of which contains the solution at a different temp.; (b) passing air through the solution, then over  $P_2O_5$ , and weighing; (c) direct determination of the v.p. of solutions prepared in vac. Solutions containing 58 g. of KCl per 1000 g. of  $H_2O$  exhibit variable and abnormally high v.p., indicating the presence of a metastable condition. Data relating to other physical properties at this concn. show similar variations. R. S.

**Positive platinum sols.** N. BACH and N. BALASCHOWA (Nature, 1936, 137, 617).—These have been prepared by the regulated oxidation of negative  $H_2$ -Pt sols. The particles behave like small Pt gas electrodes. Cataphoretic velocities of the sols corresponding with different degrees of oxidation are recorded. L. S. T.

### Colloidal solutions in concentrated electrolytes.

A. VORT (J. Physical Chem., 1936, 40, 307—315).—Sols of Pd, Pt, Au, and their sulphides, AgCl, AgBr, AgI, C, and S in 96%  $H_2SO_4$  or 87%  $H_3PO_4$  may remain stable for several weeks. In some cases slow pptn. occurs, but the ppt. can be redispersed by shaking. Stable sols of some of the above have also been prepared in saturated solutions of  $CaCl_2$  and KOAc. Dilution with  $H_2O$  invariably results in irreversible coagulation. The stability is not due to high viscosity, nor can cataphoresis of the particles be observed. The solutions all show a high electrical conductivity compared with ordinary sols. It is suggested that stability is due to solvation.

F. L. U.

**Relation between electro-chemical constitution and colloid structure of pure dyes sols.** W. PAULI and F. LANG (Monatsh., 1936, 67, 159—186).—By electro-dialysis and electro-decantation, very pure blue acidoid dye sols have been prepared from Congo-red (I), Congo-rubin (II), Congo-cornith G (III), benzopurpurin 4B (IV), and Chicago-blue 6B (V), the variation of their mol. conductivity with temp. and dilution being studied and compared with that of the basic dye sol of night-blue. The energy of association increases with increased internal salt formation and with the increase in polar acid groups arising from ammonolysis of the internal salt. Association hysteresis occurs and equilibrium vals. of the conductivity are obtained only after keeping at any prescribed temp. (II) and (III) have a greater conductivity than (I); this is attributed to the presence of OH in place of  $NH_2$ . The behaviour of (IV) and (V) is also in accord with their respective constitutions. The structure of dye sols and their relation to soap and protein sols are discussed. J. W. S.

**Production of oxide cathodes of colloidal structure.** E. PATAI and Z. TOMASCHEK (Kolloid-Z., 1936, 75, 80—88; cf. this vol., 566).—Hydrosols of alkaline-earth carbonates are prepared by leading  $CO_2$  into  $Ba(OH)_2$  dissolved in aq. glycerol or  $(CH_2OH)_2$ . The sols are suitable for electrophoretic deposition on metals to give oxide cathodes. E. S. H.

**Highly-polymerised compounds. CXXXIV. Distribution of mol. wts. in highly-polymerised mixtures and determination of mean mol. wt.** G. V. SCHULZ (Z. physikal. Chem., 1936, B, 32, 27—45; cf. this vol., 314).—The relations between the frequency and mass distribution functions and the mean mol. wt.,  $M$ , are deduced mathematically. By means of the distribution function the difference between the average mol. wt. of a mixture of polymeride homologues determined viscosimetrically and  $M$  can be calc. The distribution functions of a polystyrene fraction, a polymerised isobutylene (I), and a cellulose nitrate (II) of high mol. wt. have been determined. Calculation of the difference between the viscosimetric mol. wt. and  $M$  has shown that in the determination of the mol. wt. by the viscosimetric method the presence of moderate amounts of other polymerides does not cause notable error. The difference in the distribution functions of (I) and (II) indicates that the processes by which cellulose is

elaborated in the plant and the synthetic polymeride formed are fundamentally different. Staudinger's viscosity law is valid to within a few % for cellulose and substances of similar structure for degrees of polymerisation of 10–1000. R. C.

**Structures of precipitates. II. Effect of  $Mg^{++}$ ,  $Zn^{++}$ ,  $Ni^{++}$ ,  $Cu^{++}$ ,  $Mn^{++}$ , and  $Cd^{++}$  ions on peptisability of secondary particles of barium sulphate precipitates. III. Occlusion phenomena with barium sulphate precipitates.** B. TEŽAK (Z. physikal. Chem., 1936, B, 32, 46–51, 52–64; cf. this vol., 427).—II. The peptisability of  $BaSO_4$  pptd. from a mixture of aq.  $BaCl_2$  and  $XSO_4$  of concns. 0.02–0.05*N* decreases as *X* is varied in the order  $Mg^{++} > Zn^{++} > Ni^{++} > Cu^{++} > Mn^{++} > Cd^{++}$ . It is related to the sorption of these ions on the  $BaSO_4$  and to their hydration.

III. The effect of variation of the conditions of pptn. on the amount of Cl occluded by the ppt. formed from  $BaCl_2$  and  $Na_2SO_4$  has been studied. It appears that the occlusion is due to adsorption on the primary particles. The ions present as complementary ions in the adsorption layer may considerably influence the composition of the primary adsorption layers of the lattice ions; e.g., in pptn. with  $Ba(NO_3)_2$  the  $NO_3^-$  ions may cause preferential adsorption of  $Ba^{++}$ , the ppt. being charged positively, whereas with  $BaCl_2$  as precipitant under similar conditions the ppt. is negatively charged owing to preferential adsorption of  $SO_4^{--}$  ions. R. C.

**Viscosity and lyotropic numbers** E. M. BRUNS (Rec. trav. chim., 1936, 55, 297–300).—A reply to Merkel (this vol., 426). E. S. H.

**Directed coagulation in aerosols.** D. BEISCHER and A. WINKEL (Z. physikal. Chem., 1936, 176, 1–10).—An aerosol of dimethylaminoazobenzene coagulates at a rate essentially in accordance with Smoluchowski's theory. With an aerosol of aminoazobenzene (I) the coagulation coeff. is exceptionally large, and the relation between  $1/n$  and  $t$  becomes linear only after coagulation has proceeded for some time. This anomaly is due to the pyro-electric properties of (I). Condensation of the vapour yields crystals of colloidal dimensions in which on cooling a pyro-electric moment appears, and the particles attract and orient each other, giving long strings consisting of up to 50 particles joined end to end. Certain foreign substances inhibit the pyro-electric effect, and coagulation is then normal. A method of determining pyro-electric moments is described which consists in observing the deflexion produced when a homogeneous electric field is applied to a crystal suspended by a quartz fibre. R. C.

**Influence of alkalinity of glass on the viscosity of dilute solutions of cellulose nitrate in ether-alcohol.** J. GRÉVY (Compt. rend., 1936, 202, 480–482; cf. A., 1935, 581).—The viscosity ( $\eta$ ) of 0.3% solutions of cellulose nitrate in  $Et_2O$ – $EtOH$  ( $EtOH$  60 wt.-%) kept in glass vessels decreases at a rate depending on the nature of the glass and the extent of the surface of contact. It is greatest with ordinary glass cleaned with  $H_2O$ , and least for Pyrex

glass cleaned with  $CrO_3$  and  $H_2SO_4$ . Experiments in which small amounts of  $K_2CO_3$  or  $Na_2CO_3$  were added indicate that the alkalinity of the glass is responsible. F. L. U.

**Viscosity measurements during the coagulation of titanium dioxide sol by mixtures of electrolytes and non-electrolytes.** (Miss) O. JOSEPH and S. M. MERTA (J. Univ. Bombay, 1935, 4, Part II, 123–131).—The influence of  $MeOH$ ,  $EtOH$ , and  $PrOH$  on the changes with time of the viscosity of  $TiO_2$  sol, dialysed to different extents, on addition of  $KCl$ ,  $MgCl_2$ , and  $AlCl_3$  has been investigated. In each case the viscosity increases on addition of alcohol, in accord with the view that the dielectric const. of the medium is reduced and hence the density of charge on the particle, with consequent increased hydration. The addition also increases the rate of coagulation, indicating that either the rate of aggregation or the rate of hydration of the particles is increased. The periodic nature of the viscosity-time curve decreases with increasing purity of the sol. J. W. S.

**Coagulation of dilute oil emulsions by mercuric chloride: evidence for the discontinuity of the change in the slow region.** S. S. JOSHI and S. P. SARKAR (J. Univ. Bombay, 1935, 4, Part II, 140–145).—The coagulation of oil emulsions has been studied from variations in viscosity ( $\eta$ ), transparency, and refractive index. The discontinuities in the  $\eta$ -time curve are the more pronounced the lower is the electrolyte concn. The coagulation is always accompanied by a small initial decrease in  $\eta$  during the first 20–30 min., resulting in some cases in a nett decrease in  $\eta$  during coagulation. The change in transparency is rapid initially, but becomes almost zero in later stages. The refractive index decreases during coagulation, and this tendency is the greater the higher is the electrolyte concn. The results are only partly in accord with the view that the refractivity approximates to that of the continuous medium, modified by the presence of electrolyte. In some cases the change in refractive index is also discontinuous. J. W. S.

**Electrolyte coagulation of weakly solvated sols and electrolyte activity. II. Influence of sol concentration on flocculation value.** W. OSTWALD (Kolloid-Z., 1936, 75, 39–59; cf. this vol., 157).—A crit. discussion of published data. Increase of sol concn. may (a) sensitise the sol to univalent ions and stabilise it to multivalent ions (typical of hydrophobic sols), (b) stabilise the sol to all types of electrolytes (metal hydroxide sols, Prussian-blue, etc.), or (c) sensitise the sol to all electrolytes ( $NH_4Ph-H_2O$  emulsions). Flocculation vals. are considered in terms of the activity coeffs. of the dominating ions. E. S. H.

**Viscosity of suspensions and solutions. V. Influence of Brownian movement on the viscosity of ellipsoid suspensions.** E. GUTH. VI. Viscosity of rod-like suspensions. F. EIRICH, H. MARGARETHA, and M. BENZL (Kolloid-Z., 1936, 75, 15–20, 20–37; cf. this vol., 562).—V. Mathematical. VI. Investigation of suspensions containing rod-like particles of glass, or natural or artificial silk shows that the measured viscosity depends on the orientation

of the particles, and thus varies with the streaming velocity and with the design of the viscosimeter.

E. S. H.

**Quantitative relations in the lyotropic series.** E. H. BÜCHNER (Kolloid-Z., 1936, 75, 1—9).—A critical discussion of published work.

E. S. H.

**Influence of the addition of small quantities of electrolytes on a copper ferrocyanide sol in reference to the flocculation produced by the same electrolytes.** A. BOUTARIC and (Mlle.) P. BERTHIER (Bull. Soc. chim., 1936, [v], 3, 696—701).—Addition of small amounts of LiCl, KCl, or  $\text{NH}_4\text{Cl}$  stabilises the sol towards coagulation by larger amounts of the same electrolytes. The effect depends on the time interval which elapses before the more conc. electrolyte solution is added; protection increases at first as the time interval increases, passes through a max., and finally disappears. The effect is not observed with  $\text{CaCl}_2$ ,  $\text{BaCl}_2$ , or  $\text{AlCl}_3$ .

E. S. H.

**Problems of the theory of diffusion.** T. KATSURAI and K. KAWASHIMO (Kolloid-Z., 1936, 75, 37—39).—Mathematical.

E. S. H.

**Swelling power of caoutchouc in solvent mixtures in relation to their dielectric polarisation.** N. JERMOLENKO and S. LEVINA (Kolloid-Z., 1936, 75, 59—65).—The swelling of caoutchouc in binary mixtures of  $\text{H}_2\text{O}$ ,  $\text{CCl}_4$ ,  $\text{C}_6\text{H}_6$ , PhMe,  $\text{PhNO}_2$ ,  $\text{COMe}_2$ , EtOH, and  $\text{CHCl}_3$  has been examined. In mixtures of two polar or non-polar solvents the swelling is parallel to the change in mol. polarisation of the mixture. The effects are irregular in mixtures of polar with non-polar solvents, but in some cases the degree of swelling is in the opposite sense to the change in mol. polarisation. The swelling of caoutchouc in  $\text{C}_6\text{H}_6\text{--CHCl}_3$  is increased by addition of EtOH.

E. S. H.

**Gelatin dichromate.** II. E. ELÖD and H. BERCELI (Kolloid-Z., 1936, 75, 66—73; cf. B., 1936, 465).—Degradation of gelatin by hydrolysis at  $100^\circ$ , or the addition of gelatin degradation products or albumin, increases the rate of dissolution of gelatin- $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ , and decreases the light-sensitivity.

E. S. H.

**Dilatometric study of various ternary glasses.** E. RENCKER (Bull. Soc. chim., 1935, [v], 2, 1389—1407; cf. A., 1935, 36).—Cubical expansion coeffs. and temp. of transformation have been determined for  $\text{SiO}_2\text{--Na}_2\text{O--X}$  glasses, where  $\text{X}=\text{Al}_2\text{O}_3$ , BeO, MgO, ZnO, CaO. The law of additivity of expansion coeffs. of Winkelmann and Schott (Ann. Physik, 1894, 51, 735) was found applicable within 3%, in all melts except those containing  $>15\%$   $\text{Al}_2\text{O}_3$ , but the coeffs. for the individual oxides given by these authors, and by English and Turner (B., 1928, 262), do not accord either with one another or with the present measurements, and a new set of vals. are calc. Partial replacement of the  $\text{SiO}_2$  in a  $\text{SiO}_2\text{--Na}_2\text{O}$  glass by X raises the transformation temp. in the order: ZnO, CaO, MgO,  $\text{Al}_2\text{O}_3$ , BeO; glasses containing more than 15% BeO devitrify on cooling, due to their high basicity.

R. C. M.

**Inertia and chemical activity of the rare gases.** VI. Elimination of helium from the

compound platinum-helium and from radium salts at different temperatures. H. DAMIANOVICH (Anal. soc. cient. Argentina, 1934, 118, 227—241; cf. A., 1934, 1296).—It is suggested that He which can be eliminated from Ra salts by heating is held by certain impurities, in a combination of the type found in the Pt-He compound.

CH. ABS. (e)

**Influence of foreign substances on fluorescent power. Colourless inhibitors.** J. BOUCHARD (J. Chim. phys., 1936, 33, 325—344).—Increase of mol. association by the addition of electrolytes (I) to a conc. solution of fluorescent substance (II) decreases the fluorescent power. Variation of fluorescent power with the concn. of (II) follows an exponential law the more closely the greater is the concn. of (I).  $k$  (cf. this vol., 408) increases with concn. of (I), but in very conc. solutions only of (II) in conditions where a modification of the absorption spectrum of dissolved (II) appears. Expressions relating the action of a large no. of colourless org. and inorg. inhibitors (III) on uranine solutions (IV) to the concn. of (III) and (IV) are given. The  $h$  of (III) diminishes with decreasing dielectric const. and with increasing  $n$ . In general  $h$  varies parallel with  $k$ . The most active (III) are typical antioxidants. Relative vals. of  $h$  for different (III) vary with (II).

M. S. B.

**Dissociation of strong electrolytes in concentrated solutions.** I. R. RAO and C. S. RAO (Nature, 1936, 137, 580).—Raman spectra indicate that (i) all oxy-acids dissociate progressively with increasing dilution, (ii) the halogen acids are completely dissociated even in conc. solutions, (iii) the acid salts of the alkalis are completely dissociated into alkali ion and the acid radical, the further dissociation of which is progressive, and (iv) all other salts of the alkalis and alkaline earths are completely dissociated even in saturated solutions. An explanation of these results based on the electronic theory of valency is discussed.

L. S. T.

**Effect of ionic charge on acidity of an acid.** G. SCHWARZENBACH (Z. physikal. Chem., 1936, 176, 133—153).—Experimental evidence is adduced to show that the difference in acidity between two acids which differ only by an ionic charge, i.e., the nuclear charge of some atom in the mol., is solely a function of the distance between the seat of this charge and the seat of the proton which is released from the acid; there is no evidence of any influence exerted by an electrostatic difference between the acid groups of the two acids. This is also generally true when the ionic charge by which the acids differ is a proton. It thus becomes possible to calculate from the difference in acidity the work done in separating the acid proton from the ionic charge, and in this way an experimental potential curve for the vicinity of an ionic charge in a polar medium may be derived. This curve differs from  $e^2/rD$ . The above considerations have been utilised to calculate the acidities of certain acids which cannot be examined experimentally.

R. C.

**Influence of a substituent on the acidity of an organic acid.** II. G. SCHWARZENBACH and A. EPPRECHT (Helv. Chim. Acta, 1936, 19, 493—504).—Normal acidity potentials have been determined at

20° for  $\text{EtCO}_2\text{H}$ ,  $\text{CH}_2\text{Et}\cdot\text{CO}_2\text{H}$ ,  $\text{CHPr}_2\cdot\text{CO}_2\text{H}$  and for the  $\text{Et}_1$  esters of malonic, diethyl- and dipropyl-malonic acids in 18.1–95.0 vol.-%  $\text{EtOH}$ . It is concluded that electrostatic effects are mainly absent and that the influence of the substituents considered is electronic (cf. A., 1934, 1310). The mechanism of the electronic effect is discussed. M. S. B.

**First dissociation constant of carbonic acid at various temperatures.** Y. KAUKO and J. CARLBERG (Z. physikal. Chem., 1936, 176, 11–19).—The first dissociation const. at 0–25° has been determined by  $p_{\text{H}}$  measurements on aq.  $\text{NaHCO}_3$  through which  $\text{CO}_2$  is passing. The results agree with those of Kendall (A., 1916, ii, 512), but not with those of MacInnes *et al.* (A., 1935, 1321). R. C.

**Anomalies in the dissociation constant of some halogenated organic acids.** III. M. BETTI and E. LUCCHI (Atti R. Accad. Lincei, 1935, [vi], 22, 367–370; cf. this vol., 564).—For the two acids  $\text{trans-C}_6\text{H}_4\text{X}\cdot\text{CH}\cdot\text{CH}\cdot\text{CO}_2\text{H}$  ( $\text{X}=\text{Cl}$  and  $\text{Br}$ )  $K$  at 25° =  $0.39 \times 10^{-4}$ , which is nearly the same as the val. for cinnamic acid ( $K=0.365 \times 10^{-4}$ ). O. J. W.

**Quantitative investigations of amino-acids and peptides.** II. Apparent dissociation constants in aqueous formaldehyde solution. M. S. DUNN and A. LOSHAKOFF (J. Biol. Chem., 1936, 113, 691–694; cf. this vol., 620).—Vals. of  $pK'_a$  in aq.  $\text{CH}_2\text{O}$  of a no. of  $\text{NH}_2$ -acids have been determined. H. D.

**Differential dissolution of sodium bromide in its aqueous solutions and the activity coefficients of sodium bromide in concentrated aqueous solutions.** F. MURATA (J. Chem. Soc. Japan, 1935, 56, 588–595).—The e.m.f. of the cell  $\text{Na}$  (amalgam, 0.2203%) |  $\text{NaBr}$ , aq. ( $m$ ),  $\text{HgBr}$  |  $\text{Hg}$  has been determined for various vals. of  $m$  and of temp. The free-energy change in the differential dissolution of  $\text{NaBr}$  in aq. solution and the activity coeff. are calc. The heat of dissolution of  $\text{NaBr}\cdot 2\text{H}_2\text{O}$  at 25° is  $-2933$  g.-cal. CH. ABS. (e)

**Thermodynamic properties of cadmium sulphate in aqueous alcohol.** V. K. LAMER and E. L. CARPENTER (J. Physical Chem., 1936, 40, 287–302; cf. A., 1934, 31).—The influence of increasing  $\text{EtOH}$  content on the partial free energy, heat content, and heat capacity of  $\text{CdSO}_4$  in aq.- $\text{EtOH}$  solution has been determined. The val. of the mean ionic radius of the ions, calc. from the Born equation, agrees fairly with that of the distance of closest approach calc. by the extended theory of Debye and Hückel. F. L. U.

**Selenites of sodium, potassium, and ammonium in aqueous solution.** J. JANICKIS and H. GUTMANAITIS (Z. anorg. Chem., 1936, 227, 1–16; cf. A., 1932, 584).—Solubilities of  $\text{Na}$ ,  $\text{K}$ , and  $\text{NH}_4$  selenites in  $\text{H}_2\text{O}$ , and f.p. of the solutions, have been determined down to their respective cryohydric points. Conductivities have been measured between 0.0002  $M$  and 2  $M$ . The normal salts behave as ternary, and  $\text{NaHSeO}_3$  and  $\text{KHSeO}_3$ , except at great dilution, as binary, electrolytes. The  $\text{NH}_4$  salt behaves according to:  $(\text{NH}_4)_2\text{SeO}_5 + \text{H}_2\text{O} \rightleftharpoons 2\text{NH}_4\text{HSeO}_3$ . The behaviour of the tetraselenites is expressed by:  $\text{MH}_3(\text{SeO}_3)_2 \rightleftharpoons \text{M}' + [\text{H}_3(\text{SeO}_3)_2]' \rightleftharpoons \text{HSeO}_3' + \text{H}_2\text{SeO}_3$ . F. L. U.

**Hydrolysis of inorganic salts and chemistry of high-molecular hydrolysis products, including iso- and heteropoly-compounds.** III. G. JANDER and K. F. JAHR (Kolloid-Beih., 1936, 43, 295–362; cf. A., 1934, 489).—Mainly a crit. summary of published work, with additional experimental data relative to the diffusion, conductivity, and light absorption of aq. salts of  $\text{Mg}$ ,  $\text{Zn}$ ,  $\text{VO}_2^{\text{II}}$ ,  $\text{Be}$ ,  $\text{Al}$ ,  $\text{ZrO}^{\text{II}}$ ,  $\text{Fe}^{\text{III}}$ , and  $\text{Cr}^{\text{III}}$ . E. S. H.

**Polarimetric study of nickel malate.** J. L. DELSAL (Compt. rend., 1936, 202, 1280–1282).—When  $\text{NaOH}$  is added to solutions containing  $\text{Ni}(\text{NO}_3)_2$  and excess of malic acid, the rotatory power passes through min. and max. vals., corresponding with the formation of  $\text{Ni}$  malate and  $\text{Na}$  nickelomalate, respectively. The formation of a sol. complex nickelomalic acid is indicated. L. J. J.

**Application of thermodynamics to chemical equilibria in homogeneous systems.** M. W. MUND (Ann. Soc. Sci. Bruxelles, 1936, 56, B, 15–34).—Theoretical. M. S. B.

**Diagrams representing physico-chemical analyses of irrational systems.** M. USANOVITSCH (J. Gen. Chem. Russ., 1935, 5, 1757–1761).—Polemical, in reply to Ust-Katschkintzev (this vol., 22). R. T.

**Heterogeneous gaseous equilibria  $\text{NaCl} + \text{HBr} \rightleftharpoons \text{NaBr} + \text{HCl}$  and  $\text{KCl} + \text{HBr} \rightleftharpoons \text{KBr} + \text{HCl}$ .** K. JELLINEK, W. WLODARSKI, and T. ARCZYNSKI (Z. anorg. Chem., 1936, 227, 43–51; cf. this vol., 674).—Equilibria in the system  $\text{NaCl} + \text{HBr}$  have been determined at 850–950°, and in  $\text{KCl} + \text{HBr}$  at 765–850°. In both the condensed phase is homogeneous liquid  $[(\text{Na}, \text{K})\text{Cl} + (\text{Na}, \text{K})\text{Br}]$  which behaves as an ideal mixture. Heats of reaction are calc. F. L. U.

**Equilibria  $\text{Cl}_2 + 2\text{KBr} \rightleftharpoons 2\text{KCl} + \text{Br}_2$  and  $\text{Br}_2 + \text{Cl}_2 \rightleftharpoons 2\text{BrCl}$ .** K. JELLINEK and H. SCHÜTZ (Z. anorg. Chem., 1936, 227, 52–61; cf. A., 1933, 783).—Determination of the equilibrium const. in the above reactions at 800° gives  $N_{\text{KCl}}^2 p_{\text{Br}_2} / N_{\text{KBr}}^2 p_{\text{Cl}_2} = 303$ , and  $p_{\text{Cl}_2} p_{\text{Br}_2} / p_{\text{BrCl}}^2 = 0.12$  ( $N$ =mol. fraction,  $p$ =partial pressure). The dissociation const. for  $\text{BrCl}$  is nearly independent of temp. F. L. U.

**Equilibrium diagram of the system barium fluoride-magnesium fluoride.** U. NISIOKA and M. OKAMOTO (Kinz.-no-Kenk., 1935, 12, 220–225).—Data are recorded. The compound  $\text{BaF}_2 \cdot 2\text{MgF}_2$  is formed. It forms a eutectic with  $\text{BaF}_2$  at 912° (17%  $\text{MgF}_2$ ). A glassy mass could not be obtained by quenching the melt. CH. ABS. (e)

**Dissociation pressure of cupric sulphate pentahydrate.** K. SANO (Sci. Rep. Tôhoku, 1936, 24, 719–723).—Measurements have been made by a statical method using Jackson's glass-spring manometer at 48–82° and the results are in fair agreement with earlier ones obtained in the tensimeter. The relation  $\log P_{\text{H}_2\text{O}} = -2,894.47/T + 10.611$  holds. Thermodynamical data for the reaction  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O} = \text{CuSO}_4 \cdot 3\text{H}_2\text{O} + 2\text{H}_2\text{O}$  are  $\Delta F_{298}^\circ$  5146 g.-cal.,  $\Delta H_{298}^\circ$  26,578 g.-cal., and  $\Delta S_{298}^\circ$  71.01 e.s.u. M. S. B.

**Dissociation of smithsonite.** R. MEHMET and G. VALENSI (Bull. Soc. chim., 1935, [v], 2, 1295–

1300).—Decomp. pressures obtained by the static method at 250° and 290°, are > those given by Centnerszwer's dynamic method (A., 1924, ii, 655), but much < the equilibrium vals. calc. from published heats of dissociation, due to the low rate of decomp. below 300°. The formation of a solid solution of ZnO in ZnCO<sub>3</sub> is improbable. R. C. M.

**Mutual relation between silicates and sulphides.** A. S. GINSBERG (Trav. Inst. pét. Acad. Sci. U.R.S.S., 1933, 4, 21—45).—The systems Fe<sub>2</sub>SiO<sub>4</sub>—FeS, MnSiO<sub>3</sub>—FeS, and Mn<sub>2</sub>SiO<sub>4</sub>—FeS have been studied. The components are characterised by limited miscibility in the liquid state. CH. ABS. (e)

**Equilibria of metal fluorides with water vapour.** L. DOMANGE (Compt. rend., 1936, 202, 1276—1277; cf. A., 1935, 448, 1088).—Data are recorded for equilibrium HF—H<sub>2</sub>O concns. with a no. of fluorides at high temp. Heats of reaction at const. pressure are calc. from the data. L. J. J.

**Equilibrium diagrams of the systems** (A) CaO, Al<sub>2</sub>O<sub>3</sub>, 2SiO<sub>2</sub>—CaO, TiO<sub>2</sub>, and (B) CaO, MgO, 2SiO<sub>2</sub>—CaO, TiO<sub>2</sub>. U. NISIOKA (Sci. Rep. Tôhoku, 1936, 24, 707—713, 714—718).—(A) The quenched mixtures were examined microscopically under reflected light. There is an eutectic at 1350° and 35% CaO, TiO<sub>2</sub> by wt.

(B) There is a simple eutectic at 1270° and 32% by wt. of CaO, TiO<sub>2</sub>. M. S. B.

**Equilibria in the system cobalt sulphate-sulphuric acid-water.** L. L. KLJATSOHKO-GURVITSCH and H. OGANDSHANOVA (J. Gen. Chem. Russ., 1935, 5, 1781—1785).—Solubility data are recorded for CoSO<sub>4</sub> in H<sub>2</sub>O and aq. H<sub>2</sub>SO<sub>4</sub> at 0° and 20°. Crystallisation of CoSO<sub>4</sub>·7H<sub>2</sub>O is at a max. in presence of 35% H<sub>2</sub>SO<sub>4</sub> at 0°, and of 26.8% at 20°. R. T.

**Thermodynamic study of systems of the type PbCl<sub>2</sub>—RCl—H<sub>2</sub>O at 25°.** A. R. WEIR (Coll. Czech. Chem. Comm., 1936, 8, 93—113).—H<sub>2</sub>O activities have been derived from measurements of the v.p. of solutions of widely varying concns. Abnormal changes of v.p. are found in the vicinity of the system with PbCl<sub>2</sub> and KCl, 2PbCl<sub>2</sub> as solid phases. J. G. A. G.

**Systems antimony (or bismuth) iodide-alkali iodide-water.** F. FRANÇOIS and M. L. DELVAULLE (Bull. Soc. chim., 1936, [v], 3, 687—696).—Equilibrium data at 12—16° have been obtained. The systems contain many double salts, which are isomorphous when Sb is replaced by Bi. Interchange of alkali metal (Na, K, Li, NH<sub>4</sub>) may produce double salts of different type. E. S. H.

**Thermochemistry of titanium oxides. I. The equilibrium, 2TiO<sub>2</sub> + H<sub>2</sub> ⇌ Ti<sub>2</sub>O<sub>3</sub> + H<sub>2</sub>O.** N. NASU (J. Chem. Soc. Japan, 1935, 56, 542—551).—The heterogeneous equilibrium was studied at 1022—1282° abs. CH. ABS. (e)

**Heats of combustion and sublimation.** H. C. BLANCK and K. L. WOLF (Z. physikal. Chem., 1936, B, 32, 139—144).—These quantities have been determined for succinic acid and several derivatives. The results show that of the esters of the isomeric

tartaric acids the meso-compounds have the greatest internal energy contents, which is ascribed to difference in the extent of intramol. association of the OH groups. R. C.

**Dissociation energies of carbon monoxide and CN, and heat of sublimation of carbon.** G. HERZBERG (Nature, 1936, 137, 620).—Brons' val. of 193.9 kg.-cal. for D<sub>CO</sub> (this vol., 8) is not necessarily correct; a val. of 209.7 kg.-cal. is also compatible with available pre-dissociation data, and gives a val. for the heat of sublimation of C, viz., 125.1 kg.-cal., more in keeping with the val. of 143 kg.-cal. obtained from thermal data. L. S. T.

**Electric conductivity of the system acetic anhydride-water.** N. A. TRIFONOV and V. F. UST-KATSHKINTZEV (J. Phys. Chem. U.S.S.R., 1934, 5, 1215—1221).—Measurements at 0°, 50°, and 72.5° show max. at 3.5—4.5 and 90, and a min. at 50, mol.-% of Ac<sub>2</sub>O. The temp. coeff. of conductivity has a max. at 50 mol.-%. Formation of AcOH is indicated. CH. ABS. (e)

**Nature of the glass electrode potential. I.** H. YOSHIMURA (J. Biochem. Japan, 1936, 23, 91—100).—The deviation of the slope of the calibration line of *E* against *p*<sub>H</sub>, (*E*<sub>1</sub>—*E*<sub>2</sub>)/(*p*<sub>H1</sub>—*p*<sub>H2</sub>), from the theoretical is shown (by coating with paraffin wax) to be due, not to the "deviation film" of liquid on the non-immersed part of the electrode, but to the nature of the glass membrane, every part of which has its own val. of *E*, the observed *E* being the average of all parts in proportion to their respective *κ*. F. O. H.

**Electrolytic polarisation capacity and the atomic mechanism of hydrogen electrodes.** T. NOGUCHI (J. Electrochem. Assoc. Japan, 1935, 3, 141—149).—Data for the polarisation capacity of Pt electrodes dipped in H<sub>2</sub>SO<sub>4</sub> are given. A discharged atom should be deposited on a Pt atom in the surface at. grating of the electrode. The H absorbed by Pt should, at the higher c.d., increase the active surface of the electrode. CH. ABS. (e)

**Influence of light on electrode potential and corrosion phenomena of certain non-ferrous metals.** C. O. BANNISTER and R. RIGBY (J. Inst. Metals, 1936, 56, Advance copy, 91—108).—Apparatus for continuously recording changes of e.m.f. when an electrode is illuminated under the influence of a regulated supply of O<sub>2</sub> is described. The effect of light is considerable in the case of Al, Pb, and Zn in the presence of O<sub>2</sub>, the aerated and illuminated electrode becoming more cathodic. The max. light effect is shown by violet and near ultra-violet light; the observed effects are attributed to the catalytically accelerated formation of protective oxide films. A. R. P.

**Diffusion potentials and ionic activities.** J. J. HERMANS (Z. physikal. Chem., 1936, 176, 55—64).—Correction of Nernst's diffusion potential formula to allow for interionic forces gives as the limiting law for infinite dilution  $\epsilon = [(l_1 - l_2)(l_1 + l_2)](RT/F)(\log c + A\sqrt{c})$ , where *A* is a const. which can be calc. from known magnitudes. This expression is compatible with the assumption that at high dilutions the ionic

activity coeffs. of HCl are equal. The deductions of Szabó (A., 1935, 1323) are criticised. R. C.

**Ionic activities of sodium and potassium chlorides.** Z. SZABÓ (Z. physikal. Chem., 1936, 176, 125—130).—The equation for diffusion potential deduced theoretically by Hermans, taking account of interionic forces (preceding abstract), gives for the experimentally accessible concn. range of 0.0005—0.02*M* the same results for HCl as the author's empirical equation (A., 1935, 1323, 1325). For KCl/KCl up to *M* the diffusion potential may be represented by the empirical equation  $\epsilon = 1.04 \log (m_1/m_2)$  indicating that the ionic activities are equal even in conc. solutions. For NaCl/NaCl the equation is  $\epsilon = 12.31 \log (m_1/m_2)$  up to 0.5*M*, also indicating equality of the ionic activities. R. C.

**Diffusion potentials and ionic activities.** J. J. HERMANS (Z. physikal. Chem., 1936, 176, 131—132).—Polemical against Szabó (preceding abstract). A method of determining diffusion potentials at high concns. without using ionic activities is suggested. R. C.

**Polarographic studies with the dropping mercury electrode. IV. Measurement of the polarisation capacity.** D. ILKOVIČ (Coll. Czech. Chem. Comm., 1936, 8, 170—177; cf. this vol., 430).—The polarisation capacity *k* of the dropping Hg electrode has been determined polarographically using the relation  $Q = qk\pi$ , where *Q* is the quantity of electricity, *q* the surface of the drop, and  $\pi$  the potential. With cathodic polarisation in 0.1*N*-KCl,  $k = 22.3 \times 10^{-6}$  and with anodic polarisation  $k = 42.2 \times 10^{-6}$  farad per sq. cm. In very pure solutions the Hg sometimes acquires the potential of a reversible H electrode. R. S.

**Polarographic studies with the dropping mercury cathode. LVIII. Electro-reduction of dicyanogen and oxamic acid.** J. BREZINA and J. HEYROVSKÝ (Coll. Czech. Chem. Comm., 1936, 8, 114—124).—In aq. solutions of NaOAc, C<sub>2</sub>N<sub>2</sub> causes an increase of current when the potential of the dropping Hg cathode is -1.15 volt with respect to the *N*-Hg<sub>2</sub>Cl<sub>2</sub> electrode; this is attributed to direct electro-reduction of C<sub>2</sub>N<sub>2</sub>. The second increase of current at -1.55 volt is probably due to electro-reduction of oxamic acid or its salt. As the age of the solution increases, the first polarographic "wave" diminishes and the second increases. C<sub>2</sub>N<sub>2</sub> has no effect on current-voltage curves of alkaline solutions, and in neutral or slightly acid solutions the second "wave" develops slowly but does not appear in more acid solutions. The results are interpreted in terms of the hydrolysis of C<sub>2</sub>N<sub>2</sub>. 10<sup>-5</sup>—10<sup>-6</sup> g.-mol. per litre of C<sub>2</sub>N<sub>2</sub> and oxamic acid can be detected polarographically. J. G. A. G.

**Theory of passivity. XXIX. Theory of the barrier layer in aluminium.** W. J. MÜLLER [with E. LÖW] (Z. Elektrochem., 1936, 42, 166—175; cf. A., 1935, 1326).—The formation of an oxide layer on specially pure (99.998%) Al immersed in saturated aq. NaHCO<sub>3</sub> is much more rapid than when ordinary "pure" Al is used, and smaller residual currents are observed. With an applied p.d. < 2 volts conduction

is not unidirectional, whilst above this the cathodic current is several hundred times > the anodic. The effect is not due to formation of gaseous O<sub>2</sub>, but is fully explained by the electro-osmotic theory.

F. L. U.

**Electrochemical investigation of [mixed solutions of] aluminium and potassium bromides in solvent mixtures.** V. A. PLOTNIKOV, O. K. KUDRA, and J. F. MEJENNY (Z. physikal. Chem., 1936, 176, 154—159).—The decomp. voltages of solutions in EtBr and PhMe increase considerably on addition of small amounts of PhNO<sub>2</sub>; further additions have a smaller effect. For an equimol. ratio of AlBr<sub>3</sub> to PhNO<sub>2</sub> the conductivity in dil. solutions is a max. and in conc. solutions a min. It is inferred that a complex containing AlBr<sub>3</sub>, KBr, and PhNO<sub>2</sub> is present in solution. On electrolysis a coherent deposit of K separates on the cathode; with certain solvents the current yield may rise to 40%. R. C.

**Dissociation constants of reductone and of its product of oxidation by iodine.** G. CARPÉNI (Compt. rend., 1936, 202, 1065—1067).—The dissociation const. of reductone [OH·CH·C(OH)·CHO] at 20±0.5° is  $1.17 \times 10^{-5}$ , as calc. from titrimetric data. The NaOH titrimetric curves for the solution obtained by oxidising reductone with aq. I give a dissociation const.  $2 \times 10^{-4}$  (*K*<sub>1</sub>), in agreement with oxidation-reduction potentials (cf. this vol., 292). With *p*<sub>H</sub> > 4.6 the p.d. after each addition of NaOH falls exponentially; the decrease is at first small, but becomes large at *p*<sub>H</sub> 6—9.5. After 24—48 hr. the equilibrium mixture gives a second dissociation const.  $2.5 \times 10^{-6}$  (*K*<sub>2</sub>). A return titration by HCl gives a new curve which is not modified by a new titration with NaOH; this curve shows an exaltation of acidity, *K*<sub>1</sub> and *K*<sub>2</sub> becoming  $5 \times 10^{-4}$  and  $6.8 \times 10^{-5}$ , respectively. A parallel is drawn with the behaviour of oxyascorbic acid. R. S. B.

**Nature of complexes of phenols with amines.** L. P. KULEV (J. Gen. Chem. Russ., 1935, 5, 1566—1575).—The e.m.f. developed when Na and Pt electrodes are immersed in PhOH in C<sub>6</sub>H<sub>6</sub> in presence of C<sub>5</sub>H<sub>5</sub>N is at a max. for 25—30% of PhOH. At this concn. in absence of C<sub>6</sub>H<sub>6</sub> the e.m.f. is at a min., but rises on progressive addition of C<sub>6</sub>H<sub>6</sub> to the C<sub>5</sub>H<sub>5</sub>N solution. H<sub>2</sub>O, PhNO<sub>2</sub>, and *m*-nitrotoluene have a similar effect, Pr<sup>o</sup>OH, Bu<sup>o</sup>OH, and Bu<sup>o</sup>OH have the opposite effect, and Pr<sup>s</sup>OH and *o*-nitrotoluene are without action when added to 25% PhOH in C<sub>5</sub>H<sub>5</sub>N, but at other concns. of PhOH the effects of adding these compounds may be entirely different. Of a no. of phenols examined, PhOH is the most active; the activity of the cresols diminishes in the order *m*- > *p*- > *o*-. The above effects are ascribed to formation of mol. complexes, the possible structure of which is discussed. The complexes are more readily formed with C<sub>5</sub>H<sub>5</sub>N than with NH<sub>2</sub>Ph or NPhMe<sub>2</sub>. The high e.m.f. obtained in presence of NEt<sub>3</sub> is considered to be a consequence of formation of the salt NH<sub>2</sub>Et<sub>3</sub>·OPh. R. T.

**Chemical reaction and atomic theory.** J. M. BRJVOET (Chem. Weekblad, 1936, 33, 222—231, 270—277).—Theoretical. The factors determining

the occurrence and velocity of reactions and the magnitude of equilibrium consts. are discussed in the light of modern developments of wave mechanics.

D. R. D.

**Calculation of intermediate reactions in homogeneous systems.** A. SKRABAL (Z. Elektrochem., 1936, 42, 228—246).—Mathematical. Complete reaction schemes are developed on the basis of the kinetic theory for various types of intermediate reaction (cf. A., 1935, 39, 707, 1328). C. R. H.

**Homogeneous unimolecular decomposition reactions of gases. II.** F. PATAT (Z. Elektrochem., 1936, 42, 265—276).—A further review (cf. this vol., 293).

**Recent developments in reaction kinetics, especially gas explosions.** J. A. HVEDING (Tids. Kjemi, 1936, 16, 50—55).—A review. M. H. M. A.

**Equilibrium constants and velocity constants.** M. G. EVANS and M. POLANYI (Nature, 1936, 137, 530—531).—A generalised expression, from which the known relationship between  $k$  and  $K$  of certain related chemical reactions can be deduced as specialised cases, is derived from thermodynamic considerations. L. S. T.

**Viscosity, plasticity, and diffusion as examples of absolute reaction rates.** H. EYRING (J. Chem. Physics, 1936, 4, 283—291).—Theoretical. L. J. J.

**Absolute rate of reactions in condensed phases.** E. A. MOELWYN-HUGHES (J. Chem. Physics, 1936, 4, 292). H. EYRING and W. F. K. WYNNE-JONES (*ibid.*, 293; cf. A., 1935, 1205).—Criticism and a reply. L. J. J.

**Influence of pressure, concentration, and temperature on the speed of the slow oxidation and the ease of spontaneous inflammation of mixtures of oxygen and *n*-pentane below 300°.** M. PRETTE (Compt. rend., 1936, 202, 954—956).—Increase in the initial pressure in a 36% C<sub>5</sub>H<sub>12</sub>-O<sub>2</sub> mixture shortens the lag before ignition. The min. lag was observed in an equimol. mixture. H. J. E.

**Slow combustion of benzene and other hydrocarbons.** J. AMIEL (Compt. rend., 1936, 202, 946—948).—The fraction of C<sub>6</sub>H<sub>6</sub> oxidised at a time  $t$  and temp.  $T$  is given empirically by  $\gamma = 10^{(A/T) + Bt} - 10^{CT + D}$ . Similar expressions are valid for the oxidation of C<sub>2</sub>H<sub>2</sub> or C<sub>3</sub>H<sub>8</sub>. H. J. E.

**Decomposition of azomethane. I. Apparatus.** D. V. SICKMAN and O. K. RICE. **II. Pure azomethane and azomethane in presence of helium.** O. K. RICE and D. V. SICKMAN (J. Chem. Physics, 1936, 4, 239—241, 242—251).—I. A manometer adapted to the measurement of small changes in a large total pressure is described.

**II.** Kinetic data at 290° and 310° are recorded for  $p_{\text{Me}_3\text{N}}$ , 0.35—25 mm. and  $p_{\text{He}}/p_{\text{Me}_3\text{N}}$ , 5 and 10. The pressure dependence of  $k$  is in better agreement with the theory of Rice, Ramsperger, and Kassel than are Ramsperger's results (A., 1927, 737). He has an activating efficiency 0.120 of that of Me<sub>3</sub>N<sub>2</sub>. The evidence is against a chain mechanism. L. J. J.

**Mechanism of thermal reaction between gaseous iodine monochloride and hydrogen. A.**

SHERMAN and N. LI (J. Amer. Chem. Soc., 1936, 58, 690—691).—Theoretical. E. S. H.

**Flame speeds in moist carbon monoxide-oxygen mixtures.** V. VORONKOV and A. SOKOLIK (Nature, 1936, 137, 533—534).—Curves obtained for the speeds of propagation of flame in various CO+O<sub>2</sub> mixtures at different pressures are reproduced. Their form is not connected with hygroscopic conditions (cf. this vol., 163), but with a change in the temp. of spontaneous combustion for const. time lag. L. S. T.

**Kinetics of the reaction between hydrogen and sulphur. III.** (i) Reaction at 350—412° and 50—150 mm. (ii) Behaviour of sulphur on a hot glass surface. R. P. COOK and P. L. ROBINSON (J.C.S., 1936, 454—456).—(i) The kinetics of the reaction are the same as at the lower temp. previously investigated (A., 1935, 307), and the rise of temp. does not increase the heterogeneous reaction (cf. *ibid.*, 586).

(ii) At the reaction temp. employed (*loc. cit.*), liquid S does not "wet" glass in vac. or in an atm. of H<sub>2</sub>, and does not form a visible film on the internal surface of the reaction vessel (cf. J.C.S., 1923, 123, 696). J. G. A. G.

**Mechanism of decomposition of ethylene iodide.** R. A. OGG, jun. (J. Amer. Chem. Soc., 1936, 58, 607—609).—Theoretical. The kinetic results are explained by a chain mechanism. A similar conclusion is reached for the decomp. of di-iodopropyl alcohol and the photo-bromination of cinnamic acid. E. S. H.

**Kinetics of formation and decomposition of dicyclopentadiene.** B. S. KHAMBATA and A. WASSERMANN (Nature, 1936, 137, 496—497).—The reaction cyclopentadiene + cyclopentadiene  $\rightleftharpoons$  dicyclopentadiene is bimol. in the direct and unimol. in the reverse directions. No chain mechanism appears to be involved. Measurements of the direct reaction in C<sub>6</sub>H<sub>6</sub> between 15° and 55° and of the decomp. in paraffin between 135° and 175° show the Arrhenius equation to be valid. L. S. T.

**Relationships between reaction velocities and ionisation constants.** J. F. J. DIPPY and H. B. WATSON (J.C.S., 1936, 436—440; cf. A., 1935, 1465; this vol., 296).—It follows from accurate vals. of the dissociation consts.,  $K$ , of the acids of the reference series that the supposed linear relationships (*loc. cit.*) are approx. only. Electromeric effects cause divergences, and the connexion does not follow from known relationships of velocity coeffs. and  $K$  with dipole moment. The effects of variations in the non-exponential term of the Arrhenius equation are considered. J. G. A. G.

**Kinetic salt effect in fourth-order reaction BrO<sub>3</sub>' + Br' + 2H'  $\rightarrow$ .** M. SCLAR and L. C. RIESCH (J. Amer. Chem. Soc., 1936, 58, 667—670).—The rates of reaction in presence of allyl alcohol have been determined at different temp. and ionic strengths and compared with published data. The energy of activation has been calc. The results show that the fourth-order rate-determining reaction is reversible, so that the max. rate of reaction can be obtained

only when a primary reaction product is removed with sufficient rapidity to prevent a reversal of the reaction. Allyl alcohol and  $\text{H}_2\text{O}_2$  are equally efficient in removing a primary reaction product. E. S. H.

**Collision frequency in solution: kinetics of diene synthesis in solution and in the gaseous state.** A. WASSERMANN (Nature, 1936, 137, 497).—Comparison of the kinetics of various bimol. diene syntheses shows that with slow reactions in solution the collision frequency of mols. is  $\ll$  in the gas phase. L. S. T.

**Kinetics of a thermal polycondensation.** H. DOSTAL and R. RAFF (Z. physikal. Chem., 1936, B, 32, 117—129).—The rate of condensation of *p*-cresol with  $\text{CH}_2\text{O}$  in aq. solution at 100—130° has been determined. The energy of activation is about 20 kg.-cal. per mol. Equations for the kinetics of such reactions are deduced theoretically. R. C.

**Reactions between oxalic acid, iodine, and the iodate and iodide ions. III. Kinetics of oxalic acid-iodine reaction.** E. ABEL, K. HILFERDING, and O. SMETANA (Z. physikal. Chem., 1936, B, 32, 85—107; cf. A., 1935, 587).—Determination of the rate,  $v$ , of  $5\text{H}_2\text{C}_2\text{O}_4 + 2\text{HIO}_3 = \text{I}_2 + 10\text{CO}_2 + 6\text{H}_2\text{O}$  at 25—60° has given results agreeing with the mechanism previously suggested (A., 1931, 690). Depending on the concns.,  $v$  varies between two limits, given by  $v \propto \sqrt{[\text{IO}_3^-][\text{I}_2][\text{H}^+]^2}$  and  $v \propto \sqrt{([\text{IO}_3^-][\text{I}_2]^2\Sigma^2)}$  (where  $\Sigma = [\text{H}_2\text{C}_2\text{O}_4] + [\text{HC}_2\text{O}_4^-]$ ), which is in accordance with the above mechanism if it is assumed that for the intermediate products  $\text{I}'$  and  $\text{HIO}$  the stationary and equilibrium concns. are practically equal. The inhibiting action of  $\text{HCN}$  is due solely to its reaction with the inductor,  $\text{I}_2$ . The velocities of  $\text{IO}_3' + 2\text{H}' + \text{I}' = \text{HIO}_2 + \text{HIO}$  and  $\text{IO}_3' + 2\text{H}' + 2\text{I}' = 2\text{HIO} + \text{IO}'$  at 50° have been determined. R. C.

**Kinetics of a bimolecular association in benzene solution and in the gaseous state.** A. WASSERMANN (Nature, 1936, 137, 707—708).—The reaction between acetaldehyde and cyclopentadiene in  $\text{C}_6\text{H}_6$ , as in the gaseous state (this vol., 297), is a homogeneous bimol. association. The collision frequency in the gaseous phase is of the same order as the "apparent" collision frequency in solution. L. S. T.

**Progressive elimination of bromine in the aqueous hydrolysis of sodium bromoacetate.** H. BROOKE and H. M. DAWSON (J.C.S., 1936, 497—504; cf. A., 1933, 1125).—From measurements of the initial velocity of formation of  $\text{Br}'$  in mixtures of  $\text{CH}_2\text{Br}\cdot\text{CO}_2\text{Na}$  (I) and  $\text{OH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  (II), it is inferred that the hydrolysis  $(\text{I}) + \text{H}_2\text{O} \rightarrow (\text{II}) + \text{NaBr}$  is due to six independent bimol. processes in which  $\text{CH}_2\text{Br}\cdot\text{CO}_2'$  (III) or  $\text{CH}_2\text{Br}\cdot\text{CO}_2\text{H}$  reacts with  $\text{H}_2\text{O}$  or (III) or glycollate ion. Intermediate complexes also affect the rate of the hydrolysis, but the data from the above experiments, which, apart from the absence of complexes, correspond with successive stages of the reaction, are quantitatively explained in terms of the six simple reactions. The complexity of the hydrolytic process is emphasised and the approx. conformity to a unimol. formula is accidental. J. G. A. G.

**Sucrose inversion in  $\text{D}_2\text{O}$ - $\text{H}_2\text{O}$ .** W. H. HAMILL and V. K. LAMER (J. Chem. Physics, 1936, 4, 294).—

$k$  in  $\text{D}_2\text{O}$ - $\text{H}_2\text{O}$  mixtures is a linear function of  $F_{\text{H}^+} = [\text{D}^+]/([\text{D}^+] + [\text{H}^+])$ . L. J. J.

**Rate of dissolution of copper in dilute aqueous reagents.** C. V. KING and L. WEIDENHAMMER (J. Amer. Chem. Soc., 1936, 58, 602—607).—Determinations of temp. coeff., influence of rate of rotation of Cu, and variation with viscosity (by adding sucrose) show that the rate of dissolution in  $\text{Fe}^{III}$  solutions is controlled mainly by diffusion, but that in  $\text{AcOH}$  solutions mainly by chemical reaction. E. S. H.

**Causes of anomaly in the kinetics of the oxidation of metallic powders.** G. VALENSI (Compt. rend., 1936, 202, 414—416; cf. this vol., 434).—Irregularities in the surfaces of the particles, porosity of the particles, and unevenness of grain size all lead to anomalies in the velocity of oxidation of metallic powders, points of low radius of curvature being most easily attacked, whilst depressions and porous regions become filled with the more voluminous oxide and protected against further attack. J. W. S.

**Atmospheric rusting of iron.**—See B., 1936, 411.

**Catalysis by fusions.** E. W. R. STREACIE and E. M. ELKIN (J. Amer. Chem. Soc., 1936, 58, 691—692).—A reply to criticism (cf. this vol., 167).

E. S. H.

**Action of esterase in presence of organic solvents.**—See this vol., 637.

**Catalysts for the autoxidation of saturated cyclic hydrocarbons.** R. DUPONT (Bull. Soc. chim. Belg., 1936, 45, 113—122).—The catalytic action of the acetylacetonates of  $\text{Fe}^{III}$ ,  $\text{Cu}^{II}$ ,  $\text{Ce}^{III}$ ,  $\text{Mn}^{III}$ ,  $\text{Co}^{II}$ , and  $\text{Co}^{III}$  on the absorption of  $\text{O}_2$  by 1:4-dimethylcyclohexane (I) and phenylcyclopentane (II) has been examined. Two types of reaction curves have been observed, one autocatalytic, always found for (II) and also for (I) when the catalyst concn. is  $< 1\%$ , and the other catalytic and characteristic of (I) for a catalyst concn.  $> 1\%$ . M. S. B.

**Delayed oxidation of cysteine and ascorbic acid.** E. BAUR and H. PREIS (Z. physikal. Chem., 1936, B, 32, 65—83).—The oxidation by gaseous  $\text{O}_2$  of cysteine (I) in aq. solution of  $p_{\text{H}}$  7.6 with Cu as catalyst is retarded by low concns. of  $\text{Fe}^{III}$  and  $\text{Mn}^{II}$  and accelerated by higher concns., whilst salts of some other metals cause retardation only. In most cases the retardation is related to the inhibitor concn.,  $c$ , by the Baur-Ouellet law, whilst in the others it  $\propto c$ . Some cations have only an accelerating effect. Anions, org. substances, and some cations have no effect. In the oxidation of ascorbic acid in aq. solution at  $p_{\text{H}}$  5.3 with Cu as catalyst, (I), cystine, and phenylalanine at high dilution cause retardation, whilst other oxidation-reduction systems have no effect. Heavy-metal salts have an indefinite or no effect, and  $\text{CN}'$  and  $\text{I}'$  bind the catalyst. There is no connexion between the oxidation-reduction potential of the foreign substance and its inhibiting action. The results generally support Baur's mol. electrolysis theory. R. C.

**Preparation of platinum oxide for catalytic hydrogenations.** W. F. BRUCE (J. Amer. Chem. Soc., 1936, 58, 687—688).—The catalyst is prepared

by heating gradually a mixture of  $(\text{NH}_4)_2\text{PtCl}_6$  and  $\text{NaNO}_3$ , and keeping at  $500^\circ$  for 25–30 min.

E. S. H.

**Reactions in thin films.** A. I. ZOLIN (J. Phys. Chem. U.S.S.R., 1934, 5, 1299–1309).—The hydrogenation of  $\text{C}_2\text{H}_4$  with a colloidal Pd catalyst in presence of saponin occurs in the liquid phase in the walls of the colloidal foam bubbles. The presence of foam, due to the saponin, increases the rate 10 times at room temp.  $\text{H}_2$  tends to collect in the upper layers of the foam, due to more rapid diffusion.

CH. ABS. (e)

**Effect of promoters on molybdenum catalysts in hydrogenation.** F. E. T. KINGMAN and E. K. RIDEAL (Nature, 1936, 137, 529).—P, Ni, Cr, and Si markedly enhance, whilst Sn and Th depress, the catalytic activity of Mo oxide for the hydrogenation of PhOH at 1 atm.

L. S. T.

**Oxidation of alkali halides by molecular oxygen in presence of mercury and active charcoal.** V. A. PIANKOV (J. Gen. Chem. Russ., 1935, 5, 1543–1550).—The process  $4\text{MX} + \text{O}_2 + 2\text{H}_2\text{O} + 2\text{Hg} \rightarrow 2\text{HgX}_2 + 4\text{MOH}$  takes place when air is bubbled through a solution of alkali halide in presence of Hg; the velocity of the reaction rises in the series  $\text{Cl} < \text{Br} < \text{I}$ . The reaction is catalysed by active C, in presence of which max. velocity is attained at  $50^\circ$ . R. T.

**Promoter concentration and catalysis.** R. H. GRIFFITH (Nature, 1936, 137, 538).—For the decomp. of  $\text{C}_6\text{H}_{14}$  at  $500^\circ$  by Mo oxide catalysts the ratio of the no. of atoms of Na, Cr, Ce, Al, Ba, B, and Th (as oxides) to the no. of atoms of Mo necessary for max. promoter action is the same as that observed with Si (B., 1935, 292). With easily reducible oxides, e.g., those of Pb, Fe, or Cu, the promoter concn. required is one half. For the conversion of PhOH into  $\text{C}_6\text{H}_6$  by hydrogenation at  $450^\circ/1$  atm. with Mo oxide as catalyst the optimum concn. is  $>$  in the above reaction, but is practically the same for  $\text{SiO}_2$  and  $\text{Al}_2\text{O}_3$ .

L. S. T.

**[Catalytic] synthesis of higher alcohols under pressure.**—See B., 1936, 404.

**Carbon oxysulphide.** J. MILBAUER (Z. Elektrochem., 1936, 42, 226–227).—The effect of 32 metallic catalysts on the decomp. of COS by  $\text{H}_2\text{SO}_4$  at temp. up to  $250^\circ$  has been studied by measurement of the rate of formation of  $\text{SO}_2$ . Spongy Pd, Se, and Pt have the greatest effect, whilst the alkali metals and alkaline earths show a slight anticatalytic effect.

C. R. H.

**Active oxides. LXXXXV. Influence of various gases on the reaction between zinc oxide and chromium trioxide.** G. F. HÜTTIG, S. CASSIRER, and E. STROTZER (Z. Elektrochem., 1936, 42, 215–222).—The hygroscopicity and magnetic susceptibility of equimol. mixtures of  $\text{ZnO}$  and  $\text{Cr}_2\text{O}_3$ , which have been heated at various temp. up to  $500^\circ$  in vac., have been measured. With rise of temp., surface activity, as indicated by hygroscopic data, gives place to a period of inactivity which in turn is followed by activity due to internal diffusion. Finally, at about  $400^\circ$ , the activity is again reduced, which, with a rapid increase in the magnetic property, indicates the form-

ation of cryst.  $\text{ZnCr}_2\text{O}_4$ . The influence of A,  $\text{NH}_3$ ,  $\text{H}_2\text{O}$ , MeOH,  $\text{N}_2\text{O}$ , and air on the reaction has likewise been investigated.

C. R. H.

**Tin vanadate as a catalyst in the oxidation of toluene to benzoic acid.** R. HUITEMA and G. W. BROWN (J. Physical Chem., 1936, 40, 531–542).—The catalytic effect of Sn vanadate in the oxidation of PhMe to BzOH is affected by the extent to which it may have been previously heated. In the oxidation reaction, temp. and  $[\text{O}_2]$  affect the ratio  $\text{CO}_2 : \text{BzOH}$ , but diluents, e.g.,  $\text{CO}_2$  and  $\text{H}_2\text{O}$ , appear to have no effect. Anthraquinone and PhCHO are by-products.

M. S. B.

**Hydrogenation of carbonyl compounds by Raney nickel covered by metals of the platinum family. Influence of alkalis.** M. DELÉPINE and A. HOREAU (Compt. rend., 1936, 202, 995–998; cf. this vol., 457).—The speed of hydrogenation ( $v$ ) of COMeEt at room temp. and atm. pressure in presence of Ni is increased by depositing Pt group metals on the Ni. The efficiency of the added metals increases in the order Pd; Ru and Rh; Os, Ir, and Pt. Cu is without action, and Au has a small influence only. The addition of  $\text{Na}_2\text{CO}_3$  solution increases  $v$ . Similar detailed results have been obtained with  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{Et}$ , and the following hydrogenations have been effected on Pt+Ni:  $\beta$ -cholestanone  $\rightarrow$  mainly dihydroepicholesterol, furfuraldehyde  $\rightarrow$  furyl alcohol,  $d$ - and  $r$ -pinonic acids  $\rightarrow$  the corresponding alcoholic acids,  $d$ -,  $l$ -, and  $r$ -hydroxyketopinanes  $\rightarrow$  dihydroxypinanes, and  $d$ -camphor  $\rightarrow$  mainly  $l$ -isoborneol. With Ni and Ir  $v$  for COMeEt is approx. const. above a small % of Ir, Pt, Ir, and Rh alloy with a small quantity of Ni, which remains with the Pt etc. after dissolving the catalyst in dil. HCl.

R. S. B.

**Amorphous and crystalline oxide hydrate and oxides. XXV. Formation of ozone and hydrogen peroxide from metallic peroxide compounds formed by the oxidation of metallic salts and metallic oxides with potassium persulphate.** A. KRAUSE and G. SZMIDT (Ber., 1936, 69, [B], 805–811).—Co,  $\text{Ti}^{\text{IV}}$ , and  $\text{Zr}^{\text{IV}}$  resemble  $\text{Fe}^{\text{III}}$  in their ability to form  $\text{O}_3$  and perheteropolyacids in the system  $\text{K}_2\text{S}_2\text{O}_8\text{--H}_2\text{SO}_4$ . The apparent inability of other elements (e.g., Ce, Cr, and U) to form similar acids may be due to their very marked catalytic ability to decompose  $\text{H}_2\text{O}_2$  and  $\text{O}_3$ . An unexpectedly great " $\text{O}_3$  effect" is observed during the oxidation of Ag ferrite with  $\text{K}_2\text{S}_2\text{O}_8$  in  $0.3N\text{--H}_2\text{SO}_4$ . Simple Ag compounds ( $\text{Ag}_2\text{O}$ ,  $\text{Ag}_2\text{SO}_4$ ) also yield much  $\text{H}_2\text{O}_2$ , probably due to catalytic action associated with the formation of  $\text{Ag}_2\text{O}_2$ , its decomp., and re-formation. Under otherwise similar conditions metallic Ag gives solely  $\text{O}_3$ . Catalytic influences which accelerate the decomp. of  $\text{O}_3$  and  $\text{H}_2\text{O}_2$  are also observed in the systems.

H. W.

**Preparation of manganese catalysts for recovery of sulphur from hydrogen sulphide.**—See B., 1936, 452.

**Determination of the activity of contact catalysts for the sulphuric acid industry.**—See B., 1936, 406.

**Electrolytic oxidation and reduction of calcium cyanamide.** G. CALCAGNI and G. LAZZARI (*Annali Chim. Appl.*, 1936, 26, 43—49).— $\text{CaCN}_2$ , digested for approx. 12 days in 20%  $\text{H}_2\text{SO}_4$  and then electrolysed (3 hr. at 5 amp. and 14 volts), yields  $\text{NH}_3$  (up to 6.7% of the total N) at the cathode and  $\text{HNO}_2$  (with some  $\text{HNO}_3$ ) at the anode. F. O. H.

**Electrolysis of sodium nitrate in liquid ammonia.** E. I. ACHUMOV, N. A. GÖNTSCHAROV, and E. A. EZEROVA (*J. Gen. Chem. Russ.*, 1935, 5, 1744—1753).—V.p. data are recorded for saturated solutions of  $\text{NaNO}_3$  in liquid  $\text{NH}_3$  at 0—30°, and conductivity data at -16° to 30°. During electrolysis the anode process is:  $6\text{NH}_3' \rightarrow 4\text{NH}_3 + \text{N}_2$ ;  $\text{NH}_4' + \text{NO}_3' \rightleftharpoons \text{NH}_4\text{NO}_3$ ;  $\text{NH}_4\text{NO}_3 + \text{NaNH}_2 \rightarrow \text{NaNO}_3 + 2\text{NH}_3$ , and the cathode process  $\text{Na} + \text{NH}_3 \rightarrow \text{NaNH}_2 + \text{H}$ ;  $\text{Na} + \text{H}_2\text{O} \rightarrow \text{NaOH} + \text{H}$ ;  $\text{NaNH}_2 + \text{H}_2\text{O} \rightarrow \text{NaOH} + \text{NH}_3$ . The process as a whole is represented by  $6\text{NaNO}_3 + 14\text{NH}_3 \rightarrow 6\text{NH}_4\text{NO}_3 + 6\text{NaNH}_2 + 3\text{H}_2 + \text{N}_2$ . R. T.

**Electrolytic reductions of organic compounds at alloy cathodes. I. Reduction of aliphatic ketones to hydrocarbons at cadmium amalgams.** S. SWANN, jun., H. J. READ, and F. C. HOWARD (*Trans. Electrochem. Soc.*, 1936, 69, Preprint 24).—The electrolytic reduction of  $\text{COMePr}^a$  to  $n\text{-C}_5\text{H}_{12}$  has been studied at Cd-Hg cathodes containing 0—100% of Cd. When the yield is plotted against the composition of the amalgam, inflexions are obtained at points that correspond with phase changes in the amalgam. E. S. H.

**Transformation of a thin layer of copper sulphide under the influence of metallic copper is of an electrolytic nature.** H. DEVAUX (*Compt. rend.*, 1926, 202, 368—370; cf. this vol., 435).—When two strips of Cu foil are floated on aq.  $\text{CuSO}_4$  and a film of  $\text{CuS}$  is formed between them, the development of a blue colour on the  $\text{CuS}$  begins at each foil and spreads from them with equal velocity. However, if a p.d. is applied between the foils it accelerates on the side of the negative electrode and becomes slower on the positive side. The colour change is attributed to deposition of Cu on the conducting  $\text{CuS}$  film. J. W. S.

**Mechanism of the electrolytic polishing of copper.** P. JACQUET (*Compt. rend.*, 1936, 202, 402—404; cf. this vol., 305, 571).—Factors favouring the diffusion of the products of attack (agitation, decreased acid concn., rise of temp.) raise the min. c.d. necessary for electrolytic polishing. During electrolysis a liquid zone is produced in contact with the anode of a thickness which is diminished by these factors and is of high resistance. This layer, being deeper in contact with grooves than opposite ridges, causes the latter to be first attacked. When  $\text{HPO}_3$  is used as electrolyte this layer is first formed, but, contrary to the behaviour with  $\text{H}_3\text{PO}_4$  and  $\text{H}_2\text{P}_2\text{O}_7$ , it later forms a solid crust. J. W. S.

**Anodic behaviour of organic salts of copper.** G. KRAVTSOV (*Compt. rend.*, 1936, 202, 1036—1038).—In the electrolysis of  $\text{CuSO}_4$ ,  $\text{Cu}(\text{HCO}_2)_2$ ,  $\text{Cu}(\text{OAc})_2$ , and  $\text{Cu}(\text{EtCO}_2)_2$  with Cu anodes the ratio  $R$  of the apparent loss of wt. of anode to the wt. of Cu deposited in a voltameter = 1 or < 1 corresponding

with apparent valencies of 2 or 1—2. In the latter case  $\text{Cu}_2\text{O}$  is deposited on the anode by hydrolysis of  $\text{Cu}^+$  salts. Increase in c.d., and increase in dilution (except with salts of  $\text{HCO}_2\text{H}$  and  $\text{EtCO}_2\text{H}$ ) reduces the formation of  $\text{Cu}^+$  salts. The time of electrolysis influences  $R$  considerably with many solutions, owing partly to the influence of  $\text{Cu}^{++}$  dissolved from the anode. The reactions  $\text{Cu} \rightarrow \text{Cu}^{++}$ ,  $\text{Cu} \rightarrow \text{Cu}^+ \rightarrow \text{Cu}_2\text{O}$  occur, and are confirmed by a study of p.d.—time curves. R. S. B.

**Simultaneous electrodeposition of thallium and zinc.** W. G. PARKS and I. M. LE BARON (*Trans. Electrochem. Soc.*, 1936, 69, Preprint 14, 171—182).—The electrolyte contains  $\text{TlClO}_4$  and  $\text{Zn}(\text{NO}_3)_2$  and is operated at c.d. 0.2—0.9 amp. per sq. dm. Unless the Tl content of the deposit is low oxidation is rapid. No serviceable plates were obtained. Only the eutectic cast and deposited alloys have similar structures. From cathodic potential measurements the composition of the deposit obtained at a given c.d. can be predicted. J. W. C.

**Electrolytic production of boron and its alloys.**—See B., 1936, 414.

**Alkaline plating baths containing ethanolamines. II. Nickel. III. Cobalt.**—See B., 1936, 458.

**Influence of composition of electrolyte in the electrolysis of carnallite.**—See B., 1936, 458.

**Electroplated gold.**—See B., 1936, 458.

**Synthesis of ammonia by cathodic sputtering of lead.** P. JOLIBOIS and F. OLMER (*Compt. rend.*, 1936, 202, 1268—1269; cf. A., 1935, 1087).—The yield of  $\text{NH}_3$  per watt dissipated increases with the pressure of the  $\text{N}_2\text{-H}_2$  mixture. Prolonged cathodic action produces an equilibrium concn. of  $\text{NH}_3$  corresponding closely with the thermodynamic val. at room temp. L. J. J.

**Formation of hydrogen peroxide in the electrodeless discharge in water vapour.** R. W. CAMPBELL and W. H. RODEBUSH (*J. Chem. Physics*, 1936, 4, 293).—When the dissociated  $\text{H}_2\text{O}$  vapour is passed through a liquid-air trap, formation of  $\text{H}_2\text{O}_2$  takes place exclusively in the latter. L. J. J.

**Constitution of mixed organo-magnesium compounds.**—See this vol., 743.

**Photochemical sensitivity of mercuric nitrate.** S. SCHLIVITCH and D. NIKOLITCH (*Bull. Soc. Chim. Yougoslav.*, 1935, 6, 159—163).—The e.m.f. set up in a photogalvanic cell by illumination ( $\lambda > 4600 \text{ \AA}$ ) of aq.  $\text{Hg}(\text{NO}_3)_2$  is increased in presence of  $\text{EtOH}$  or glycerol. R. T.

**Photolysis of nitrates (spectrophotometric determination of potassium nitrate; catalytic action of manganous salts).** H. VOGELS (*Bull. Acad. roy. Belg.*, 1936, [v], 22, 320—333; cf. A., 1912, ii, 862).—The photochemical reduction of  $\text{KNO}_3$  to  $\text{KNO}_2$  in aq. solutions of varying  $p_H$  has been studied, using the absorption at 3650  $\text{\AA}$ . as a measure of  $[\text{KNO}_2]$ . The  $p_H$  falls during the reaction, which does not lead to the establishment of the simple equilibrium  $2\text{KNO}_3 \rightleftharpoons 2\text{KNO}_2 + \text{O}_2$ . The mechanism is discussed. The velocity increases considerably

with change of  $p_H$  from 7 to 10, but is little affected by further rise in  $p_H$ . The reaction is accelerated by  $Mn^{II}$  salts and by tartrates. The effect with the former is not immediate, suggesting that the true catalyst is Mn in a higher state of oxidation.

D. R. D.

**Photographic photometry in the extreme ultra-violet.** (MME.) R. MONTAGNE and R. RICARD (Compt. rend., 1936, 202, 477—479).—The factors of contrast for const. times of exposure and const. illumination respectively are const. within 10% over the range  $\lambda$  2000—1250 Å. for plates sensitised with Na salicylate.

F. L. U.

**New process of development. Photo-electrochemical process.** K. M. KOSONOGOVA (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 167—168).—A polished Cu electrode, covered with  $Cu_2I_2$  by dipping in I in EtOH, is placed in  $Pb(NO_3)_2$  solution and polarised at a potential about 0.3 volt < the normal electrode potential. At the illuminated parts, the electrode is covered with a greenish deposit. This can be strengthened by colouring with dyes, e.g., rhodamine-B.

A. J. M.

**Photochemical formation of ethylene iodide in solutions of carbon tetrachloride.** R. E. DE-RIGHT and E. O. WIGG (J. Amer. Chem. Soc., 1936, 58, 693).— $C_2H_4I_2$  is formed when solutions of  $C_2H_4$  and I in  $CCl_4$  are exposed to red light. The rate of reaction depends on the pressure of  $C_2H_4$  and decreases with decreasing [I]. No measurable dark reaction occurs. The mechanism is discussed.

E. S. H.

**Photolysis of acetic acid.** M. BURTON (J. Amer. Chem. Soc., 1936, 58, 692).—Evidence for the formation of Me and at. H is given.

E. S. H.

**Photobromination of acetylene dichloride in the gaseous state and in carbon tetrachloride solution.** J. C. GHOSH, S. K. BHATTACHARYA, and S. C. BHATTACHARYA (Z. physikal. Chem., 1936, B, 32, 145—157).—The rate of reaction at 30° and 40° in light of  $\lambda$  546, 436, and 406 m $\mu$  has been determined. In both reactions the unimol. velocity coeff. in respect of  $[Br_2]$ ,  $k$ ,  $\propto$  the square root of the energy absorbed, the temp. coeff. is 1.4, and the graph of  $1/k$  against  $1/\text{mean } [C_2H_2Cl_2]$  is rectilinear. Reaction in the gaseous state is about 30 times as rapid as in solution. These results agree with the mechanism previously suggested (A., 1930, 1260). The concn. of Br atoms in the stationary state and the velocity coeff. and activation energy of  $Br + Br_2 \rightarrow Br_3$  have been calc.; apparently there is a steric factor of  $\sim 10^{-2}$ . Quantum yields have been determined.

R. C.

**Addition of bromine and iodine to compounds with an ethylene linking. Photobromination of ethyl *m*-nitrobenzylidenemalonate, bromination of fumaric and maleic acids, addition of iodine to allyl alcohol.** A. BERTHOUD and M. MOSSET (J. Chim. phys., 1936, 33, 272—305).—The photobromination of Et *m*-nitrobenzylidenemalonate in  $CCl_4$  is similar to that of cinnamic acid or stilbene (A., 1927, 528). The bromination of maleic (I) and fumaric (II) acids is not influenced by light and is more rapid for the ions than for the undissociated

mols.  $Br_2$  reacts more rapidly than  $Br_3$  on (I), but the opposite is the case for (II). The addition of I to allyl alcohol in  $H_2O$  is also uninfluenced by light, but the action is reversible. In  $CCl_4$  solution, however, there is a light reaction similar to photobromination. In the dark a reaction appears to take place mainly through the agency of  $HI_2$ . HI acts as an accelerator.

M. S. B.

**Photo-oxidation of succinic acid by methylene-blue sensitised by uranyl salts.** J. C. GHOSH, T. BANERJEE, and B. BHATTA (Z. physikal. Chem., 1936, B, 32, 163—167).—In light of  $\lambda$  366 m $\mu$  the reaction is, after an initial period of induction, of zero order in respect of methylene-blue. The velocity coeff.,  $k$ ,  $\propto$  the intensity of incident radiation but is independent of the  $p_H$ , and the graph of  $1/k$  against  $1/\text{succinic acid (I) concn.}$  is rectilinear. Only half the collisions between the excited  $UO_2^{++}$  ion and the (I) mol. are effective.

R. C.

**Photochemical oxidation of mandelic acid by bromine with uranyl salts as ultra-violet sensitisers.** J. C. GHOSH and B. B. ROY (Z. physikal. Chem., 1936, B, 32, 158—162).—Below 313 m $\mu$  this is purely a sensitised reaction and unimol. in respect of  $Br_2$ . The velocity coeff.,  $k$ ,  $\propto$  the square root of the incident energy and  $\propto$  the square root of the energy absorbed by the  $UO_2SO_4$  and a graph of  $1/k$  against  $1/\text{mandelic acid concn.}$  is rectilinear. The quantum yield is large. These results are accounted for by assuming that each quantum absorbed by the  $UO_2^{++}$  ion resolves a  $Br_2$  mol. into atoms which then set up chains of the type previously suggested (A., 1930, 1260).

R. C.

**Radiochemical synthesis and decomposition of hydrogen bromide.** S. C. LIND and R. LIVINGSTON (J. Amer. Chem. Soc., 1936, 58, 612—617).—The reaction rate under the influence of Rn has been determined at 25° by measuring the pressure of  $H_2$  when the reaction vessel was immersed in liquid  $O_2$ . A theory of reaction, which is consistent with the data, has been developed, and a relation between the ion pair yield and the initial pressures deduced.

E. S. H.

**Action of  $\alpha$ -particles on mixtures of nitrogen and oxygen.** R. CLOETENS (Bull. Soc. chim. Belg., 1936, 45, 97—112).—Measurements of the changes with time of the pressure  $p$  of  $Rn-O_2-N_2$  mixtures indicate that an initial diminution of  $p$  takes place at a rate which is a function of the concn. of the constituents of the mixture. A rapid increase in  $p$  follows and then a final slow decrease. The results are discussed on the basis of ionic yields calc. on the assumption of gaseous reactions of the type  $A+B \rightarrow AB$ .

M. S. B.

**Preparation of distilled water in a vacuum.** J. THOMANN and A. KÄLIN (Pharm. Acta Helv., 1935, 10, 96—101; Chem. Zentr., 1935, ii, 1212).— $H_2O$  distilled in vac. is not necessarily sterile, whereas  $H_2O$  distilled at 100° is sterile.

H. N. R.

**Reaction of formaldehyde with hydrogen peroxide in heavy water. Non-exchangeability of hydrogen atoms of formaldehyde.** K. WIRTZ and K. F. BONHOEFFER (Z. physikal. Chem., 1936,

**B, 32, 108—112).**—In the reaction of  $\text{CH}_2\text{O}$  with  $\text{H}_2\text{O}_2$  in  $\text{D}_2\text{O}$  solution there is evolved no D but only H, which therefore originates entirely in the  $\text{CH}_2\text{O}$ . This result supports Wieland and Winger's mechanism of the reaction (A., 1923, i, 850). None of the H atoms of  $\text{CH}_2\text{O}$  is exchangeable for D in  $\text{D}_2\text{O}$ .

R. C.

**Effect of heavy water on the colour of hydrated salts.** J. BELL (Nature, 1936, 137, 534).—Solutions of  $\text{CuSO}_4$  in 99.5%  $\text{D}_2\text{O}$  are less intensely coloured than solutions of equal concn. in  $\text{H}_2\text{O}$ . Solid  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  and  $\text{CuSO}_4 \cdot 5\text{D}_2\text{O}$  are readily distinguishable by the difference in tint.

L. S. T.

**Bis-8-hydroxyquinoline inner complex salt of bivalent silver.**—See this vol., 613.

**Fluoberyllates and their analogy with sulphates. IV. Double salts of rubidium and caesium fluoberyllates. V. Double salts of thallous fluoberyllate.** N. RÂY (Z. anorg. Chem., 1936, 227, 32—36, 103—106; cf. A., 1932, 706).—IV. The following salts are described:  $\text{M}^I\text{BeF}_4 \cdot \text{M}^{II}\text{BeF}_4 \cdot 6\text{H}_2\text{O}$  ( $\text{M}^I = \text{Rb}$ ,  $\text{M}^{II} = \text{Co}$ ,  $\text{Zn}$ ,  $\text{Cu}$ ,  $\text{Cd}$ ,  $\text{Fe}^{II}$ );  $\text{Cs}_2\text{BeF}_4 \cdot \text{NiBeF}_4 \cdot 6\text{H}_2\text{O}$ .

V. The salts  $\text{Tl}_2\text{BeF}_4 \cdot \text{M}^{II}\text{BeF}_4 \cdot 6\text{H}_2\text{O}$  ( $\text{M}^{II} = \text{Ni}$ ,  $\text{Co}$ ,  $\text{Cu}$ ,  $\text{Zn}$ ,  $\text{Cd}$ ) are described. The properties of all of the above are similar to those of the corresponding sulphates, and the mol. vols. are of the same order of magnitude.

F. L. U.

**Basic magnesium sulphatocarbonate.** (MME.) L. WALTER-LÉVY (Compt. rend., 1936, 202, 1074—1076).—Aq.  $\text{KHCO}_3$  was added to aq.  $\text{MgSO}_4$  at  $70^\circ$  and boiled, and the ppt. obtained up to 2 hr. examined by X-rays and chemical analysis.  $4\text{MgO} \cdot 2\text{CO}_2 \cdot \text{SO}_3 \cdot 7\text{H}_2\text{O}$  is deposited with  $\text{MgSO}_4$  2—5 mols. per litre.

R. S. B.

**Magnesium cyanamide.** A. PERRET and R. PERROT (Compt. rend., 1936, 202, 420—422).— $\text{Mg}(\text{CN})_2$  changes slowly at  $300^\circ$  and rapidly above  $600^\circ$ , yielding  $\text{MgCN}_2$ , which is also obtained on heating  $\text{Mg}_2\text{Fe}(\text{CN})_6$ .  $\text{Mg}[\text{N}(\text{CN})_2]_2$ , when heated above  $500^\circ$ , also yields  $\text{MgCN}_2$ , which decomposes into its elements at about  $750^\circ$ .  $\text{MgCl}_2$  reacts with  $\text{NaCN}$  at  $400^\circ$  in presence of reduced Fe, and at  $500^\circ$  is absence of catalyst, yielding  $\text{MgCN}_2$ . The relative instability of  $\text{MgCN}_2$  compared with alkaline-earth cyanamides is attributed to the weakness of the  $\text{Mg-N}$  linking and the volatility of Mg.

J. W. S.

**Marginal effect in the dissolution of magnesium in aqueous organic acids.** J. V. DURDIN and A. M. MARKEVITSCH (J. Gen. Chem. Russ., 1935, 5, 1690—1695).—When a Mg plate with part of its surface protected with paraffin wax is immersed in aq. org. acids, the most intense corrosion is observed around the margin of the protected area; this effect is not observed in presence of  $\text{EtOH}$ , or using mineral acids. The effect is ascribed initially to adsorption of acid at the paraffin wax-metal-solution boundary, and in the latter stages to more intense stirring of the solution by  $\text{H}_2$  bubbles in the cavity formed below the margin of the wax.

R. T.

**Decrease of a calcite crystal in an active isotropic medium; corrosion figures in dolomite.** L. ROYER (Compt. rend., 1936, 202, 429—431).

—The action of *d*- and *l*-tartaric, *l*-malic, and *l*-aspartic acids on the  $a^1$  (111) face of calcite or dolomite yields equilateral triangular planes, as with inactive acids, but on the  $b^1$  (110) and  $c^2$  (211) faces of calcite the active acids yield asymetric corrosion planes, whilst with inactive acids they are symmetrical.

J. W. S.

**Conversion of strontium sulphate into carbonate.** G. GALLO (Annali Chim. Appl., 1936, 26, 109—115).—The most favourable conditions for the conversion of pptd.  $\text{SrSO}_4$  (I) and celestine (II) into  $\text{SrCO}_3$ , by means of  $(\text{NH}_4)_2\text{CO}_3$  solution, are: (1) < 5 parts  $\text{H}_2\text{O}$  to 1 part (I) or (II); (2) temp.  $40$ — $50^\circ$ ; (3) > 25%  $(\text{NH}_4)_2\text{SO}_4$  in solution for (I) and > 15% for (II); (4) slightly increased pressure; (5) amount of  $(\text{NH}_4)_2\text{CO}_3$ , just above theoretical. (I) is more easily convertible than (II). Yields were 98.5% and 96.39%, respectively.

L. A. O'N.

**Barium osmichloride.** F. PUCHE (Compt. rend., 1936, 202, 1285—1286).— $\text{BaOsCl}_6$ , prepared by the action of  $\text{Cl}_2$  on Os and  $\text{BaCl}_2$  at  $350^\circ$ , forms orange crystals sol. in  $\text{H}_2\text{O}$  and  $\text{EtOH}$ , dissociating reversibly above  $430^\circ$ . Data are recorded for equilibrium dissociation pressures of  $\text{Cl}_2$  at  $719$ — $947^\circ$  abs.

L. J. J.

**Method of dissolving pitchblende for the preparation of radium standards.** V. H. MATULA (Coll. Czech. Chem. Comm., 1936, 8, 178—184).—The pitchblende (I) is fused with  $\text{Na}_2\text{CO}_3$  in a Pt crucible, the melt dissolved in  $\text{HCl}$ , and the  $\text{SiO}_2$  separated. This is decomposed by  $\text{HF}$  and any residue dissolved in  $\text{HNO}_3$ . The method is applicable to all (I) and is superior to the acid decomp. The Boltwood coeff. applies in the case of old, unweathered, (I).

R. S.

**Exothermic transformations of aluminium oxide.** D. AYDALIAN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 173—175).—When  $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$  is dehydrated there is a distortion of the lattice, but no exothermic effect could be observed with the  $\text{Al}_2\text{O}_3$  produced. Hence the effect is probably not concerned with distortion of the lattice, contrary to Parravano (A., 1928, 1190).  $\text{Al}_2\text{O}_3$  obtained by pptg. an aq. solution of  $\text{Al}(\text{NO}_3)_3$  with aq.  $\text{NH}_3$ , and by dehydrating  $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$  are identical, and give an exothermic arrest at  $850^\circ$ , as does  $\text{Al}_2\text{O}_3$  obtained by heating  $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$ .

A. J. M.

**Separation of rare earths by chromatographic adsorption.** E. LANGE and K. NAGEL (Z. Elektrochem., 1936, 42, 210).—Theoretical.

F. L. U.

**Graphite formation. II. Chemical nature of graphite and amorphous carbon.** A. E. BALFOUR, H. L. RILEY, and R. M. ROBINSON (J.C.S., 1936, 456—461).—Evidence for the chemical resemblance of graphite and the triarylmethyls is supported by the facts that the capacity of sugar charcoal to absorb  $\text{H}_2$  decreases with temp. above  $900^\circ$  whilst the wet-oxidation rate (this vol., 178) increases and the sp. electrical resistance decreases. The wet oxidation of C free from H is very rapid. The graphitisation of coke is increased with the rapidity of carbonisation.

F. R. G.

**Reaction of carbonyl chloride with hexamethylenetetramine.** N. A. PUSHIN and R. D. ZIVADI-

NOVIĆ (Bull. Soc. Chim. Yougoslav., 1935, 6, 165—168).— $(\text{CH}_2)_6\text{N}_4$  and  $\text{COCl}_2$  in  $\text{CHCl}_3$  yield a 1:1 compound, m.p. 187—190°, decomposed by  $\text{H}_2\text{O}$  to yield  $\text{CH}_2\text{O}$ ,  $\text{NH}_4\text{Cl}$ , and  $\text{CO}_2$ . R. T.

**Silica fluff.** C. A. JACOBSON (J. Physical Chem., 1936, 40, 413—418).—The product formed by drying slowly at room temp. hydrated  $\text{SiO}_2$  obtained by the action of  $\text{SiF}_4$  on  $\text{H}_2\text{O}$  has  $d$  1.018 and composition  $12\text{SiO}_2 \cdot 3\text{H}_2\text{O}$ . The material in its usual state of packing has an apparent  $d$  0.025 and can flow like a liquid through narrow tubes. Its chemical nature is discussed. F. L. U.

**Titanium. II. Decomposition of titanomagnetite concentrate with dilute sulphuric acid.** E. G. SCHTANDEL (J. Gen. Chem. Russ., 1935, 5, 1629—1633).—The rate of dissolution in aq.  $\text{H}_2\text{SO}_4$  of  $\text{Fe}_2\text{O}_3$  in titanomagnetite is  $>$  that of  $\text{TiO}_2$ . In both cases it rises rapidly with increasing  $[\text{H}_2\text{SO}_4]$  to 30%, and then continues to rise more slowly; it is greater at higher than at lower temp. R. T.

**Composition of titanium nitride.** E. A. OSTROUMOV (Z. anorg. Chem., 1936, 227, 37—42).—Ti nitrides, when heated in a stream of  $\text{Cl}_2$ , are completely converted into  $\text{TiCl}_4$  below 300°, at which temp. neither  $\text{TiO}_2$  nor lower oxides are perceptibly attacked. Examination of technical and laboratory Ti nitride preps. by this method showed a varying content of  $\text{TiO}_2$ . In two specimens the nitride fraction corresponded with  $\text{Ti}_5\text{N}_6$ , whilst the remainder appeared to contain a mixture of nitrides. F. L. U.

**Lead complexes of hydroxy-acids.**—See this vol., 706.

**Preparation of pure  $\text{N}_2\text{O}_4$ .** A. V. TOPTSCHIEV (J. Gen. Chem. Russ., 1935, 5, 1718—1722).— $\text{H}_2\text{SO}_4$  is added to saturated aq.  $\text{NaNO}_2$ , and sufficient  $\text{O}_2$  is mixed with the gases to convert  $\text{NO}$  into  $\text{NO}_2$ . No advantage is gained by using  $\text{V}_2\text{O}_5$  catalyst at 20—200°, and higher yields of  $\text{N}_2\text{O}_4$  are obtained at low than at high temp. R. T.

**Preparation and b.p. of phosphorus trichloride.** I. TEODOREANU (Bull. Acad. Sci. Roumaine, 1935, 17, 38—40).—An apparatus for the prep. of pure  $\text{PCl}_3$  is described. The b.p. is 75.5—76°/749—755.9 mm. R. S. B.

**Hydrolysis of phosphorus dichloronitrides and their amines.** A. M. DE FICQUELMONT (Compt. rend., 1936, 202, 423—425; cf. this vol., 566).—Treatment of an  $\text{Et}_2\text{O}$  solution of  $\text{P}_3\text{N}_3\text{Cl}_4(\text{NH}_2)_2$  (I) with  $\text{NaOAc}$  solution yields  $\text{P}_3\text{N}_2\text{O}_3\text{H}_4\text{Na}_3$  (II). The slowness of hydrolysis of (I) suggests a difference in its mechanism from the hydrolysis of the trimeric and tetrameric chlorohydrins, probably owing to the solidity of the linking of the  $\text{NH}_2$ -groups. This makes it improbable that  $\text{P}_4\text{N}_4\text{O}_8\text{H}_8$  is an intermediate product in the formation of (II).  $\text{P}_4\text{N}_4\text{O}_8\text{H}_8$  yields very little  $\text{P}_3\text{N}_2\text{O}_3\text{H}_7$  on hydrolysis. J. W. S.

**Double decomposition in solution of sodium niobates with metal salts.** P. SUE (Compt. rend., 1936, 202, 486—488; cf. A., 1935, 825).—Conductometric titration of various metal salts with  $\text{Na}_2\text{O} \cdot \text{Nb}_2\text{O}_5 \cdot 7\text{H}_2\text{O}$  (I) and  $7\text{Na}_2\text{O} \cdot 6\text{Nb}_2\text{O}_5 \cdot 32\text{H}_2\text{O}$  (II) indicates the formation of corresponding niobates as

follows: with (I), Ca, Sr, Ba, Ag, Cu,  $\text{Hg}^{\text{I}}$ , Tl, Zn, Cd, Co, Ni, Mn, Pb; with (II), Ag, Tl, Mg, Ca, Sr, Ba. F. L. U.

**Etherates of iodobismuthous and iodoantimonious acids.** V. AUGER and (MLLE.) N. IVANOV (Compt. rend., 1936, 202, 484—486).—The following compounds are described:  $\text{HBI}_4 \cdot 16\text{H}_2\text{O} \cdot 10\text{Et}_2\text{O}$ ;  $\text{HSbI}_4 \cdot 5\text{H}_2\text{O}$  (yellow prisms);  $\text{HSbI}_4 \cdot 11\text{H}_2\text{O} \cdot 13\text{Et}_2\text{O}$ . F. L. U.

**Amphoteric hydrated oxides, solutions of their hydrolysing salts, and their high-molecular compounds. XXXI. Hydrolysis and properties of bismuth perchlorate.** M. PRYTZ and P. NAGEL (Z. anorg. Chem., 1936, 227, 65—80; cf. A., 1935, 181, 703).—Conductometric, potentiometric, and thermometric titrations, and measurements of diffusion and of optical absorption, indicate that  $\text{Bi}(\text{ClO}_4)_3$  is stable only in presence of very conc.  $\text{HClO}_4$  when the solution is 0.1M with respect to Bi. With  $\text{HClO}_4$ :  $\text{BiO} \cdot \text{OH} = 6.5$  hydrolysis to  $\text{BiOH}(\text{ClO}_4)_2$  is complete. With decreasing  $[\text{HClO}_4]$  further hydrolysis to  $(\text{BiOH})_2\text{O}(\text{ClO}_4)_2$  occurs, accompanied by condensation which, at  $\text{HClO}_4$ :  $\text{BiO} \cdot \text{OH} < 2.5$ , yields  $(\text{BiOH})_4\text{O}_3(\text{ClO}_4)_2$ . The compounds  $\text{Bi}_2\text{O}_3(\text{OH})_3(\text{ClO}_4)_2$  and  $\text{Bi}_2\text{O}_3(\text{OH})\text{ClO}_4$  (bimol. in solution) have been prepared and analysed. Their solubility in  $\text{H}_2\text{O}$  is about 0.025 mol. per litre, in contrast to the readily sol.  $\text{BiOClO}_4$ . F. L. U.

**Hydrolysis of protoactinium and its reaction with sodium thiosulphate in acid solutions.** CHENG DA-CHANG and H. LI (J. Chinese Chem. Soc., 1936, 4, 93—97).—When acid solutions of active  $\text{TiO}_2$  are treated with  $\text{Na}_2\text{S}_2\text{O}_3$  in the presence of  $(\text{NH}_4)_2\text{MoO}_4$  or a Cu salt, some Pa is pptd. with the  $\text{MoS}_3$  or  $\text{CuS}$ . In slightly acid solutions hydrolysis occurs and Pa is pptd. with the Ti, little Pa being pptd. with the sulphide. C. R. H.

**Entrainment of protoactinium by titanium and a method of purification.** (MME.) EMMANUEL ZAVIZZIANO (Compt. rend., 1936, 202, 1052—1054).—In the chemical purification of ppt. of active Ti, Sn is only partly eliminated from a mixture of Ti, Sn, Bi, Pb, and Pa hydroxides by  $\text{NaOH}$ , but on treating the mixed hydroxides with yellow  $(\text{NH}_4)_2\text{S}$ , Ti and Pa remain as hydroxides, Sn forms a sol. polysulphide, and Bi and Pb form insol. sulphides. Treatment of the residue with dil.  $\text{HF}$  dissolves the hydroxides of Ti and Pa (with radioactive impurities). For radioactive purification, 1 c.c. of conc.  $\text{H}_2\text{SO}_4$  is added to the  $\text{HF}$  solution,  $\text{HF}$  is evaporated off, and  $\text{H}_2\text{O}$  and aq.  $\text{NH}_3$  are added. The hydroxides are then dissolved in  $\text{HCl}$  and a few drops of 1% nitrates of La, Bi, Th, Pb, and Ba are added. The whole is pptd. hot by aq.  $\text{NH}_3$ , and the ppt. is washed with 2%  $(\text{NH}_4)_2\text{SO}_4$  to remove all  $\text{NH}_3$ , since this gives with  $\text{HF}$  double fluorides of Pa and  $\text{NH}_4$  and of Ti and  $\text{NH}_4$  which are incompletely pptd. by  $\text{NH}_3$ . The hydroxides of Pa and Ta alone dissolve in  $\text{HF}$ . The whole is repeated 3 or 4 times. For the concn. of Pa, a few drops of  $\text{H}_2\text{O}_2$  are added to the dil. solution in  $\text{H}_2\text{SO}_4$ , which is then heated just to boiling. A part of the Ti is pptd. as  $\text{TiO}_2$ , and entrains a proportion of Pa which varies with the concn. of acid, the % of  $\text{H}_2\text{O}_2$ , and the temp. R. S. B.

**Thiosulphato-compounds.** I. H. BRINTZINGER and W. ECKARDT (Z. anorg. Chem., 1936, 227, 107—111).—Dialysis coeffs. of complex ions formed from salts of various heavy metals and  $\text{Na}_2\text{S}_2\text{O}_3$  have been measured at 18°. The calc. ionic wts. indicate the existence of the following ( $\text{S}_2\text{O}_3=\text{X}$ ):  $[\text{Ag}_2\text{X}_2]''$ ;  $[\text{Cu}_2\text{X}_2]''$ ;  $[\text{Ti}_2\text{X}_2]''$ ;  $[\text{M}^{\text{II}}\text{X}_3]'''$  ( $\text{M}^{\text{II}}=\text{Mn, Fe, Co, Ni, Zn, Cd}$ ). F. L. U.

**Molybdenum blues.** V. AUGER (Compt. rend., 1936, 202, 1180—1182).—The unstable Mo blue obtained by dissolution of  $\text{MoO}_3$  in conc.  $\text{H}_2\text{SO}_4$  can form stable blue complexes with alcohols,  $\text{C}_2\text{Me}_2$ , and  $\text{AcOH}$ . The stable complex with  $\text{AcOH}$  has been isolated and analysed. Its composition appears to be  $\text{Mo}_2\text{O}_5 \cdot 4\text{MoO}_3 \cdot \text{SO}_3 \cdot 4\text{AcOH} \cdot 4\text{H}_2\text{O}$ .  $\text{SO}_3$  is not in a form precipitable by  $\text{BaCl}_2$ . M. S. B.

**Polarimetric study of the formation of complex molybdosaccharates.** H. PARISELLE and F. CHIRVANI (Compt. rend., 1936, 202, 482—484; cf. A., 1934, 252, 992).—Polarimetric observations of K or  $\text{NH}_4$  molybdates with saccharic acid ( $\text{SaH}_2$ ) or  $\text{SaK}_2$  in aq. solution indicate the existence of the compounds  $3\text{SaH}_2 \cdot 7\text{MoO}_3 \cdot 3(\text{K}, \text{NH}_4)_2\text{O}$ ,  $M[\alpha] -70^\circ$ ; and  $3\text{SaH}(\text{K}, \text{NH}_4) \cdot 7\text{MoO}_3 \cdot 3(\text{K}, \text{NH}_4)_2\text{O}$ ,  $M[\alpha] +1050^\circ$ . F. L. U.

**Preparation of hydrofluoric acid.** A. BOOKHEM (J. Chem. Educ., 1936, 13, 93). L. S. T.

**Chrétien's iodine sulphate.** F. FICHTER and A. DINGER (Helv. Chim. Acta, 1936, 19, 607—608).—Chrétien's formula,  $\text{I}_2\text{O}_3 \cdot \text{SO}_3 \cdot 0.5\text{H}_2\text{O}$  (A., 1897, ii, 138), is confirmed, but not that of Bahl *et al.*,  $\text{I}_2\text{O}_3 \cdot \text{H}_2\text{SO}_4$  (A., 1935, 1335). Further, the compound  $\text{I}_2\text{O}_4 \cdot \text{H}_2\text{SO}_4$ , described by the latter, was probably simply  $\text{I}_2\text{O}_3 \cdot \text{SO}_3 \cdot 0.5\text{H}_2\text{O}$  partly decomposed by  $\text{H}_2\text{O}$ . M. S. B.

**Anionic iron.** R. SCHOLDER [with H. WEBER, CHRISTOPH, and DOLGE] (Angew. Chem., 1936, 49, 255—259).—By the action of boiling aq.  $\text{NaOH}$  on reduced Fe in the absence of  $\text{O}_2$ , Fe is dissolved as  $\text{Fe}^{\text{II}}$ , with the simultaneous evolution of 2 atoms of H per atom of Fe dissolved, up to a limiting concn. which is a max. with 55%  $\text{NaOH}$ . With massive Fe, action is similar but proceeds less far. The limiting concn. of Fe is conditioned by electrochemical considerations, and in glass vessels is  $>$  in Fe or Ag, due to formation of silicato-ferroates from dissolved  $\text{SiO}_2$ . From the blue alkaline solution the ferroate  $\text{FeO} \cdot \text{Na}_2\text{O} \cdot 2\text{H}_2\text{O}$  (I) or  $\text{Na}_2[\text{Fe}(\text{OH})_4]$  is deposited on cooling, and with  $\text{Ba}(\text{OH})_2$  or  $\text{Sr}(\text{OH})_2$  gives  $\text{FeO} \cdot 2(\text{Ba}, \text{Sr})\text{O} \cdot 3\text{H}_2\text{O}$  or  $(\text{Ba}, \text{Sr})_2[\text{Fe}(\text{OH})_6]$ , in conformity with the hydroxo-salts of Zn, Co, and Cu. Addition of  $\text{H}_2\text{O}$  ppts.  $\text{Fe}(\text{OH})_2$ . Atm. oxidation of the solution of (I) at 20—25° gives the ferrite  $\text{Na}_3[\text{Fe}(\text{OH})_8] \cdot 5-6\text{H}_2\text{O}$ , and at 30—70° gives  $\text{Na}_4[\text{Fe}(\text{OH})_7 \cdot \text{H}_2\text{O}] \cdot 1-2\text{H}_2\text{O}$ . The 50%  $\text{NaOH}$  solution of (I) at 100—125° yields an olive-green meta-ferrite,  $\text{NaFeO}_2$  (II), isomeric or polymeric with the red  $\text{NaFeO}_2$  (III) prepared by the action of  $\text{Fe}_2\text{O}_3$  on fused  $\text{NaOH}$ . (III) is formed also by the oxidation of boiling 55—60%  $\text{NaOH}$  solutions of (I), and differs from (II) in being stable to dil.  $\text{NaOH}$ .  $\text{Na}_2\text{S}$  gives with solutions of (I) green solutions depositing the thiohydroferroate  $\text{Na}_3[\text{S} \cdot \text{Fe}(\text{OH})_3] \cdot 2\text{H}_2\text{O}$ . Ferrite solutions similarly give

$\text{Na}_8[(\text{H}_2\text{O})(\text{HO})_6\text{Fe} \cdot \text{S} \cdot \text{Fe}(\text{OH})_6(\text{H}_2\text{O})] \cdot 2\text{H}_2\text{O}$ . Under no conditions was  $\text{K}_2\text{FeO}_5$  formed (cf. A., 1927, 433), and its existence is improbable. J. S. A.

**Autoxidation of iron, manganese, and cobalt hydroxides.** J. HERMAN (Compt. rend., 1936, 202, 419—420; cf. A., 1935, 834).—The amount of  $\text{O}_2$  absorbed by  $\text{Fe}(\text{OH})_2$  pptd. by  $\text{KOH}$  from excess of  $\text{FeSO}_4$  in an atm. of  $\text{O}_2$  increases with time to attain a limiting val. in 2 min. This amount is  $>$  that corresponding with transformation into  $\text{Fe}^{\text{III}}$ . With  $\text{MnSO}_4$  there is a rapid initial absorption, followed by slow reaction  $\propto$  time, attaining a limit corresponding, approx., with the conversion into  $\text{Mn}^{\text{III}}$ . If excess of  $\text{KOH}$  is present, however, this state is passed. With excess of  $\text{CoSO}_4$  a green ppt. is obtained which is almost non-oxidisable under the conditions investigated. The same results are obtained with the respective chlorides. J. W. S.

**Action of anhydrous ferric chloride on anhydrous acetic and formic acids.** H. FUNK and M. DEMMEL (Z. anorg. Chem., 1936, 227, 94—102; cf. A., 1931, 1020).—Interaction of anhyd.  $\text{FeCl}_3$  and anhyd.  $\text{AcOH}$  yields the compound  $[\text{Fe}_3(\text{OAc})_6]\text{Cl}_3 \cdot \text{AcOH}$  (I), in which the  $\text{AcOH}$  is directly replaceable by  $\text{Et}_2\text{O}$ . (I) reacts with  $\text{EtOH}$ ,  $\text{MeOH}$ ,  $\text{C}_2\text{Me}_2$ , and dioxan to give the following compounds ( $[\text{Fe}_3(\text{OAc})_5\text{OH}]\text{Cl}_3=\text{Z}$ ):  $\text{Z} \cdot 4\text{EtOH}$ ;  $\text{Z} \cdot 4\text{MeOH}$ ;  $\text{Z} \cdot 1.5\text{C}_2\text{Me}_2$ ;  $\text{Z} \cdot 4\text{C}_4\text{H}_8\text{O}_2$ ;  $\text{Z} \cdot 2\text{C}_4\text{H}_8\text{O}_2$ .  $\text{FeCl}_3$  with  $\text{HCO}_2\text{H}$  (95%) gives  $\text{Fe}(\text{HCO}_2)_3\text{Cl} \cdot \text{H}_2\text{O}$ , which is also obtained with anhyd.  $\text{HCO}_2\text{H}$ ,  $\text{CO}$  being evolved in the latter case. The product could not be dehydrated. F. L. U.

**Reaction of ferric salts with organic acids.** A. ZAIDES (J. Gen. Chem. Russ., 1935, 5, 1530—1536).— $\text{Fe}(\text{OH})_3$  does not react chemically with  $\text{AcOH}$  or  $\text{HCO}_2\text{H}$ , the only effect being that of peptisation of the gel. With  $\text{H}_2\text{C}_2\text{O}_4$  a complex, probably  $\text{Fe}[\text{Fe}(\text{C}_2\text{O}_4)_3]$ , is formed. R. T.

**Amorphous and crystalline oxide hydrates and oxides.** XXIV. Autoxidation and induction actions of ferrous hydroxide in presence of  $\gamma\text{-FeO} \cdot \text{OH}$ . A. KRAUSE and Z. ERNST (Ber., 1936, 69, [B], 656—664; cf. A., 1935, 1335).—The action of air on an undisturbed ammoniacal mixture of  $\text{Fe}(\text{OH})_2$  and  $\gamma\text{-FeO} \cdot \text{OH}$  causes oxidation of  $\text{Fe}(\text{OH})_2$  and ferro-ferrite reaction which may interfere with one another. The relative rates of the two reactions govern the processes occurring in the system,  $\text{Fe}(\text{OH})_2$ — $\gamma\text{-FeO} \cdot \text{OH}$ . During autoxidation  $\text{Fe}(\text{OH})_2$  behaves as inductor and acceptor, the activating no. being about 2. Higher vals. are explained by the hypothesis that the double  $\text{O}_2$  excess absorbed by 2 mols. of  $\text{Fe}(\text{OH})_2$  cannot oxidise the 2 additional  $\text{Fe}(\text{OH})_2$  mols. which have previously combined with  $\gamma\text{-FeO} \cdot \text{OH}$  to produce the black ferro-ferrite; the latter is stable towards atm. oxidation. The chemistry of the process is complex and may be considered as a chain reaction.  $\text{H}_2\text{O}_2$  is produced. In presence of  $\text{EtOH}$  as acceptor the activation no. is about 3. If ferro-ferrite reaction does not occur in the system  $\text{Fe}(\text{OH})_2$ — $\gamma\text{-FeO} \cdot \text{OH}$  [as when  $\text{Fe}(\text{OH})_2$  is rapidly oxidised], the activation no. is about 1 or 1.4 or 2 with  $\text{EtOH}$  and  $\text{NaAsO}_3$ , respectively, as acceptor. In such cases  $\gamma\text{-FeO} \cdot \text{OH}$  is without influence. H. W.

**Basic salts. XII Chemistry and morphology of basic salts of bivalent metals. IV. Basic cobalt bromides.** W. FEITKNECHT and G. FISCHER (Helv. Chim. Acta, 1936, 19, 448—466; cf. A., 1935, 716).—Four basic  $\text{Co}^{\text{II}}$  bromides exist. The green basic bromide I is pptd. at room temp., as a disperse gel, from aq.  $\text{CoBr}_2$  of concn. 1.5—approx.  $3.5 \times 10^{-2} M$  by < the equiv. quantity of  $\text{NaOH}$ . At  $100^\circ$  the upper limit falls to  $0.5 M$ . The ppt. becomes microcryst. by slow hydrolysis at higher temp. It is probably metastable only under all conditions. After long ageing or slow hydrolysis the compound contains more  $\text{Co(OH)}_2$  than corresponds with the formula  $\text{CoBr}_2 \cdot 9\text{Co(OH)}_2$ . The initial ppt. contains 7—11  $\text{Co(OH)}_2$  to each  $\text{CoBr}_2$ , according to the end concn. of the solution. From data relating to this compound the solubility product of  $\text{Co(OH)}_2$  is  $3.3 \times 10^{-15}$ . Basic bromide II,  $\text{CoBr}_2 \cdot 3\text{Co(OH)}_2$ , is reddish-violet and coarsely cryst., the form changing with the temp. of separation, which must be above room temp. It is stable towards  $\text{H}_2\text{O}$ . Basic bromide III is formed, not very readily, as dark bluish-violet crystals of unknown composition, by warming I in  $3.5 \times 10^{-2}$ — $0.1 M$ - $\text{CoBr}_2$ . I, II, and III give characteristic X-ray diagrams. A rose-coloured basic bromide IV is obtained as a partly amorphous product by heating bromide I in a sealed tube above  $150^\circ$  in dil. aq.  $\text{CoBr}_2$ . A mixed basic chloride-bromide, isomorphous with basic chloride II, and of composition  $\text{CoCl}_{1.34}\text{Br}_{0.66} \cdot 3\text{Co(OH)}_2$ , has also been obtained. M. S. B.

**Complex salts of dipyriddy with bivalent tervalent cobalt.** F. M. JAEGER and J. A. VAN DIJK (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 164—175; cf. A., 1935, 714).—Analyses and crystallographic data for the following complex salts are given:  $[\text{Co(dipy)}_3]\text{Cl}_2 \cdot 6\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_2]\text{Cl}_2 \cdot 5\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_2(\text{H}_2\text{O})_2]\text{Cl}_2 \cdot 4\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_2\text{CO}_3]\text{Cl}_2 \cdot 2\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_3]\text{SO}_4 \cdot 7\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}(\text{H}_2\text{O})_2]\text{SO}_4 \cdot 4\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_2\text{CO}_3]_2\text{SO}_4 \cdot 9\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_3](\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_2\text{CO}_3]\text{NO}_3 \cdot 5\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_2]\text{Cl}_2 \cdot 2\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_3]_2(\text{SO}_4)_3 \cdot 5\text{H}_2\text{O}$ ;  $[\text{Co(dipy)}_3]\text{Cl}_3 \cdot 3\text{H}_2\text{O}$ . O. J. W.

**Hydrolysis of basic nickel sulphate.** G. GIRE (Compt. rend., 1936, 202, 1182—1184).— $\text{H}_2\text{O}$  gradually reacts with the compound  $5\text{NiO} \cdot \text{SO}_3 \cdot n\text{H}_2\text{O}$  (I) previously obtained (A., 1935, 716), dissolving  $\text{NiSO}_4$  and forming insol.  $\text{Ni(OH)}_2$ . There are no indications of the existence of any salt more basic than (I). M. S. B.

**Oxyhalides of nickel obtained by Sénarmont's synthesis.** A. FERRARI and R. CURTI (Gazzetta, 1936, 66, 104—114).—When  $\text{CaCO}_3$  is heated with aq.  $\text{CoCl}_2$  in a sealed tube  $\text{CoCO}_3$  is formed. With  $\text{NiCl}_2$  no  $\text{NiCO}_3$ , but the compound  $3\text{Ni(OH)}_2 \cdot \text{NiCl}_2$  (I), is formed. This substance is hexagonal, and on further heating with  $\text{NiCl}_2$  gives the compound  $\text{Ni(OH)}_2 \cdot \text{NiCl}_2$ . A compound analogous to (I) can be obtained by using  $\text{NiBr}_2$ . These substances are probably solid solutions. O. J. W.

**Complex compounds of semicarbazides.** K. A. JENSEN and E. RANCKE-MADSEN (Z. anorg. Chem., 1936, 227, 25—31; cf. A., 1934, 1188).—The following compounds of semicarbazide (=sem) and its deriv-

atives are described:  $[\text{Ni sem}_2]\text{Cl}_2$ ;  $[\text{Ni sem}_2]\text{SO}_4$ ;  $[\text{Ni sem}_3]\text{Cl}_2$ ;  $[\text{Co sem}_3](\text{NO}_3)_2$ ;  $[\text{Ni}(\text{CON}_3\text{H}_4)_2]$ ;  $[\text{Cu}(\text{NHAc} \cdot \text{NH}_2)_2]\text{SO}_4$ ;  $[\text{Ni}(\text{NHAc} \cdot \text{NH}_2)_3]\text{SO}_4$ ;  $[\text{Ni}(\text{EtO} \cdot \text{CO} \cdot \text{NH} \cdot \text{NH}_2)_3]\text{SO}_4$ ;  $[\text{Ni}(\text{NHPh} \cdot \text{CO} \cdot \text{NH} \cdot \text{NH}_2)_3](\text{NO}_3)_2$ ;  $[\text{Cu}(\text{NHPh} \cdot \text{CO} \cdot \text{NH} \cdot \text{NH}_2)_2](\text{NO}_3)_2$ ;  $[\text{Ni}(\text{NH} \cdot \text{C}(\text{O}) \cdot \text{NMe} \cdot \text{NH}_2)_2]$ ;  $[\text{Ni}(\text{NH} \cdot \text{C}(\text{O}) \cdot \text{NMe} \cdot \text{NHMe})_2, \text{NH}_2 \cdot \text{CO} \cdot \text{NMe} \cdot \text{NHMe}]$ ;  $[\text{Cu}(\text{NH}_2 \cdot \text{CO} \cdot \text{NMe} \cdot \text{NHMe})_2]\text{SO}_4$ ;  $[\text{Ni}(\text{NHPh} \cdot \text{CS} \cdot \text{NMe} \cdot \text{NHMe})_2]\text{Cl}_2$ .

F. L. U.

**Osmic acid esters as intermediate products in oxidations.**—See this vol., 603.

**Quantitative spectral analysis.** W. VAN TONGEREN (Chem. Weekblad, 1936, 33, 249).—A correction (cf. this vol., 441). S. C.

**Spark and arc spectrum of pure iron as accessory for qualitative emission spectrum analysis. Iron alloys.** H. HAMMERSCHMID, C. F. LINSTRÖM, and G. SCHEIBE (Mitt. Forsch. Anst. Konz. Gutehoffnungshütte, 1935, 3, 223—229; Chem. Zentr., 1935, ii, 1221—1222).—Procedure and sensitive lines for the detection of the elements commonly alloyed with or present in Fe are recorded. J. S. A.

**Theory of titration error.** S. KUPPI (Z. anal. Chem., 1936, 104, 390—400).—Expressions are developed for the calculation of titration errors in those acidimetric and pptn. analyses in which the end-point does not coincide with the true equivalence point. J. S. A.

**Application of polarographic method in analytical chemistry. I. Theoretical introduction.** H. J. ANTWEILER (Z. anal. Chem., 1935, 102, 385—393).—The principles of the method are reviewed, and modified apparatus is described. J. S. A.

**Titrimetric colorimetry.** P. KARSTEN (Pharm. Weekblad, 1935, 72, 1327—1339).—The method of varying the thickness of a standard solution is untrustworthy, since Beer's law is rarely applicable, and that of preparing a series of standards is tedious and less accurate than the method recommended, viz.: equal quantities of the reagent are placed in two similar Nessler glasses; to one is added a known vol. of the solution to be analysed, whilst to the other a standard solution of the substance to be determined is added from a burette until the colours match. For determining  $\text{Fe}^{\text{III}}$ , 50 c.c. of the reagent (I) should contain 2.5 c.c. of  $4N\text{-HNO}_3$  and 5 c.c. of  $N\text{-KCNS}$ , the suitable concn. (II) of Fe being 0.04—0.10 mg. in 50 c.c. of solution, the thickness of which is 10 cm.; substances which interfere (III) are Bi, Co,  $\text{Hg}^{\text{II}}$ ,  $\text{Cu}^{\text{II}}$ , Ag, Ni, oxalate, phosphate, and alkali and alkaline-earth sulphates, chlorides, and nitrates. Corresponding data for other determinations are: CNS' determination: (I) 2 c.c.  $4N\text{-HNO}_3$  and 0.5 c.c.  $N\text{-FeCl}_3$ ; (II) 0.15—0.40 mg. Bi determination: (I) 2.5 c.c.  $4N\text{-HNO}_3$  or  $\text{-H}_2\text{SO}_4$ , 5 c.c. 20% KI, 6 drops 1%  $\text{NaHSO}_3$ ; (II) 0.05—0.15 mg.; (III) Cu, Pb, Sb, Ag, Fe, Cl'. Cu determination:  $\text{NH}_3$  method—(I) 5 c.c. 10%  $\text{NH}_3$ ; (II) 0.5—3.0 mg.; (III) Bi, Co, Ni, Cr, Fe;  $\text{Fe}(\text{CN})_6$  method—(I) 1 c.c. 10%  $\text{AcOH}$ , 1 c.c.  $N\text{-NaHCO}_3$ , 2—3 drops 1%  $\text{K}_4\text{Fe}(\text{CN})_6$ , 1 c.c. 10%  $\text{NH}_4\text{Cl}$ ; (II) 0.15—0.30 mg.; (III) Zn, Hg.

Co, Cr, Fe; Na diethyldithiocarbamate (IV) method—0.5 c.c. 10%  $\text{NH}_3$ , 1 c.c. 1% gum arabic, 5 c.c. 0.1% (IV); (II) 0.01—0.05 mg.; (III) Pb, Zn, Al, Bi, Hg, Cr, Ag, Sb, Sn, Mn, Ni, Co, Fe;  $\text{Na}_2\text{S}$  method—(I) 1 c.c. 10%  $\text{AcOH}$ , 1 drop 10%  $\text{Na}_2\text{S}$  in glycerol, 1 g.  $\text{NH}_4\text{Cl}$ ; (II) 0.03—0.10 mg.; (III) Pb, Zn, Hg, Bi, Cd, Ni, Co, Sn, Sb, As, Fe; in presence of Pb, 2 c.c. 4*N*- $\text{H}_2\text{SO}_4$  may be used in place of the  $\text{AcOH}$ . Pb determination with  $\text{Na}_2\text{S}$  as in the case of Cu (with  $\text{AcOH}$ )—(II) 0.8—0.20 mg. (*sic*); (III) Cu, Zn, Hg, Bi, Cd, Ni, Co, Sn, Sb, As, Fe—or in alkaline solution: (I) 2.5 c.c. 10%  $\text{NH}_3$ , 1 drop 10%  $\text{Na}_2\text{S}$  in glycerol, 1 g.  $\text{NH}_4\text{Cl}$ ; (II) 0.05—0.10 mg.; (III) Fe, Hg, Bi, Cd, Co, Mn, Cr, Sb, Sn; if Ni, Ag, Cu, or Zn is present, KCN must be added. Cr determination: diphenylcarbazide (V) method—to the solution containing Cr 4*N*- $\text{HNO}_3$  is added until the acidity reaches 1.0—1.5*N*, followed by 1 c.c. 0.1*N*- $\text{AgNO}_3$  and 1 g.  $\text{NH}_4\text{SO}_4$ . The solution is boiled for 3 min., cooled, and poured into the Nessler glass. 0.5 c.c. of (V) solution, containing 2 g. of (V) dissolved in 10 c.c. of glacial  $\text{AcOH}$  and diluted to 100 c.c. with 96%  $\text{EtOH}$ , are finally added; (II) 0.003—0.010 mg.; (III) Mn [reduce  $\text{MnO}_4^-$  with  $\text{H}_2\text{C}_2\text{O}_4$  before adding (V)], Fe,  $\text{Cl}^-$ . If the  $\text{CrO}_4^{2-}$  is determined directly, without adding (V), (II) is 1.4 mg. Mn determination: boil for 5 min. with either 5 c.c. 50%  $\text{H}_2\text{SO}_4$ , 1 c.c. 0.1*N*- $\text{AgNO}_3$ , and 0.5 g.  $\text{NH}_4\text{SO}_4$ , or 2—3 c.c. 85%  $\text{H}_3\text{PO}_4$  and 0.25% periodate; (II) 0.06—0.16 mg.; (III) Cr,  $\text{Cl}^-$  (in first case). Phenolphthalein determination: (I) 1 c.c. 0.1*N*- $\text{NaOH}$ ; (II) 0.02—0.07 mg. Salicylic acid determination: (I) 2 c.c.  $\text{FeCl}_3$  solution containing 54 mg.  $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$  and 10 c.c. glacial  $\text{AcOH}$  diluted to 100 c.c. with  $\text{H}_2\text{O}$ ; (II) 0.15—0.25 mg.; (III) benzoic, cinnamic, tartaric, oxalic, and phosphoric acids and their salts,  $\text{HCl}$ ,  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{NaOH}$ , and  $\text{Na}_2\text{CO}_3$ . Adrenaline determination: (I) 1 c.c. 10%  $(\text{NH}_4)_2\text{MoO}_4$ ; (II) 0.5—2.0 mg.; (III) other pyrocatechol derivatives. Fe may be removed with  $\text{Na}_4\text{P}_2\text{O}_7$ . D. R. D.

**Ebulliometric determination of small amounts of water.** M. WOJCIECHOWSKI (Nature, 1936, 137, 707).—The sensitivity of the method is markedly increased by using the azeotropic mixture  $\text{Pr}^\circ\text{OH}$ - $\text{PhMe}$  instead of  $\text{EtOH}$ - $\text{C}_6\text{H}_6$ . L. S. T.

**Hydrogen peroxide reaction with diphenylcarbazide.** L. N. LAPIN (Z. anal. Chem., 1935, 102, 418—420).— $\text{K}_2\text{Cr}_2\text{O}_7$  is added to the acidified solution, forming perchromic acid (I) which is extracted with  $\text{Et}_2\text{O}$  (peroxide-free). The (I) in the  $\text{Et}_2\text{O}$  layer formed from 0.005 mg. of  $\text{H}_2\text{O}_2$  gives a violet coloration with an  $\text{EtOH}$ - $\text{Et}_2\text{O}$  solution of diphenylcarbazide (II). Alternatively, Br may be added to the acidified test solution to oxidise  $\text{Fe}^{II}$ ,  $\text{S}^{II}$ , etc., followed by 2 c.c. of 0.00002*N*- $\text{K}_2\text{CrO}_4$ . Free Br is removed by adding  $\text{PhOH}$ . On adding (II), no violet coloration or a weakened colour is obtained in presence of  $\text{H}_2\text{O}_2$ , due to the formation of (I), and its rapid decomposition. The method may be used to determine minute amounts of  $\text{H}_2\text{O}_2$ . J. S. A.

**Micro-determination of chlorine.** I. M. KOBENMAN (Mikrochem., 1936, 19, 144—146).—Free Cl in  $\text{H}_2\text{O}$  is titrated with aq. Me-red or, better, with 0.001*M*-Me-orange. J. S. A.

**Nephelometric micro-determination of chlorine and its application to determination of chlorine in [ash of] organic substances.** F. ALTEN and E. HILLE (Mikrochem., 1936, 19, 118—128).—Stable  $\text{AgCl}$  sols are formed by the addition of  $\text{Cl}^-$  to a solution of 0.01*N*- $\text{AgNO}_3$ +0.05*N*- $\text{Al}(\text{NO}_3)_3$ +0.05*N*- $\text{Ca}(\text{NO}_3)_2$ +0.1*N*- $\text{NaNO}_3$ . The turbidity formed may be measured photometrically, and is  $\propto \text{Cl}^-$ . The method is applicable to 0—0.25 mg. of Cl. Org. materials (plant tissue etc.) are ashed, with the addition of lactose+ $\text{Na}_2\text{O}_2$ . The residue is dissolved in  $\text{H}_2\text{O}$ , and treated with 10%  $\text{H}_2\text{SO}_4$  at 70—80° to destroy  $\text{CN}^-$ . Cl in the filtered solution is then determined as above. J. S. A.

**Determination of hydrobromic acid in presence of hydrochloric acid.** G. G. LONGINESCU and E. I. PRUNDEANU (Bull. Acad. Sci. Roumaine, 1935, 17, 47—51).—The solution containing  $\text{Cl}^-$  and  $\text{Br}^-$  is shaken with  $\text{H}_2\text{O}_2$ ,  $\text{H}_2\text{SO}_4$ , and petrol, when the Br liberated by the  $\text{H}_2\text{O}_2$  is absorbed by the petrol.  $\text{HCl}$  remains in the aq. layer and can be determined as  $\text{AgCl}$ . The petrol layer is reduced by Na and  $\text{C}_2\text{H}_{11}\text{OH}$  and the Br determined as  $\text{AgBr}$ , volatilisation on heating being avoided. Results are accurate to 0.06%. R. S. B.

**Separation of bromides from chlorides by means of iodic acid.** L. MARTINI (Annali Chim. Appl., 1936, 26, 102—105).—Kolthoff's modification of Bugarszky's method (Z. anal. Chem., 1921, 60, 405) gives satisfactory results in the presence of a limited amount of  $\text{Cl}^-$  if the Br content is  $\leq 7$ —8 mg. L. A. O'N.

**Reactions occurring during the absorption of nitrous vapours by potassium iodide solutions.** M. DODÉ (Compt. rend., 1936, 202, 1076—1078; cf. this vol., 439).—The action of  $\text{NO}_2$  on aq. KI is expressed by:  $\text{N}_2\text{O}_4 + 2\text{KI} = 2\text{KNO}_2 + 2\text{I}$  (1);  $\text{N}_2\text{O}_4 + \text{H}_2\text{O} = \text{HNO}_2 + \text{HNO}_3$  (2);  $\text{HNO}_2 + \text{KI} = \text{NO} + \text{KOH} + \text{I}$  (3);  $\text{HNO}_3 + \text{KOH} = \text{KNO}_3 + \text{H}_2\text{O}$  (4);  $2\text{N}_2\text{O}_3 + 2\text{H}_2\text{O} = 4\text{HNO}_2$ ,  $4\text{HNO}_2 + 2\text{KI} = 2\text{KNO}_2 + 2\text{NO} + 2\text{I} + 2\text{H}_2\text{O}$  (5). In presence of  $\text{O}_2$  the NO liberated in (3) is oxidised in the gas phase when the vol. of solution is small, or otherwise directly to  $\text{HNO}_2$  in solution. The indirect production of nitrite by (5) increases with the dilution. The difference in hydrolysis of  $\text{NO}_2$  and  $\text{NOCl}$  may be explained.  $\text{N}_2\text{O}_4$  is equiv. to 2I, as may be proved: (a) in the titration of I by  $\text{Na}_2\text{S}_2\text{O}_3$  in presence of nitrites; I consumed by oxidation of  $\text{NaNO}_2$  is entirely regenerated by  $\text{NaNO}_2 + 2\text{HI} = \text{NaI} + \text{H}_2\text{O} + \text{I} + \text{NO}$ ,  $\text{NO} + \frac{1}{2}\text{O}_2 + \text{KI} = \text{KNO}_2 + \text{I}$  or  $\text{NO} + \text{O}_2 + \text{KI} = \text{KNO}_3 + \text{I}$ ; (b) iodometric titration of acids by the action of the acid on a mixture of  $\text{KNO}_2$  and KI in presence of  $\text{O}_2$ ; (c) determination of  $\text{NO}_2$  and  $\text{Cl}_2$  in a mixture. Analytical application for the determination of nitrous vapours is discussed. R. S. B.

**Determination and detection of fluoride ion with lanthanum.** J. FISCHER [with E. MÜLLER and H. KNOTHE] (Z. anal. Chem., 1936, 104, 344—346).—The determination of F by pptn. as  $\text{LaF}_3$  (cf. A., 1925, ii, 598) is not practicable owing to the strong adsorptive properties of  $\text{LaF}_3$ . As a qual. test, by pptg. from  $\text{AcOH}$  solution in presence of dyes (*e.g.*, eosin)

the dye is taken up, giving a red ppt. Limiting concn., 1 in 50,000. J. S. A.

**Determination of ozone and nitrogen peroxide in air.** G. A. GORODETZKI (J. Appl. Chem. Russ., 1936, 9, 353—361).—Trustworthy results are not obtained in the iodometric determination of  $O_3$  in air, since  $NO_2$ , which is invariably produced at the same time as  $O_3$ , gives the same reactions.  $O_3$  is determined by shaking a sample of air (10 litres) with 50 ml. of standard aq.  $NaNO_2$  (1 ml. equiv. to 0.0005 mg. of  $O_3$ ) and 2 ml. of 0.01M- $MnSO_4$ . 3 ml. of Griess-Ilosvay reagent are added to 20 ml. of the solution, which is warmed at 70—80° for 3—5 min., and  $H_2O$  is added to 25 ml. The coloration is compared with that given by the standard. R. T.

**Quantitative analysis by the Raman effect of sulphato-nitric mixtures.** J. CHÉDIN (Compt. rend., 1936, 202, 1067—1069).—The % of  $N_2O_5$  in mixtures of  $HNO_3$  and  $H_2SO_4$  has been determined by observing the Raman spectrum,  $N_2O_5$  giving, among other lines, an intense line  $\Delta\nu=1398\text{ cm}^{-1}$ . The  $HNO_3$  is entirely dehydrated up to approx. 15%, and the % of  $N_2O_5$  in the mixture is a max. at approx. 20% of  $HNO_3$ . It follows that in mixtures of oleum and  $HNO_3$  the dehydration of  $HNO_3$  is complete at a much higher % of  $HNO_3$ . R. S. B.

**Determination of nitrogen by Kjeldahl's method. Ammonia distillation.** J. SPEIRS and W. J. MITCHELL (J. Inst. Brew., 1936, 42, 247—250).—Loss of  $NH_3$  could not be demonstrated during Kjeldahl distillations carried out by the method of Ford *et al.* (see B., 1933, 842), either in modifications wherein the  $NaOH$  was added before or after the commencement of boiling, or with various described modifications of the apparatus (cf. Miller, this vol., 302). Further, the use of air-saturated  $H_2O$  or the passage of air through the boiling mixture caused no loss, whilst slow boiling held no advantage. I. A. P.

**Copper selenite as a catalyst in the Kjeldahl nitrogen determination.** E. J. SCHWÖGLER, B. J. BABLER, and L. C. HURD (J. Biol. Chem., 1936, 113, 749—751).— $CuSeO_3 \cdot 2H_2O$  is a better catalyst for Kjeldahl digestion than are those at present in use. H. D.

**Kjeldahl decomposition using selenium.** K. TAUFEL, H. THALER, and K. STARKE (Angew. Chem., 1936, 49, 265—266).—Se is adequate as a catalyst; addition of  $CuSO_4$  gives satisfactory results, but  $K_2SO_4$  leads to some loss of N. J. S. A.

**Modified technique for Kjeldahl procedure.** A. HENWOOD and R. M. GAREY (J. Franklin Inst., 1936, 221, 531—538).—Procedure is outlined for a rapid modification of the macro-Kjeldahl process, using one tenth of the usual quantity of material. J. S. A.

**Determination of nitrate by means of Devarda's alloy.** M. B. DONALD (Analyst, 1936, 60, 249—250).—Reduction is optimal when 1 g. of  $NaNO_3$  is treated with 3 g. of alloy and 2 g. of  $NaOH$  in 250 c.c. of  $H_2O$ . E. C. S.

**Drop method of detection of ammonium.** N. A. TANANAEV and A. A. BUDKEVITSCH (J. Appl.

Chem. Russ., 1936, 9, 362—363, 369—371).—A drop of conc. aq.  $NaOH$  is added to a drop of the solution, which, if turbid, is then filtered through a capillary. A drop of Nessler's reagent is then placed on a drop of the filtrate on filter-paper, when a yellow stain is obtained in presence of  $< 3 \times 10^{-7}$  g. of  $NH_4^+$ . If the solution contains Ag, Hg, or Pb, a drop is placed on a drop of 2N- $NaOH$  on filter-paper, 2 drops of 2N- $NaOH$  are added, and a capillary containing Nessler's reagent is drawn across the spot; a peripheral coloration is obtained in presence of  $< 2 \times 10^{-6}$  g. of  $NH_4^+$ . R. T.

**Azorubin, a new reagent for detection of nitrates and nitrites.** F. SKOUTIL (Chem. Listy, 1936, 30, 74—77).—1—3 drops of aq. 0.01% azorubin are added to 1—2 c.c. of solution, and 1—2 c.c. of conc.  $H_2SO_4$  are added, when a blue ring appears at the  $H_2SO_4$ - $H_2O$  interface; this will be separated from the aq. layer by a yellow ring if the solution contains  $< 1.25 \times 10^{-6}$  g. of  $NaNO_3$  or  $NaNO_2$ . The reaction is also given by  $ClO_3^+$ ,  $BrO_3^+$ ,  $IO_3^+$ ,  $IO^+$ ,  $SeO_4^{++}$ ,  $SeO_4^{--}$ ,  $TeO_4^{++}$ ,  $Fe(CN)_6^{--}$ ,  $H_2O_2$ ,  $CrO_4$ ,  $MnO_4$ , and  $VO_3^+$ , but not by  $Fe^{++}$ ,  $Fe(CN)_6^{--}$ , or oleum. R. T.

**Effect of fluorine on precipitation of phosphoric acid with ammonium molybdate.** F. W. NEUHAUS (Z. anal. Chem., 1936, 104, 416—417; cf. this vol., 303).—The effect is already well known. J. S. A.

**Colorimetric determination of orthophosphate in presence of meta- and pyro-phosphate.** K. BORATYŃSKI (Z. anal. Chem., 1935, 102, 421—428).— $P_2O_7^{--}$  and  $PO_3^+$  do not give the Mo-blue reaction.  $PO_4^{--}$  may be determined colorimetrically in presence of  $P_2O_7^{--}$  and  $PO_3^+$  by addition of  $(NH_4)_2MoO_4$  and reduction with 1 : 2 : 4- $NH_2 \cdot C_{10}H_5(OH) \cdot SO_3H$  or  $p\text{-OH} \cdot C_6H_4 \cdot NHMe \cdot H_2SO_4$  at 25°. In presence of a large excess of  $P_2O_7^{--}$  the  $(NH_4)_2MoO_4$  must be increased, owing to the formation of a stable pyrophosphate-molybdic compound. J. S. A.

**Colorimetric determination of phosphoric and arsenic acid with ascorbic acid.** R. AMMON and K. HINSBERG (Z. physiol. Chem., 1936, 239, 207—216).—Ascorbic acid (I) may usefully be used as reducing agent in the method of Lohmann *et al.* (A., 1927, 69).  $AsO_4^{--}$  and (I) can also be determined under certain conditions but determination of  $AsO_4^{--}$  and  $PO_4^{--}$  in presence of each other is possible only with the help of other methods. W. McC.

**Determination of phosphate in presence of arsenate.** J. COURTOIS (J. Pharm. Chim., 1936, [viii], 13, 404—418).— $PO_4^{--}$  is determined by Copaux' approx. method, being pptd. selectively by  $Na_2MoO_4$  in presence of  $Et_2O$  from  $H_2SO_4$  solutions. Alternatively,  $AsO_4^{--}$  may be reduced to  $AsO_3^{--}$  by  $SO_2$  in  $H_2SO_4$  solution, or in biological fluids by  $Hl$ . In the latter case  $PO_4^{--}$  is pptd. as  $MgNH_4PO_4$ , which is redissolved and determined as before. J. S. A.

**Assay of hypophosphites.**—See B., 1936, 475.

**Sources of error in arsenic determination by Gutzeit's reaction on paper strips.** W. MÜHLSTEDT (Z. anal. Chem., 1936, 104, 333—344).—A crit. review of published methods. Constancy in the humidity of the gas is essential. J. S. A.

**Detection of small amounts of arsenic by electrolytic reduction.** M. T. KOSLOVSKY and A. J. PENNER (Mikrochem., 1936, 19, 89—97).—As, present in 12% aq.  $\text{H}_2\text{SO}_4$  solution, is reduced electrolytically in an undivided cell at a Hg cathode to  $\text{AsH}_3$ . By separating the gases liberated at the anode and cathode, respectively,  $10^{-6}$  g. of As may be detected. In alkaline solution  $\text{AsO}_3^{3-}$ , but not  $\text{AsO}_4^{3-}$ , is reduced to  $\text{AsH}_3$ . J. S. A.

**Direct determination of small amounts of arsenic in presence of mercury.** J. GANGL and H. DIETERICH (Mikrochem., 1936, 19, 253—261).—By effecting reduction with Zn in hot solution, As is reduced quantitatively to  $\text{AsH}_3$  in presence of a large excess of Hg, and is determined titrimetrically from the mirror formed by thermal decomp. of the  $\text{AsH}_3$  produced. J. S. A.

**Determination of carbon dioxide in carbonates.**—See B., 1936, 406.

**Rapid determinations of carbon dioxide in gaseous atmospheres.**—See B., 1936, 478.

**Sensitive reaction for potassium.** H. FREDHOLM (Z. anal. Chem., 1936, 104, 400—405).—Diluturic (5-nitrobarbituric) acid, prepared by direct nitration of barbituric acid at  $100^\circ$ , gives a characteristically cryst. ppt. with K at concns.  $> 0.09$  mg. of K per c.c. The Rb,  $\text{NH}_4$ , Mg, and Ba salts are also sparingly sol. and characteristic in crystal habit. J. S. A.

**Phthalic acid as reagent for optical identification of some metals and alkaloids.** K. P. YORKS and M. L. WILLARD (Mikrochem., 1936, 19, 227—229).—Optical properties of K, Co, Cu, Hg, Sr, Zn, Ni, quinine, brucine, and strychnine phthalates are recorded. J. S. A.

**Volumetric determination of sodium.** A. B. LEWIN (Z. anal. Chem., 1936, 104, 406—413).—The conc. neutral or slightly alkaline solution, containing  $> 0.1$  g. of Na, is treated at  $> 12^\circ$  with saturated aq.  $\text{K}_2\text{HSbO}_4$  (obtained by fusing  $\text{Sb}_2\text{O}_5$  with 6 mol. proportions of  $\text{KNO}_3$ ).  $\text{Na}_2\text{HSbO}_4$  is pptd. completely on addition of EtOH. The ppt. is redissolved in  $\text{H}_2\text{O}$ , and reduced with  $\text{HCl} + \text{Na}_2\text{SO}_3$ .  $\text{SO}_2$  is boiled off, and Sb is finally titrated with  $0.02N\text{-KBrO}_3$ . J. S. A.

**Spectrographic determination of certain elements by the arc process.** K. KONISHI and T. TSUGE (J. Agric. Chem. Soc. Japan, 1936, 12, 216—248).—Minute amounts of elements in soils and plants are determined by examination of their emission spectra. The min. amount of element varies from  $1\text{--}5 \times 10^{-4}$  mg. for Na and Ca to  $> 0.1$  mg. for Cs. The advantages of the method are simplicity, speed, and sensitivity. J. N. A.

**Analysis and separation of the more important anions.** F. POZNA and E. MIGRAY (Annali Chim. Appl., 1936, 26, 81—83).—The detection of inorg. anions and  $\text{OAc}'$  is described. F. O. H.

**Analysis of solutions of salts of heavy metals.** F. POZNA and E. MIGRAY (Annali Chim. Appl., 1936, 26, 78—80).—A method for the detection of

all the common metals in solutions free from Ca, Ba, and Sr is described. F. O. H.

**Simplified method of separating and identifying cations of second group.** E. CHIRNOAGA (Z. anal. Chem., 1936, 104, 356—358).—The sulphide ppt. is divided into two portions: (a) As is dissolved on boiling with  $(\text{NH}_4)_2\text{C}_2\text{O}_4 + \text{NH}_3$ , and may be repptd. with  $\text{H}_2\text{S}$ ; (b) Cd, Bi, Sb, and Sn are dissolved by  $2N\text{-HCl} + \text{H}_2\text{O}_2$ . Cd is pptd. as CdS from the solution obtained by adding an excess of aq.  $\text{NH}_3$ ; Bi, Sb, and Sn as ordinarily. (c) The residue ( $\text{CuS} + \text{HgS}$ ) is dissolved in conc.  $\text{HCl} + \text{H}_2\text{O}_2$ . J. S. A.

**Microchemical determination of silver.** J. DONAU (Mikrochem., 1936, 19, 108—117).—Ag is determined in the  $\text{HNO}_3$  solution from the inquantation of Au alloys, or in the  $\text{HNO}_3$  solution of Ag alloys. Ag is displaced from solution by Cu (in the form of wire) at  $100^\circ$ . Supernatant liquid is sucked off, and the Ag is washed and dried *in situ*. J. S. A.

**Qualitative micro-separations.** A. A. BENEDETTI-PICHLER and W. F. SPIKES (Mikrochem., 1936, 19, 239—244).—Ag, Pb, and Tl, are pptd. with HBr. Pb and Tl are extracted with  $\text{H}_2\text{O} + \text{Br}$ . Pb is pptd. as  $\text{PbSO}_4$ , which is converted into  $\text{K}_2\text{PbCu}(\text{NO}_2)_6$ , and  $\text{Tl}^{III}$  is reduced with  $\text{SO}_2$  and repptd. as TlI. J. S. A.

**Determination of lead in drinking water.**—See B., 1936, 430.

**Volumetric analysis of lead chromate.**—See B., 1936, 419.

**Detection of thallium.** L. KUHLEBERG (Mikrochem., 1936, 19, 183—186).— $\text{Tl}^{III}$  oxidises  $o\text{-NO}_2\text{-C}_6\text{H}_4\text{-CH}(\text{C}_6\text{H}_4\text{-NEt}_2\text{-}p)_2$  (I) (prep. described) to an intense green dye.  $\text{Tl}^I$  is oxidised by  $\text{K}_3\text{Fe}(\text{CN})_6$  to the very insol.  $\text{Tl}(\text{OH})_3$ , which is filtered through a micro-filter. The paper is spotted with (I), dissolved in AcOH; limiting concn.  $10^{-7}M$ . In presence of other cations, Pb is pptd. with  $\text{Na}_2\text{SO}_4$ , and other metals with NaOH before pptg.  $\text{Tl}(\text{OH})_3$ . J. S. A.

**Drop colorimetric determination of copper.** N. A. TANANAEV and A. I. IVANOVA (J. Appl. Chem. Russ., 1936, 9, 364—366).—The intensity of coloration obtained when a drop of aq.  $\text{K}_3\text{Fe}(\text{CN})_6$  is placed on a drop of solution is compared with those given by a series of standard Cu solutions. The procedure for determination of Cu in ores is described. R. T.

**Qualitative micro-analysis.** F. FEIGL and R. UZEL (Mikrochem., 1936, 19, 132—143).—(a) For the detection of Cu, a drop of the solution under test is treated with 0.1% aq.  $\text{K}_2\text{TeO}_4$  or  $\text{KIO}_4$  and made alkaline with NaOH.  $\text{K}_2\text{S}_2\text{O}_8$  is added, and the solution is heated to  $100^\circ$ . In presence of  $< 0.02 \times 10^{-6}$  g. of Cu a yellow to red coloration is produced, due to the formation of tervalent Cu compounds.  $\text{NH}_4^+$ , or an excess of Cr or Mn, should be absent. Conversely, by adding  $0.00002M\text{-CuSO}_4$ ,  $0.5 \times 10^{-6}$  g. of Te (as  $\text{H}_6\text{TeO}_6$ ) or  $2 \times 10^{-6}$  g. of  $\text{H}_6\text{IO}_6$  may be detected in presence of other strongly oxidising anions. Te, in presence of 20,000 parts of Se, and  $\text{H}_6\text{IO}_6$  may also be detected by their inhibiting action on the catalytic effect of Cu on the oxidation

of  $Mn^{++}$  to  $MnO_4^-$  by  $NaOBr$ . (b)  $NH_2OH$  is detected by adding  $FeSO_4$ , and then making alkaline with  $NaOH$ .  $NH_2OH$  forms  $Fe(OH)_3 + NH_3$ , which is detected by its action on  $AgNO_3 + MnSO_4$  (A., 1933, 798). (c)  $Na_2[Fe(CN)_5NO]$  gives with piperidine in  $AcOH$  solution the salt  $Na_3[Fe(CN)_5C_5H_{11}N] \cdot 6H_2O$ , which gives, on filter-paper, a green fleck with  $< 0.05 \times 10^{-6}$  g. of Co. Hg, Cu, Ag, Pb, Bi, and Ni which interfere are first removed as insol. salts; Fe is converted into  $FePO_4$ . J. S. A.

**Determination of aluminium by means of aniline.** T. KOZU (J. Chem. Soc. Japan, 1935, 56, 562—569).—Al can be pptd. from a K alum solution by adding saturated aq.  $NH_2Ph$ . The  $p_H$  of the solution when pptn. is complete is 4.45—4.50. The ppt. is collected, washed, and weighed as  $Al_2O_3$ .

CH. ABS. (e)

**Aluminium alizarinate. Colorimetric determination of aluminium.** A. K. BABKO (J. Appl. Chem. Russ., 1936, 9, 375—378).—The compound  $Al(C_{14}H_7O_4)_3$  is formed in presence of considerable excess of alizarin (I), whilst when excess of  $Al^{+++}$  is present a maximally saturated adsorption compound approximating to  $Al_2(C_{14}H_7O_4)_3$  is obtained. The rate of increase of the concn. of the lake is  $<$  that of  $Al^{+++}$ , at const. concn. of (I); at const. concn. of (I) and Al the ratio of (I) to Al in the compound rises with increasing dilution. R. T.

**Detection of gallium using colour reactions.** N. S. POLUEKTOV (Mikrochem., 1936, 19, 248—252).—Ga gives with alizarin in presence of  $NH_3 + NH_4Cl$  a bright red lake. The sensitivity is enhanced by concentrating the ppt. at an  $Et_2O-H_2O$  interface. Ga, but not Al or In, gives with  $K_4Fe(CN)_6 + MnCl_2$  in presence of oxidising agents (e.g.,  $KBrO_3$ ) a sensitive reddish-brown coloration or ppt. Ga is best separated from other metals by extraction of  $GaCl_3$  with  $Et_2O$ , followed by extraction from the  $Et_2O$  layer by means of  $NaOH$ . Ga is then pptd. by means of 8-hydroxyquinoline before applying drop tests.

J. S. A.

**Determination of manganese in cobalt alloys.**—See B., 1936, 412.

**Colorimetric determination of iron with thiocyanates.** K. STEINHAUSER and H. GINSBERG (Z. anal. Chem., 1936, 104, 385—390).—The red  $Fe(CNS)_3$  coloration is stabilised by extracting it with  $Et_2O$  saturated with  $SO_2$  (I). The solution is acidified with conc.  $HCl$ , and treated with  $KCNS$ .  $EtOH$  is added, and the solution is extracted with (I). The coloured  $Et_2O$  solution is photometered by filtered blue or green light. J. S. A.

**Determination of traces of ferric iron in blood serum.**—See this vol., 747.

**Determination of tungsten in wolframite by chlorination.**—See B., 1936, 413.

**Determination of tungsten and silicon in steels by means of perchloric acid.**—See B., 1936, 457.

**Detection and colorimetric determination of tin by means of substituted 1:2-dimercaptobenzenes.** A specific reagent for tin. R. E. D. CLARK (Analyst, 1936, 60, 242—245).—A few drops

of 0.2% 4:1:2- $C_6H_3Cl(SH)_2$  or 4:1:2- $C_6H_3Me(SH)_2$  in aq.  $NaOH$  are added to the solution of Sn in  $> 15\%$  aq.  $HCl$ ; on warming in presence of  $< 1$  p.p.m. of  $Sn^{II}$ , a pink or red colour is formed within a few sec. With  $Sn^{IV}$  the colour takes longer to develop and the test is less sensitive. Bi gives a brick-red ppt. which cannot be mistaken for the magenta-red of Sn. The reaction is applied to the colorimetric determination of Sn, by means of which 1.5—6 p.p.m. may be determined to within 10%. E. C. S.

**Drop method of detection of antimony.** N. A. TANANAEV and L. M. RABINOVITSCH (J. Appl. Chem. Russ., 1936, 9, 369—371).—The solution is heated with  $HCl$  and Fe for 3—4 min., allowed to settle, the supernatant liquid is poured off, and the sediment (Pb, Hg, Bi, Cu, Sb, and excess of Fe) is washed by decantation and transferred as a suspension to a second tube. It is then treated with hot conc.  $HNO_3$ , when a white ppt. is obtained in presence of  $< 0.1$  mg. of Sb. R. T.

**Analytical chemistry of tantalum, niobium, and their mineral associates.** XXX. Beryllium. W. R. SCHÖELLER and H. W. WEBB (Analyst, 1936, 60, 235—242; cf. A., 1935, 838, 1217).—For its determination, the ppt. of  $BeO$  obtained by treatment with aq.  $NH_3$  or tannin (I) in presence of alkali sulphate is fused with  $Na_2CO_3$  and extracted with  $H_2O$ , as for the separation of Be from Al (cf. A., 1912, ii, 687);  $BeO$  is quantitatively pptd. from aq.  $NH_3$ -tartrate by (I). The earth-acid ppt. obtained by tartaric hydrolysis (cf. A., 1930, 184) does not occlude  $BeO$ . Ti, Nb, and Ta are separated from Be as well as from Zr etc. by pptn. with (I) from  $C_2O_4^{--}$  solution half-saturated with  $NH_4Cl$  (cf. A., 1932, 1012). U is separated from Be by pptn. as ferrocyanide.

E. C. S.

**Detection and determination of gold by means of filter-paper impregnated with reducing substances.** R. N. COSTEANU (Z. anal. Chem., 1936, 104, 351—355).—The alloy is treated with  $HNO_3$  to remove Ag and Cu, and the residue is dissolved in  $HCl + HNO_3$ , and diluted to a known vol. A standard drop of the solution is applied to paper impregnated with  $SnCl_2$ , benzidine, quinol,  $NH_2OH \cdot HCl$ , or other suitable reducing agent, and the intensity of the fleck obtained is matched against that given by solutions of known  $[Au]$ . J. S. A.

**Liquid-operated thermostat.** A. R. PEARSON and R. E. NORRIS (J.S.C.I., 1936, 55, 127—128t).—Part of the wall of the regulator vessel is made in re-entrant form, of material having high thermal conductivity and expansion.

**Apparatus for heating inflammable solvents.** B. MELKON (Amer. J. Pharm., 1936, 108, 95—98).—An asbestos-lined paint can enclosing an electric lamp is used as heating bath. R. S. C.

**Measurement of the thermal conductivity of gases.** T. H. LABY (Nature, 1936, 137, 741).—Advantages of the use of a thick in preference to a thin wire are discussed. L. S. T.

**Fluorescencethermoscope.** H. EICHLER (Chem.-Ztg., 1936, 60, 357).—Solutions of Magdala-red in solvents containing OH- or  $CO_2H$ -groups change from

violet to yellowish-red with sudden appearance of fluorescence when the m.p. of the solvent is exceeded. This property is utilised in a thermoscope, comprising a thin-walled glass tube containing such a solution, loaded with Pb at one end so as to float in liquids, which permits ready observation when a certain temp. is exceeded. Solvents suitable for the specified temp. are:  $o\text{-C}_6\text{H}_4(\text{CO}_2\text{H})_2$  (213°),  $o\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  (159°), BzOH (121°),  $m\text{-C}_6\text{H}_4(\text{OH})_2$  (118°), thymol (51°), PhOH (42°),  $p\text{-cresol}$  (36°),  $o\text{-cresol}$  (31°), AcOH (17°),  $\text{HCO}_2\text{H}$  (9°), and  $m\text{-cresol}$  (3°). For intermediate temp. mixed solvents are used, whilst below 0° the solvent can be  $\text{CH}_2\text{O}$ , MeOH, EtOH, glycerol, or  $\text{COMe}_2$ . J. W. S.

**Spectropolarimetry with metallic mirrors in the far ultra-violet.** R. SERVANT (Compt. rend., 1936, 202, 476—477).—An arrangement suitable for polarimetry with light sources between  $\lambda$  2500 and 1850 Å. is described. F. L. U.

**Technique for obtaining X-ray powder patterns.** R. A. STEPHEN and R. J. BARNES (Nature, 1936, 137, 532—533; cf. this vol., 45). L. S. T.

**Demonstrating and measuring approximately the index of refraction of crystalline substances for X-rays.** H. C. HOYT and G. A. LINDSAY (Physical Rev., 1936, [ii], 49, 498—501).—By reflecting the same spectral line simultaneously from two faces of a crystal by turning the crystal so that for the proper reflecting angle the rays fall at the intersection of the two faces,  $n$  can be obtained by a simple calculation from the width included between the reflected and refracted portions of the line. The method has been confirmed for a cerussite crystal. N. M. B.

**Drop-plate for the observation of turbidity in the dark field.** S. WEHRLI (Helv. Chim. Acta, 1936, 19, 505—506).—A method of illuminating small drops of liquid in the investigation of pptn. reactions is described. M. S. B.

**Measurement of dielectric constant for very short waves with a registering apparatus.** R. FREYMAN (Compt. rend., 1936, 202, 952—954).—Drude's method is applied, the resonance curve being recorded photographically with a galvanometer. Measurements are recorded for certain aromatic N compounds ( $\lambda$  3.72—2.41 m.). H. J. E.

**Counter for  $\alpha$ -particles.** S. S. VASSILIEV (Nature, 1936, 137, 533). L. S. T.

**Characterisation and designation of new counters for elementary rays and photo-electrons.** Spark counter. H. GREINACHER (Helv. phys. Acta, 1935, 8, 265—266; Chem. Zentr., 1935, ii, 1219).—Counters based on a spark discharge between metal and liquid, or dissimilar metal electrodes, are described. J. S. A.

**New counting methods for elementary rays and photo-electrons.** H. GREINACHER (Z. tech. Physik., 1935, 16, 165—170; Chem. Zentr., 1935, ii, 1219; cf. preceding abstract). J. S. A.

**Comparison of photo-emissive and photo-voltaic devices [for measuring radiant energy].** E. D. WILSON (Trans. Electrochem. Soc., 1936, 69,

Preprint 19, 221—228).—Useful characteristics of each type of photo-cell are discussed. By suitable construction and the use of various filters, photo-electric devices can be suited to any particular range of the spectrum, from the ultra-violet to the near infra-red ( $\lambda$  1.4  $\mu$ ). By using fluorescent screens and suitable filters the intensity of X-ray radiations can be measured. J. W. C.

**Barrier layers and photoelectricity.** J. ROULEAU (Compt. rend., 1936, 202, 470—472; cf. A., 1935, 585).—In cells of the metal- $\text{Cu}_2\text{O}$  type the photo-electric effect and contact rectification are both independent of the sp. resistance of the  $\text{Cu}_2\text{O}$  in bulk, whilst both increase with the contact resistance and are therefore related to it. F. L. U.

**Electrophoresis cell for microscopic observations.** M. E. SMITH and M. W. LASSIE (J. Physical Chem., 1936, 40, 399—412).—A cell of new design is described. Observations are made at the axis, where the electro-osmotic flow is zero, and the velocity gradient a min. Mobilities of quartz particles in  $\text{H}_2\text{O}$  so measured agree with vals. determined by the usual methods. The respective electrophoretic and electro-osmotic velocities of quartz in  $\text{H}_2\text{O}$  and of  $\text{H}_2\text{O}$  in a quartz tube are 3.0 and  $-3.1 \mu$  per sec. per volt per cm. F. L. U.

**$p_H$  conversion chart.** W. H. GOSS (J. Washington Acad. Sci., 1936, 26, 150—156).—The chart facilitates conversion of e.m.f. into  $p_H$  vals. with reference to various electrodes. A. G. P.

**Automatic precision burettes.** F. KÖHLER (Chem. Fabr., 1936, 9, 115—116).—The two types of burette described are filled automatically from the supply bottle to which they are attached, by the use of compressed air or suction, respectively. A. B. M.

**Precision apparatus for mixing gases in various proportions.** B. N. SINGH and P. B. MATHUR (Science, 1936, 83, 309—310). L. S. T.

**Washing tube for gas analyses.** O. HACKL (Z. anal. Chem., 1936, 104, 359).—Priority is claimed over Cauer (this vol., 577). J. S. A.

**Drainage errors and U-tube viscosimeters.**—See B., 1936, 436.

**Suspended-level viscosimeter.**—See B., 1936, 436.

**Specific gravity balance.** P. F. KERR (Amer. Min., 1936, 21, 121—124).—The apparatus described is particularly suitable for crystals, small masses of minerals, or gem stones. L. S. T.

**Arsenic combustion tubes.** G. LOCKEMANN (Angew. Chem., 1936, 49, 252).—Tubes with 2 and 3 compartments separated by constrictions, for use in the Marsh-Liebig method of As detection, are described. M. S. B.

**Sucrose as a standard for obtaining absolute viscosities.** T. H. MESSENGER (J. Res. Assoc. Brit. Rubber Manuf., 1936, 5, 25—35).—Viscosities and  $d$  of aq. sucrose solutions are tabulated and the use of such solutions as standards in viscosimetry is demonstrated. R. S.

**Micro-Kjeldahl flask.** A. SOLTYS (Mikrochem., 1936, 19, 304—305).—By setting the neck at an angle, loss by bumping or splashing is avoided. J. S. A.

**Simplified form of Schöbel heating mortar.** SCHOTT UND GEN. (Mikrochem., 1936, 19, 164; cf. A., 1934, 425). J. S. A.

**Apparatus for recrystallisation of small amounts.** B. K. BLOUNT (Mikrochem., 1936, 19, 162—163).—The substance, in a sintered glass funnel, is suspended below the condenser from which the solvent is refluxed. J. S. A.

**Demountable centrifuge tubes for gravimetric determinations.** S. D. ELEK (Mikrochem., 1936, 19, 129—131). J. S. A.

**Shaker with lengthwise and cross motions.** G. LOCKEMANN and P. LOCH (Chem. Fabr., 1935, 9, 200). D. R. H.

**Mirrors obtained by evaporation in a vacuum.** L. DUNOYER (Compt. rend., 1936, 202, 474—476).—In depositing a metallic mirror (e.g., Al) by evaporation it is essential for good adherence that the residual gas pressure should correspond with a mean free path of the same order as the max. distance of the vapour source from the surface to be covered. Deposits of uniform thickness can be obtained by suitable relative movement of source and surface. Flaws in the receiving surface, or defects in polishing, are reproduced in the deposited metal. In the absence of any defects the metallic surface, unlike chemical deposits, shows no diffuse reflexion. F. L. U.

**Comparative method for measuring aqueous vapour and dissociation pressures, with some applications.** E. M. COLLINS and A. W. C. MENZIES (J. Physical Chem., 1936, 40, 379—397; cf. A., 1934, 248).—The method described depends on measurement (by weighing) of the change in concn. of a small amount of aq.  $\text{H}_2\text{SO}_4$  during the attainment of equilibrium,

through the vapour phase, with a large amount of the material, the aq. v.p. of which is required. The substances are placed in an exhausted sealed tube, and equilibrium is approached from both directions. The method is suitable for temp. up to  $130^\circ$ . Data for six salt hydrate systems are recorded. F. L. U.

**Rapid and exact transference of a precipitate to a filter.** G. G. LONGINESCU and I. I. PRUNDEANU (Bull. Acad. Sci. Roumaine, 1936, 17, 151—154).—Pptn. and washing are carried out in a funnel, and the ppt. is transferred directly to the crucible. H. G. R.

**Sliding ground-glass joint.** J. FINE (Rev. Sci. Instr., 1936, [ii], 7, 192).—A short connecting piece has joints at each end ground on the inside, both tapers pointing in the same direction. It can therefore be telescoped over the tube which enters it at its narrower end. C. W. G.

**Simplified apparatus for high hydrostatic pressures.** L. H. ADAMS (Rev. Sci. Instr., 1936, [ii], 7, 174—177).—A simple piston is forced into a 19-mm. hole in a steel block. Leakage is prevented by a rubber plug and a layer of oil moving ahead of the piston. Pressure is measured by a Hg-in-glass piezometer tube inside the piston. 10,000 atm. can be reached. C. W. G.

**Average pore size of diaphragms.** H. B. BULL and L. S. MOYER (Science, 1936, 83, 242—243).—The radius of powdered quartz diaphragms ranged from 1.4 to  $30\ \mu$  according to the degree of grinding, whilst that of cellulose membranes varied from 0.88 to  $0.98\ \mu$ . L. S. T.

**Cullen chemical manuscript of 1753.** L. DOBBIN (Ann. Sci., 1936, 1, 138—156).

**Thomas Cochrane's MS. notes of Black's chemical lectures, 1767—1768.** D. MCKIE (Ann. Sci., 1936, 1, 101—110).

## Geochemistry.

**Explanation of the relatively large concentration of  $\text{O}^{18}$  in the atmosphere.** C. H. GREENE and R. J. VOSKUYL (J. Amer. Chem. Soc., 1936, 58, 693—694).—Attention is directed to the rôle played by the respiration of plants. E. S. H.

**Carbon dioxide content of atmospheric air.** J. B. S. HALDANE (Nature, 1936, 137, 575).—An improved form of the Haldane gas analysis apparatus adapted for the determination of  $\text{CO}_2$  only permits rapid analyses with an accuracy of 1 or 2 parts in  $10^5$  using 20 c.c. of air. The  $\text{CO}_2$  in country air at 4 to 70 ft. above ground level varied between 21 and 44 parts in  $10^5$ . Diurnal variation due to photosynthesis is marked between July and October, but not in December. Exhalation of  $\text{CO}_2$  from the soil is definite, the mean excess being 5.4 parts in  $10^5$  at ground-level compared with a height of 4 ft. above. The effect of combustion is marked, the average val. for London being 65 parts in  $10^5$ . Other variations due to causes at present uncertain are recorded. L. S. T.

**Alkali metals in natural waters.** R. BOSSUET (Compt. rend., 1936, 202, 1162—1164).—A large no. of samples of natural  $\text{H}_2\text{O}$  have been examined in the  $\text{O}_2\text{—C}_2\text{H}_2$  flame for alkali metals. The presence of Na and K increases the sensitivity of the test for Rb and Cs. All five alkali metals have been found in most cases, but Cs is absent (i.e.,  $< 10^{-3}$  mg. per litre) in certain cases where  $\text{Ca}(\text{HCO}_3)_2$  or  $\text{CaSO}_4$  predominate, and in some other samples. M. S. B.

**Chemical and physico-chemical analysis of the mineral water of Fontecchio.** L. BELLUCCI, M. SGARZI, and A. BARILLARO (Annali Chim. Appl. 1936, 26, 130—138).—The  $\text{H}_2\text{O}$  has an odour of  $\text{H}_2\text{S}$ . Analytical data, physico-chemical properties, and radioactivity are recorded. L. A. O'N.

**Activity of non-pathogenic bacteria in the thermal water of Aix-les-Bains and Aix-Burtscheid.** II. A. SCHLOEMER (Z. Unters. Lebensm., 1936, 71, 268—273; cf. A., 1933, 691; 1934, 53).—The  $\text{NO}_2^-$  in the thermal  $\text{H}_2\text{O}$  is due entirely to the

growth of nitrifying bacteria. The deposit is largely due to the action of  $\text{CaCO}_3$ - and  $\text{SiO}_2$ -bacteria, but deposition of  $\text{CaCO}_3$  is facilitated by the low  $\text{CO}_2$  content of the  $\text{H}_2\text{O}$ . E. C. S.

**Chemical and biological characteristics of the Lake of Massaciuccoli.** G. BRUNELLI and G. CANNICCI (Atti R. Accad. Lincei, 1935, [vi], 22, 598—604).—A preliminary description. O. J. W.

**Carbon dioxide and hydrogen ion content of the lake waters of N.E. Wisconsin.** C. JUDAY, E. A. BIRGE and V. W. MELOCHE (Trans. Wis. Acad. Sci., 1936, 29, 1—82).—Data for 518 lakes are recorded, showing annual variation and variation with depth. C. W. G.

**Analysis of thermal spring at Lipik.** S. MIHOLIC (Bull. Soc. Chim. Yougoslav., 1935, 6, 169—177).—The I content has diminished exponentially since 1870. R. T.

**Mineral water of Rogaska Slatina.** A. REŽEK (Bull. Soc. Chim. Yougoslav., 1935, 6, 179—187).—The  $\text{H}_2\text{O}$  activates salivary and pancreatic amylases (optimum  $p_{\text{H}}$  6.0—6.4 and 6.0—6.8, respectively). The mechanism of activation is discussed. R. T.

**Boron content of oil-field waters.** S. G. ZEITLIN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 123—126).—Data are recorded for samples from the Baku, Dagestanskiye Ogni, Novogroznenskoie, and Turkestan regions. The borax content of the dry residue was 0.5—0.6%. H. J. E.

**Waters, magmatic and meteoric.** F. E. KEEP (Econ. Geol., 1936, 31, 118—121).—A discussion (cf. A., 1935, 1343) relating mainly to Witwatersrand water. L. S. T.

**Concentration of  $\text{D}_2\text{O}$  in natural ice. III.** E. BARONI and A. FINK (Monatsh., 1936, 67, 193—195; cf. A., 1935, 953).—Snow, independent of age, has the same  $\text{D}_2\text{O}$  content as normal  $\text{H}_2\text{O}$ , but hoar frost samples have 15—50% greater concn. than normal. It is concluded that concn. of  $\text{D}_2\text{O}$  is possible under natural conditions such as hoar frost formation and slow evaporation of glaciers. J. W. S.

**Theoretical consideration of ideal liquid inclusions.** S. T. YUSTER (Amer. J. Sci., 1936, [v], 31, 363—372).—Calculations are made of the temp. and pressures which existed at the time when liquids and gases were enclosed in crystals. L. J. S.

**Crystallisation process of basalt.** T. F. W. BARTH (Amer. J. Sci., 1936, [v], 31, 321—351; cf. A., 1931, 708, 816; 1932, 494).—Further discussion on the crystallisation of feldspar and pyroxene in basaltic magma with progressive alteration in the composition of the magma. L. J. S.

**Occurrence of claudetite in Imperial County, California.** V. C. KELLEY (Amer. Min., 1936, 21, 137—138).—An occurrence in a vein composed mainly of kaolin, gypsum, halloysite, and S is described. L. S. T.

**Accessory minerals of the Wolf Mountain granite, Llano County, Texas.** R. E. MCADAMS (Amer. Min., 1936, 21, 128—135).—The percentages of the accessory minerals biotite, hornblende, mag-

netite (I), muscovite, apatite (II), zircon (III), titanite (IV), monazite, rutile, chlorite, fluorite (V), garnet, tourmaline, brookite, ilmenite, and pyrite are tabulated. A yellow, isotropic mineral, as yet unidentified, is also present. The Wolf Mountain granite, the Bear Mountain granite, and the quartz porphyry have different accessory mineral assemblages. The former and the Lone Grove granites apparently had a common parent magma. The Bear Mountain granite, with its more abundant (V), is probably younger than these granites, and of the same age as the quartz porphyry. The ratio of (III) to (II) appears to increase toward the bottom of the Wolf Mountain mass, where (I) is also conc. The % of (IV) increases as the border of Wolf Mountain is approached. L. S. T.

**Chemical composition of the eruptive rock of Cupaello (Rieti).** F. RODOLICO (Atti R. Accad. Lincei, 1935, [vi], 22, 469—472).—The following composition is given:  $\text{SiO}_2$  42.64,  $\text{TiO}_2$  0.87,  $\text{P}_2\text{O}_5$  1.26,  $\text{SO}_2$  0.62,  $\text{Al}_2\text{O}_3$  7.01,  $\text{Fe}_2\text{O}_3$  5.78,  $\text{FeO}$  1.66,  $\text{MnO}$  0.16,  $\text{MgO}$  10.86,  $\text{CaO}$  14.53,  $\text{Na}_2\text{O}$  0.71,  $\text{K}_2\text{O}$  5.61,  $\text{H}_2\text{O} +$  6.22,  $\text{H}_2\text{O} -$  2.28, total 100.21%; d 2.61. O. J. W.

**New crystal-bearing glass from Macusani (Peru).** F. HEIDE (Naturwiss., 1936, 24, 281—282).—A description of a glass containing crystals, and identical with that discovered by Linck (Chem. Erde, 1926, 2, 157) at Paucartambo (Peru), is given. A. J. M.

**Ore-bearing zones of the metal deposits of Karakstan.** N. KASSIN (Problem. Sovet. Geol., 1933, 4, 58—63).—The deposits are described. CH. ABS. (e)

**Radium discoveries in N.W. Canada.** H. S. SPENCE (Sands, Clays and Min., 1935, 2, No. 3, 8—23).—A review. H. J. E.

**Zermattite and schweizerite from Dshemarakly-tjube Mt. in the Karatschai region, Caucasus.** D. SERDIUTSCHENKO (Mém. Soc. russe Min., 1932, 61, 94—100).—These minerals were deposited from  $\text{H}_2\text{O}$  solutions genetically connected with the intrusion of a quartz-keratophyre, and are exceptionally rich in  $\text{CaO}$  and  $\text{Al}_2\text{O}_3$ . CH. ABS. (e)

**Petrology of the Hartley district. III. Contact metamorphism of the upper Devonian (Lambian) series.** G. A. JOPLIN (Proc. Linnean Soc. N.S. Wales, 1935, 60, 16—50). CH. ABS. (e)

**Bolivian tin belt.** F. AHLFELD (Econ. Geol., 1936, 31, 48—72).—The Bolivian metallogenetic province contains chiefly Sn, W, Mo, As, Bi, Cu, Zn, Pb, Sb, commonly Ag, and rarely Au, Ni, Co, and Hg. B is very common, whilst Be and U are absent. The minerals and their paragenesis, the rock alteration, and the ore deposits are described, and the genesis of the deposits is discussed. L. S. T.

**Hydrothermal oxidation of manganese minerals.** S. A. TRENGOVE (Econ. Geol., 1936, 31, 29—47).—Rhodochrosite (I) is readily decomposed and oxidised by steam in 24 hr. at temp.  $> 170^\circ$ . Pyrolusite is probably present in the alteration product. Oxidation increases with temp. up to approx.  $300^\circ$ , above which temp. complex alteration products

are formed. High pressure or the addition of  $\text{CO}_2$  to the steam retards decomp. Oxidation occurs slowly at high pressures when small amounts of  $\text{HCl}$  are present and more rapidly at pressures nearer 1 atm. (I) is stable at room temp. in air, and at  $250^\circ$  when steam or other sources of  $\text{O}_2$  is absent. Decomp. commences at approx.  $275^\circ$  and oxidation due to the decomp. of the contained  $\text{CO}_2$  occurs. Fowlerite shows no hydrothermal oxidation at temp.  $> 400^\circ$ . The bearing of these results on the genesis of Mn oxide ore deposits in various parts of the world is discussed. L. S. T.

**Battle Branch gold mine, Auraria, Georgia.** C. F. PARK, jun., and R. A. WILSON (Econ. Geol., 1936, 31, 73—92).—The mineralogy of the deposit is unusual and three stages are recognised. An early high-temp. stage produced coarsely cryst. silicates, such as garnet (almandite common), cummingtonite, kyanite, and micas, probably formed by recrystallisation of minerals in the country rock. During an intermediate stage ankerite, quartz, and pyrrhotite were deposited, and the last stage produced chlorite, galena (I), and Au. The Au in the rich shoots is contemporaneous with (I) and is of hypogene origin. The soil and saprolite extend to a max. depth of 80 ft., and mechanical enrichment of Au has occurred in the latter. L. S. T.

**Geology and ore deposits of the Central Patricia gold mine, Ontario.** J. M. CORMIE (Econ. Geol., 1936, 31, 93—103).—These ore bodies are sulphide-rich masses formed by fracture filling and by replacement of the Fe formation in which they occur. Pyrrhotite (I) and arsenopyrite (II) are predominant, whilst chalcopyrite (III) and pyrite (IV) are less abundant. The non-metallic minerals are quartz (black and white), chlorite, and carbonate. Au is the only economically valuable mineral in the ores and is associated with all the sulphides except (IV); Ag is present in minor amounts. The mineral succession is (IV), quartz veins; fracturing; (I), (III), and gangue; fracturing; (II); fracturing. The hypothermal genesis of the deposit is discussed. L. S. T.

**Cinnabar deposits in S.W. Arkansas.** N. H. STEARN (Econ. Geol., 1936, 31, 1—28).—The deposits occurring in the Athens Plateau are described. The ores are mainly fracture fillings in the sandstone with dickite, cinnabar, and quartz as the principal minerals, and small amounts of pyrite, stibnite, and siderite. They are hydrothermal in origin. The tenor of the ore in place is approx. 10 lb. of Hg per ton of rock. Secondary minerals are meta-cinnabar, Hg, eglestonite, livingstonite, calomel, chaledony or opal, hydrated Fe oxide, and stibiconite. L. S. T.

**High-temperature mineral associations at moderate to shallow depth.** B. S. BUTLER (Econ. Geol., 1936, 31, 115—118).—A discussion (cf. A., 1935, 955). L. S. T.

**Gabbros and associated xenolithic complexes of the Haddo House district, Aberdeenshire.** H. H. READ (Quart. J. Geol. Soc., 1935, 91, 591—638).—The country rocks into which the Haddo

House igneous masses intrude consist of andalusite-cordierite-schists, pebbly grits, and cordierite-biotite-gneisses. The gabbro mass consists of olivine- and quartz-gabbro, both considered to be of primary igneous origin, and norite and cordierite-norite which contain abundant xenoliths. The mechanism of the production of the noritic rocks, by assimilation of argillaceous material, is discussed. The gabbros and their xenolithic complexes are intruded by a later granite and by innumerable granitic and pegmatitic dykes. The conditions of formation of monomineralic calc-silicate rocks, such as those of diopside and wollastonite, are discussed. L. S. T.

**Base of the Gault in Sussex.** J. F. KIRKALDY (Quart. J. Geol. Soc., 1935, 91, 519—537).—The glauconitic sandy clays and layers of hard phosphatic nodules composing the base of the Gault and a bed of limonitic grit are described. Conditions of deposition of the beds are discussed. L. S. T.

**Basic intrusive rocks associated with the Cambrian inlier near Malvern.** F. G. H. BLYTH (Quart. J. Geol. Soc., 1935, 91, 463—478).—A petrological and chemical examination of minor intrusions in the Cambrian strata near Eastnor, Herefordshire. L. S. T.

**Age relations of the Ward ores, Boulder County, Colorado.** E. E. WAHLSTROM (Econ. Geol., 1936, 31, 104—114).—Structure, paragenesis, and age relations of the ore deposits of the Ward district are discussed. The predominant mineralisation is auriferous quartz-pyrite-chalcopyrite ores occasionally with small amounts of molybdenite, wolframite, sphalerite, and specularite. At White Raven mine important amounts of galena-Ag carbonate ore occur. The Au-Cu ore was probably deposited under conditions of medium to high temp. and high pressure from solutions originating from the same magma chamber which gave rise to the Tertiary (?) intrusives. The Pb-Ag ore was probably deposited under conditions of low to medium temp. L. S. T.

**Occurrence and properties of herzenbergite.** P. RAMDOHR (Z. Krist., 1935, 92, 186—189).—A description of naturally occurring  $\text{SnS}$ . B. W. R.

**Dielectric constant of mineral powders.** J. L. ROSENHOLTZ and D. T. SMITH (Amer. Min., 1936, 21, No. 2, 11 pp.).—Data for 160 minerals are recorded. C. W. G.

**Scheelite from the mines of Gerrei in Sardinia.** A. PELLOUX (Atti R. Accad. Lincei, 1935, [vi], 22, 554—556).—Crystallographic data are recorded. O. J. W.

**Geochemical frequency of barium.** C. J. VAN NIEUWENBURG and R. H. DEWALD (Rec. trav. chim., 1936, 55, 263—266).—The Ba content of igneous rocks is  $<$  the Sr content. E. S. H.

**Enrichment of heavy spar by alkaline weathering solutions in a Frankish keuper-arkose, and its regional and geochemical significance.** S. KLEIN (Z. deut. geol. Ges., 1935, 87, 320—332; Chem. Zentr., 1935, ii, 1152).—The origin of  $\text{BaSO}_4$  deposits by the solvent action of alkali carbonates on feldspar is discussed. J. S. A.

**Granitic injection processes in the Columbia quadrangle, South Carolina.** T. L. KESLER (J. Geol., 1936, 44, 32—44).—The effects of intrusion of granite are described. L. S. T.

**Clay colloids as a cause of bedding in sedimentary rocks.** W. D. KELLER (J. Geol., 1936, 44, 52—59).—Colloidal clay of the montmorillonite-beidellite group extracted from the Putnam soil of Missouri flocculates to relatively coarse aggregates oriented so as to resemble crystals. Their platy shape resembles that of the mineral in a bedded clay shale. The possibility that the lamination of shale develops from deposition of colloidal clay is discussed. L. S. T.

**Probable non-existence of arsenoferrite.** M. J. BUEGER (Amer. Min., 1936, 21, 70—71).—X-Ray examination of the apparently isotropic mineral of composition corresponding with  $\text{FeAs}_2$  described by Poshag and Short (A., 1931, 817) shows that the mineral is not cubic and that it is identical with lollingite. L. S. T.

**X-Ray powder diffraction data for antlerite and brochantite.** A. W. WALDO (Amer. Min., 1936, 21, 71—73).—The data previously given for antlerite (1) (A., 1935, 1474) apply to brochantite and not to (1). L. S. T.

**Andalusite in pegmatite.** J. MURDOCH (Amer. Min., 1936, 21, 68—69).—Pegmatite dykes cutting the magnesite deposits at Winchester, California, contain reddish-brown andalusite (I). Sillimanite replaces some of the (I). L. S. T.

**Bustamite from [Saline Valley,] Inyo County, California.** J. MURDOCH and R. W. WEBB (Amer. Min., 1936, 21, 69—70).—Bustamite occurs in numerous boulders of a silicate rock. L. S. T.

**Analyses of thulite.** S. A. NORTHROP (Amer. Min., 1936, 21, 73).—An additional analysis is recorded (this vol., 308). L. S. T.

**Distribution of the chief mineral deposits of Morocco.** F. BLONDEL and J. BONDON (Compt. rend., 1936, 202, 1197—1198).—Recent data on the age, distribution, and origin of the different mineral deposits of Morocco are summarised. M. S. B.

**Ligneous substances in lacustrine materials.** J. F. STEINER and V. W. MELOCHE (Trans. Wis. Acad. Sci., 1935, 29, 389—402).—Analyses for C, N, protein, and lignin are given. C. W. G.

**Vanadium in the petroleum and bitumens of the U.S.S.R.** A. P. VINOGRADOV and G. G. BERGMAN (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 349—352; cf. A., 1934, 1380).—The distribution of V in the petroleum and bitumens of the U.S.S.R. has been determined. Deposits of the Devonian period contain the highest and those of the Jurassic period the lowest % of V. From much of the data it appears that V occurs  $\propto$  the % of org. matter in the rock, in Ishma asphaltite. The view that V passes into the petroleum from aq. solution in presence of  $\text{H}_2\text{S}$ , the V being held as  $\text{V}_2\text{S}_5$ , is considered disproved. It is probable that the V comes from the mud of continental sea basins in which V has been conc. by marine organisms. R. S. B.

**Extra-terrestrial hydrocarbons and petroleum genesis.** F. M. VAN TUYL and B. H. PARKER (Bull. Amer. Assoc. Petroleum Geol., 1935, 19, 900—902).—A discussion. CH. ABS. (e)

**Age and conditions of formation of brown coals in the Upper Zeya plain.** G. E. BRIKOV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 355—359).—Brown coals of *d* 1.44 found in the Sektakhan mountains are described. R. S. B.

## Organic Chemistry.

**Structural chemistry.** N. V. SIDGWICK (J.C.S., 1936, 533—538).—Presidential address.

**Action of aluminium chloride on paraffins. Autodestructive alkylation.** V. N. IPATIEV and A. V. GROSSE (Ind. Eng. Chem., 1936, 28, 461—464).— $n\text{-C}_4\text{H}_{10}$ ,  $\text{-C}_6\text{H}_{14}$ ,  $\text{-C}_7\text{H}_{16}$ , or  $\beta\beta\delta$ -trimethylpentane with  $\text{AlCl}_3$  and  $\text{HCl}$  gives complex mixtures of paraffins of lower and higher mol. wt. together with unsaturated hydrocarbons according to four types of reaction: (a) formation of paraffin and olefine of lower mol. wt.; (b) addition of olefine to paraffin; (c) isomerisation regarded as (a) followed by (b); (d) polymerisation of olefines followed by (b). The products were separated by Podbielniak distillation, b.p. and  $n_D^{20}$  being recorded for the fractions obtained. F. R. G.

**Isomerisation of hydrocarbons. II. Isomerisation of *n*-hexane and *n*-octane in presence of aluminium chloride.** B. L. MOLDAVSKI, M. V. KOBILSKAJA, and S. E. LIFSCHITZ (J. Gen. Chem. Russ., 1935, 5, 1791—1797).—Up to 30% of  $n\text{-C}_6\text{H}_{14}$  or  $\text{-C}_8\text{H}_{18}$  is converted into *iso*- $\text{C}_6\text{H}_{14}$  or  $\text{-C}_8\text{H}_{18}$  by

the action of  $\text{AlCl}_3$  at 20—90°. The velocity of the reaction is greatly increased by  $\text{HCl}$ . R. T.

**Preparation of isooctane.** G. S. PARKS and S. S. TODD (Ind. Eng. Chem., 1936, 28, 418—419).—The temp. conditions for the conversion of *isobutene* into  $\beta\beta\delta$ -trimethylpentane are deduced from thermochemical data. F. R. G.

**Methylnonanes.** G. CALINGAERT and H. SOROOS (J. Amer. Chem. Soc., 1936, 58, 635—636).—The following are obtained by simultaneous dehydration and hydrogenation of the alcohols quoted with  $\text{H}_2$  (200 atm.) and Raney Ni at 250° (after the preliminary absorption of  $\text{H}_2$  ceases, the  $\text{H}_2\text{O}$  formed is removed and the product reduced further):  $\beta$ -methylnonane (I), b.p. 166.8°/760 mm., m.p.  $-74.69 \pm 0.05^\circ$  ( $\beta$ -methylnonan- $\gamma$ -ol, from  $\text{MgPr}^2\text{Br}$  and  $n\text{-C}_6\text{H}_{13}\text{CHO}$ );  $\gamma$ -methylnonane (II), b.p. 167.8°/760 mm., m.p.  $-84.86 \pm 0.03^\circ$  ( $\gamma$ -methylnonan- $\gamma$ -ol, from  $\text{MgEtBr}$  and *Me n*-hexyl ketone);  $\delta$ -methylnonane, b.p. 165.7°/760 mm., m.p.  $-101.62 \pm 0.05^\circ$  (f.p. and m.-p. curves indicate a second form of m.p.  $-99 \pm 0.1^\circ$ ) ( $\delta$ -methylnonan- $\delta$ -ol, from  $\text{MgPr}^2\text{Br}$  and *Me*

*n*-amyl ketone);  $\epsilon$ -methylnonane, b.p. 165.1°/760 mm., m.p.  $-86.8 \pm 0.03^\circ$  ( $\epsilon$ -methylnonan- $\epsilon$ -ol, from  $\text{MgBu}^\circ\text{Br}$  and  $\text{EtOAc}$ ). Vals. of  $d_4^{20}$ ,  $n_D^{20}$ , and crit. solution temp. in  $\text{NH}_2\text{Ph}$  are given. The influence of structure on the physical properties is discussed. The data for (I) and (II), compared with *n*-decane, are in agreement with those predicted (this vol., 309).

H. B.

**Olefine elimination.** E. D. HUGHES and C. K. INGOLD (Chem. and Ind., 1936, 312—313, 422).—Polemical with Taylor (this vol., 587).

**Olefine formation.** W. TAYLOR (Chem. and Ind., 1936, 383—384).—Polemical (see above).

**Polymerisation.** XV. Polymerisation of *n*-butylene. S. V. LEBEDEV and S. M. ORLOV. XVI. Polymerisation of isobutylene by the action of floridin at low temperatures. S. V. LEBEDEV and J. A. BORGMAN (J. Gen. Chem. Russ., 1935, 5, 1589—1594, 1595—1606).—XV.  $\text{CHMe}:\text{CHMe}$  (I) yields 80—85% of polymerides when left with floridin at room temp. for 6 months; the product contains 43% of the dimeride (II), b.p. 115—116°/756 mm., and 15—18% of the trimeride (III) of (I), b.p. 78—79°/18 mm. (II) is oxidised by  $\text{KMnO}_4$  in aq.  $\text{COMe}_2$  at room temp. to yield  $\text{COMe}:\text{CHMeEt}$  (IV),  $\gamma\delta$ -dimethylhexane- $\beta\gamma$ -diol (V), b.p. 110—112°/14 mm., m.p. 55°, *Me*  $\alpha$ -hydroxy- $\alpha\beta$ -dimethylbutyl ketone (VI), b.p. 110—118°/14 mm. (semicarbazone, m.p. 170°),  $\text{COMeEt}$ ,  $\text{AcOH}$ , and  $\text{EtCO}_2\text{H}$ ; it is hence concluded that (II) is  $\text{CHMeEt}:\text{CHMe}$ . The oxidation of (II) proceeds as follows: (II)  $\rightarrow$  (V)  $\rightarrow$  (VI)  $\rightarrow$  (IV)  $\rightarrow$   $\text{COMeEt} + \text{EtCO}_2\text{H} + \text{AcOH}$ .

XVI. The % polymerisation of  $\text{CMe}_2:\text{CH}_2$  in presence of floridin increases to a max. as the temp. falls to  $-65^\circ$ , and is greatest when the activation temp. of the catalyst is  $300^\circ$ . The mol. wt. of the polymerides rises uninterruptedly with falling temp.; formation of products of high mol. wt. is most actively catalysed by floridin activated at  $200^\circ$ . The mol. wt. of the polymerides varies from 112 to 12,000. The polymerides obtained at  $-70^\circ$  with floridin activated at  $300^\circ$  consist of  $\text{C}_8\text{H}_{16}$  3.4,  $\text{C}_{12}\text{H}_{24}$  20.7,  $\text{C}_{16}\text{H}_{32}$  15.3,  $\text{C}_{24}\text{H}_{48}$  10.8,  $\text{C}_{28}\text{H}_{56}$  5.4, and higher polymerides 44.4%.

R. T.

**Action of certain silicates on hydrocarbons possessing the *tert.*-butyl radical.** S. V. LEBEDEV and N. A. KUDRJAFTZEV (J. Gen. Chem. Russ., 1935, 5, 1859—1865).—In presence of floridin  $\text{CHBu}^\circ:\text{CH}_2$  is converted into  $\text{CMe}_2:\text{CMe}_2$  (I) ( $160-170^\circ$ ), and  $\text{CHBu}^\circ:\text{CHMe}$  into  $\text{CMe}_2:\text{CMeEt}$  (II) ( $150-270^\circ$ ), whilst (I), (II), and  $\text{CBu}^\circ:\text{CH}$  ( $145-360^\circ$ ) are unaffected.

R. T.

**Determination of piperylene by means of maleic anhydride.** V. P. KRAUSE, A. M. KOGAN, and M. A. POLIEVKTOVA (Sintet. Kautschuk, 1934, No. 3, 30—33).—Piperylene with maleic anhydride (I) forms 3-methyl- $\Delta^4$ -tetrahydrophthalic anhydride and rubber-like polymerides. The reaction is carried out in a weighed sealed flask for 30 min. at  $70-75^\circ$ , the product which is non-volatile in vac. at room temp. being weighed. Excess of (I) decreases the formation of polymeride.

CH. ABS. (e)

**Determination of diallyl and dipropenyl in their mixtures by the hydrogenation method.** J. M. SLOBODIN (J. Gen. Chem. Russ., 1935, 5, 1830—1832).—Dipropenyl (I) undergoes hydrogenation only after complete saturation of diallyl (II); the composition of (I)-(II) mixtures can be determined from velocity of hydrogenation data.

R. T.

**Dimerisation of  $\Delta^{\alpha\gamma}$ -butadiene.** S. V. LEBEDEV and S. R. SERGIENKO (J. Gen. Chem. Russ., 1935, 5, 1839—1858).—Divinyl is converted into  $\Delta^3$ -cyclohexenylethylene (I) by heating at  $150^\circ$  for 120 hr.; (I) yields *cis*-, m.p.  $74-75^\circ$ , and *trans*-3:4-dibromo-1- $\alpha\beta$ -dibromoethylcyclohexane, m.p.  $101.5^\circ$ , and  $\alpha$ -bromoethyl-, b.p.  $102-104^\circ/20$  mm., and  $\alpha\beta$ -dibromoethyl- $\Delta^3$ -cyclohexene, b.p.  $105-118^\circ/3$  mm., with Br in  $\text{Et}_2\text{O}$  at  $0^\circ$ . (I) is very gradually converted at  $150^\circ$  into  $\Delta^1$ -cyclohexenylethylene.

R. T.

**Raman effect and organic chemistry.** Allyl isomerism in the case of the bromohexenes. (MLLES.) H. VAN RISSEGHEM and B. GREY (Compt. rend., 1936, 202, 489—491).— $\text{PBr}_3$  and propylvinylcarbinol give  $\text{CHPrBr}:\text{CH}:\text{CH}_2$  (I) and  $\text{CHPr}:\text{CH}:\text{CH}_2\text{Br}$  (II), separated by distillation under reduced pressure. Isomerisation of (I) and (II) into an equilibrium mixture [90—95% (II)] occurs on repeated distillation at  $100^\circ$  in a sealed tube, and was followed by means of the Raman lines near  $1650\text{ cm}^{-1}$  characteristic of the double linking. The isomerisation of (I) and (II) explains the formation of the same mixture from either of the corresponding alcohols.

H. G. M.

**Bromides obtained by action of phosphorus tribromide on propylvinylcarbinol, and the corresponding acetates.** (MLLES.) B. GREY and H. VAN RISSEGHEM (Bull. Soc. chim. Belg., 1930, 45, 177—185).—Propylvinylcarbinol with  $\text{PBr}_3$  in  $\text{C}_5\text{H}_5\text{N}$  below  $0^\circ$  affords *trans*- $\Delta^3$ -hexene (I), b.p.  $57.5-58^\circ/25$  mm., and  $\gamma$ -bromo- $\Delta^3$ -hexene (II), b.p.  $51-52^\circ/36$  mm. On keeping (I) passes partly into (II) (cf. A., 1935, 1480; also preceding abstract). (I) with  $\text{NaOAc}$  affords *trans*- $\Delta^3$ -hexenyl acetate (III) (cf. A., 1928, 1112), whilst (II) gives a mixture of  $\gamma$ -acetoxy- $\Delta^3$ -hexene, b.p.  $49-50^\circ/16$  mm., and (III). Either Ac derivative is stable at  $100^\circ$ .

J. L. D.

**Alkylacetylenes and their additive compounds.** IX. Reaction of allyl bromide with acetylenic Grignard reagents. J. P. DANEHY, D. B. KILLIAN, and J. A. NIEUWLAND (J. Amer. Chem. Soc., 1936, 58, 611—612).— $\text{CH}_2:\text{CH}:\text{CH}_2:\text{C}:\text{CR}$  (I) could not be prepared from  $\text{CH}_2:\text{CH}:\text{CH}_2\text{Br}$  (II) and  $\text{CR}:\text{C}:\text{MgX}$  in  $\text{Et}_2\text{O}$ ,  $\text{C}_6\text{H}_6$ , or di-*n*-amyl ether; reaction occurs, however, in presence of anhyd.  $\text{Cu}_2\text{Cl}_2$  or  $\text{Cu}_2\text{Br}_2$ , and to a smaller extent with  $\text{Cu}_2(\text{CN})_2$  or  $\text{CuHal}_2$ . Cu-bronze,  $\text{Cu}_2\text{S}$ , and  $\text{CuS}$  are not catalysts. Vinyl-[(I)  $\text{R}=\text{CH}_2:\text{CH}:$ ], b.p.  $109-110^\circ/750$  mm. (explodes violently on attempted combustion), butyl-, b.p.  $58^\circ/22$  mm., amyl-, b.p.  $73-74^\circ/22$  mm., and phenyl-, b.p.  $107-108^\circ/22$  mm., -alkylacetylenes are described.  $\beta$ -Methyl- $\Delta^7$ -octinen- $\beta$ -ol, b.p.  $92-93^\circ/33$  mm., is formed from  $\text{COMe}_2$  and  $\text{CBu}^\circ:\text{C}:\text{MgBr}$  even in presence of (II).

H. B.

**Trifluoronitrosomethane,  $\text{CF}_3\text{NO}$ .** III. O. RUFF and M. GIESE (Ber., 1936, 69, [B], 684—689).—

The production of trifluoronitrosomethane by the action of F on technical AgCN is due to the presence of  $\text{AgNO}_3$  or, possibly,  $\text{Ag}_2\text{O}$ ; the best yields are obtained from  $\text{AgCN}-\text{CaF}_2-\text{KNO}_3-\text{Ag}_2\text{O}$  (1:2:0.3:0.3). The blue fraction, formerly regarded as homogeneous  $\text{CF}_3\cdot\text{NO}$ , corresponds in all portions according to mol. wt. and analyses with the at. ratio  $\text{CF}_3\cdot\text{NO}$ . It has b.p.  $-84^\circ$ , m.p.  $-196.6^\circ$ . The gas is unchanged in contact with glass, 96%  $\text{H}_2\text{SO}_4$ , 60%  $\text{HNO}_3$ , 35%  $\text{HCl}$ ,  $\text{Hg}$ ,  $\text{AcOH}$ ,  $\text{K}_2\text{Cr}_2\text{O}_7$ ,  $\text{CrO}_3-\text{AcOH}$ ,  $\text{HSO}_4$ ,  $\text{KMnO}_4$  with 10%  $\text{H}_2\text{SO}_4$  or  $\text{AcOH}$ ,  $\text{H}_2\text{O}_2$ , or  $\text{H}_2\text{S}$ , but becomes decolorised in presence of 8%  $\text{NaOH}$ , active C,  $\text{Mn}_2\text{O}_7$  in  $\text{AcOH}$ , Zn dust and  $\text{AcOH}$ , Pd-sponge and dil.  $\text{HCl}$ . It therefore contains about 50–48% of the colourless isomeride  $\text{COF}\cdot\text{NF}_2$  which is so stable that the chemical properties of the blue fraction are almost identical with those of homogeneous  $\text{CF}_3\cdot\text{NO}$ . H. W.

**Chlorofluoroethanes and chlorofluoroethyl-  
enes.** II. A. L. HENNE and E. C. LADD. III. A. L. HENNE and D. M. HUBBARD (J. Amer. Chem. Soc., 1936, 58, 402–403, 404–406; cf. A., 1934, 1089).—II. The prep. of the following compounds is described:  $\text{CHCl}_2\cdot\text{CCl}_2\text{F}$ , m.p.  $-82.6^\circ$ , b.p.  $116.6^\circ$ ;  $\text{CHClF}\cdot\text{CCl}_3$ , m.p.  $-95.35^\circ$ , b.p.  $117.0^\circ$ ;  $\text{CHCl}_2\cdot\text{CClF}_2$ , b.p.  $71.9^\circ$ ;  $\text{CHClF}\cdot\text{CCl}_2\text{F}$ , b.p.  $72.5^\circ$ ;  $\text{CHF}_2\cdot\text{CCl}_3$ , b.p.  $73.0^\circ$ ;  $\text{CHClF}\cdot\text{CF}_2\text{Cl}$ , b.p.  $28.0^\circ$ ;  $\text{CHF}_2\cdot\text{CF}_2\text{Cl}$ , b.p.  $-12^\circ$ ;  $\text{CHF}\cdot\text{CCl}_2$ , m.p.  $-108.8^\circ$ , b.p.  $37.3^\circ$ ;  $\text{CHCl}\cdot\text{CClF}$ , b.p.  $35.1^\circ$ ;  $\text{CHCl}\cdot\text{CF}_2$ , b.p.  $2.4^\circ$ ;  $\text{CHClBr}\cdot\text{CClFBr}$ , b.p.  $163.5^\circ$ ;  $\text{CHClBr}\cdot\text{CF}_2\text{Br}$ , b.p.  $118.7^\circ$ . The preferential course of fluorination during synthesis is discussed.

III. Fluorination of  $\text{CH}_2\text{Cl}\cdot\text{CCl}_3$  with  $\text{SbF}_3$  gives  $\alpha\beta\beta$ -trichloro- $\beta$ -fluoroethane, m.p.  $-104.7^\circ$ , b.p.  $88.0^\circ$ , and  $\alpha\beta$ -dichloro- $\beta\beta$ -difluoroethane, m.p.  $-101.2^\circ$ , b.p.  $46.8^\circ$ . E. S. H.

**Preparation of *n*-heptyl bromide.** C. L. TSENG, T. S. HO, and (Miss) P. T. CHIA (Sci. Rep. Nat. Univ. Peking, 1936, 1, 17–18).— $\text{HBr}-\text{H}_2\text{SO}_4$ ,  $\text{NaBr}-\text{H}_2\text{SO}_4$ , and  $\text{PBr}_3$  give 66–69, 60.4, and 64.5%, respectively, of  $n\text{-C}_7\text{H}_{15}\text{Br}$ . R. S. C.

**Hydroxyl linking in *n*-aliphatic alcohols.** D. A. WILSON (Nature, 1936, 137, 617–618).—A discussion. L. S. T.

**Hydrogen linking between oxygen atoms in organic compounds.** G. E. HILBERT, O. R. WULF, S. B. HENDRICKS, and U. LIDDEL (J. Amer. Chem. Soc., 1936, 58, 548–555; cf. A., 1935, 563).—The following compounds give no infra-red absorption characteristic of mols. containing the OH group:  $\text{CH}_3\text{Ac}$ ,  $\text{CH}_3\text{BzAc}$ ,  $\text{CH}_3\text{Bz}$ ,  $o\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$ , *p*-homosalicylaldehyde, Me and Ph salicylates, Me 3:5-dibromosalicylate,  $o\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{COMe}$ , 2:1- $\text{C}_{10}\text{H}_6\text{Ac}\cdot\text{OH}$ , 1:2- $\text{C}_{10}\text{H}_6\text{Bz}\cdot\text{OH}$ , 2-hydroxy-5-methylbenzophenone, dihydrorotenol, 1-hydroxyanthraquinone,  $o\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{NH}_2$ ,  $o\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$ , 2:6-( $\text{NO}_2$ ) $_2\text{C}_6\text{H}_3\cdot\text{OH}$ , 1:2- $\text{NO}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{OH}$ , 1:4:1:5, and 1:8-dihydroxyanthraquinones, 5:8-dihydroxy-1:4-naphthaquinone, naphthazarin, 2:4- and 4:6-diacetyl- and -dinitro-resorcinols, 2-nitro-resorcinol, 2:2'-dihydroxy-1:1'-dinaphthyl sulphone, 2:2'-dihydroxybenzophenone, derritol, and Et 2:5-dihydroxyterephthalate. The above compounds are

chelated (singly or doubly) through H. The following show OH absorption (which often differs from that of simple alcohols) and are not, therefore, chelated: aldol,  $\alpha$ - and  $\beta$ -benzilmonoximes, benzoin,  $\alpha$ - and  $\beta$ -benzoinoxime acetates, Et and Bu<sup>a</sup> *d*-tartrates, Et mesotartrate,  $o\text{-C}_6\text{H}_4(\text{OH})_2$ , and  $o\text{-C}_6\text{H}_4\text{Cl}\cdot\text{OH}$ . 9-Keto-10-nitromethyl-9:10-dihydro-10-phenanthrol is considered not to contain a H linking. 3-Nitropyrocatechol appears to contain a single chelate linking (cf. Baker, A., 1935, 85). Et 3:6-dibromo-2:5-dihydroxyterephthalate (I) is probably not chelated; the  $\text{CO}_2\text{Et}$  groups are probably displaced owing to the proximity of the Br. A structure is suggested for (I); it indicates the possibility of *cis*- and *trans*-forms of (I) and resolution of, e.g., alkyl 3-bromo-4- or -5-aminosalicylates. H. B.

**Reaction products of ethyl alcohol and sodium hydroxide.** D. WILLIAMS and R. W. BOST (J. Chem. Physics, 1936, 4, 251–253).— $\text{NaOH}$  and  $\text{EtOH}$  when heated in the absence of  $\text{H}_2\text{O}$  form  $\text{NaOEt}$  and  $\text{H}_2\text{O}$ , which latter can be detected by means of its absorption band at  $4.7\ \mu$ , by the Cu acetylide method, and by its reaction with  $\text{CaC}_2$ . The reaction goes to 75–100% completion. L. J. J.

**Mechanism of contact conversion of alcohols into diethylenic hydrocarbons by the method of S. V. Lebedev.** J. A. GORIN and O. M. NEIMARK (J. Gen. Chem. Russ., 1935, 5, 1772–1780).—The chief product obtained when  $\text{PrOH}$  is passed over a mixed dehydrating-dehydrogenating catalyst (not specified) at  $400^\circ$  is  $\text{CH}_2\cdot\text{CMe}\cdot\text{CH}\cdot\text{CHMe}$ ;  $\text{CHMe}\cdot\text{CH}_2$ ,  $\text{EtCHO}$ ,  $\text{CMe}_2\cdot\text{CHEt}$ , isohexane, and  $\text{H}_2$  are obtained as by-products. R. T.

**Highly unsaturated alcohols in sperm blubber oil.** Y. TOYAMA and G. AKIYAMA (Bull. Chem. Soc. Japan, 1936, 11, 29–34).—The high-boiling fraction of the unsaponifiable matter of the oil contains clupanodonyl (docosapentenol; A., 1926, 1226) and catadonyl (eicosatetraenol; Br<sub>8</sub>, blackens at about  $240^\circ$ , and *Ac* derivatives) alcohols. The latter is hydrogenated to *n*-eicosanol. H. G. M.

**Hydrogenation of acetylene derivatives.** XXIII. Dihexylbutinenediol. J. S. SALKIND [with V. I. TZERESCHKO] (J. Gen. Chem. Russ., 1935, 5, 1768–1771).—Two isomerides of  $(\text{Me}\cdot[\text{CH}_2]_5\cdot\text{CH}(\text{OH})\cdot\text{C})_2$  are described, (I), m.p.  $47-49^\circ$ , and (II), m.p.  $68-70^\circ$ . (I), when hydrogenated (Pd), yields two isomerides of  $(\text{Me}\cdot[\text{CH}_2]_5\cdot\text{CH}(\text{OH})\cdot\text{CH})_2$ , one (III), m.p.  $44-45^\circ$ , and the other (IV) an oil, b.p.  $195-200^\circ/14\ \text{mm}$ . (dibromide, m.p.  $140^\circ$ ); (III) gives hexadecane- $\eta\kappa$ -diol (V), m.p.  $85-86^\circ$ , and (IV) an isomeride (VI) of (V), m.p.  $105-106^\circ$ , when further hydrogenated. The dibromide, m.p.  $97-98^\circ$ , obtained from the mixture of (I) and (II) eliminates Br when treated with Zn in  $\text{EtOH}$ , to yield a product (VII), m.p.  $53-54^\circ$ , isomeric with (II). It is concluded that (I) is a mixture of optical (?) isomerides, and that hydrogenation proceeds as follows: (VII)  $\rightarrow$  (III)  $\rightarrow$  (V); (II)  $\rightarrow$  (IV)  $\rightarrow$  (VI). R. T.

**Catalytic action of monoses on the condensation of aldehydes.** II. Synthesis of pentarythritol. A. KUZIN (J. Gen. Chem. Russ. 1935

5, 1527—1529).—Glucose or fructose catalyses the condensation of  $\text{CH}_2\text{O}$  and  $\text{MeCHO}$  to pentaerythritol.

R. T.

**Isomeric monoalkyl ethers of  $\beta$ -methylpropane- $\alpha\beta$ -diol from  $\alpha\beta$ -epoxy- $\beta$ -methylpropane.** C. E. SPARKS and R. E. NELSON (J. Amer. Chem. Soc., 1936, 58, 671—672).— $\alpha\beta$ -Epoxy- $\beta$ -methylpropane (I) (1 mol.) with 3 mols. of  $\text{MeOH}$ ,  $\text{EtOH}$ , and  $\text{Pr}^\text{OH}$  (rate of reaction and yield diminish in this order) at 230—270° under pressure give  $\text{OAlk}\cdot\text{CMe}_2\cdot\text{CH}_2\cdot\text{OH}$  [ $\text{Alk}=\text{Pr}^\text{a}$  (II), b.p. 162—163°/739.2 mm.] and  $\text{OH}\cdot\text{CMe}_2\cdot\text{CH}_2\cdot\text{OAlk}$  [ $\text{Alk}=\text{Pr}^\text{a}$ , b.p. 147—147.5°/748.6 mm. (lit. 150—151°/763 mm.)]. (I) heated with  $\text{Pr}^\text{OH}$  and 10%  $\text{H}_2\text{SO}_4$  affords (II).

H. B.

**Radiate ethers of pentaerythritol.** H. J. BACKER and G. DIJKIN (Rec. trav. chim., 1935, 55, 22—32).—The prep. of the following *pentaerythritol ethers* is described:  $\text{Me}_4$  (I), m.p. 30—30.5°, b.p. 196—198°;  $\text{Et}_4$ , b.p. 230—231°/763 mm. (cf. lit.);  $\text{Pr}^\text{a}_4$ , b.p. 124—127°/3 mm.;  $\text{Bu}^\text{y}_2$ , m.p. 102—104°; *tetractetyl*, m.p. 57.5—59°;  $\text{Ph}_4$  (II), m.p. 113—113.5° [ $(\text{NO}_2)_8$ -derivative, decomp. about 114°]; *tetra-p-bromophenyl* (III), m.p. 153—157° (crystallises from  $\text{C}_6\text{H}_6\text{--CHCl}_3$  with 2 mols. of  $\text{C}_6\text{H}_6$ ), also obtained by bromination of (II); *tetra-p-chlorophenyl* (IV), m.p. 141—142°; *tetra-p-tolyl* (V), m.p. 96°;  $(\text{CH}_2\text{Ph})_4$ , b.p. 246—250°; *tetra-p-tert.-butylphenyl*, m.p. 168—169° ( $\text{Br}_4$ -derivative, m.p. 231—232°); *tetra-p-tert.-amylphenyl*, m.p. 193—194.5°;  $(\alpha\text{-C}_{10}\text{H}_7)_4$ , m.p. 170—171.5° (*monopicate*, m.p. 200—201.5°);  $(\beta\text{-C}_{10}\text{H}_7)_4$ , m.p. 119—120° (*dipicate*, m.p. 189.5—190.5°). (II) when boiled with  $\text{AlCl}_3$  in  $\text{C}_6\text{H}_6$  is converted into an *isomeride*, m.p. 97—98°, also obtained when  $\text{C}(\text{CH}_2\text{Br})_4$  is heated with  $\text{PhOH}$  and  $\text{Na}$ . This does not react with  $\text{AcCl}$  or dissolve in alkali; its  $(\text{NO}_2)_8$ -derivative, decomp. about 115°, however, is readily sol. in  $\text{COMe}_2$  and in  $\text{KOEt}\text{--EtOH}$ . (IV) when heated with  $\text{AlCl}_3$  in light petroleum gives a *compound*, m.p. 218—220°, considered to be  $\text{C}(\text{CH}_2\text{O})_4\text{C}_6\text{H}_3\text{Cl}$ . A similar *compound*, m.p. 169—170°, is obtained from (V) with  $\text{AlCl}_3$ , and is also formed from  $\text{C}(\text{CH}_2\text{Br})_4$ ,  $\text{Na}$ , and *p*-cresol together with an *isomeride*, m.p. 100.5—101.5°, of (V). The crystallographic properties of (I)—(V) have been determined (by P. TERPSTRA).

H. G. M.

**Syntheses of glycerides by means of triphenylmethyl compounds. II. Diglycerides.** P. E. VERKADE and J. VAN DER LEE (Rec. trav. chim., 1936, 55, 267—277).— $\alpha$ -Monostearin (I) and  $\text{CPh}_3\text{Cl}$  in quinoline afford  $\gamma$ -triphenylmethylglyceryl  $\alpha$ -stearate (II), m.p. 66.5—67°, and  $\beta\gamma$ -ditriphenylmethylglyceryl  $\alpha$ -stearate. Similarly,  $\alpha$ -monopalmitin affords  $\gamma$ -triphenylmethylglyceryl  $\alpha$ -palmitate (III), m.p. 61.5—62°. (II) and  $\gamma$ -triphenylmethylglyceryl  $\alpha\beta$ -distearate are also obtained from triphenylmethylglycerol and stearyl chloride (IV). Palmityl chloride and (II) give  $\gamma$ -triphenylmethylglyceryl  $\beta$ -palmitate  $\alpha$ -stearate (V), m.p. 37—37.5°, and (III) and (IV) give  $\gamma$ -triphenylmethylglyceryl  $\alpha$ -palmitate  $\beta$ -stearate (VI), m.p. 57—57.5°. Removal of  $\text{CPh}_3$  from (V) and from (VI) affords glyceryl  $\alpha$ -stearate  $\gamma$ -palmitate.

P. G. C.

**Constituents of the adrenal gland. III. Sulphur-containing substance.** T. REICHSTEIN

and A. GOLDSCHMIDT (Helv. Chim. Acta, 1936, 19, 401—402; cf. this vol., 605).— $\text{S}(\text{CH}_2\cdot\text{CH}_2\cdot\text{OH})_2$  with 27%  $\text{H}_2\text{O}_2$  (1 mol.) in a little  $\text{AcOH}$  gives *di- $\beta$ -hydroxyethyl sulphoxide* (I), m.p. 112—113° (corr.) (reduces  $\text{KMnO}_4$  at 0° instantaneously), identical with the substance isolated from the adrenal gland. Solubility relations show that (I) occurs naturally as ester of a fatty acid. Possibly, however, the SO is produced during isolation.

R. S. C.

**Thio-derivatives of glycerol. I. Preparation of  $\alpha$ -monothioglycerol.** L. SMITH and B. SJÖBERG (Ber., 1936, 69, [B], 678—680).— $\beta\gamma$ -isoPropylidenedioxypropyl chloride is converted by  $\text{K}_2\text{S}_2$  at 100° into *di- $\beta\gamma$ -isopropylidenedioxypropyl disulphide*, b.p. 165°/3 mm., which is hydrolysed by 2.5N- $\text{H}_2\text{SO}_4$  and then electrolytically reduced at a Pb electrode to  $\alpha$ -thiolpropene- $\beta\gamma$ -diol [ $\alpha$ -monothioglycerol], b.p. 112°/3 mm. Essentially the same substance appears to result from  $\beta\gamma$ -oxidopropyl alcohol and  $\text{H}_2\text{S}$  in presence of  $\text{Ba}(\text{OH})_2$  at room temp.

H. W.

**$\beta$ -Oxidation and  $\omega$ -oxidation.** B. FLASCHEN-TRÄGER and K. BERNHARD (Rec. trav. chim., 1936, 55, 278—281).—A reply to Verkade *et al.* (this vol., 234).

P. G. C.

**$\psi$ -Halogens. XXXII. Reaction of the silver salts of monobasic organic acids with iodine in the presence of benzene.** L. BIRCKENBACH and K. MEISENHEIMER (Ber., 1936, 69, [B], 723—729).—The possible actions between I and the Ag salts of monobasic org. acids in presence of  $\text{C}_6\text{H}_6$  are represented:  $\text{R}\cdot\text{CO}_2\text{Ag} + \text{I}_2 \rightleftharpoons \text{R}\cdot\text{CO}_2\text{I} + \text{AgI}$ ;  $\text{R}\cdot\text{CO}_2\text{I} + \text{C}_6\text{H}_6 \rightarrow$  (a)  $\text{PhI} + \text{R}\cdot\text{CO}_2\text{H}$  or (b)  $\text{ROBz} + \text{HI}$ ;  $\text{HI} + \text{R}\cdot\text{CO}_2\text{Ag} = \text{R}\cdot\text{CO}_2\text{H} + \text{AgI}$ ;  $\text{R}\cdot\text{CO}_2\text{I} + \text{R}\cdot\text{CO}_2\text{Ag} \rightleftharpoons [\text{R}\cdot\text{CO}_2\text{I}, \text{AgO}_2\text{C}\cdot\text{R}] \rightarrow$  (c)  $\text{R}\cdot\text{CO}_2\text{R} + \text{CO}_2 + \text{AgI}$ . With aliphatic acids reaction (c) is so much more rapid than (a) or (b) that substitution occurs to only a slight extent, if at all. With  $\text{BzOH}$  the reactions are about equally rapid, whereas with substituted benzoic acids substitution is so much the faster process that only a slight evolution of  $\text{CO}_2$  is observed. With aliphatic acids change (b) does not occur appreciably except in the case of  $\text{AcOH}$ . With  $\text{AgOBz}$  approx. equal amounts of  $\text{PhI}$  and  $\text{PhOBz}$  are formed, but the latter may arise according to (c). Among the isomeric nitro-, chloro-, and methylbenzoic acids the *p*-derivatives followed by the *m*-compounds react most markedly according to (b), the *o*-derivatives exclusively in accordance with (a). The results appear related to the electrolytic dissociation consts. of the acid. The action of  $\text{Cl}_2$  or  $\text{Br}$  on  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{CO}_2\text{Ag}$  in  $\text{C}_6\text{H}_6$  is examined in cold solution in the dark; it takes place without evolution of  $\text{CO}_2$ , giving mainly  $\text{PhCl}$  and  $\text{PhBr}$ , respectively, with 0% and 6% of  $\text{Ph}$  ester. Substitution of  $\text{PhCl}$  for  $\text{C}_6\text{H}_6$  in the reaction of  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{CO}_2\text{Ag}$  and I considerably diminishes the rate of substitution (recognisable by increased evolution of  $\text{CO}_2$ ) without influencing the ratio of changes (a) and (b), whereas  $\text{PhOMe}$  enhances substitution and a complete displacement towards direction (a).

H. W.

**Preparation of cellulose acetate. I. Preparation of acetyl chloride.** Y. KATO and S. FUJINO

(J. Electrochem. Assoc. Japan, 1935, 3, 42—46).—Cl<sub>2</sub> is passed into a mixture of PCl<sub>3</sub> and AcOH.

CH. ABS. (r)

**Products of reaction of ethyl dichloroacetate with alcoholic sodium ethoxide.** A. C. COPE (J. Amer. Chem. Soc., 1936, 58, 570—572).—Contrary to Wohl and Lange (A., 1908, i, 943), CHCl<sub>2</sub>·CO<sub>2</sub>Et (I) (1 mol.) and EtOH·NaOEt (1.5 mols.) give 22% of CH(OEt)<sub>2</sub>·CO<sub>2</sub>Et (II), b.p. 84—85°/14 mm., and 42% of Et α-chloro-β-diethoxysuccinate (III), b.p. 122—125° (slight decomp.)/2 mm. (III) heated at 170—250° affords CO, CO<sub>2</sub>, C<sub>2</sub>H<sub>4</sub>, small amounts of HCO<sub>2</sub>Et, Et<sub>2</sub>CO<sub>3</sub>, and EtOH, 23% of CHCl(CO<sub>2</sub>Et)<sub>2</sub>, and 58% of Et α-chloro-β-ethoxymaleate, b.p. 150—152°/17 mm. [free acid (+H<sub>2</sub>O), m.p. 77—77.5°, m.p. (anhyd.) 88—88.5° (anhydride, m.p. 37—37.5°)]. (III) is hydrolysed by aq. EtOH·HCl (trace) to Et<sub>2</sub> oxalochloroacetate. (III) is not obtained from OEt·CHCl·CO<sub>2</sub>Et and EtOH·NaOEt or from (I), (II), and EtOH·NaOEt. (III) may arise thus:

**Grignard reactions with ethyl β-chloropropionate.** I. C. WEIZMANN and E. BERGMANN (J.C.S., 1936, 401—402).—MgRBr and MgRCl with CH<sub>2</sub>Cl·CH<sub>2</sub>·CO<sub>2</sub>Et give, respectively, CH<sub>2</sub>Cl·CH·CR<sub>2</sub> and CH<sub>2</sub>Cl·CH<sub>2</sub>·CR<sub>2</sub>·OH which with KOH yields CH<sub>2</sub>·CH·CR<sub>2</sub>·OH. The following new carbinols were prepared: *dibenzyl-β-chloroethyl*-, b.p. 214°/22 mm., 206°/8 mm., 192°/3 mm.; *dibenzylvinyl*-, b.p. 145—146°/1 mm., reduced (Pd—BaSO<sub>4</sub>) to *dibenzylethyl*-, b.p. 190—192°/12 mm. [also prep. from CO(CH<sub>2</sub>Ph)<sub>2</sub> and MgEtBr], *dibenzyl-β-piperidinoethyl*-, b.p. 224—225°/5 mm., m.p. 45—46° (p-nitrobenzoate, m.p. 138—139°); p-aminobenzoate, b.p. 245—250°/25 mm., m.p. 147—148°, β-chlorotriethyl-, b.p. 118—119°/54 mm., β-piperidinotriethyl-, b.p. 105—106°/3 mm. [p-nitrobenzoate, m.p. 148° (alcoholate, m.p. 100°; hydrochloride, cryst.)], β-chloroethyldibutyl-, b.p. 128—133°/4 mm., dibutylvinyl-, b.p. 125°/34 mm., β-piperidinoethyldibutyl-, b.p. 140—143°/5 mm. MgPhBr with CH<sub>2</sub>Cl·CH<sub>2</sub>·CO<sub>2</sub>Et gives γγ-diphenylallyl chloride, b.p. 159—161°/4 mm. (converted by MgPhBr into CPh<sub>2</sub>·CH·CH<sub>2</sub>Ph), and CH<sub>2</sub>Cl·CH<sub>2</sub>·COPh, identified as CH<sub>2</sub>Ph·CH<sub>2</sub>·COPh. F. R. G.

**Comparison of a group of isomeric ethylenic chlorides (allyl-crotonic isomerism) amongst themselves and with the corresponding bromides, on the basis of reactions and mobility of hydrogen.** R. RAMBAUD (Bull. Soc. chim., 1936, [v], 3, 134—141).—Et γ-chlorocrotonate (I) (improved prep.) reacts with hot and cold solutions of alkalis, alkali acetates, NH<sub>3</sub>·H<sub>2</sub>O [product isolated was the *picrate*, m.p. 130—150° (decomp.)], of γ-aminocrotonic acid, and alkaline-earth iodides, giving the same products as are obtained from the γ-Br-compound (cf. A., 1935, 63, 64). The reaction with NaOEt is an exception (*ibid.*, 1105). (I) reacts about twice as rapidly as Et α-chloro-Δ<sup>8</sup>-butenoic acid (II) with NaI in CMe<sub>2</sub>, whereas Et α-chlorocrotonate does not react. (II) is oxidised by AgOH probably to Et<sub>2</sub> αα'-dichloro-αα'-divinylsuccinate. H. G. M.

**Geometrical isomerism of halogen-substituted ethylenic acids. Synthesis of β-bromo-Δ<sup>8</sup>-pentenoic acids.** A. E. FAVORSKI and V. O. MOCHNATSCHE (J. Gen. Chem. Russ., 1935, 5, 1668—1678).—CEt·C·CO<sub>2</sub>H (I) (K, +2H<sub>2</sub>O, Na, +2H<sub>2</sub>O, Ca, +0.5H<sub>2</sub>O, Sr, +1.5H<sub>2</sub>O, Mg, +3H<sub>2</sub>O, Ba, +0.5H<sub>2</sub>O, salts), obtained by boiling a paraffin solution of αβ-dibromobutane with NaNH<sub>2</sub> and saturating the product with CO<sub>2</sub>, reacts with aq. HBr at 0° to yield two stereoisomerides of CEtBr·CH·CO<sub>2</sub>H (II), one, m.p. 24—26° (K, +2H<sub>2</sub>O, and Ca salts), and the other, m.p. 53.5—54° (K, +H<sub>2</sub>O, Ba, +0.5H<sub>2</sub>O, and Ca, +4H<sub>2</sub>O, salts). α-Bromovaleric acid, b.p. 109.5—110.5°/6.5 mm. (lit. 67°/10 mm.) (Na, +0.5H<sub>2</sub>O, Ca, +7H<sub>2</sub>O, Mg, +H<sub>2</sub>O, and Sr, +H<sub>2</sub>O, salts), and Br (145—160°; 6 hr.) yield αα-dibromovaleric acid, b.p. 118—128°/10 mm., converted by steam-distillation into α-bromo-Δ<sup>8</sup>-pentenoic acid, b.p. 113—115°/5 mm. (Ca, Ba, and K salts). Both forms of (II) regenerate (I) when heated with aq. Ba(OH)<sub>2</sub>. R. T.

**Decenoic acid C<sub>10</sub>H<sub>18</sub>O<sub>2</sub> in sperm head oil.** Y. TOYAMA and T. TSUCHIYA (Bull. Chem. Soc. Japan, 1936, 11, 26—29).—The isolation of Δ<sup>8</sup>-decenoic acid from sperm head oil is described. Its constitution is established by hydrogenation to decanoic acid and by oxidation of the Me ester in CMe<sub>2</sub> by KMnO<sub>4</sub> to azelaic and formic acids. H. G. M.

**Transposition of the double linking in Δ<sup>4</sup>- and Δ<sup>8</sup>-oleic acids.** I. I. VANIN and A. A. TSCHERNJAROVA (J. Gen. Chem. Russ., 1935, 5, 1537—1542).—Δ<sup>4</sup>-Oleic acid in AcOH and HCl at 0° yield 1-chlorostearic acid, which with NiCO<sub>3</sub> (190—210°; 3 hr.) affords isooleic acid, Me·[CH<sub>2</sub>]<sub>6</sub>·CH·CH·[CH<sub>2</sub>]<sub>8</sub>·CO<sub>2</sub>H, m.p. 43—44°. Δ<sup>4</sup>-Oleic acid and HCl yield 7-chlorostearic acid, converted similarly into Me·[CH<sub>2</sub>]<sub>9</sub>·CH·CH·[CH<sub>2</sub>]<sub>5</sub>·CO<sub>2</sub>H, m.p. 51—52°. R. T.

**Halogenation of the thiocyanates of polyethylenic acids. Synthesis of halogenothiocyanates of ethyl linoleate.** W. KIMURA (Ber., 1936, 69, [B], 786—789).—Et linoleate is obtained by the successive action of Zn dust and conc. H<sub>2</sub>SO<sub>4</sub> on tetrabromostearic acid in abs. EtOH. It is converted by (CNS)<sub>2</sub> in CCl<sub>4</sub> into Et 9*α*-dithiocyano-Δ<sup>8</sup>-octadecenoate, which with Cl<sub>2</sub> or Br respectively in cold Et<sub>2</sub>O affords Et λμ-dichloro- and λμ-dibromo-9*α*-dithiocyanostearate. With Wijs' and Hanns' solutions Et λμ-chloroiodo- and λμ-bromoiodo-9*α*-dithiocyanostearate result. H. W.

**Polymerisation of the methyl esters of higher unsaturated fatty acids. XVII. Increase in the iodine value of the polymerisation product.** K. KINO (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 31—36; cf. A., 1934, 755).—The Me esters of the fatty acids of linseed and sesame oil, and Me oleate show no increase in I val. even after being in contact with I during 24 hr., but after heating at 280—290° for several hr. the increase may amount to 16.7 units, and is the higher the greater is the unsaturation of the starting material. Intermol. polymerides, unhydrolysable substances derived from them, and substances of high b.p. are responsible for the increase. Some substitution occurs in the poly-

merisation product, but the reaction is mainly additive. J. L. D.

**Interaction between the methyl esters of unsaturated aliphatic acids of the  $C_{20}$  and  $C_{22}$  class, containing four and five ethenoid linkings respectively, and maleic anhydride.** R. S. MORRELL and W. R. DAVIS (J.S.C.I., 1936, 55, 101—103r).—The Diels-Alder synthesis between conjugated diene systems and maleic anhydride has been extended to the Me esters of unsaturated  $C_{20}$  and  $C_{22}$  acids occurring in fish oils. No reaction of the type was found with either of these esters, although the former contained four and the latter five ethenoid linkings, respectively. The absence of conjugation indicated by these results is in accordance with existing work on the structure of the acids. An impurity in the  $C_{20}$  ester produced a small amount of amorphous heteropolymeride, probably composed of an oxidised pentaethylenic mol. in combination with three mols. of anhydride.

**Lead complexes of hydroxy-acids.** H. PARSSELLE (Compt. rend., 1936, 202, 1173—1176).—Pb tartrate exists in two forms; the hydrated salt first pptd. has an acid reaction, but changes subsequently into an anhyd. neutral form. The action of aq. NaOH on an equimol. mixture of tartaric acid and  $Pb(NO_3)_2$  has been followed polarimetrically. The ppt. first obtained redissolves in excess of NaOH, giving a *l*-complex in solution. The rotatory power is a function of  $[NaOH]$ , becoming positive and then negative again as this increases. With aq.  $NH_3$  the solution always remains *l*. A comparison with the behaviour of Pb saccharate in aq. KOH is made. The *l*-complex first produced becomes *d* as  $[KOH]$  increases, but there is no return to *l* with further increase of  $[KOH]$ . M. S. B.

**Determination of keto-enolic mixtures.** F. SEIDEL, W. THIER, A. UBER, and J. DITTMER (Ber., 1936, 69, [B], 650—653).—In presence of  $OAc \cdot CMe \cdot CH \cdot CO_2Et$  the enolic fraction of  $CHAc \cdot CO_2Et$  can be determined by titration with 0.2N-NaOH or  $-Ba(OH)_2$  in presence of phenolphthalein, since  $OAc \cdot OMe \cdot CH \cdot CO_2Et$  does not react appreciably with alkali. The results agree with those of Meyer's Br titration. The % enol in  $CHAc_2$  can be similarly determined, but the procedure fails with  $CH_2Ac \cdot CO_2Et$ . H. W.

**Acetolic condensations of ethyl acetoacetate with acetaldehyde.** H. GAULT and T. WENDLING (Bull. Soc. chim., 1936, [v], 3, 53—70; cf. A., 1935, 65).— $CH_2Ac \cdot CO_2Et$ ,  $MeCHO$ ,  $K_2CO_3$ , and  $H_2O$  give Et di- $\alpha'$ -hydroxyethylacetoacetate (I) and an oil consisting of  $Et_2$  ethylidenebisacetoacetate and some  $Et_2$  dimethylcyclohexenedicarboxylate, or of Et  $\alpha'$ -hydroxyethylacetoacetate, according to the temp. at which it was separated.  $NHEt_2$  or KOH may be used instead of  $K_2CO_3$  in the prep. of (I), but the  $H_2O$  cannot be replaced by EtOH. The stability of (I) at various temp. in the pure state and in  $H_2O$ , EtOH, and  $Et_2O$  is recorded. H. G. M.

**Preparation of macrocyclic lactones by depolymerisation.** E. W. SPANAGEL and W. H. CAROTHERS (J. Amer. Chem. Soc., 1936, 58, 654—656).—The

polyesters from  $OH \cdot [CH_2]_n \cdot CO_2H$  ( $n=9, 12, 13$ ) and  $OH \cdot [CH_2]_n \cdot O \cdot [CH_2]_{10} \cdot CO_2H$  ( $n=2-4$ ) are depolymerised at  $270^\circ/1$  mm. in presence of (usually) a little  $MgCl_2 \cdot 6H_2O$  to the mono- (main product with higher members) and/or di-meric lactones; this method (cf. A., 1935, 844) is simpler and quicker than that of Stoll and Rouvé (A., 1934, 1201; 1935, 1351). The following are new:  $\kappa\beta'$ -hydroxyethoxyundecomono- (I), b.p.  $108-111^\circ/1$  mm., m.p.  $8^\circ$ , and -di-, m.p.  $106-107^\circ$ , -lactones;  $\kappa\delta'$ -hydroxybutoxyundecomono-lactone (II), b.p.  $129-131^\circ/1$  mm., m.p.  $-19^\circ$ . (I) and (II) have musk-like odours.  $\kappa\beta'$ -Hydroxyethoxy-, m.p.  $48-50^\circ$ ,  $\kappa\gamma'$ -hydroxypropoxy-, m.p.  $51^\circ$ , and  $\kappa\delta'$ -hydroxybutoxy-, m.p.  $53^\circ$ , -undecolic acids are prepared from  $\kappa$ -bromoundecolic acid and  $OH \cdot [CH_2]_n \cdot ONa$  in  $(CH_2)_n(OH)_2$ . The effects of temp. and catalyst on the depolymerisation are studied.

H. B.

**Autoxidation of fatty acids. II. Oxidoelaidic acid and some cleavage products.** G. W. ELLIS (Biochem. J., 1936, 30, 753—761; cf. A., 1932, 931).—The rate of autoxidation of elaidic acid (I) has been increased to an  $O_2$  uptake of 20% in  $<7$  hr.  $CO_2$  must be removed by rapid circulation of  $O_2$ , and 0.2% of Co, as elaidate, be added. Oxidoelaidic acid, m.p.  $55.5^\circ$ , is formed to the extent of 16-20% of (I) oxidised. A similar oxidation of oleic acid yielded 20% of the same acid with a small amount of oxido-oleic acid. Autoxidation of (I) also yields azelaic, suberic, nonoic, and octoic acids, and a trace of  $H_2C_2O_4$ . J. N. A.

**Micrometric oxalic acid titration.** J. RENAUDIN (J. Pharm. Chim., 1936, [viii], 23, 447—454).—Micrometric titration of  $H_2C_2O_4$  with  $KMnO_4$  by the usual procedure using hot solutions is not trustworthy. Cold titration with 0.01N- $Na_2S_2O_3$  after addition of excess of 0.01N- $KMnO_4$  and KI is more accurate. Addition of  $MnSO_4$  accelerates the liberation of I and is desirable in the presence of mineral salts.

E. H. S.

**$\alpha$ -Deoxy-*l*-ascorbic acid.** F. MICHEEL and K. HASSE (Ber., 1936, 69, [B], 879—881).—*iso*Propylideneascorbic acid (improved prep.) is transformed into K  $\alpha$ -acetyl- $\beta\gamma$ -isopropylidenethreonate, which with  $SOCl_2$  at room temp. affords  $\alpha$ -acetyl- $\beta\gamma$ -isopropylidenethreonyl chloride, b.p.  $124-126^\circ/14$  mm. This is condensed with  $CHNa(CO_2Et)_2$  in anhyd.  $Et_2O$ , and the product is boiled with EtOH and then hydrolysed with dil. HCl, thus giving Et  $\alpha$ -deoxy-*l*-ascorbic- $\alpha$ -carboxylate,  $OH \cdot CH_2 \cdot CH(OH) \cdot CH \begin{smallmatrix} \diagup CO \cdot CH \cdot CO_2Et \\ \diagdown O \cdot CO \end{smallmatrix}$ , m.p.  $116-117^\circ$ ,  $[\alpha]_D^{20} +94.9^\circ$  in EtOH, transformed by NaOH-MeOH into  $\alpha$ -deoxy-*l*-ascorbic acid,  $OH \cdot CH_2 \cdot CH(OH) \cdot CH \begin{smallmatrix} \diagup C(OH) \cdot CH \\ \diagdown O \cdot CO \end{smallmatrix}$ , m.p.  $170^\circ$  after softening.

H. W.

**[Isolation of crystalline *d*-galacturonic acid from tobacco.]** F. EHRLICH (Ber., 1936, 69, [B], 920).—A question of priority (cf. Collatz, this vol., 591).

H. W.

**Walden inversion reactions of *d*-(+)-*p*-toluenesulphonoxypionic acid and amide and their derivatives.** C. M. BEAN, J. KENYON, and H. PHILLIPS (J.C.S., 1936, 303—311).—*p*-Toluenesulphonoxypionic acid is partly resolved through

the quinine salt, but the optically pure acid is obtained from *d*-lactic acid. The *d*-(+)-acid and  $\text{SOCl}_2$  give *d*-(+)- $\alpha$ -*p*-toluenesulphonylpropionyl chloride, b.p.  $140\text{--}145^\circ < 0.1$  mm., m.p.  $53^\circ$ ,  $[\alpha]_{5461}^{20} +3.69^\circ$  in  $\text{C}_6\text{H}_6$ ; the *l*-(-)-chloride with  $\text{LiCl}$  in  $\text{COMe}_2$  yields (+)- $\alpha$ -chloropropionyl chloride, converted into Et (+)- $\alpha$ -chloropropionate. *l*-(-)- $\alpha$ -*p*-Toluenesulphonylpropionamide and  $\text{KOAc}$  in EtOH give *d*-(+)- $\alpha$ -acetoxypropionamide, b.p.  $128\text{--}131^\circ < 0.1$  mm., m.p.  $59\text{--}60^\circ$ ,  $\alpha_{5461}^{20} +4.26^\circ$ . Et *l*-(-)-lactate, converted into the acid and treated successively with  $\text{AcCl}$ ,  $\text{SOCl}_2$ , and  $\text{CH}_2\text{Cl}_2$  and  $\text{NH}_3$ , yields *l*-(-)- $\alpha$ -acetoxypropionamide, b.p.  $104\text{--}105^\circ < 0.1$  mm., m.p.  $59\text{--}60^\circ$ ,  $\alpha_{5461}^{20} -17.7^\circ$ . *d*-(+)- $\alpha$ -Toluenesulphonylpropionamide with  $\text{KOBz}$  affords *d*-(+)- $\alpha$ -benzoyloxypropionamide, m.p.  $127\text{--}128^\circ$ ,  $[\alpha]_{5461}^{20} +66.6^\circ$  in EtOH, also obtained from Et *l*-(-)-lactate. *l*-(-)- $\alpha$ -*p*-Toluenesulphonylpropionanilide (I) with  $\text{KOAc}$  leads to *d*-(+)- $\alpha$ -acetoxypropionanilide,  $[\alpha]_{5461}^{20} +12.7^\circ$  in EtOH; the *l*-(-)-compound, obtained from  $\text{NH}_2\text{Ph}$  and (-)-acetoxypropionyl chloride, has m.p.  $121^\circ$  and  $[\alpha]_{5461}^{20} -12.2^\circ$  in EtOH. *d*-(-)- $\alpha$ -Benzoyloxypropionanilide, obtained from (I) and  $\text{KOBz}$ , has m.p.  $160^\circ$ ,  $[\alpha]_{5461}^{20} -12.0^\circ$  in EtOH, and the *l*-(+)-compound, m.p.  $160^\circ$ ,  $[\alpha]_{5461}^{20} +15.0^\circ$  in EtOH, is prepared from Et *l*-(-)-lactate, through *l*-(+)- $\alpha$ -benzoyloxypropionyl chloride, b.p.  $98^\circ < 0.1$  mm.,  $[\alpha]_{5461}^{20} +51.3^\circ$ .  $\beta$ -Naphthylamine and *l*-(-)- $\alpha$ -*p*-toluenesulphonylpropionyl chloride give *l*-(-)- $\alpha$ -*p*-toluenesulphonylpropiono- $\beta$ -naphthalide, m.p.  $128^\circ$ ,  $[\alpha]_{5461}^{20} -123.8^\circ$  in EtOH.

*dl*- $\alpha$ -*p*-Toluenesulphonylpropionyl chloride and Na *p*-toluenesulphonamide lead to *dl*- $\alpha$ -*p*-toluenesulphonyl-N-*p*-toluenesulphonylpropionamide, m.p.  $137^\circ$ , and similarly *K* *l*- $\alpha$ -*p*-toluenesulphonyl-N-*p*-toluenesulphonylpropionamide, m.p.  $160^\circ$  (decomp.),  $[\alpha]_{5461}^{20} -79.4^\circ$  in  $\text{COMe}_2$ , is derived. The *K* salt and EtOH yield *l*-(-)- $\alpha$ -ethoxy-N-*p*-toluenesulphonylpropionamide, m.p.  $80\text{--}81^\circ$ ,  $[\alpha]_{5893}^{20} -10.0^\circ$  in EtOH, which can also be obtained from Et *l*-(-)-lactate.

*d*-(+)- $\alpha$ -Chloro-N-*p*-toluenesulphonylpropionamide, m.p.  $118^\circ$ ,  $[\alpha]_{5467}^{20} +29.7^\circ$  in EtOH, may be obtained from the *l*-(-)- $\alpha$ -*p*-toluenesulphonyl compound and  $\text{LiCl}$ , or from Et *d*-(+)- $\alpha$ -chloropropionate. *l*-(-)- $\alpha$ -*p*-Toluenesulphonyl-N-*o*-carboxyphenylpropionamide, m.p.  $131^\circ$ ,  $[\alpha]_{5893}^{20} -102.4^\circ$  in EtOH, with  $\text{LiCl}$  affords *d*-(+)- $\alpha$ -chloro-N-*o*-carboxyphenylpropionamide, m.p.  $148^\circ$ ,  $[\alpha]_{5893}^{20} +3.34^\circ$  in  $\text{CHCl}_3$  [also derived from *d*-(+)- $\alpha$ -chloropropionyl chloride], and its Na salt with  $\text{NaOEt}$  and  $\text{LiCl}$  yields the lactone of  $\alpha$ -hydroxy-N-*o*-carboxyphenylpropionamide, m.p.  $236\text{--}238^\circ$ ,  $[\alpha]_{5893}^{20} -449^\circ$  in EtOH. Na *l*-(-)- $\alpha$ -*p*-toluenesulphonyl-N-*p*-carboxyphenylpropionamide on heating forms the "lactone" of  $\alpha$ -hydroxy-N-*p*-carboxyphenylpropionamide, decomp.  $270\text{--}290^\circ$ ,  $[\alpha]_{5893}^{20} -161^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , whilst the free amide with  $\text{NH}_2\text{Ph}$  and  $\text{LiCl}$  gives *d*-(+)- $\alpha$ -chloro-N-*p*-carboxyphenylpropionamide, m.p.  $230\text{--}233^\circ$ ,  $[\alpha]_{5893}^{20} +18.0^\circ$  in EtOH. The replacement of the  $\alpha$ -*p*-toluenesulphonyl groups in the neutral compounds by either  $\text{OAc}$  or  $\text{OBz}$  occurs with inversion.

F. R. S.

Fission of disulphides by alkali. II. Hydrolytic fission of the disulphide linking. A. SCHÖBERL and H. ECK (Annalen, 1936, 522, 97--115).—

Partly a more detailed account of work previously reviewed (A., 1935, 1106). Alkaline hydrolysis of  $(\text{S}\cdot\text{CHR}\cdot\text{CO}_2\text{H})_2$  gives  $\text{SH}\cdot\text{CHR}\cdot\text{CO}_2\text{H}$  (A) and  $\text{OH}\cdot\text{S}\cdot\text{CHR}\cdot\text{CO}_2\text{H}$  (B); (B) then decompose to  $\text{H}_2\text{S}$  and  $\text{COR}\cdot\text{CO}_2\text{H}$  (C) [R may be H; when R is  $\text{CO}_2\text{H}$  or  $\text{CH}_2\cdot\text{CO}_2\text{H}$ , the intermediate  $\text{CO}(\text{CO}_2\text{H})_2$  or  $\text{CO}_2\text{H}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{CO}_2\text{H}$  loses  $\text{CO}_2$  to give  $\text{CHO}\cdot\text{CO}_2\text{H}$  or  $\text{AcCO}_2\text{H}$ , respectively]. It is probable that (B) also undergo slight disproportionation to (A) and  $\text{SO}_2\text{H}\cdot\text{CHR}\cdot\text{CO}_2\text{H}$ . The formation of (C) is demonstrated by carrying out the hydrolysis with aq.  $\text{NaOH}$  in presence of  $\text{Pb}(\text{OAc})_2$  (to remove  $\text{H}_2\text{S}$ ) and  $p\text{-NH}_2\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  (I); acidification of the filtrate affords  $p\text{-CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{N}\cdot\text{CR}\cdot\text{CO}_2\text{H}$ . Under these conditions  $\alpha\alpha'$ -disulphidobisphenylacetic acid (A., 1934, 1348) yields 25.6% of phenylglyoxylic acid *p*-carboxyphenylhydrazone, m.p.  $217\text{--}219^\circ$ ;  $[\text{S}\cdot\text{CH}(\text{CO}_2\text{H})_2]_2$  and  $(\text{S}\cdot\text{CH}_2\cdot\text{CO}_2\text{H})_2$  afford 49.3 and 50%, respectively, of glyoxylic acid *p*-carboxyphenylhydrazone, decomp.  $> 265^\circ$  [also obtained from  $\text{CHCl}_2\cdot\text{CO}_2\text{H}$  and (I) in conc. aq.  $\text{KOH}$ ], whilst  $(\text{S}\cdot\text{CHMe}\cdot\text{CO}_2\text{H})_2$  and  $\alpha\alpha'$ -disulphidodisuccinic acid (II) give 67.5 and 32%, respectively, of pyruvic acid *p*-carboxyphenylhydrazone (III), decomp.  $236^\circ$  ( $\text{Me}_2$  ester, m.p.  $166^\circ$ , prepared with  $\text{MeOH}\cdot\text{HCl}$ ). A neutral solution of the Na salt of (II) is hydrolysed when boiled; in presence of (I), 1-phenyl-5-pyrazolone-3:4'-dicarboxylic acid (IV) [ $\text{Me}_2$  ester, m.p.  $242^\circ$  (decomp.)] and some (III) are produced. (III) is also obtained from  $\text{CO}_2\text{H}\cdot\text{CO}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  and (I) in aq.  $\text{NaOH}$ ; in neutral solution (III) and (IV) result, whilst in acid (IV) is the sole product. The  $\text{Me}_2$  ester of 1-phenyl-5-pyrazolone-3:3'-dicarboxylic acid has m.p.  $198^\circ$  (decomp.).

Hydrolysis (aq.  $\text{NaOH}$ ) of  $\alpha\alpha'$ -disulphidobis- $\beta$ -phenylpropionic acid [formed by oxidation (5%  $\text{H}_2\text{O}_2$ , trace of  $\text{FeSO}_4$ ) of  $\text{CH}_2\text{Ph}\cdot\text{CH}(\text{SH})\cdot\text{CO}_2\text{H}$  (Gränacher, A., 1922, i, 849) in neutral solution] gives  $\alpha$ -thiolcinnamic acid, m.p.  $129^\circ$  (sinters at  $125^\circ$ ) (lit.  $119^\circ$ ) [oxidised (0.1*N*-I in EtOH or  $\text{AcOH}$ ) to  $\alpha\alpha'$ -disulphidobiscinnamic acid, m.p.  $179^\circ$ ], which may arise (partly) by loss of  $\text{H}_2\text{O}$  from the intermediate  $\text{CH}_2\text{Ph}\cdot\text{CH}(\text{S}\cdot\text{OH})\cdot\text{CO}_2\text{H}$ . H. B.

Formation of hydrogen cyanide and formaldehyde by oxidation of organic substances. R. FOSSE (Compt. rend., 1936, 202, 445--448).— $\text{CH}_2\text{O}$  has been detected in the ammoniacal oxidation (electrolytic or  $\text{KMnO}_4$ ) of glucose (I), sucrose,  $(\text{CH}_2\cdot\text{OH})_2$ , glycerol (II), mannitol,  $\text{COMe}_2$ ,  $\text{AcOH}$ , and glycine, which also form  $\text{CO}(\text{NH}_2)_2$ ,  $\text{HCNO}$ , and  $\text{HCN}$ . In the cases of (I) and (II),  $\text{CH}_2\text{O}$  is shown to be an intermediate in the formation of  $\text{HCNO}$  and  $\text{CO}(\text{NH}_2)_2$ . It is suggested that respiratory oxidation *in vivo* produces, in addition to energy, highly active intermediates for the synthesis of org. matter. Oxidation of  $\text{CH}_2\text{O}$  by Parrod's method (A., 1935, 1109) yields no  $\text{HCN}$ . H. G. M.

Colorimetric determination of acetaldehyde. III. S. HÄHNEL (Svensk Kem. Tidskr., 1936, 48, 61--64).—Modifications of the author's method (B., 1933, 328; this vol., 191) are described.

M. H. M. A.

Effect of the reaction products on the thermal decomposition of gaseous acetaldehyde. M.

LETORT (Compt. rend., 1936, 202, 491—494; cf. A., 1934, 1073).—The decomp. of MeCHO is retarded by the products of reaction ( $\text{CO} + \text{CH}_4$ ) (cf. A., 1926, 804; 1936, 191). An expression is developed which shows how, for the decomp. of pure MeCHO, the retardation due to the products changes the order of the reaction from 1.5 at the beginning to 1.8 during the course of the reaction. The mean observed val. for the latter is 1.87. H. G. M.

**Condensation of chloral and bromal with polyhydric alcohols.** A. N. MELDRUM and G. M. VAD (J. Indian Chem. Soc., 1936, 13, 118—122).—s-Di-( $\beta\beta\beta$ -trichloro- $\alpha$ -hydroxyethoxy)ethane (I) (de Forcrand, A., 1889, 689) (diacetate, b.p. 132—134°/15 mm., formed using  $\text{Ac}_2\text{O}$  at room temp.) with  $\text{Ac}_2\text{O}$ -conc.  $\text{H}_2\text{SO}_4$  or boiling  $\text{AcCl}$  gives the anhydro-derivative,  $\text{CH}_2\text{O} \cdot \text{CH}(\text{CCl}_3) > \text{O}$ , m.p. 144°, which is stable

to hot conc.  $\text{HNO}_3$ , boiling alkali, and conc. aq.  $\text{NH}_3$  at 110°. Distillation of (I) under atm. pressure affords glycol  $\beta\beta\beta$ -trichloroethylidene ether [2-trichloromethyl-1:3-dioxolan], b.p. 200°, m.p. 42°, reduced (Zn dust,  $\text{AcOH}$ ) to the  $\beta\beta$ -dichloroethylidene ether, b.p. 118°/25 mm. Glycerol, chloral, and  $\text{H}_2\text{SO}_4$  give  $\gamma$ -hydroxy- $\alpha\beta$ -di-( $\beta'\beta'\beta'$ -trichloro- $\alpha'$ -hydroxyethoxy)propane (II), b.p. 145—150°/15 mm., oxidised (conc.  $\text{HNO}_3$  at 0°) to the acid,  $\text{O} < \text{CH}(\text{CCl}_3) \cdot \text{O} \cdot \text{CH}_2 \cdot \text{CH}(\text{CCl}_3) \cdot \text{O} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$ , m.p. 192—193° ( $\text{Na} + 2.5\text{H}_2\text{O}$ , and  $\text{Ba} + 2\text{H}_2\text{O}$ , salts). Distillation of (II) under 70 mm. pressure affords glycerol  $\alpha\beta$ - $\beta'\beta'\beta'$ -trichloroethylidene ether [4-hydroxymethyl-2-trichloromethyl-1:3-dioxolan], b.p. 162—164°/25 mm. (cf. Yoder, A., 1923, i, 309) (acetate, b.p. 205°/120 mm.; nitrate, m.p. 64°; Me ether, b.p. 140—142°/15 mm.; corresponding chloride, b.p. 130°/15 mm.), which is reduced to glycerol  $\alpha\beta$ - $\beta'\beta'\beta'$ -dichloroethylidene ether, b.p. 160°/20 mm. (acetate, b.p. 188°/30 mm.). Erythritol  $\alpha\beta$ -di-( $\beta'\beta'\beta'$ -trichloro- $\alpha'$ -hydroxyethyl) ether, m.p. 167—171° (tetra-acetate, m.p. 164°), is formed from erythritol and chloral at 100°.  $(\text{CH}_2\text{OH})_2$  and  $\text{CBr}_3 \cdot \text{CH}(\text{OH})_2$  (III) at 130—140° give s-di-( $\beta\beta\beta$ -tribromo- $\alpha$ -hydroxyethoxy)ethane, b.p. 145—147°/25 mm. (diacetate, b.p. 196°/135 mm.), which when distilled passes into glycol  $\beta\beta\beta$ -tribromoethylidene ether, m.p. 103—104°, also formed from  $(\text{CH}_2\text{OH})_2$ , (III), and conc.  $\text{H}_2\text{SO}_4$ . Glycerol and (III) similarly yield  $\gamma$ -hydroxy- $\alpha\beta$ -di-( $\beta'\beta'\beta'$ -tribromo- $\alpha'$ -hydroxyethoxy)propane (IV), b.p. 205°/25 mm. (triacetate, b.p. 190°/155 mm.); in presence of conc.  $\text{H}_2\text{SO}_4$ , glycerol  $\alpha\beta\gamma$ -tri-( $\beta'\beta'\beta'$ -tribromo- $\alpha'$ -hydroxyethyl) ether (V) results. Distillation of (IV) and (V) under reduced pressure affords glycerol  $\alpha\beta$ - $\beta'\beta'\beta'$ -tribromoethylidene ether, b.p. 210°/60 mm., and its  $\gamma$ - $\beta'\beta'\beta'$ -tribromo- $\alpha'$ -hydroxyethyl ether, b.p. 145°/20 mm., respectively. H. B.

**isoPropylideneglyceraldehyde. III. Synthesis of d-fructose and d-sorbose from d-glyceraldehyde or d-glyceraldehyde and dihydroxyacetone.** H. O. L. FISCHER and E. BAER (Helv. Chim. Acta, 1936, 19, 519—532; cf. A., 1934, 635).—d-OH- $\text{CH}_2\text{CH}(\text{OH})\text{CHO}$  (I) (prep. from diisopropylidenemannitol improved to give a 86.2% yield) and 0.01N-Ba(OH) $_2$  give 95% of a 1:1-mixture of d-fructose (II) and d-sorbose (III), determined as phenylosazones; (II) is isolated free as Ca salt in

good yield, the mother-liquor giving (III) after removal of the residual (II) by fermentation. The reaction is shown polarimetrically to be complete in 2 hr. (I),  $\text{CO}(\text{CH}_2\text{OH})_2$  (IV), and  $\text{Ba}(\text{OH})_2$ , however, give a similar mixture in 40 min. Reaction thus proceeds by slow change of (I) to (IV), followed by a faster condensation of the enolic form of (I) with (IV). The above reaction and the fact that iso-propylideneglyceraldehyde gives a branched-chain product show that condensation occurs only with  $\text{OH} \cdot \text{CH}_2 \cdot \text{COR}$ . Absence of d-psicose and d-tagatose from the products shows preferential formation of products with opposite configurations at C3 and C4.

[With H. POLLOK.] A similar reaction occurs with  $\text{CH}_2\text{O}$  and  $\text{CH}_2\text{AcOH}$ , giving a 25% yield of  $\text{COMe} \cdot \text{CH}(\text{OH}) \cdot \text{CH}_2 \cdot \text{OH}$ , m.p. 37—38° (also obtained from  $\text{COMe} \cdot \text{CH} \cdot \text{CH}_3$  and  $\text{KMnO}_4$  or  $\text{KClO}_3$ - $\text{OsO}_4$ ), which in turn with  $\text{CH}_2\text{O}$  gives a  $\text{C}_5$ -sugar.

R. S. C.

**Electrolytic reduction of organic compounds at the dropping mercury electrode.** I. A. WINKEL and G. PROSKE (Ber., 1936, 69, [B], 693—706).—Under the experimental conditions introduction of Me into  $\text{CH}_2\text{O}$  diminishes the reducibility, the effect being enhanced when a second Me becomes attached to CO, but not when Me is replaced by Et. Introduction of further Me groups into  $\text{COMe}_2$  does not alter its behaviour; cyclo-hexanone and -pentanone resemble aliphatic ketones. Ph behaves oppositely to Me. With aromatic ketones the polarographic stages are very distinct, so that the method is peculiarly adapted to the aromatic series. When in the  $\alpha$ -position to CO the effect of Ph is lost; it therefore depends on the presence of a conjugated system. Condensed ring residues are more effective than is Ph. The reduction potential is markedly affected by halogen, notably by I, and a second halogen enhances the effect of the first. OH attached to CO inhibits its reduction. The reduction potential is displaced towards the positive in sequence of decreasing effect by  $\text{C}_2\text{H}_5\text{I}$ ,  $\text{C}_2\text{H}_5\text{Br}$ ,  $\text{C}_2\text{H}_5\text{Cl}$ ,  $1\text{-C}_{10}\text{H}_7$ , Ph, and towards the negative by OH and Me. The influence of the several groups can be qualitatively evaluated by addition or subtraction of the vals. for the individual groups, but a quant. measurement is not yet possible, since the displacement of the potential depends on its abs. val. H. W.

**Conditions of condensation of acetone molecules with each other.** P. P. SURMIN (J. Gen. Chem. Russ., 1935, 5, 1639—1641).—Condensation of  $\text{COMe}_2$  proceeds most energetically in alkaline media, alcoholic alkalis being more efficacious than aq. The greatest yields of condensation products are obtained in presence of  $\text{CaC}_2$  at the b.p.; the relative yields of products of higher b.p. rise with increasing amount of  $\text{CaC}_2$ . R. T.

**Semicarbazones of [dialkyl] ketones.** H. S. RHINESMITH (J. Amer. Chem. Soc., 1936, 58, 596—597).— $\text{CHEt}(\text{CO}_2\text{Et})_2$ ,  $\text{COMe} \cdot \text{CH} \cdot \text{CH}_3$ , and  $\text{EtOH} \cdot \text{NaOEt}$  (trace) give Et heptan- $\beta$ -one- $\varepsilon\epsilon$ -dicarboxylate, b.p. 136—138°/2 mm. (semicarbazone, m.p. 116.5—117.5°), hydrolysed (cold dil.  $\text{EtOH} \cdot \text{KOH}$ ) to the Et H ester, b.p. 71—73°/2 mm. (semicarbazone, m.p. 114—115°), and thence (conc.  $\text{EtOH} \cdot \text{KOH}$ ) to the

free acid, decarboxylated at  $130^\circ$  to *heptan- $\beta$ -one- $\epsilon$ -carboxylic acid*, b.p.  $135\text{--}137^\circ/2$  mm. [*semicarbazone*, m.p.  $127\text{--}129^\circ$ ; *Me ester*, b.p.  $75^\circ/2$  mm. (*semicarbazone*, m.p.  $108^\circ$ )].  $\text{CHEt}_2\cdot\text{CH}_2\text{Br}$ , b.p.  $144\text{--}145^\circ$  (from the alcohol and  $\text{PBr}_3$ ), with  $\text{NaCN}$  in 50%  $\text{EtOH}$  affords  $\text{CHEt}_2\cdot\text{CH}_2\cdot\text{CN}$ , b.p.  $164\text{--}166^\circ$ , which with  $\text{MgEtBr}$  yields  *$\epsilon$ -ethylheptan- $\gamma$ -one*, b.p.  $171\text{--}173^\circ/760$  mm. (*semicarbazone*, m.p.  $133\text{--}134^\circ$ ). Oxidation ( $\text{CrO}_3$ ) of the carbinol from  $\text{Bu}^\delta\text{CHO}$  and  $\text{MgEtBr}$  gives  *$\epsilon$ -methylhexan- $\gamma$ -one*, b.p.  $135\text{--}137^\circ/760$  mm. (*semicarbazone*, m.p.  $149\text{--}150^\circ$ ). The *semicarbazones* of  $\gamma$ -, b.p.  $136\text{--}139^\circ/760$  mm., and  $\delta$ -, b.p.  $137\text{--}139^\circ/760$  mm., -methylhexan- $\beta$ -one have m.p.  $69\text{--}70^\circ$  and  $127\text{--}128^\circ$ , respectively; that of  *$\epsilon$ -methylhexan- $\beta$ -one*, b.p.  $143\text{--}144^\circ/760$  mm., has m.p.  $146\text{--}147^\circ$  (lit.  $141^\circ$ ). The Grignard reagent from  $\text{CHMeEt}\cdot\text{CH}_2\text{I}$ , b.p.  $137\text{--}140^\circ$  (alcohol from *sec.*- $\text{BuMgI}$  and  $\text{CH}_2\text{O}$ ) and  $\text{PrCHO}$  give a carbinol, b.p.  $157\text{--}163^\circ$ , oxidised ( $\text{CrO}_3$ ) to  *$\zeta$ -methyloctan- $\delta$ -one* (*semicarbazone*, m.p.  $75^\circ$ ).

H. B.

**Colour reaction of hexoses and their polymericides, and its application to colorimetric determination of glucose in blood.** J. A. SANCHEZ [with R. C. D'ALESSIO] (*J. Pharm. Chim.*, 1936, [viii], 13, 377—387).—Hexoses and polysaccharides derived from them, but not pentoses, give a rose-red coloration, the intensity of which is  $\propto$  hexose concn., when their dil. (e.g., 1 : 5,000) aq. solution is treated with warm conc.  $\text{H}_2\text{SO}_4$ . The absorption spectrum contains three bands (except in the case of galactose) with max. at 5300, 4920, and 5520 Å. For the detection or determination of glucose (I), total blood or blood-serum is deproteinised with  $\text{CCl}_3\cdot\text{CO}_2\text{H}$ , and the colour produced by the above reaction is matched against that given by similarly treated blood-serum, freed from (I) by allowing glycolysis to proceed to completion at  $37^\circ$ , to which known amounts of (I) are added. The method is suitable for solutions with  $< 0.1\%$  of (I).

J. S. A.

**Cupro-alkali metal carbonate solution in the determination of reducing sugars. II. Modification of Pellet's solution.** C. Y. CHANG and H. A. SCHUETTE (*Trans. Wis. Acad. Sci.*, 1935, 29, 381—388; cf. A., 1931, 199).—Pellet's  $\text{CuSO}_4\text{--NH}_4\text{Cl}\text{--Na K tartrate--Na}_2\text{CO}_3$  solution (A., 1875, 666; 1878, 612) slowly and irreversibly deposits a ppt. and loses in reducing power (17.3% in 515 hr.). Mixture of  $\text{CuSO}_4\text{--NH}_4\text{Cl}$  and tartrate- $\text{Na}_2\text{CO}_3$  solutions in the proportions of Pellet's solution immediately prior to the test leads to erratic results. More reproducible results and stable solutions are obtained by increasing the alkalinity, max. reducing power being found with 4.5*N*- $\text{Na}_2\text{CO}_3$ ; reaction is then complete in 40 min. at  $90^\circ$ . The reagents recommended are: (A)  $\text{CuSO}_4\cdot 5\text{H}_2\text{O}$  343.5 and  $\text{NH}_4\text{Cl}$  34.35 g. per litre; (B) Na K tartrate 216.52 and  $\text{Na}_2\text{CO}_3$  283.5 g. per litre. Solutions (A) and (B) are mixed in the proportions 1 : 4 just before use; 20 ml. of the mixed reagent and  $\approx 0.1$  g. of glucose or fructose or 0.22 g. of lactose or maltose in a total vol. of 80 ml. are heated in a stoppered flask at  $90^\circ$  for 45 min. Cu equivs. of the above-mentioned sugars are given; they are higher than for Pellet's solution, thus giving increased accuracy. This technique requires no blank

determination, gives zero results for sucrose, and is accurate for mixtures of all the sugars named except for that of lactose with much sucrose. The reason for this exception is unknown.

R. S. C.

**Benedict's qualitative [sugar] test.** J. FINE (*Brit. Med. J.*, 1935, I, 1169—1170).—The test is adapted to the quant. examination of glucose.

CH. ABS. (p)

**Synthesis of 5 : 6-benzhydrylidene-1 : 2-*iso*-propylidene- $\alpha$ -*D*-glucofuranose.** Catalytic

hydrogenation of acetals of aromatic ketones and sugars. P. E. PAPADAKIS (*J. Amer. Chem. Soc.*, 1936, 58, 665—666).—1 : 2-*iso*Propylideneglucose (I) and  $\text{CPh}_2\text{Cl}_2$  in  $\text{C}_5\text{H}_5\text{N}$  at  $0^\circ$  give 5 : 6-benzhydrylidene-1 : 2-*isopropylideneglucose*, m.p.  $147\text{--}148^\circ$ ,  $[\alpha]_D^{25} + 21.7^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , which does not react with  $\text{CPh}_3\text{Cl}$  and is reduced ( $\text{H}_2$ , Pd,  $\text{MeOH--AcOH}$ ) to (I) and  $\text{CH}_2\text{Ph}_2$ .  $\text{CPh}_2(\text{OMe})_2$  (from  $\text{CPh}_2\text{Cl}_2$  and  $\text{MeOH}$  in  $\text{C}_5\text{H}_5\text{N}$ ) is similarly reduced to  $\text{CH}_2\text{Ph}_2$ .

H. B.

**Behaviour of glucose towards thiocyanic acid.**

G. ZEMPLÉN, Á. GERECs, and M. RADOS (*Ber.*, 1936, 69, [B], 748—754).—Treatment of glucose and KCNS in  $\text{H}_2\text{O}$  with 12*N*-HCl at room temp. slowly affords  $\mu$ -thiol-glucosazoline (I), m.p.  $172^\circ$ ,  $[\alpha]_D^{20} + 34.12^\circ$  in  $\text{H}_2\text{O}$ . It does not reduce Fehling's solution. It does not behave towards alkali as a lactone, but its optical behaviour when treated with increasing quantities of NaOH indicates salt formation (I) with or without enolisation. N is partly evolved as  $\text{NH}_3$  when it is boiled with alkalis.  $\text{Hg}(\text{OAc})_2$  gives cryst. additive compounds with varying Hg content. S is removed with difficulty by metallic salts, readily by oxidising agents. Reducing agents cause production of COS or  $\text{H}_2\text{S}$ , but do not give homogeneous products. With  $\text{NHPh}\cdot\text{NH}_2$  (I) affords glucosephenylosazone in good yield. It is very sensitive towards hot 10% HCl; reducing substances are formed, but the reducing power remains  $<$  that calc. for glucose. (I) with anhyd. NaOAc and  $\text{Ac}_2\text{O}$  at  $100^\circ$  gives the corresponding *tetra-acetate* (II), m.p.  $120^\circ$ ,  $[\alpha]_D^{25} + 123.9^\circ$  in  $\text{CHCl}_3$ , hydrolysed by NaOMe in  $\text{CHCl}_3$  to (I) and unchanged by boiling EtOH or  $\text{NH}_3\text{--MeOH}$  at  $0^\circ$ . Partial hydrolysis of (II) by NaOMe- $\text{CHCl}_3$  yields the *triacetate*, m.p.  $131.9^\circ$ ,  $[\alpha]_D^{20} + 107^\circ$  in  $\text{CHCl}_3$ , re-acetylated to (II). (I), NaOH, and  $\text{H}_2\text{O}_2$  give  $\mu$ -hydroxy-glucosazoline,  $[\alpha]_D^{20} + 6.79^\circ$  in  $\text{H}_2\text{O}$ , which reduces Fehling's solution to an extent depending on the duration of heating, is sensitive to boiling acids, loses part of its N as  $\text{NH}_3$  when boiled with alkalis, and affords a yellow oil when treated with  $\text{NHPh}\cdot\text{NH}_2$ . Its *triacetate*, m.p.  $139^\circ$ ,  $[\alpha]_D^{17} + 58.86^\circ$  in  $\text{CHCl}_3$ , is obtained by the action of  $\text{H}_2\text{S}$  in EtOH- $\text{AcOH}$  on the Hg derivative  $\text{C}_{26}\text{H}_{32}\text{O}_{18}\text{N}_2\text{Hg}$ , m.p.  $245^\circ$  (decomp.), prepared from (II) and HgO in BuOH, and is converted by NaOAc and  $\text{Ac}_2\text{O}$  at  $100^\circ$  into the *tetra-acetate*, m.p.  $95^\circ$ ,  $[\alpha]_D^{17} + 104.8^\circ$  in  $\text{CHCl}_3$ .

H. W.

**Nature of sucrose caramel.** G. VON ELBE (*J. Amer. Chem. Soc.*, 1936, 58, 600—601; cf. Cunningham and Dorée, *J.C.S.*, 1917, 111, 589).—

Caramel (I), prepared by heating sucrose (loss  $\pm 12\%$ ) at atm. pressure or in a vac., is a colloidal dispersion of a lyophobic, humic substance (II) in a mixture of two protective substances (III), decomp.  $> 95^\circ$ ,  $[\alpha]_D^{25} +24.5^\circ$ , and (IV), decomp.  $> 140^\circ$ ,  $[\alpha]_D^{25} +63^\circ$ . Extraction of (I) with successive quantities of MeOH followed by  $H_2O$  removes most of (III) and (IV); the residual (II) coagulates irreversibly to a dark brown, insol., and infusible mass showing a diffuse X-ray pattern. (III) and (IV) are separated by repeated pptn. of (IV) from MeOH with PrOH; they are thermally unstable, hygroscopic, amorphous powders which yield acetates. (III) and  $NHPh \cdot NH_2$  give glucosazone and an oily product; (IV) affords similar products only after hydrolysis. (III) and (IV) show marked thermal stability and resistance to dissolution in presence of (II). H. B.

**Action of pyridine on maltose.** R. SUTRA (Bull. Soc. chim., 1936, [v], 3, 145).—Maltose (I) when crystallised from  $C_5H_5N$  gives the compound,  $C_{12}H_{22}O_{11} \cdot 2C_5H_5N$ , m.p.  $106^\circ$ , stable at room temp., but decomposed by EtOH, regenerating (I).

H. G. M.

**Heterosides of the fruits of *Sophora japonica*, L.**—See this vol., 768.

**Glucosides of *Strophanthus emini*.** I. D. LAMB and S. SMITH (J.C.S., 1936, 442—447).—A more detailed account of work previously reported (B., 1935, 606). Enzymic hydrolysis of strophanthin from *S. emini* yields a new cardio-tonic monoside, *emicymarin* (I),  $C_{30}H_{46}O_9$ , sinters  $160^\circ$ , m.p.  $207^\circ$  (indefinite),  $[\alpha]_{5461}^{20} +15.8^\circ$ ,  $[\alpha]_{5461}^{20} +12.8^\circ$  in EtOH {tetrahydrate;  $Ac_3$  derivative, m.p. about  $278^\circ$ ,  $[\alpha]_{5461}^{20} +27.8^\circ$ ,  $[\alpha]_{5461}^{20} +22.8^\circ$  in MeOH;  $H_2$ -derivative, m.p.  $151^\circ$  (indefinite after sintering),  $[\alpha]_{5461}^{25} +11.2^\circ$ ,  $[\alpha]_{5461}^{19} +8.6^\circ$  in EtOH, iso-compound, m.p. about  $270^\circ$  (previous sintering),  $[\alpha]_{5461}^{25} +30.9^\circ$ ,  $[\alpha]_{5461}^{20} +26.2^\circ$  in  $C_5H_5N$ , identical with trianhydroperiplogenin (Jacobs *et al.*, A., 1933, 1038)}, *anhydroemicymarigenin*,  $C_{28}H_{32}O_4$ , m.p.  $269$ — $277^\circ$ ,  $[\alpha]_{5461}^{24} +67^\circ$ ,  $[\alpha]_{5461}^{24} +59^\circ$  in  $C_5H_5N$ , and digitalose, m.p.  $106^\circ$  (after sintering; m.p. rises on keeping), converted by Br into digitalonolactone, m.p.  $137$ — $138^\circ$ . (I) is an unsaturated  $\Delta^8$ -lactone; by enzymic hydrolysis it gives a monoside, *allo-emicymarin*, m.p.  $248^\circ$  (sinters  $240^\circ$ ),  $[\alpha]_{5461}^{20} +29.7^\circ$ ,  $[\alpha]_{5461}^{23} +24.6^\circ$  in 95% EtOH, identical with the monoside obtained by Jacobs *et al.* (A., 1933, 278) direct from the seeds.

**Constituents of *Epimedium macranthum*, Morr and Decne.** I. **Chemical constitution of a new flavone glucoside of *E. macranthum*.** 1. S. AKAI (J. Pharm. Soc. Japan, 1935, 55, 537—599).—Extraction of the dry leaves and roots with MeOH affords *icariin* (I),  $C_{33}H_{39}O_{15} \cdot OMe$ , m.p.  $231$ — $235^\circ$ ,  $[\alpha]_D^{15} -87.09^\circ$  in  $C_5H_5N$  ( $Ac_3$  derivative, m.p.  $120^\circ$ ), which is hydrolysed (dil.  $H_2SO_4$ ) to *icariside* I (II),  $C_{26}H_{29}O_{11} \cdot OMe$ , m.p.  $256^\circ$ ,  $[\alpha]_D^{15} -28.39^\circ$  in  $C_5H_5N$  ( $Ac_7$  derivative, m.p.  $143^\circ$ ;  $Bz_7$  derivative, m.p.  $151.5^\circ$ ), and rhamnose. Under other conditions (I) is hydrolysed to (II) and *anhydroicaritin* (III),  $C_{21}H_{17}O_3(OH)_3$ , m.p.  $242$ — $243^\circ$  ( $Ac_3$  derivative, m.p.  $185^\circ$ ;  $Bz_3$  derivative, m.p.  $190.5^\circ$ ; *dimethylate*, m.p.  $176^\circ$ ; *trimethylate*, m.p.  $146$ — $147^\circ$ ; *dihydro-trimethyl ether*, m.p.  $134^\circ$ ; *dibromotrimethyl ether*,

m.p.  $189^\circ$ ;  $Me_3$  ether hydrochloride, m.p.  $162^\circ$ ). Hydrolysis of (II) with 50%  $H_2SO_4$  yields  $\beta$ -*anhydroicaritin* (IV),  $C_{20}H_{17}O_5 \cdot OMe$ , m.p.  $222$ — $223^\circ$  ( $Ac_3$  derivative, m.p.  $228^\circ$ ;  $Bz_2$  derivative, m.p.  $299^\circ$ ;  $Me_1$  ether, m.p.  $191^\circ$ ;  $Me_2$  ether, m.p.  $221$ — $222^\circ$ ), and glucose (V). Demethylation of (IV) gives 4'-*demethyl- $\beta$ -anhydroicaritin*,  $C_{20}H_{18}O_6$ , m.p.  $308$ — $309^\circ$  ( $Ac_3$  derivative, m.p.  $208^\circ$ ). (II) and (IV), with alkali at  $250$ — $260^\circ$ , yield phloroglucinol (VI) and *p-OH-C\_6H\_4 \cdot CO\_2H*. With 35% KOH in the presence of  $H_2$ , (II) yields (III) and *icaritin* (VII),  $C_{21}H_{22}O_7$ , m.p.  $239$ — $239.5^\circ$  ( $Ac_3$  derivative, m.p.  $212^\circ$ ;  $Ac_4$  derivative, m.p.  $146.5^\circ$ ;  $Bz_4$  derivative, m.p.  $184^\circ$ ;  $Me_2$  ether, m.p.  $168.5^\circ$ ;  $Me_3$  ether, m.p.  $174^\circ$ , and its *phenylurethane*, m.p.  $213$ — $214^\circ$ , which with dil.  $H_2SO_4$  affords (IV). The  $Me_2$  ether of (III) with 10% EtOH-KOH yields anisic acid (VIII) and *icaritol* II,  $C_{13}H_{13}O_3(OMe)_2$ , m.p.  $106^\circ$  (*oxime*, m.p.  $162$ — $163^\circ$ ; *Me ether*, m.p.  $99^\circ$ ), which, with KOH at  $250$ — $260^\circ$ , yields (VI) and  $Bu^iCO_2H$ . The  $Me_3$  ether of (III) similarly affords (VIII) and *icaritol* I (IX),  $C_{13}H_{13}O_2(OMe)_3$ , m.p.  $128^\circ$  (*oxime*, m.p.  $115^\circ$ ; *oxime* of *Me* derivative, m.p.  $139^\circ$ ;  $Br_2$ -derivative, m.p.  $154^\circ$ ; *hydrochloride*, m.p.  $106^\circ$ ), hydrogenated to *dihydroicaritol* I, m.p.  $118$ — $118.5^\circ$ . Oxidation ( $CrO_3$ ) of the *Me* ether of (VII) gives  $COMe_2$  (?) and an aldehyde. With  $H_2SO_4$ , (IX) is cyclised to  $\beta$ -*icaritol* I,  $C_{13}H_{13}O_2 \cdot OMe$ , m.p.  $82^\circ$  (*oxime*, m.p.  $165^\circ$ ). On hydrolysis with emulsin, (I) yields *icariside* II (X),  $C_{27}H_{30}O_{10}$ , m.p.  $204$ — $205^\circ$ ,  $[\alpha]_D^{15} -128.03^\circ$  in EtOH ( $Ac_5$  derivative, m.p.  $88^\circ$ ;  $Bz_5$  derivative, m.p.  $225^\circ$ ), and  $\beta$ -glucose. (X), with dil.  $H_2SO_4$ , yields (III) and rhamnose, and, with 35% KOH, (III) and (VIII). (II) is hydrolysed by emulsin to (III) and (V). The *Me* derivative of (X) is hydrolysed (dil.  $H_2SO_4$ ) to *anhydroicaritin* 7-*Me ether*, m.p.  $204^\circ$ , further methylated to *anhydroicaritin* 3 : 7-*Me\_2 ether*, m.p.  $174^\circ$ . CH. ABS. (r)

**Highly polymerised compounds. CXXXVI. Structure of starch. CXXXVII. Macromolecular structure of lichenin.** H. STAUDINGER and H. EILERS (Ber., 1936, 69, [B], 819—848, 848—851).—CXXXVI. Enzymic degradation of potato starch gives products of mol. wt. 10,000—20,000, which are very difficult to purify and free from ash. Controlled degradation with 2N-HCl or  $HCO_2H$  gives more amenable materials of mol. wt. 10,000—100,000, which can be fractionated by pptn. from  $H_2O$  by MeOH. The viscosity of these products has been measured in  $H_2O$ ,  $HCO \cdot NH_2$ , N-NaOH, and  $HCO_2H$  under varied conditions of temp. and concn. It is thus shown that the particles consist of macromols., and not micelles; the conclusion is strengthened by the conversion of degraded starches into their acetates, from which they are regenerated unchanged by cautious hydrolysis in absence of air. Nitrating acid causes degradation of the starch mol. which precedes esterification, since the nitrates are relatively stable in the mixture of acids. The form of the extended starch mol. differs greatly from that of the cellulose mol.  $K_m$  of starch is 8—10 times  $<$  that of cellulose, so that a starch mol. equal in length to a cellulose mol. has about 8—10 times its wt. and contains 8—10 times as many glucose residues. A zigzag or meander

form of the starch mol. is suggested which harmonises with its greater solubility. According to physical properties, starches of mol. wt. 10,000–100,000 are hemicolloidal in character, whereas according to particle wt. they belong to the mesocolloids. For this reason they have been frequently regarded as relatively simple, whereas they are of high mol. wt.

CXXXVII. The vals.  $\eta_{sp}/C_{gm}$  are const. for solutions of lichenin (I) in Schweitzer's reagent and *N*-NaOH provided the viscosity is low and  $n_{sp}$  is the same for solutions of equal concn. in either solvent within the experimental limits. A macromol. structure of the colloidal particles of (I) is thus indicated; probably this is branched or bent. Treatment of (I) with nitrating acid caused degradation which precedes esterification.

H. W.

**$\alpha$ -Amino- $\beta$ - $\gamma$ -dihydroxy-*n*-butyric acid. III.** H. O. L. FISCHER and L. FELDMANN (Helv. Chim. Acta, 1936, 19, 532–537; cf. A., 1932, 930).—*d*-iso-Propyrideneglyceraldehyde (prep. without isolation from diisopropylidenemannitol) in MeOH with  $NH_3$ , followed by HCl, gives a 30% yield of  $\alpha$ -amino- $\beta$ - $\gamma$ -dihydroxy-*n*-butyric acid, decomp. 215° (discoloration from about 190°),  $[\alpha]_D^{20} -13.73^\circ$  in  $H_2O$  [Cu salt; phenylcarbamide, +  $H_2O$ , m.p. 165° (decomp.),  $[\alpha]_D^{17} +29.8^\circ$  as Na salt in  $H_2O$ , and 2- $C_{10}H_7 \cdot SO_2$  derivative, m.p. 180–181° (decomp. from 178–179°),  $[\alpha]_D^{25-27} +12.5-13.45^\circ$  as Na salt in  $H_2O$ ], in which the configuration of the  $>CH \cdot OH$  is fixed. The Strecker synthesis proceeds better with the isopropylidene than with the OH-compound.

R. S. C.

**Synthesis of a  $\alpha\alpha'$ -diamino- $\beta\beta'$ -dihydroxyadipic acid.** H. O. L. FISCHER and L. FELDMANN (Helv. Chim. Acta, 1936, 19, 538–543).—*iso*Propylidene-*d*-tartaraldehyde gives, by the Strecker synthesis,  $\alpha\alpha'$ -diamino- $\beta\beta'$ -dihydroxyadipic acid, m.p. 255–256° (decomp. from about 235°),  $[\alpha]_D^{22-25} -24.1^\circ$  to  $-25.09^\circ$  in HCl [Cu salt, +  $H_2O$ ; diphenylcarbamide derivative, m.p. 181–183° (decomp. from about 170°),  $[\alpha]_D^{17} +26.9 \pm 2^\circ$  in dry EtOH], in which the configuration of both  $>CH \cdot OH$  is known. The acid gives a deep blue colour with ninhydrin, but other reactions are negative; it is not deaminated by rat's liver or kidney.

R. S. C.

**Form of polypeptide chains. I. *dl*-Alanine-hexapeptide.** G. BOEHM (Biochem. Z., 1936, 284, 322–328).—Aq. sols of hexa-(*dl*-alanyl)-*dl*-alanine (Abderhalden, A., 1932, 503) exhibit strongly positive streaming double refraction, both in "streaky" solutions containing needle-shaped particles and in solutions containing only amierons; this shows the presence of long anisotropic micelles, and indicates a long chain formation, and not a spherical structure for the free peptide in solution.

F. O. H.

**Isolation of *dl*-arginine from kidney autolysate.**—See this vol., 749.

**Constitution of reduction product of chloral-acetamide.** A. N. MELDRUM and G. M. VAD (J. Indian Chem. Soc., 1936, 13, 117–118).—In agreement with Yelburgi and Wheeler (A., 1934, 770),  $CCl_3 \cdot CH(OH) \cdot NHAc$  (I) is reduced to  $CCl_2 \cdot CH \cdot NHAc$ , since the latter with  $Cl_2$  in  $CHCl_3$  at  $<60^\circ$  gives *acet- $\alpha\beta\beta\beta$ -tetrachloroethylamide*, m.p. 128° [also obtained

from (I) and  $PCl_5$ ], which with  $NH_2Ph$  in  $C_6H_6$  affords *acet- $\beta\beta\beta$ -trichloro- $\alpha$ -anilinoethylamide*, m.p. 146°.

H. B.

**Carbon suboxide and its reactions with amines.** E. A. PAUW (Rec. trav. chim., 1936, 55, 216–226).— $C_3O_2$  [determined by adding a measured vol. of its solution in  $Et_2O$  to excess of  $CO_2$ -free  $H_2O$ , and titrating  $CH_2(CO_2H)_2$  by  $CO_3^{2-}$ -free alkali (phenolphthalein)] reacts in  $Et_2O$  with amines  $NHRR'$  to form malondiamides  $CH_2(CO \cdot NRR')_2$ , diamines yielding heterocyclic compounds.  $NH_3$  and aliphatic primary amines have been used to give the diamides  $CH_2(CO \cdot NHR)_2$ , where  $R = H, Me, Et, Pr^a, Bu^a, Bu^b, [CH_2]_4 \cdot Me, [CH_2]_2 \cdot Pr^b$ , and  $[CH_2]_6 \cdot Me$ , and to give *malon-diallylamide*, m.p. 149°, and *-dibenzylamide*, m.p. 141° [both also obtained from  $CH_2(CO_2Et)_2$ ].  $NHMe_2, NHEt_2, NHPr^a_2, NHBu^a_2$ , piperidine, and piperazine, do not give isolable products with  $C_3O_2$ .  $NHBu^b_2$  and  $NH([CH_2]_2 \cdot Pr^b)_2$  give, however, *malon-bis(diisobutylamide)*, m.p. 276°, and *-bis(diisoamylamide)*, m.p. 289°. The appropriate diamines yield *malonpentamethylenediamide*,  $CH_2[CO \cdot NH \cdot CH_2 \cdot CH_2]_2CH_2$ , m.p. 221–222°, and its *NN'*-*dibenzyl*, m.p. 123–124°, and *N-benzhydryl*, m.p. 112–114°, analogues. Aromatic amines yield malondiamides,  $CH_2(CO \cdot NH \cdot C_6H_4 \cdot X)_2$ , where  $X = H, p\text{-}Cl, p\text{-}Br, p\text{-}I, o\text{-}, m\text{-},$  and  $p\text{-}Me, p\text{-}OMe, p\text{-}OEt$ , and  $m\text{-}NO_2$ , and *malon-di-o-*, m.p. 176°, and *-di-m-chloro-*, m.p. 164°, *-di-o-*, m.p. 175°, and *-di-m-bromo-*, m.p. 175°, and *-di-m-iodo-anilide*, m.p. 182°, *-di-o-*, m.p. 164°, and *-di-m-anisidide*, m.p. 151°, and *-di-o-*, m.p. 165°, and *-di-m-phenetidide*, m.p. 157°; all these are also prepared from  $CH_2(CO_2Et)_2$ . *Malon-di-o-iodo-anilide*, m.p. 177°, and *-di-N-methylanilide* are further prepared from  $C_3O_2$ , which does not, however, yield *malondi-p-nitroanilide* [prepared from  $CH_2(CO_2Et)_2$ ].  $o\text{-}NO_2 \cdot C_6H_4 \cdot NH_2$  does not combine with  $C_3O_2$  or with  $CH_2(CO_2Et)_2$ , nor does  $NHPhEt$  combine with  $C_3O_2$ . *Malondi-p-phenetidide* is nitrated to *malondi-2-nitro-p-phenetidide*, m.p. 165–166°, hydrolysed to 2-nitro-*p*-phenetidino. *l*-Bornylamine yields *l-malondibornylamide*, m.p. 187° (from  $C_3O_2$ ), or 192° [from  $CH_2(CO_2Et)_2$ ],  $[\alpha]_D^{20} -46^\circ$ . *l*-Menthylamine does not react with  $CH_2(CO_2Et)_2$ , but with  $C_3O_2$  gives *l-malondimenthylamide*, m.p. 177°,  $[\alpha]_D^{20} -87.3^\circ$ .  $\alpha$ - and  $\beta$ - $C_{10}H_7 \cdot NH_2$  with  $C_3O_2$  give the corresponding diamides. 2-Aminopyridine combines with 1 mol. only of  $C_3O_2$  (to give a ketenium base?). 5- and 8-Aminoquinoline react with  $C_3O_2$  to form *malon-di-5-*, m.p. 265–271°, and *-di-8-quinolylamide*, m.p. 200–204°. The following are obtained from the appropriate amino-esters and  $C_3O_2$ : *Et\_2 malondiamidoacetate*, m.p. 107°, *Et\_2 malondi- $\alpha$ -amidoisobutyrate*, and the *Et\_2* esters of *dl*-malondialanide, and *malondisarcoside*.  $NH_2 \cdot CH_2 \cdot CO_2H$  and  $NH_2 \cdot CO_2Et$  do not react with  $C_3O_2$ . The relative ease of formation, qual. solubility, and taste of the above diamides are recorded.

E. W. W.

**Reaction between organic sulphur compounds and hydrogen peroxide. III. Reaction mechanism.** 1. R. KITAMURA (J. Pharm. Soc. Japan, 1935, 55, 300–349).—In alkaline solution  $H_2O_2$  oxidises  $R \cdot CS \cdot NHR'$  to  $R \cdot CO \cdot NHR'$ ; the reaction mechanism and factors influencing the course

of the reaction are discussed. In neutral or acid solution sulphinic acids, disulphides, etc. are formed.

CH. ABS. (r)

**Structure and formulæ of Prussian-blues and related compounds.**—See this vol., 670.

**Boron hydrides. V. Ethyl- and *n*-propyl-diboranes. VI. Action of ammonia on methyl-diboranes.** H. I. SCHLESINGER, L. HORVITZ, and A. B. BURG (J. Amer. Chem. Soc., 1936, 58, 407—409, 409—414; cf. A., 1935, 738).—V. The prep. of *mono*-, *di*-, b.p. 67.1°, *tri*-, and *tetra-ethyl*-, m.p. —56.3°, *mono*- and *di-propyl-diborane* is described. The compounds are analogous to the corresponding Me derivatives of  $B_2H_6$ .

VI. The prep. of  $B_3MeN_3H_5$ , m.p. —59°, b.p. 87°;  $B_3Me_2N_3H_4$ , m.p. —48°, b.p. 107°; and  $B_3Me_3N_3H_3$ , m.p. 31.5°, b.p. 129°, is described. V.p. and heats of vaporisation have been determined and Trouton's const. has been evaluated.  $BM_2 \cdot NH_2$  appears to exist in several forms between —60° and room temp.

E. S. H.

**Alkaline-earth cacodylates. I.** R. TIOLLAIS (Bull. Soc. chim., 1936, [v], 3, 70—87).—Pure Ca (+9, and 1  $H_2O$ , and anhyd.), Ba (+9, 3, and 1  $H_2O$ ), and Sr (+13, 3, and 1  $H_2O$ ) cacodylates are prepared from cacodylic acid and the appropriate hydroxide. The solubility curves show breaks corresponding with changes in the no. of mols. of  $H_2O$  of crystallisation. The solubilities of the anhyd. and the fully hydrated salts in MeOH and 95% and 100% EtOH have been determined. Aq. solutions of the salts are decomposed by atm.  $CO_2$ , and with  $H_2S$  give compounds, probably thiocacodylates.

H. G. M.

**Synthesis of dihalogeno-thallium organic compounds.** N. N. MELNIKOV and G. P. GRATSCHEVA (J. Gen. Chem. Russ., 1935, 5, 1786—1790).—Compounds of the type  $TlRX_2$  are readily prepared by the general reactions:  $TlR_2X (I) + TlX_3 (II) \rightarrow 2TlRX_2 (III)$ ;  $2TlR_3 + (II) \rightarrow 3(III)$ . Different by-products, in amounts increasing with the at. wt. of X, are formed by the reactions:  $(I) + (II) \rightarrow Tl_2X_4 + 2RX$ ;  $(III) \rightarrow RX + TlX$ ;  $2(III) \rightarrow (I) + (II)$ ;  $TlR_3 + (II) \rightarrow (I) + RX + TlX$ ;  $2TlR_3 + (II) \rightarrow 2(I) + TlX + R_2$ . The following compounds are described:  $TlMeBr_2$ , decomp. at 140—160°,  $TlEtCl_2$ , decomp. at 180°,  $TlEtBr_2$ , decomp. at 140—160° (1:1 compound with  $C_5H_5N$ ), *iso*- $C_5H_{11} \cdot TlCl_2$ , decomp. at 210°, *iso*- $C_5H_{11} \cdot TlBr_2$ , decomp. at 95—110°, *p*- $C_6H_4Cl \cdot TlCl_2$ ,  $TlPhCl_2$ , decomp. at 240°. R. T.

**Magnetochemical investigations of organic substances. VII. Pentaphenylcyclopentadienyl.** E. MÜLLER and I. MÜLLER-RODLOFF (Ber., 1936, 69, [B], 665—668; cf. A., 1935, 1453).—At room temp. the observed data for the solid material are in harmony with a completely monomeric radical and the  $\Sigma$  condition. Curie's law is not quite exactly obeyed, but the small divergencies do not indicate an appreciable course moment. At lower temp. the divergencies are less than those observed with tridiphenylmethyl, and are possibly due to changes in the cryst. condition or incipient association. All C and N radicals examined appear to exist almost exclusively in the  $\Sigma$  condition.

H. W.

**Catalytic dehydrogenation of cyclohexane.** V. I. KARSHEV, M. G. SEVERJANOVA, and A. N. SIVOVA (J. Appl. Chem. Russ., 1936, 9, 269—278).—The activity of a no. of catalysts in promoting dehydrogenation of cyclohexane at 500—550°, with production of aromatic compounds, rises in the series  $Al_2O_3 < Cr-Cu-H_3PO_4-Al_2O_3 < CrO_3-H_3PO_4 < Cr-Cu$ . R. T.

**Thermal decomposition of dimethylcyclohexanes.** J. A. ARBUSOV and B. M. MICHAILOV (Compt. rend. Acad. Sci., U.R.S.S., 1935, 4, 337—340; cf. A., 1935, 73).—The yields of butadiene (mol. % calc. on the hydrocarbon decomposed) obtained by heating 1:2- (I), 1:3- (II), and 1:4-dimethylcyclohexane (III) with  $H_2O$  at 700—750° are, respectively, 20.7, 18.4, and 23.9. The other gaseous products [vol. % in parentheses for (I), (II), and (III), respectively] obtained (at 700°) are  $H_2$  (18.4, 16.8, 17.0), saturated hydrocarbons (31.1, 32.0, 29.7), unsaturated hydrocarbons (50.0, 50.8, 52.6), acetylenic hydrocarbons (1.5, 1.3, 0.9),  $C_3H_6 + C_4H_8$  (14.4, 22.3, 24.1), and  $C_2H_4$  (26.8, 19.1, 16.8). J. W. B.

**Fluorocyclohexane.** F. SWARTS (Bull. Acad. roy. Belg., 1936, [v], 22, 105—121).—When cyclohexyl bromide (I) is distilled (Pt vessels) at 130° (5—6 days) with  $Hg_2F_2$ , and finally at 140°/100 mm., a 30% yield of cyclohexyl fluoride (II), b.p. 43.2°/100 mm., f.p. 13°, is obtained with unchanged (I), 31% of cyclohexene (III) (removed by Br-addition at 0°), HF, HBr, and, by extraction of the residue with boiling  $C_6H_6$ , a polymeride ( $C_6H_{10}$ )<sub>n</sub> of (III). When heated, especially in glass, (II) readily loses HF to give (III); conc.  $H_2SO_4$ ,  $Mg(ClO_4)_2$ ,  $P_2O_5$ ,  $CaCl_2$ , and HF, but not Pt-black, catalyse this elimination. (II) is stable towards dil. NaOH and fused  $K_2CO_3$ , and is attacked only slowly by Na to give (III), cyclohexane, and a trace of a liquid, b.p. 232—235°, probably a mixture of cyclohexylcyclohexene and dicyclohexyl. No appreciable formation of a Grignard compound occurs with (II)-Mg-Et<sub>2</sub>O. With  $MgPhBr$  and  $MgEtBr$  the main reaction is removal of HF to form (III). With Br-AcOH (II) gives mainly 1:2-dibromocyclohexane [from the initial product, (III)] and only a trace of bromofluorocyclohexane, b.p. 80°/30 mm.; reaction is rapid in light and is catalysed by the liberated HBr. With fuming  $HNO_3$  at —10° (II) gives adipic and a trace of picric acid.

J. W. B.

**Catalytic reduction of organic fluorine compounds. III. Reduction of cyclohexyl fluoride.** F. SWARTS (Bull. Acad. roy. Belg., 1936, [v], 22, 122—124).—Contrary to the rapid hydrogenation of PhF with  $H_2$ -Pt-black, with elimination of HF, absorption of  $H_2$  by cyclohexyl fluoride is negligible under the same conditions. An electronic explanation, based on the symmetrical group  $\cdot CH_2F$  in the latter and the unsymmetrical group  $>CHF$  in the former, is outlined.

J. W. B.

**Autoxidation of cyclic ethylenic hydrocarbons. I.** R. DUPONT (Bull. Soc. chim. Belg., 1936, 45, 57—64).—Autoxidation of 1-methyl- $\Delta^1$ -cyclohexene yields 1-methyl- $\Delta^1$ -cyclohexen-6-one, methylcyclohexenol, and 1-methyl-*trans*-1:2-cyclohexanediol, whilst 1-methyl- $\Delta^3$ -cyclohexene gives an unidentified

peroxide, b.p. 67—70°, and 1-methyl-*trans*-3:4-cyclohexanediol. The gaseous products contain approx. 50% of H<sub>2</sub> in each case. R. S.

**Processes of dehydration. IV. Dehydrogenation of cycloheptane, cyclooctane, and methylated cycloheptanes to aromatic hydrocarbons.** L. RUZICKA and C. F. SEIDEL (Helv. Chim. Acta, 1936, 19, 424—433).—*cyclo*-Heptane (I) and -octane (II) derivatives with Se give C<sub>8</sub>H<sub>6</sub> derivatives under the conditions normally used for obtaining C<sub>10</sub>H<sub>8</sub> derivatives from their H<sub>10</sub>-derivatives. (I) is unchanged at 350—360°, but at 440° gives PhMe. Methylcycloheptane, unchanged at 410°, gives at 440° PhEt, *o*- and *p*-xylene. (II) at 390—410° gives *p*-xylene. 1:2:2-Trimethylcycloheptane (from the semicarbazone of the 3-ketone and Na-EtOH at 200—210°), b.p. 104—105°/100 mm., with Se at 420° (only slowly at 400°) gives *m*-C<sub>6</sub>H<sub>4</sub>MePr and 1:2:3-C<sub>6</sub>H<sub>3</sub>Me<sub>3</sub> (III); with Pd at 420° it affords (III) and other products. 1:1:4-Trimethyl-Δ<sup>1</sup>-cycloheptene (*eucarvene*) (IV) (from tetrahydrocarveol and KHSO<sub>4</sub> at 210°), b.p. 161—165°/720 mm., is almost unaffected by Se at 340°, but at 370° gives a hydrocarbon, oxidised to *m*-C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub>, but 1:1:4-trimethylcycloheptane (*eucarvene*) (from tetrahydroeucarvone-semicarbazone and Na-EtOH at 200—210°), b.p. 162—163°/720 mm., with Se at 390—400° gives *m*-C<sub>6</sub>H<sub>4</sub>MeEt and (III). *cyclo*Pentadecane and Se at 390—410° give a mixture, which does not contain aromatic hydrocarbons. 1:1:3-Trimethyl-2-butylcyclohexane (from tetrahydroionone semicarbazone), b.p. 94—95°/10 mm., is unaffected by Se at 350°, but at 390—400° affords *m*-xylene and 1:3:2-C<sub>6</sub>H<sub>3</sub>Me<sub>3</sub>Bu. *trans*-Decalin and Se at 370—390° (not at 340—360°) or, better, Pd-C at 320—340° give C<sub>10</sub>H<sub>8</sub>. The structures of the products are proved by oxidation to acids and by-products may have been undetected. It is uncertain whether fission precedes dehydrogenation or vice versa and whether (IV) yields *m*-C<sub>6</sub>H<sub>4</sub>MeEt or *m*-xylene [by way of (III)].

R. S. C.

**Fused carbon rings. VII. Preparation of cyclic hydrocarbons from unsaturated tertiary alcohols. Synthesis of *cis*-9-methyl-octalin and -decalin, and a proof of the presence of the angular methyl group.** D. C. HIBBIT and R. P. LINSTEAD (J.C.S., 1936, 470—476).—CHR:CH[CH<sub>2</sub>]<sub>n</sub>·CO<sub>2</sub>Et (cf. A., 1931, 935; 1935, 195) with MgMeI gives CHR:CH[CH<sub>2</sub>]<sub>n</sub>·CMe<sub>2</sub>·OH (I) which with H<sub>3</sub>PO<sub>4</sub> yields CHR:CH[CH<sub>2</sub>]<sub>n-1</sub>·CH:CMe<sub>2</sub> when *n*=1, R=Et and when *n*=2, R=H or Me, but when *n*=3, R=H, yields 1:1-dimethyl-Δ<sup>3</sup>-cyclohexene. The following new *pentenylcarbinols* (I) were prepared: *dimethyl*-Δ<sup>4</sup>, b.p. 65—66°/15 mm. (*phenylurethane*, m.p. 67—68°), *dimethyl*-Δ<sup>3</sup>, b.p. 70°/17 mm. (*phenylurethane*, m.p. 89°), *dimethyl*-Δ<sup>2</sup>, b.p. 63—64°/20 mm., m.p. -27° to -28° (corr.). A method for the synthesis of 9-methyloctalin is deduced. The Na compound from Et cyclohexanone-2-carboxylate in PhMe with CH<sub>2</sub>:CH·CH<sub>2</sub>·CH<sub>2</sub>Br yields Et 2-Δ<sup>7</sup>-butenylcyclohexanone-2-carboxylate, b.p. 156—158°/25 mm., hydrolysed [Ba(OH)<sub>2</sub>] to 2-Δ<sup>7</sup>-butenylcyclohexanone (II), b.p. 112—114°/28 mm. (*semicarbazone*, m.p. 127°) and the acid (not

purified) corresponding with Et 1-Δ<sup>7</sup>-butenylpimelate, b.p. 161—162°/11 mm., converted (Dieckmann) into Et 2-Δ<sup>7</sup>-butenylcyclohexanone-6-carboxylate, b.p. 146—148°/11 mm., hydrolysed [Ba(OH)<sub>2</sub>] to 1-Δ<sup>7</sup>-butenylpimelic acid, m.p. 39°, and (II), converted (Grignard) into 1-methyl-2-Δ<sup>7</sup>-butenylcyclohexanol, b.p. 102—104°/13 mm., dehydrated (H<sub>3</sub>PO<sub>4</sub>) to *cis*-9-methyl-Δ<sup>2</sup>-octalin (III), b.p. 82°/14 mm., reduced (H<sub>2</sub>-Pt) to *cis*-9-methyldecalin, b.p. 82°/11 mm., converted by AlCl<sub>3</sub> into *trans*-9-methyldecalin. The structure of (III) is proved by oxidation (KMnO<sub>4</sub>) to *trans*-, m.p. 194—196°, and *cis*-1-methylcyclohexane-1:2-diacetic acid, m.p. 160—163°, both of which are converted [Ba(OH)<sub>2</sub>] with loss of CO<sub>2</sub> into 9-methyl-2-hydrindanone, b.p. 109°/20 mm., 219°/760 mm., m.p. indefinite (glass) (*trans*- and *cis*-semicarbazones, m.p. 238° and 220°), oxidised (HNO<sub>3</sub>) to *trans*-, m.p. 162—164°, and *cis*-1-methylcyclohexane-1:2-dicarboxylic acid, m.p. 175°. *n*<sub>D</sub>, *d*, and [R]<sub>D</sub> are recorded for many of these compounds. F. R. G.

**Metallic titanium in organic synthesis.** V. N. SHARMA and S. DUTT (J. Indian Chem. Soc., 1935, 12, 774—780).—Ti may be successfully used as the metallic reactant in Zincke's and Friedel and Crafts' reactions, but is unsatisfactory for Ullmann's reaction, reaction occurring only when the halogen is loosely bound in the org. mol. It is unsatisfactory as a neutral reducing agent. Several examples of each reaction are given. H. G. M.

**Influence of solvent on the course of chemical reactions. V. State of the benzene molecule in solution.** K. LAUER and R. ODA (Ber., 1936, 69, [B], 851—861; cf. this vol., 300).—Examination of the absorption spectrum of C<sub>6</sub>H<sub>6</sub> in AcOH, cyclohexane (I), cyclohexene (II), and C<sub>2</sub>Me<sub>4</sub> combined with Henri's earlier measurements shows that all bands of it are displaced towards longer λ in all the media used, that the permanent dipole of the solvent does not appear to be related to the displacement, and that the most marked total displacement occurs in CCl<sub>4</sub>. The solvent appears to exercise three actions which result in band displacements of the solute; (a) impediment of the association of the dissolved mols. by formation of its proper, voluminous associates, (b) hindrance of association by its own mol. form, and (c) association of the solvent mols. with the solute mols. Saturated dipolar mols. such as H<sub>2</sub>O, EtOH, and Et<sub>2</sub>O belong to the first group, saturated non-polar mols. such as hexane and (I) to the second group. All three actions are present simultaneously in AcOH. C<sub>2</sub>Me<sub>4</sub>, (II), and liquid C<sub>6</sub>H<sub>6</sub> belong to group (b), whilst CCl<sub>4</sub> is the sole exclusive representative of group c. Determination of the rates of reaction of Br on C<sub>6</sub>H<sub>6</sub>, PhMe, and tetrahydronaphthalene in hexane shows that bromination occurs at associated and non-associated C<sub>6</sub>H<sub>6</sub> mols. The apparent constancy of the heat of activation in very dil. solution is caused by the small heat of association. The rapid reaction after further dilution is due to increase in the no. of non-associated mols. recognised by the increasing action const. The reason of the increase of the action const. in conc. solution is increase in the mol. size by association and the consequent increase of the

sensitive region. The results of measurements in  $\text{H}_2\text{O}$ ,  $\text{AcOH}$ , and  $\text{CCl}_4$  are discussed. It is concluded that the displacements observed in the spectrum of non-polar mols. in various solvents is caused by the formation of organised mol. aggregates in which the individual mols. have an altered affinity field and changed region of susceptibility. All reactions hitherto investigated occur with associated and non-associated mols. Heats of dissolution, solvation, and association of the partners in the reaction are expressed in the criteria of the changes, so that addition occurs previously to substitution. H. W.

**Preparation of deuterobenzene.** A. KLIT and A. LANGSETH (Z. physikal. Chem., 1936, 176, 65—80).— $\text{C}_6\text{D}_6$  containing up to 98% D has been prepared by exchange reaction between  $\text{DCl}$  and  $\text{C}_6\text{H}_6$  catalysed by anhyd.  $\text{AlCl}_3$ . For pure  $\text{C}_6\text{D}_6$  the vals.  $d_4^{20}$  0.9483 and m.p.  $6.64^\circ$  have been calc. The equilibrium const. of the simplified exchange reaction  $\text{CH} + \text{DCl} \rightleftharpoons \text{CD} + \text{HCl}$  is  $\sim 1.6$ . In a mixture of various deuterobenzenes not containing a catalyst there is no exchange of H atoms between the mols. When exchange occurs, the D atoms are distributed between the benzene nuclei in such a way that the product is a mixture of the possible isomeric deuterobenzenes in such proportions as correspond with the laws of probability. R. C.

**Reactions of hexadeuterobenzene.** H. ERLMEYER, H. LOBECK, and A. EPPRECHT (Helv. Chim. Acta, 1936, 19, 546—547).—When  $\text{C}_6\text{D}_6$ ,  $\text{ClCO}\cdot\text{NH}_2$ , and  $\text{AlCl}_3$  react in  $\text{CS}_2$  and the complex is decomposed with 99.6%  $\text{D}_2\text{O}$ , the amide (I) gives on hydrolysis  $\text{C}_6\text{D}_5\text{CO}_2\text{H}$ , as when the complex is decomposed with  $\text{H}_2\text{O}$  (this vol., 604), showing that exchange of D with the H of  $\text{ClCO}\cdot\text{NH}_2$  occurs during condensation. (I) gives by the Hofmann reaction  $\text{C}_6\text{D}_5\text{CH}_2\text{NHAc}$ , m.p.  $114.3^\circ$ , i.e., without exchange of H and D. Reaction of  $\text{C}_6\text{D}_6$  with  $\text{PhNCO}$  and  $\text{AlCl}_3$  in  $\text{CS}_2$ , followed by decomp. with  $\text{D}_2\text{O}$ , gives nearly pure  $\text{C}_6\text{D}_5\text{CONDPh}$ , which with molten  $\text{KOH}$  loses D to give  $\text{C}_6\text{D}_5\text{CO}_2\text{H}$ . R. S. C.

**Additive products of halogens and benzene derivatives.** IV. Addition of chlorine and bromine to monohalogenobenzenes. T. VAN DER LINDEN (Rec. trav. chim., 1936, 55, 282—292).— $\text{Cl}_2$  and  $\text{PhF}$ , exposed to light in a sealed tube, afford *chlorofluorobenzene hexachloride*, m.p.  $213\text{--}215^\circ$ , *fluorobenzene hexachloride*, b.p.  $112\text{--}117.5^\circ/0.5\text{--}0.6\text{ mm.}$ , and a more highly chlorinated product. Similarly,  $\text{Cl}_2$  and  $\text{PhBr}$  afford a *chlorobromobenzene hexachloride*, m.p.  $254\text{--}256^\circ$ , and unidentified products.  $\text{Cl}_2$  and  $\text{PhI}$  give  $\text{C}_6\text{Cl}_5\text{I}$ ,  $p\text{-C}_6\text{H}_4\text{ClI}$ , and probably  $2:4:5\text{-C}_6\text{H}_2\text{Cl}_3\text{I}$ ; no additive products were found.  $\text{Br}$  (6 atoms) and  $\text{PhF}$  react with evolution of  $\text{HBr}$ ; after 7 months in sunlight in a sealed tube  $\text{Br}$  was still present. The crystals formed are probably *bromofluorobenzene hexabromide* (I), m.p.  $161^\circ$ ; an *isomeric*, m.p.  $252^\circ$ , a *bromofluorobenzene*, and a *dibromofluorobenzene* are also obtained.  $\text{Br}$  (1 atom) and  $\text{PhF}$  in 20 days afford a mixture of  $\text{C}_6\text{H}_4\text{BrF}$  isomerides, b.p.  $154\text{--}158^\circ$ , two *fluorobenzene hexabromides*, m.p.  $127\text{--}129^\circ$  and  $154\text{--}156^\circ$ , and (I).  $\text{Br}$  (1 atom) and  $\text{PhCl}$  afford  $p\text{-C}_6\text{H}_4\text{ClBr}$  and *chlorobenzene hexabromide*, m.p.  $126^\circ$ .  $\text{Br}$  and  $\text{PhBr}$  give  $p\text{-C}_6\text{H}_4\text{Br}_2$  and a

*bromobenzene hexabromide*, m.p.  $146^\circ$ .  $\text{Br}$  and  $\text{PhI}$  afford I and  $p\text{-C}_6\text{H}_4\text{BrI}$ . P. G. C.

**Action of aromatic nitro-compounds on magnesium aryl halides.** D. N. KIRSANOV and P. A. SOLODKOV (J. Gen. Chem. Russ., 1935, 5, 1487—1493).—The reaction consists of  $\text{RNO}_2 + \text{MgXR}' \rightarrow \text{ONRR}'\cdot\text{OMgX}$  (II); (I) + (II)  $\rightarrow \text{NRR}'\cdot\text{OMgX}$  (III) +  $\text{R}'\text{O}\cdot\text{MgX}$ ; (III) + 2(I)  $\rightarrow \text{RR}' + \text{NRR}'\cdot\text{MgX} + (\text{MgX})_2\text{O}$ . The final products have been isolated and identified in the cases  $\text{R}=\text{R}'=\text{Ph}$ ,  $\text{X}=\text{Br}$ ;  $\text{R}=\alpha\text{-C}_{10}\text{H}_7$ ,  $\text{R}'=\text{Ph}$ ,  $\text{X}=\text{Br}$ ;  $\text{R}=\text{Ph}$ ,  $\text{R}'=\alpha\text{-C}_{10}\text{H}_7$ ,  $\text{X}=\text{Br}$ ;  $\text{R}=\text{Ph}$ ,  $\text{R}'=p\text{-C}_6\text{H}_4\text{Me}$ ,  $\text{X}=\text{Br}$ . R. T.

**Attempted preparation of benzyl fluoride from phenyldiazomethane.** C. L. TSENG, (Miss) P. T. CHIA, and T. S. Ho (Sci. Rep. Nat. Univ. Peking, 1936, 1, 9—16).— $\text{CHPhN}_2$  and 40% aq.  $\text{H}_2\text{F}_2$  give  $(\text{CHPh})_2$  and a trace of  $\text{PhCHO}$ . R. S. C.

**Cracking process. Pyrolytic transformation of *p*-xylene and *m*-xylene.** G. BADDELEY and J. KENNER (Ber., 1936, 69, [B], 902—904).—Analogy is traced between the actions of heat and  $\text{AlCl}_3$  on hydrocarbons. Passage of *p*-xylene (I) vapour through a  $\text{SiO}_2$  tube at  $800^\circ$  gives  $\text{C}_6\text{H}_6$ ,  $\text{PhMe}$ , 2:6-dimethylantracene (II), and a little *m*-xylene (III). Under similar conditions (III) is much more extensively carbonised; it gives  $\text{C}_6\text{H}_6$ ,  $\text{PhMe}$ ,  $\text{C}_{10}\text{H}_8$ , and anthracene, but apparently not (I) or (II). H. W.

**Chlorination and nitration by nitrosyl chloride.** R. PERROT (Compt. rend., 1936, 202, 494—495).—Addition of  $\text{NOCl}$  to phenylethylene derivatives in  $\text{CCl}_4$  at room temp. is always accompanied by oxidation, which accounts for the small yields of the expected nitrosochloride.  $\text{N}_2$ ,  $\text{NH}_4\text{Cl}$ , and sometimes  $\text{NH}_2\text{OH}\cdot\text{HCl}$  are also formed, together with an oil which loses  $\text{HCl}$  on distillation giving a mixture of nitrated and chlorinated products. Thus styrene yields  $\text{CHPhCl}\cdot\text{CH}_2\text{Cl}$ ,  $\text{CHPh}\cdot\text{CH}\cdot\text{NO}_2$ , and a compound, m.p.  $118^\circ$  (decomp.), which contains two N to one of Cl and behaves like a nitrosochloride, giving with  $\text{C}_6\text{H}_{11}\text{N}$  a nitro-amine, m.p.  $136^\circ$ .  $\alpha$ -Chlorostyrene is converted into its  $\alpha\beta$ -trichloro- and  $\alpha\beta$ -dichloro- $\beta$ -nitro, b.p.  $148\text{--}150^\circ/20\text{ mm.}$ , derivatives.  $\text{CPh}_2\cdot\text{CH}_2$  gives a mixture of  $\text{Cl}_2$ - and  $(\text{NO}_2)_2$ -derivatives, and some  $\text{CPh}_2\cdot\text{CH}\cdot\text{NO}_2$ .  $\text{CPh}_2\cdot\text{CHMe}$  gives its  $\beta$ -Cl-derivative, m.p.  $39^\circ$ , and a compound, m.p.  $103^\circ$ , considered to be  $\text{CPh}_2\text{Cl}\cdot\text{CHMe}\cdot\text{NO}_2$ .  $\text{CPh}_2\cdot\text{CMe}_2$  reacts slightly with  $\text{NOCl}$  and  $\text{CPh}_2\cdot\text{CPh}_2$  not at all, except at about  $150^\circ$  with the formation of  $\text{CPh}_2\text{Cl}_2$  and products containing nuclear Cl. Other styrene derivatives yield mixtures difficult to separate. *cycloHexene* gives a mixture of 1:2-dichloro- and chloronitroso-*cyclohexane*. H. G. M.

***o*-Divinylbenzene and naphthalene.** K. FRIES and H. BESTIAN [with, in part, W. KLAUDITZ] (Ber., 1936, 69, [B], 715—722).—Spectrochemical evidence shows that in the formation of  $\text{C}_{10}\text{H}_8$  from *o*-divinylbenzene (I) ring closure is not accompanied by "optical neutralisation of valencies," and does not therefore involve appreciable change in the state of union and the internal compensation of the conjugated system. The transition of  $\Delta^{7,8}$ -hexatriene into  $\text{C}_6\text{H}_6$  and of phenylbutadiene into  $\text{C}_{10}\text{H}_8$  is accom-

panied by marked change in optical properties and chemical behaviour.  $\beta\beta'$ -*o*-Phenylenediacrylic acid (II) (*Me*<sub>2</sub> ester, m.p. 68°, and its tetrabromide, m.p. 141°; *Et*<sub>2</sub> ester, m.p. 81°, and its tetrabromide, m.p. 138°; dichloride, m.p. 84°; dianilide, m.p. 231°) evolves CO<sub>2</sub> when heated with production of a (?) polymeride of (I); its Na salt is transformed by distillation with soda-lime mainly into C<sub>10</sub>H<sub>8</sub>. Short treatment of (II) with boiling Ac<sub>2</sub>O leads to the mixed anhydride, C<sub>6</sub>H<sub>4</sub>(CH:CH:CO·OAc)<sub>2</sub>, m.p. 94° (decomp.), which passes when heated at 120°/vac. into Ac<sub>2</sub>O and  $\beta\beta'$ -*o*-phenylenediacrylic anhydride, m.p. 254–256° (decomp.), unusually stable towards alkali hydroxide.  $\beta\beta'$ -*o*-Phenylenedipropionic acid, m.p. 171°, readily prepared by hydrogenating (II) under pressure at room temp. in presence of Ni, Co, or mixed Cu catalyst, is converted by the successive action of SOCl<sub>2</sub> and NH<sub>3</sub>·H<sub>2</sub>O into  $\beta\beta'$ -*o*-phenylenedipropionamide, m.p. 195°, transformed by KOH and Br into *o*- $\beta\beta'$ -diaminoethylbenzene, b.p. 130–131°/1 mm. [hydrochloride, m.p. 255–265° (decomp.); Ac<sub>2</sub>, m.p. 111°, and Bz<sub>2</sub>, m.p. 154°, derivatives], not identical with the product described by von Braun *et al.* (A., 1917, i, 130). The corresponding diquaternary iodide, C<sub>16</sub>H<sub>30</sub>N<sub>2</sub>I<sub>2</sub>, m.p. 310° (decomp.), is converted by treatment with Ag<sub>2</sub>O and distillation into (I), b.p. 73–74°/12 mm., which is stable in the dark, but rapidly polymerises in direct sunlight. Hydrogenation (PtO<sub>2</sub>) of (I) affords *o*-diethylbenzene, b.p. 66–67°/12 mm., 176–177°/760 mm. Partial hydrogenation of (I) and treatment of the product with Br in CHCl<sub>3</sub> leads to unchanged (I), its tetrabromide, and, mainly, *o*-ethyl- $\alpha\beta$ -dibromoethylbenzene, b.p. 141–142°/12 mm., which is debrominated by Mg in Et<sub>2</sub>O to *o*-ethylvinylbenzene, b.p. 68–68.5°/12 mm.

H. W.

**Plano-radiate compounds. III. Hexasulphones of hexamethylbenzene.** H. J. BACKER (Rec. trav. chim., 1936, 55, 17–21).—The following compounds, C<sub>6</sub>(CH<sub>2</sub>·SO<sub>2</sub>·R)<sub>6</sub>, are obtained by oxidation of the appropriate thio-ether with H<sub>2</sub>O<sub>2</sub>–AcOH: R=Me, m.p. > 360°; Et (+2AcOH), m.p. 340°; Pr<sup>n</sup>, m.p. 305°; Pr<sup>s</sup> (+2AcOH), m.p. 340°; Bu<sup>n</sup>, m.p. 315–316°; Bu<sup>s</sup>, m.p. 289–290°; *sec*-Bu (+AcOH), m.p. 260–261°; Bu<sup>r</sup>, m.p. > 360°; *n*-amyl, m.p. 279–281°; *tert*-amyl (+2AcOH), m.p. > 360°; *n*-hexyl, m.p. 266–267°; Ph (+AcOH), m.p. 320–325°; *p*-C<sub>6</sub>H<sub>4</sub>Me, m.p. 282°; *p*-C<sub>6</sub>H<sub>4</sub>Bu<sup>r</sup>, m.p. 295–300°; and CH<sub>2</sub>Ph, m.p. 334°. These compounds crystallise readily and are not very sol. C<sub>6</sub>(CH<sub>2</sub>·S·C<sub>6</sub>H<sub>4</sub>Bu<sup>r</sup>)<sub>6</sub> crystallises with 1 mol. of heptane, 2 mols. of C<sub>6</sub>H<sub>6</sub>, and 2 mols. of *m*-xylene, respectively, from these solvents.

H. G. M.

**Dipole moment and molecular structure.**  
**XVI. Configuration of ethylenic compounds.**  
 E. BERGMANN (J.C.S., 1936, 402–411).—A vanishing dipole moment ( $\mu$ ) for *isostilbene* (Wildschut, Diss., Delft, 1932), *stilbene* (Smyth *et al.*, A., 1931, 669), (NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CH)<sub>2</sub>, m.p. 225°, (CClPh)<sub>2</sub>, m.p. 144°, and (C[NO<sub>2</sub>]Ph)<sub>2</sub>, m.p. 186°, indicates a *trans* structure. The following finite vals. indicate a *cis* structure: (CClPh)<sub>2</sub>, m.p. 60°,  $\mu$  2.69, [compound with (CPh)<sub>2</sub>], m.p. 67–69°, (CBrPh)<sub>2</sub>, m.p. 68°,  $\mu$  2.53 [compound with (CPh)<sub>2</sub>], *p*-C<sub>6</sub>H<sub>4</sub>Cl·CPh:CCBrPh, m.p. 160°,  $\mu$  2.61, or m.p. 113°,  $\mu$  1.57, CPh:CClPh,  $\mu$  1.53. The following vals. of  $\mu$  were also obtained:  $\alpha$ -bromostilbene, m.p. 31°, 1.38 (liquid), 1.30, Et, 1.84, Et *allo*-, 1.77, Et  $\beta$ -phenyl-, 1.98, Me  $\alpha$ -phenyl-cinnamate, 1.92; *o*-C<sub>6</sub>H<sub>4</sub>Ph·CN, 3.81; Et *p*-nitro-, 3.50, and Me *p*-nitro- $\alpha$ -phenyl-cinnamate, 3.78, indicating *trans* structures; *p*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>Et, 3.84; of Me, 1.89 Et, 1.98 (from acid m.p. 134°), and Me  $\alpha\beta$ -dibromocinnamate 2.68 (from acid, m.p. 100°) (the last is Ph > C:C < CO<sub>2</sub>H / Br > C:C < Br); of Et, 2.63 (from acid, m.p. 159°) and Me  $\beta$ -bromocinnamate, 1.81 (from acid, m.p. 134°) (the latter is Ph > C:C < CO<sub>2</sub>H / Br > C:C < H contrary to Auwers *et al.*; A., 1932, 271); benzylidene-, 2.92, benzylidene-*p*-bromo-, 2.93,  $\alpha\beta$ -dibromobenzylidene- (m.p. 113–114°), 3.17 (hence Ph > C:C < Br / Br > C:C < CPh),  $\beta$ -bromobenzylidene-, 3.59 (hence Ph > C:C < H / Br > C:C < CPh),  $\alpha$ -bromobenzylidene-, 3.87, *p*-bromobenzylidene-, 2.47 (hence *trans*), *pp'*-dibromobenzylidene-acetophenone, 2.03 (hence *trans*); CHPh:CCBr·CO<sub>2</sub>Et (from acid, m.p. 131°), 2.25 (from acid, m.p. 126°), 2.80; Et-, 1.75, Et *p*-nitro-, 4.58, Me *p*-bromo- $\beta$ -phenylpropionate, 2.39; NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·C:C·CO<sub>2</sub>Et, 3.54 (hence straight structure);  $\omega$ -nitro-, 4.48,  $\omega$ -chloro-, 1.40,  $\omega$ -bromo-, 1.51,  $\omega$ -ethoxy-styrene, 1.63.

F. R. G.

**Use of paramagnetism as a test for free radicals.** F. L. ALLEN and S. SUGDEN (J.C.S., 1936, 440–441).—Solid NPh<sub>2</sub>·N·C<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>3</sub>, (p-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>)<sub>3</sub>C, and CPh<sub>2</sub>·OK are strongly paramagnetic and hence consist largely of free radicals. Solid 10:10'-bis-5:10-dihydrophenarsazine and CSpH<sub>2</sub> are diamagnetic, hence the former probably contains no free radical and the latter may be a free diradical.

F. R. G.

**Autoxidation of substituted difluoryls and dixanthyls.** H. W. SCHERF (J. Amer. Chem. Soc., 1936, 58, 576–580).—Autoxidation of 9:9'-diphenyl- (I), 9:9'-*di-p-tolyl*- (II), m.p. 216° (from 9-chloro-9-*p*-tolylfluorene, m.p. 96.5°, and Cu-bronze in N<sub>2</sub>), 9:9'-didiphenyl- (III), and 9:9'-dianisyl- (IV) -9:9'-difluoryls in *s*-C<sub>2</sub>H<sub>5</sub>Cl<sub>4</sub> (usually 0.01M solution) at 0° and 25° occurs principally by oxidation of the undissociated mol. and to a small extent by oxidation of the free radical. The rate for (I) is not affected by quinol (0.1 or 1%) or change in concn. With one exception, the ratio  $k_{O_2}/k_{air}$  is lower at 0° than at 25°. There is no parallelism between the rate of autoxidation [viz., (III) < (IV) < (II) < (I)] and degree of dissociation into free radicals [viz., (II) < (I) < (III) < (IV); determined in EtOBz and N<sub>2</sub> at 70°]. Autoxidation of dimethyl-, *disoamyl*-, and dibenzyl-dixanthyls at –11.2° to 50° is dependent (in the early stages of the reaction) on slow dissociation into free radicals and subsequent rapid oxidation (cf. Conant and Evans, A., 1929, 934).

H. B.

**Rubenes. Isomerisation of diphenylbis-*p*-bromophenylrubene into the corresponding pseudo-derivatives.** L. ENDERLIN (Compt. rend., 1936, 202, 495–497; cf. A., 1929, 549; this vol.,

462).—Diphenylbis-*p*-bromophenylrubene when treated in  $C_6H_6$  with  $H_2SO_4$  yields irreversibly two isomerides, m.p.  $340^\circ$  and m.p.  $240$ – $245^\circ$  and m.p.  $295^\circ$  after resolidification, separable by means of  $CS_2$ .

H. G. M.

**Reversible oxidisability of organic compounds: dihydroxide of diphenylbis-(*p*-bromophenyl)-rubene.** L. ENDERLIN (Compt. rend., 1936, 202, 1188–1190; cf. this vol., 600).—Prolonged oxidation of diphenylbis-*p*-bromophenylrubene in  $C_6H_6$  with 0.1%  $KMnO_4$  at room temp. affords dihydroxydihydrodiphenylbis-(*p*-bromophenyl)rubene,  $C_{42}H_{26}Br_2(OH)_2$ , decomp. at  $230^\circ$  (block), which is reduced ( $Fe-AcOH$ ) quantitatively to the rubene, and at  $220^\circ$  loses  $1H_2O$  to give a monoxide,  $C_{42}H_{26}Br_2O$ . Boiling  $AcOH$  or cold  $H_2SO_4$  removes  $2H_2O$  to give  $C_{42}H_{24}Br_2$ , which exhibits a violet fluorescence.

J. L. D.

**Mechanism of isomerisation of cyclic amines.**

**Action of potassium hydroxide on nitrosocyclopropylcarbamide.** V. P. GOLMOV (J. Gen. Chem. Russ., 1935, 5, 1562–1565).—cycloPropylamine and  $KCNO$  are dissolved in  $H_2O$ , the solution is evaporated to dryness at  $100^\circ$ , and the residue is extracted with  $EtOH$ , when cyclopropylcarbamide (I), m.p.  $123$ – $124^\circ$ , is obtained. (I) in aq.  $H_2SO_4$  and  $NaNO_2$  at  $0^\circ$  afford nitrosocyclopropylcarbamide, m.p.  $86^\circ$  (decomp.), which is converted, probably by way of diazocyclopropane, into  $CH_2:CH-CH_2-OH$  by aq.  $KOH$  at  $0^\circ$ .

R. T.

**Transposition of *N*-arylformimino-ethers,  $OEt-CH:NR$ .** M. GRUNFELD (Bull. Soc. chim., 1936, [v], 3, 668–674).—When passed over infusorial earth at  $200^\circ/17$  mm.,  $NPh:CH-OEt$  is largely unchanged; at  $300^\circ/15$  mm., it gives  $EtOH$ ,  $PhNC$ , and  $PhCN$ , whereas at  $400^\circ/65$  mm.  $EtOH$  and  $PhCN$  are formed exclusively.  $o-C_6H_4Me:N:CH-OEt$  is unchanged at  $180^\circ/13$  mm., gives  $EtOH$ ,  $o-C_6H_4Me:NC$ , and  $o-C_6H_4Me-CN$  at  $300^\circ/16$  mm., and  $EtOH$  and  $o-C_6H_4Me-CN$  at  $400^\circ/40$ – $50$  mm.  $p-C_6H_4Me:N:CH-OEt$  at  $300^\circ/18$ – $25$  mm. affords unchanged material,  $EtOH$ ,  $p-C_6H_4Me:NC$ , and  $p-C_6H_4Me-CN$ . Contrary to Wislicenus, diphenylformamidine is not produced when  $NPh:CH-OMe$  or  $NPh:CH-OEt$  is heated in a sealed tube at  $230$ – $240^\circ$ . Ethoxymethylene-*m*-toluidine, from  $m-C_6H_4Me:NH_2$  and  $CH(OEt)_3$  at  $125^\circ$  and subsequently at  $190$ – $210^\circ$ , has b.p.  $84^\circ/2$  mm.

H. W.

**Mechanism of amination by means of sodamide. I. Preparation of substituted amidines.**

A. V. KIRSANOV and J. N. IVASCHTSCHENKO (J. Gen. Chem. Russ., 1935, 5, 1494–1505).— $NPh:CHPh$  (I) in  $PhMe$  and  $NaNH_2$  (II) at  $120^\circ$  react as follows: (I) + (II)  $\rightarrow NH_2-CHPh-NPhNa \rightarrow NH_2-CPh:NPh$  (III) +  $NaH \rightarrow NHNa-CPh:NPh$  (IV) +  $2H$ ; (I) +  $2H \rightarrow NHPh-CH_2Ph$  (V); (III) + (II)  $\rightarrow$  (IV) +  $NH_3$ ;  $3(I) + 2NH_3 \rightarrow \begin{matrix} CHPh-NH \\ | \\ CHPh-N \end{matrix} \gg CPh$  (VI) +  $3NH_2Ph$ ; (VI) undergoes further conversion into lophine (VII). The yields of final products isolated were  $NH_2Ph$  12.0, (III) 19.6, (V) 14.9, and (VIII) 12.8%; the corresponding products and yields obtained when benzyldine-*p*-toluidine is substituted for (I) are *p*-toluidine 22.6, *p*-tolylbenzamidine 22.6, benzyl-*p*-toluidine 20.6, and (VII) 12.3%, whilst piperonylideneaniline yields the

*N*-phenylamidine of piperonylic acid, m.p.  $138$ – $139^\circ$ , and piperonylaniline. It is considered that the above mechanism also applies to the reaction of amination of  $C_6H_5N$  by (II).

R. T.

**Regulated hydrolysis of acetyl derivatives of reducing sugars.** M. FRÈREJACQUE (Compt. rend., 1936, 202, 1190–1192).—Glucose  $\beta$ -penta-acetate (I) in 95%  $EtOH$  containing some  $AcOH$  with  $p-C_6H_4Me-NH_2$  at room temp. affords  $\beta$ -tetra-acetylglucosidyl-*p*-toluidide (cf. A., 1928, 870). With  $NH_2Ph$ , (I) similarly affords a mixture of the anilides of the  $\alpha$ - and  $\beta$ -tetra-acetates. The following are prepared:  $\alpha$ -tetra-acetylglucosidylanilide, m.p.  $143^\circ$ ;  $\beta$ -tetra-acetylglucosidylacetyl-anilide, m.p.  $100^\circ$ , *p*-toluidide, m.p.  $142^\circ$ , *p*-bromoanilide, m.p.  $134^\circ$ ;  $\alpha$ -, m.p.  $197^\circ$ , and  $\beta$ -hepta-acetyl-lactosidyl-anilide (I), m.p.  $152^\circ$ , and *p*-toluidide, m.p.  $202^\circ$ ;  $\beta$ -hepta-acetyl-maltosidyl-anilide (II), m.p.  $205^\circ$ , and *p*-toluidide, m.p.  $182^\circ$ ;  $\beta$ -hepta-acetylcellobiosidyl-anilide (III), m.p.  $218^\circ$ , and *p*-toluidide, m.p.  $215^\circ$ . (I), (II), and (III) show mutarotation and are easily hydrolysed, but after acetylation, they neither mutarotate nor are they easily hydrolysed.

J. L. D.

**Attempted cyclisation of *N*- $\beta$ -hydroxyethyl-aniline, and its benzoyl derivatives.** P. P. SCHORIGIN and V. N. BELOV (J. Gen. Chem. Russ., 1935, 5, 1707–1717).—Attempts to obtain dihydroindole by the dehydration of  $NHPh-CH_2-CH_2-OH$  (I) (picrate, m.p.  $124$ – $125^\circ$ ), under different conditions (passing the vapour in a stream of  $CO_2$  over kaolin at  $450$ – $520^\circ$ , heating with  $H_2C_2O_4$ ,  $AlCl_3$ , or  $Na$ ), were unsuccessful. A small amount of *N*-vinylaniline, m.p.  $66$ – $67.5^\circ$  (*Bz* derivative, m.p.  $191$ – $192^\circ$ ), was obtained by heating with  $Na$  for 2 hr. at  $260$ – $280^\circ$ . The *Bz* derivative of (I) yields the *O*-monobenzoate (II) [picrate, m.p.  $150^\circ$ ; *N*-*Me* derivative, m.p.  $46$ – $48^\circ$  (picrate, m.p.  $163$ – $164^\circ$ )] of (I) when hydrolysed with  $EtOH-KOH$ ; under very mild conditions of hydrolysis an intermediate product, m.p.  $74$ – $75^\circ$ , probably  $NPh-\begin{matrix} CH_2 \\ | \\ CPh(OH)-O \end{matrix}-CH_2$ , is obtained. The *N*-*Bz* derivative of (I) readily undergoes conversion into (II).

R. T.

**Rhodanisation of organic compounds.** S. A. ZABOEV (J. Gen. Chem. Russ., 1935, 5, 1607–1610).—*p*- $SCN-C_6H_4-NMe_2$  (I) is obtained in good yield from  $NPhMe_2$  (II),  $NH_4CNS$ , and  $CaOCl_2$  in aq.  $AcOH$ , at room temp., or by passing  $Cl_2$  at  $-10^\circ$  into an aq.  $AcOH$  solution of (II) and  $KCNS$ . (I) is converted into  $(NMe_2-C_6H_4-S)_2$  by boiling with aq.  $KOH$ .  $5:1:2-CNS-C_6H_3Me-NH_2$  and *p*- $CNS-C_6H_4-OH$  have been prepared similarly from *o*-toluidine and  $PhOH$ , respectively.

R. T.

**Rearrangement of carbamyl-sulphones and -sulphides.** W. J. EVANS and S. SMILES (J.C.S., 1936, 329–331).—2-Nitrophenyl-thioacetanilide, m.p.  $159$ – $160^\circ$ , is oxidised to -sulphonylacetanilide, m.p.  $151$ – $152^\circ$ , which undergoes rearrangement ( $NaOH$ ) to 2-nitro-*N*-acetyldiphenylamine. Similarly, 2-nitrophenyl-sulphonylacetate, m.p.  $207^\circ$ , obtained from -thioaceto-*m*-nitroanilide, m.p.  $216$ – $217^\circ$ , is rearranged to 2:3'-dinitrodiphenylamine. 2-Nitrophenylsulphonyl-, m.p.  $155$ – $156^\circ$ , obtained from -thioacetamide, m.p.  $178$ – $179^\circ$ , does not undergo rearrangement.

$\beta$ -2-Nitrophenyl-thiopropionanilide, m.p. 166°, obtained from the corresponding acid, m.p. 147°, is oxidised to the -sulphonyl compound, m.p. 186—187°, neither sulphide nor sulphone undergoing rearrangement, possibly owing to the steric relationships. 2-o-Nitrophenylthiobenzamide, m.p. 164°, and -anilide, m.p. 127—128°, obtained from the acid chloride, are oxidised, respectively, to 2-o-nitrobenzenesulphonylbenzamide, m.p. 193—194°, and -anilide, m.p. 184°. Rearrangement, followed by methylation, of these compounds gives, respectively, 2-methylthiolbenzo-o-nitroanilide, m.p. 111°, and -2'-nitrodiphenylamide, m.p. 146—147°, and 2-methylsulphonylbenzo-o-nitroanilide, m.p. 221°, and -2'-nitrodiphenylamide, m.p. 206°.

F. R. S.

**3-Nitro-4-aminodiphenylmethane and its derivatives.** W. A. WATERS (J.C.S., 1935, 1875).—4-Acetamidodiphenylmethane when treated at 25° during 1 hr. with  $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$  in  $\text{Ac}_2\text{O}$  (Menke's method) affords 3-nitro-4-acetamidodiphenylmethane (I), m.p. 99°, also obtained when a warm solution of 4-aminodiphenylmethane in  $\text{Ac}_2\text{O}$  is similarly treated with  $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ — $\text{Ac}_2\text{O}$ , and hydrolysed by  $\text{H}_2\text{SO}_4$ — $\text{EtOH}$  to 3-nitro-4-aminodiphenylmethane, m.p. 78° (5-Br-derivative, m.p. 71°). (I) with  $\text{H}_2\text{SO}_4$ — $\text{AcOH}$ — $\text{HNO}_3$  yields 3:4'-dinitroacetamidodiphenylmethane (A., 1933, 1044), also obtained together with some 3:5-dinitro-4-acetamidodiphenylmethane, m.p. 81—82°, when (I) is treated by Menke's method.

H. G. M.

**Optical activity in relation to tautomeric change.** V. Kinetic status of ionic intermediates in prototropy. S. K. HSÜ, C. K. INGOLD, and C. L. WILSON (J.C.S., 1935, 1778—1785).—The velocity coeffs. and equilibrium consts. of isomerisation of *dl*-benzhydrylidene- $\alpha$ -phenylethylamine (I) and of *dl*-benzylidene-*p*-phenylbenzhydrylamine (II) have been determined and compared, respectively, with the rate of racemisation of optically active (I) and the rate of mutarotation of the system optically active (II)+its isomeride. The results accord with the view that loss of optical activity does not occur in any reversibly formed intermediate state in the isomerisation process (cf. A., 1934, 260), and that the ionisation products of these systems do not become kinetically free during isomerisation. Prototropy in the methyleneazomethine system therefore occurs by a termol. mechanism of the type proposed by Lowry (A., 1927, 1150), the bimol. mechanism (cf. A., 1926, 939) being restricted to more acid systems such as carboxyl ( $[\text{H}]\cdot\text{O}\cdot\text{C}\cdot\text{O}$ ) and acetone ( $[\text{H}]\cdot\text{O}\cdot\text{C}\cdot\text{C}$ ). *p*-Phenylbenzophenone-2:4-dinitrophenylhydrazone has m.p. 217—217.5°. H. G. M.

**Preparation of Freund's acid from  $\alpha$ -naphthylamine-3:6:8-trisulphonic acid.** G. I. OSTROSHINSKAJA (Anilinokras. Prom., 1935, 5, 138—143).—1:3:6- $\text{NH}_2\cdot\text{C}_{10}\text{H}_5(\text{SO}_3\text{H})_2$  (I) is obtained in 93% yield by boiling a mixture of 1:3:6:8- $\text{NH}_2\cdot\text{C}_{10}\text{H}_4(\text{SO}_3\text{H})_3$ , aq. NaOH, and Zn dust for 7 hr. The dichloride of (I) has m.p. 149° (lit. 157°).

R. T.

**Determination and purification of  $\beta$ -naphthylamine in the presence of  $\alpha$ -naphthylamine, and**

3 B

**properties of some sulphonyl derivatives.** H. H. HODGSON and E. W. SMITH (J.C.S., 1935, 1854—1856).—The solubilities of *p*-toluenesulphon- $\alpha$ - (I) and  $\beta$ -naphthalide (II) in 20% aq. NaOH at 16° are 125 g. and 3 g. per litre, but in 2% aq. KOH are 85 g. and 66 g. per litre, respectively. (II) is completely pptd. by  $\leq 10\%$  aq. NaOH from a solution of (I) and (II) in 2% NaOH, provided [(I)] is  $\geq 20\%$ , thus permitting the determination of  $\beta\text{-C}_{10}\text{H}_7\cdot\text{NH}_2$  (III) in presence of  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{NH}_2$  (IV). (III) may be purified from (IV) by pptn. from  $\text{C}_6\text{H}_6$  by HCl, or by neutralising an acid solution of the mixture, the hydrochloride of (III) or (III) itself being pptd. first, respectively. Na<sup>+</sup> can easily be detected when  $[\text{Na}^+]$  is  $> 2\%$  by addition of (II)— $\text{KOH}$ — $\text{H}_2\text{O}$ . 2:4:1- $(\text{NO}_2)_2\text{C}_{10}\text{H}_5\cdot\text{NH}_2$  (improved prep.) has m.p. 242° (lit. 239°). The following are described: Na salt, m.p. 370°, of (II); Na, m.p. 256°, Na ( $+\text{H}_2\text{O}$ ), Na ( $+\text{H}_2\text{O}$ ), m.p. 85°, K, m.p. 232°, and K ( $+\text{H}_2\text{O}$ ) salts of *m*-nitrobenzenesulphon- $\alpha$ -naphthalide; *m*-nitrobenzenesulphon- $\beta$ -naphthalide, m.p. 166.5° [Na, m.p. 290°, Na ( $+\text{H}_2\text{O}$ ), and Na ( $+\text{H}_2\text{O}$ ), m.p. about 77°; K, m.p. 240°, K ( $+\text{H}_2\text{O}$ ), K ( $+\text{H}_2\text{O}$ ), m.p. about 70°; Ba, m.p. about 280° (with charring), and Ba ( $+\text{H}_2\text{O}$ ) salts].

H. G. M.

**Preparation and properties of some 1:2-diaminocyclohexanes.** F. M. JAEGER and J. A. VAN DIJK (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 384—393).—2-Methylcyclohexanone with  $\text{Et}_2\text{C}_2\text{O}_4$  and NaOEt— $\text{EtOH}$  at  $-15^\circ$  affords its 6-glyoxylic acid and the corresponding *Et* ester, converted by heating at 210—220° into *Et* 2-methylcyclohexanone-6-carboxylate, b.p. 115—116.5°/12—13 mm., converted by 6% aq. KOH—NaNO<sub>2</sub> and 30%  $\text{H}_2\text{SO}_4$  at room temp. into 6-oximino-2-methylcyclohexanone (I), m.p. 167° (decomp.), a (?) stereoisomeric oxime (II), m.p. 65°, and an oily mixture of oximes. (I) with  $\text{NH}_2\text{OH}\cdot\text{HCl}$ —NaOMe— $\text{MeOH}$  affords 2:3-dioximino-1-methylcyclohexane (III), m.p. 167° [differs in its reactions from that obtained by Wallach *et al.* (A., 1924, i, 862), which was probably a mixture of (III) and (IV)]; (II) similarly gives a dioxime (IV), m.p. 140°. Reduction of (III) with Na-boiling  $\text{EtOH}$  affords 2:3-diamino-1-methylcyclohexane, b.p. 84°/12 mm. (isolated as its hydrochloride  $+\text{H}_2\text{O}$ ), also obtained, together with 3-amino-1-methylcyclohexane, b.p. 41°/12 mm. (Bz derivative, m.p. 106°), by similar reduction of the dioxime obtained from the oily mixed oximes. By similar series of reactions are obtained 2-oximinocyclohexanone (from *Et* cyclohexanone-2-carboxylate), the dioxime, m.p. 187—189°, and trans-1:2-diaminocyclohexane, b.p. 79—81°/15 mm. (resolvable); *Et* 3-methylcyclohexanone-6-carboxylate, b.p. 118—120°/13 mm., 6-oximino-3-methylcyclohexanone, m.p. 159°, the dioxime, m.p. 180—181° (also obtained from *Et* 4-methylcyclohexanone-6-carboxylate, b.p. 113—115°/13 mm.), and 3:4-diamino-1-methylcyclohexane, b.p. 81.5°/13 mm. 3:4-Diamino-1-methyl-4-isopropylcyclohexane (diaminomenthane), b.p. 110—113°/12 mm., is obtained by a modification of the method of Kononov *et al.* (A., 1898, i, 530). Crystallographic data and reactions with metallic salts are given for many of the above compounds.

J. W. B.

**Derivatives of 4:4'-diaminodiphenylmethane.** G. D. PARKES and R. H. H. MORLEY (J.C.S., 1936, 315—317).—Bromination of 4:4'-diacetamidodiphenylmethane gives the 3:3'-Br<sub>2</sub>-derivative, m.p. 198°, hydrolysed to 3:3'-dibromo-4:4'-diaminodiphenylmethane dihydrochloride, m.p. 285° (decomp.), from which is prepared through the tetrazo-compound the corresponding 4:4'-dihydrazinodiphenylmethane dihydrochloride, m.p. 279° (decomp.). 3:3'-Dibromo-4:4'-dibenzamidodiphenylmethane has m.p. 217°. The following have been prepared from the appropriate dihydrazine and the carbonyl compound: 4:4'-bis-o-, m.p. 189°, m-, m.p. 192°, and p-nitrobenzylidenehydrazino-, m.p. 218°; 4:4'-bis-salicylidenehydrazino-, m.p. 252°, -β-phenylethylidenehydrazino-, m.p. 174°, and -γ-phenyl-α-methylallylidenehydrazino-, m.p. 222°; 3:3'-dibromo-4:4'-bis-benzylidenehydrazino-, m.p. 165°, -o-nitrobenzylidenehydrazino-, m.p. 234°, m-, m.p. 278°, and p-, m.p. 255° (decomp.), -salicylidenehydrazino- m.p. 236° (decomp.), and -p-hydroxybenzylidenehydrazino-diphenylmethane, m.p. 238° (decomp.). F. R. S.

**Salt formation of homonuclear naphthalene derivatives.** H. H. HODGSON and R. L. ELLIOTT (J.C.S., 1935, 1850—1854).—2-Nitroaceto-1-naphthalide (I) when treated with AcOH-Cl<sub>2</sub> at 100° (30 min.) yields its 4-Cl-derivative (II), m.p. 219°, hydrolysed to 4-chloro-2-nitro-α-naphthylamine (III), m.p. 202°. This when treated with H<sub>2</sub>SO<sub>4</sub>-NaNO<sub>2</sub> below 20° and then heated with EtOH (water-bath, 90 min.) affords 1-chloro-3-nitronaphthalene, m.p. 127°, which when heated with SnCl<sub>2</sub>-HCl-EtOH gives 4-chloro-β-naphthylamine stannichloride, which with 2% aq. NaOH gives 4-chloro-β-naphthylamine, m.p. 68°. The corresponding 4-Br-derivative (stannichloride; Ac derivative, m.p. 186.5°) was similarly prepared. 2:1-NO<sub>2</sub>·C<sub>10</sub>H<sub>6</sub>·NH<sub>2</sub> and Hg(OAc)<sub>2</sub>-boiling AcOH yield 2-nitro-α-naphthylamine 4-mercuriacetate, m.p. 242° [the corresponding mercurichloride, m.p. 289°, mercuribromide, m.p. 248°, mercuri-iodide, m.p. 237°, and mercurihydroxide, m.p. above 360° (decomp.)], which with Cl<sub>2</sub> or Br in AcOH gave the corresponding 4-Cl- or 4-Br-derivative, respectively, and when boiled with KI-H<sub>2</sub>O yields the 4-I-derivative, m.p. 195.5° (lit. 192—193°). This when deaminated and subsequently reduced (SnCl<sub>2</sub>-EtOH) affords 4-iodo-2-naphthylamine, m.p. 76° (Ac, m.p. 201°, and Bz derivative, m.p. 145°), as the stannichloride. 4:2:1-NO<sub>2</sub>·C<sub>10</sub>H<sub>5</sub>Cl·NH<sub>2</sub> when boiled with hydrated SnCl<sub>2</sub>, EtOH, and HCl gives 2-chloro-1:4-naphthylenediamine monohydrochloride (IV), diazotisation of which proceeded normally at first but subsequently the diazo-solution deposited a deep purple powder, m.p. above 360° (decomp.). The diamine, m.p. 114° (NN'-Ac<sub>2</sub>, m.p. 314°, and NN'-Bz<sub>2</sub> derivative, m.p. 255°), obtained from (IV), is readily oxidised by 2% alkaline KMnO<sub>4</sub> to 2-chloro-1:4-naphthaquinone. Similarly 2-chloro-4-nitroaceto-1-naphthalide when reduced (hydrated SnCl<sub>2</sub>-HCl-EtOH) affords 2-chloro-1-N-acetyl-1:4-naphthylenediamine, m.p. 215°, as the stannichloride, from which the base was obtained with NaOH. The following were prepared by similar methods: 2-bromo-1:4-naphthylenediamine, m.p. 110° (stannichloride; monohydrochloride; Ac<sub>2</sub>, m.p.

318°, and Bz<sub>2</sub> derivative, m.p. 259°), oxidised to 2-bromo-1:4-naphthaquinone; 2-bromo-4-nitroaceto-1-naphthalide, m.p. 239° (obtained from the amine), with boiling 20% aq. NaOH affords 2-bromo-4-nitro-α-naphthol, m.p. 236°, and is reduced to 2-bromo-1-N-acetyl-1:4-naphthylenediamine, m.p. 217° (stannichloride); 2-iodo-1:4-naphthylenediamine, m.p. 119° (monohydrochloride; NN'-Ac<sub>2</sub>, m.p. 322°, and NN'-Bz<sub>2</sub> derivative, m.p. 262°), oxidised by alkaline 2% KMnO<sub>4</sub> to 2-iodo-1:4-naphthaquinone, m.p. 120°; 2-iodo-4-nitroaceto-1-naphthalide, m.p. 222° (prepared by heating 4-nitro-α-naphthylamine 2-mercuriacetate with Ac<sub>2</sub>O and boiling the resulting 4-nitroaceto-1-naphthalide 2-mercuriacetate, m.p. 270°, with aq. KI-I), with boiling 20% aq. NaOH affords 2-iodo-4-nitro-α-naphthol, m.p. 229°, and is reduced to 2-iodo-1-N-acetyl-1:4-naphthylenediamine, m.p. 235° (stannichloride); 4-chloro-1:2-naphthylenediamine (V), m.p. 95° (monohydrochloride; with Ac<sub>2</sub>O at 35—40° gives the 2-N-Ac derivative (VI), m.p. 235°), obtained from (III); 4-chloro-1-N-acetyl-1:2-naphthylenediamine (VII), m.p. 243° (stannichloride), obtained from (II), yields (with Ac<sub>2</sub>O) the Ac<sub>2</sub> derivative, m.p. 174°, of (V), not obtained from (VI) and boiling Ac<sub>2</sub>O; 4-chloro-1:2-naphthaquinone, m.p. 188° [readily obtained by air-oxidation of (VII)]; 4-bromo-1:2-naphthylenediamine (VIII), m.p. 97° (monohydrochloride; 2-N-Ac derivative, m.p. 225°, obtained from the base and boiling Ac<sub>2</sub>O). (I) with Br-AcOH above 45° yields 4-bromo-2-nitroaceto-1-naphthalide, m.p. 239°, reduced to 4-bromo-1-N-acetyl-1:2-naphthylenediamine, m.p. 248° (stannichloride), converted by boiling Ac<sub>2</sub>O into the NN'-Ac<sub>2</sub> derivative, m.p. 225°, of (VIII), not obtained from the 2-N-Ac isomeride and Ac<sub>2</sub>O. The following were similarly prepared: 4-iodo-1:2-naphthylenediamine, m.p. 98° [monohydrochloride; 2-N-Ac, m.p. 238°, and NN'-Ac<sub>2</sub> derivative, m.p. 167°; 1-N-Ac derivative, m.p. 271° (stannichloride)]. The stability of the salts of the foregoing bases is discussed. H. G. M.

**Decomposition of azo-compounds by mineral acids.**—See B., 1936, 311.

**Interpretation of infra-red absorption of organic compounds containing hydroxyl and imino-groups.** L. PAULING (J. Amer. Chem. Soc., 1936, 58, 94—98).—The single sharp absorption peak (in the region 6200—7200 cm.<sup>-1</sup>) exhibited by 21 of the 32 substances investigated by Wulf and Liddel (A., 1933, 1102; 1935, 1189) indicates that the OH or NH groups in the dissolved mols. have nearly the same characteristic frequencies; in the mols. containing 2 or more OH or NH, there is little interaction between such groups. The C=O in phenols has some C=O character (resulting from resonance with a structure such as  $\cdot\bar{C}_2\cdot\bar{C}_1\cdot\bar{O}-H$ ), thus tending to cause the H atom to lie in the plane of the rest of the mol. PhOH and s-C<sub>6</sub>H<sub>4</sub>Cl<sub>3</sub>·OH can thus assume either of two equiv. configurations (cf. below); the OH frequency for s-C<sub>6</sub>H<sub>4</sub>Cl<sub>3</sub>·OH (6390 cm.<sup>-1</sup>) will, however, owing to the attraction of the (+)-H by the (-)-Cl, be < that for PhOH (7050 cm.<sup>-1</sup>) (cf. Badger, A., 1934, 477). o-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub>·OH can exist in *cis*- (A) and *trans*- (B) forms; owing to the stabilising effect of the

tendency for interaction of H and Cl, the former should be the more stable and predominate. The

curve for  $o\text{-C}_6\text{H}_4\text{Cl}\cdot\text{OH}$  contains two peaks (large at 6910, small at 7050  $\text{cm}^{-1}$ ) and indicates the presence of about 91% of (A) and 9% of (B). The free energy difference of (A) and (B) is about 1400 g.-cal. per mol.  $o\text{-C}_6\text{H}_4(\text{OH})_2$  has structure (C); the two (equal) peaks at 6970 and 7060  $\text{cm}^{-1}$  represent *cis*- and *trans*-OH, respectively. Weak chelation is considered to occur in Et lactate and tartrate and benzoic, but not in  $o\text{-OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot\text{OH}$  and  $\text{OH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OAc}$ . The splitting of the  $\text{NH}$ -absorption for pyrrole (and  $\text{NHAcPh}$ ) is probably due to the existence (in solution) of mols. of (mainly) coplanar (H of NH in plane of ring) and non-coplanar forms. Carbazole and tetraphenylpyrrole have coplanar configurations. The tendency for  $\text{CO}\leftarrow\text{HN}$  chelation (as in phenanthraquinoneimine) is much  $<$   $\text{CO}\leftarrow\text{HO}$ . H. B.

**Chloro-alkylation of anisole; synthesis of vinylanisole.** R. QUELET (Compt. rend., 1936, 202, 956—958).—Chloro-ethylation is effected by saturating at  $0^\circ$  with HCl a mixture of 1 mol. of anisole, 1 mol. of paraldehyde, and 100 g. of conc. HCl. The product is washed with  $\text{H}_2\text{O}$  and extracted with light petroleum. Warming with  $\text{C}_5\text{H}_5\text{N}$  gives a mixture of *o*- and *p*-vinylanisole, b.p.  $91\text{--}94^\circ/16\text{ mm.}$ , in 40% yield.  $\alpha\alpha$ -Di-*p*-anisylethane is also formed.  $\alpha$ -Chloropropylanisole is similarly obtained in 20% yield with  $\text{H}_3\text{PO}_4$  as catalyst, and  $\alpha$ -chlorobutylanisole in 50% yield with HCl as catalyst; these yield respectively a mixture of anethole and *o*-methoxy- $\Delta^2$ -propenylbenzene, and of *o*- and *p*-methoxy- $\Delta^2$ -butenylbenzene. P. G. M.

#### Halogenation of phenolic ethers and anilides.

**V. Alkyl and  $\omega$ -substituted-alkyl ethers. VI. Benzyl and substituted-benzyl ethers.** B. JONES (J.C.S., 1935, 1831—1835, 1835—1840).—V. The velocity coeffs. of chlorination at  $20^\circ$  of a no. of ethers of the type  $\text{C}_6\text{H}_4\text{X}\cdot\text{OR}$  ( $\text{X}=\text{o-}$  and  $\text{p-CO}_2\text{H}$ , hal.;  $\text{R}=\text{alk.}$ ,  $[\text{CH}_2]_n\cdot\text{Br}$ ,  $[\text{CH}_2]_n\cdot\text{Ph}$ ) in AcOH containing 1%  $\text{H}_2\text{O}$  have been determined. The reactivity of *n*-alkyl ethers is const. from  $\text{R}=\text{Pr}$  to  $\text{R}=\text{heptyl}$ , but is slightly lower when  $\text{R}=\text{octyl}$  and *cetyl*.  $\omega\text{-Br-}$  and  $\omega\text{-Ph}$  substituents depress the reactivity, the effect decreasing with increasing chain-length. The following ethers have been prepared: *p*-chlorophenyl *n*-amyl, b.p.  $132\text{--}133^\circ/12\text{ mm.}$ , *n*-hexyl, b.p.  $172^\circ/34\text{ mm.}$ , *n*-heptyl, b.p.  $162^\circ/14\text{ mm.}$ , and *cetyl*, m.p.  $48^\circ$ ; *p*-bromophenyl *cetyl*, m.p.  $49^\circ$ ; *o*-chlorophenyl *Pr*, b.p.  $119^\circ/26\text{ mm.}$ , *Pr*<sup>2</sup> (I), b.p.  $93^\circ/12\text{ mm.}$ , *Bu*<sup>2</sup>, b.p.  $117^\circ/13\text{ mm.}$ , *n*-amyl, b.p.  $117^\circ/13\text{ mm.}$ ; *p*-bromophenyl  $\gamma$ -bromopropyl, m.p.  $49.5^\circ$ , b.p.  $169^\circ/12\text{ mm.}$  (by-product trimethylene glycol bis-*p*-bromophenyl ether, m.p.  $143^\circ$ ). *p*- $\beta$ -Phenylethoxybenzoic acid has m.p.  $160^\circ$ , and *p*- $\gamma$ -phenylpropoxybenzoic acid has m.p.  $166^\circ$ .

VI. The velocity coeffs. of chlorination at  $20^\circ$  of a no. of ethers of the type  $\text{C}_6\text{H}_4\text{X}\cdot\text{OR}$  ( $\text{X}=\text{o-}$  and  $\text{p-CO}_2\text{H}$ , Cl, Br;  $\text{R}=\text{CH}_2\text{Ph}$ ,  $\text{CH}_2\cdot\text{C}_6\text{H}_4\text{Y}$  where  $\text{Y}=\text{o-}$ , *m*-, and *p*-Me, -F, -Cl, -NO<sub>2</sub>, and *m*- and *p*-Br) in AcOH containing 1%  $\text{H}_2\text{O}$  have been determined (cf. A., 1932, 26). The majority (including those of the preceding paper) accord with the view that each of the groups X and R contributes a characteristic additive quota to the activation energy of chlorination. (I) and ethers of salicylic acid give anomalous results. The order of reactivity for *p*-substituents in the  $\text{CH}_2\text{Ph}$  radical is  $\text{Me} > \text{H} > \text{F} > \text{Cl} > \text{Br} > \text{NO}_2$ ; in the *m*-position the halogens show almost identical effects. The reactivity of the *o*- and *m*-halogenobenzyl ethers is  $<$  that of the *p*-compounds. The results indicate a mesomeric effect in the order  $\text{F} > \text{Cl} > \text{Br}$ . The following have been prepared:—*p*-chlorophenyl ethers: *m*-, b.p.  $223\text{--}225^\circ/12\text{ mm.}$ , and *p*-, m.p.  $60^\circ$ , -fluoro-; *o*-, b.p.  $191^\circ/12\text{ mm.}$ , *m*-, b.p.  $222\text{--}224^\circ/12\text{ mm.}$ , and *p*-, m.p.  $60^\circ$ , -chloro-; *m*-, m.p.  $43^\circ$ , and *p*-, m.p.  $93^\circ$ , -bromo-; *p*-methyl-, m.p.  $97^\circ$ , and *o*-nitro-benzyl, m.p.  $73^\circ$ ; *o*-chlorophenyl ethers: *p*-fluoro-, m.p.  $35^\circ$ , b.p.  $170^\circ/12\text{ mm.}$ , *p*-chloro-, m.p.  $69^\circ$ , *p*-methyl-, m.p.  $76^\circ$ , and *o*-nitro-benzyl, m.p.  $84.5^\circ$ ; *p*-bromophenyl ethers: *p*-chloro-, m.p.  $98^\circ$ , and *p*-methyl-benzyl, m.p.  $105^\circ$ ; *o*-bromophenyl ethers: *p*-chloro-, m.p.  $69^\circ$ , and *o*-, m.p.  $107^\circ$ , and *m*-, m.p.  $100^\circ$ , -nitro-benzyl. *p*-(*p*-Fluorobenzoyloxy)benzoic acid has m.p.  $213^\circ$ , the corresponding *p*'-chloro-acid, m.p.  $218^\circ$ , and *p*'-bromo-acid, m.p.  $231^\circ$ . *p*-(*p*-Methylbenzoyloxy)benzoic acid has m.p.  $212^\circ$ , and the corresponding *m*'-methyl-acid, m.p.  $157^\circ$ . *p*-(*m*'-Fluorobenzoyloxy)benzoic acid has m.p.  $194^\circ$ , the corresponding *m*'-chloro-acid, m.p.  $194^\circ$ , and *m*'-bromo-acid, m.p.  $202^\circ$ . *p*-(*o*'-Fluorobenzoyloxy)benzoic acid has m.p.  $181^\circ$ , the corresponding *o*'-chloro-acid, m.p.  $189^\circ$ , and the *o*'-methyl-acid, m.p.  $169^\circ$ . *o*-Benzoyloxybenzoic acid has m.p.  $77^\circ$  and *o*-(*p*'-fluorobenzoyloxy)benzoic acid, m.p.  $87^\circ$ , the corresponding *p*'-chloro-acid, m.p.  $115^\circ$ , and the *p*'-methyl-acid, m.p.  $111^\circ$ .

H. G. M.

***o*-Nitrophenylsulphenates of phenols.** E. K. LEARMONTH and S. SMILES (J.C.S., 1936, 327—328).—The 2-nitrophenylsulphenates of the phenols are obtained from  $2:1\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{SCl}$  and the Na phenoxide and converted into the OH-sulphides with HCl. 2-Nitrophenylsulphenates of *m*-4- (I), m.p.  $85^\circ$ , and *m*-5-xylene (II), m.p.  $74^\circ$ , 2-chloro-, m.p.  $118\text{--}120^\circ$ , and 2:6-dichloro-*m*-5-xylene, m.p.  $125\text{--}127^\circ$ , 5-chloro-*p*-2-xylene, m.p.  $120^\circ$  and  $\psi$ -cumenol, m.p.  $103^\circ$ , have been prepared. (I) gives 2-nitro-2'-hydroxy-3:5'-dimethyldiphenyl sulphide (*Me* ether, m.p.  $79^\circ$ ). 2-Nitro-4'-hydroxy-2':6'-dimethyldiphenyl sulphide, m.p.  $154^\circ$  [from (II)] (*Ac* derivative, m.p.  $121^\circ$ ; *Me* ether, m.p.  $130^\circ$ ), is oxidised to the sulphone, m.p.  $218^\circ$  (decomp.). 3'-Chloro-2-nitro-6'-hydroxy-2':4'-dimethyldiphenyl sulphide forms an *Ac* derivative, m.p.  $145^\circ$ , and a *Me* ether, m.p.  $156^\circ$ , and 2-nitro-2'-hydroxy-3':5':6'-trimethyldiphenyl sulphide gives an *Ac* derivative, m.p.  $135^\circ$ . F. R. S.

**Benzylation of phenol.** L. McMASTER and W. M. BRUNER (Ind. Eng. Chem., 1936, 28, 505—506).— $\text{CH}_2\text{PhCl}$  dropped slowly into  $\text{PhOH}$  (10 mols.) at  $150^\circ$ , yields *o*- (52.7%) and *p*- (39.9%)  $\text{CH}_2\text{Ph}\cdot\text{C}_6\text{H}_4\cdot\text{OH}$

together with 2:4- and 2:6-(CH<sub>2</sub>Ph)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·OH which are separated in a 40-in. Vigreux column. The effect of varying the temp. and mol. ratio is recorded.

F. R. G.

**Hydrolysis and thermal decomposition of mixed diacyl derivatives of 4-chloro-2-aminothiophenol.** H. P. LANKELMA and E. VOPIČKA (J. Amer. Chem. Soc., 1936, 58, 609—611; cf. A., 1931, 348).—4-Chloro-2-cinnamamidothiophenyl cinnamate, m.p. 172—173°, and 4-chloro-2-phenylacetamidothiophenyl phenylacetate, m.p. 149°, are hydrolysed (method: *loc. cit.*) to 4-chloro-2-cinnamamidothiophenol, m.p. 153—155° (acetate, m.p. 138°; benzoate, m.p. 164—165°), and 4-chloro-2-phenylacetamidothiophenol (I), m.p. 126° [acetate (II), m.p. 122—123°; benzoate, m.p. 161°], respectively. 4-Chloro-2-acetamidothiophenyl phenylacetate (III), m.p. 149°, and cinnamate, m.p. 142°, and 4-chloro-2-benzamidothiophenyl phenylacetate, m.p. 154°, and cinnamate, m.p. 122°, are described. Hydrolysis (EtOH-KOH at room temp.) of each pair of isomeric NS-diacyl derivatives gives the same N-acyl derivative (migration of acyl between S and N thus occurring), which when crystallised from EtOH passes into the corresponding benzthiazole (also formed by thermal decomp. of each pair of isomerides); for the following pairs the first-named group is eliminated on hydrolysis: Ac-CH<sub>2</sub>Ph·CO·; Ac-cinnamyl; CH<sub>2</sub>Ph·CO·-Bz; Bz-cinnamyl; Ac-Bz. Thus, (II) and (III) give (I) and then 5-chloro-2-benzylbenzthiazole, m.p. 81—82°.

H. B.

**Alkylated phenolic hydroxy-indenes and -indanes. Synthesis involving condensation of diacetone alcohol or pinacol with phenols.** J. B. NIEDERL, V. NIEDERL, and S. REZNEK (J. Amer. Chem. Soc., 1936, 58, 657—659).—Diacetone alcohol (I) (1 mol.), PhOH (1 mol.), and ZnCl<sub>2</sub> (2 mols.) at 180—210° give polymeric 5-hydroxy-1:1:3-trimethylindene, b.p. 250—255°/3 mm., m.p. 80—90°, pyrolysis of which affords 10—15% of 5-hydroxy-1:1:3-trimethylindane (II), b.p. 263—267°, m.p. 119° [(NO<sub>2</sub>)<sub>2</sub>·, m.p. 112°, and Br<sub>2</sub>·, m.p. 190°, derivatives; Me ether, an oil (*Br*-derivative, m.p. 69°)], oxidised (conc. HNO<sub>3</sub>) to 4-hydroxyphthalic acid and anhydride and *m*-OH·C<sub>6</sub>H<sub>4</sub>·COMe. Non-cryst. hydroxytetramethylindanes (not investigated) are similarly formed from the cresols and (I); guaiacol leads to 5-hydroxy-(?)methoxy-1:1:3-trimethylindane, b.p. 258—265°. Pinacol and PhOH similarly lead to 5-hydroxy-1:1:2-trimethylindane, m.p. 121°. Cryst. products could not be obtained from diacetone glycol (β-methylpentane-βδ-diol). Numerous by-products (e.g., COMe<sub>2</sub>, mesityl oxide, phenolic and non-phenolic chromans, *p*-C<sub>6</sub>H<sub>4</sub>Bu<sup>γ</sup>·OH, resins) are also formed in the condensations. (II) appears to possess slight oestrogenic activity.

H. B.

**Condensation of succinic anhydride with phenols and phenolic ethers. Synthesis of derivatives of tetrahydronaphthalene.** P. C. MITTER and S. DE (J. Indian Chem. Soc., 1935, 12, 747).—PhOMe, succinic anhydride, and AlCl<sub>3</sub> in (·CHCl<sub>2</sub>)<sub>2</sub> give γ-keto-γ-*p*-methoxyphenylbutyric acid [semicarbazone, m.p. 185—186° (decomp.)] in good yield (cf. A., 1934, 652). This on Clemmensen reduction

gives γ-*p*-methoxyphenylbutyric acid, m.p. 60°, dehydrated by P<sub>2</sub>O<sub>5</sub> in C<sub>6</sub>H<sub>6</sub> to 1-keto-7-methoxy-1:2:3:4-tetrahydronaphthalene, m.p. 61° (semicarbazone, m.p. 221°), reduced (Clemmensen) to 1:2:3:4-tetrahydro-7-naphthyl Me ether, m.p. 146°. The following compounds were similarly prepared and also appear new: γ-keto-γ-3:4-dimethoxyphenylbutyric acid, m.p. 163° (from veratrole) (semicarbazone, m.p. 177°); γ-3:4-dimethoxyphenylbutyric acid, m.p. 61°; 1-keto-6:7(=7:8)-dimethoxy-1:2:3:4-tetrahydronaphthalene, m.p. 99—100° (semicarbazone, m.p. 242—243°); and γ-o-hydroxyphenylbutyric acid, m.p. 65—66°. H. G. M.

**Naphthalene series. IV. Hydrolysis of α-naphthylamine by dilute sulphuric acid.** N. N. VOROSHCHEV and A. V. GUTORKO (J. Gen. Chem. Russ., 1935, 5, 1581—1585).—Max. yields of α-C<sub>10</sub>H<sub>7</sub>·OH are obtained at 200°, taking 1 mol. of H<sub>2</sub>SO<sub>4</sub> per mol. of α-C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub>; the concn. of the acid is immaterial.

R. T.

**Diaryls and their derivatives. VIII. Influence of acidity of the medium on interaction of β-naphthol with ferric chloride.** J. S. JOFFE, S. G. KUZNETZOV, and S. LITOVSKI (J. Gen. Chem. Russ., 1935, 5, 1685—1686).—In the reaction between β-C<sub>10</sub>H<sub>7</sub>·OH and aq. FeCl<sub>3</sub> the yield of 2:2'-dihydroxy-1:1'-dinaphthyl falls, and that of 1:2-C<sub>10</sub>H<sub>6</sub>Cl·OH rises, with increasing [HCl].

R. T.

**Phenanthrene series. I. 2-Methoxy-1-methylphenanthrene.** P. HILL, W. F. SHORT, and (in part) (MISS) A. HIGGINBOTTOM. **II. 7-Methoxy-1-methylphenanthrene and a new route to phenanthrene.** W. F. SHORT, H. STROMBERG, and A. E. WILES. **III. 9-Hydroxyphenanthrene.** I. R. SHERWOOD, W. F. SHORT, and J. WOODCOCK (J.C.S., 1936, 317—319, 319—322, 322—324).—I. 1:2-C<sub>10</sub>H<sub>6</sub>Me·OMe, succinic anhydride, and AlCl<sub>3</sub> give β-(2-methoxy-1-methyl-6-naphthoyl)propionic acid, m.p. 161—162°, reduced (Hg-Zn) to γ-(2-methoxy-1-methyl-6-naphthyl)butyric acid, m.p. 123—123·5°, which with SnCl<sub>4</sub>-HCl forms 1-keto-7-methoxy-8-methyl-1:2:3:4-phenanthrene, m.p. 107° (2,4-dinitrophenylhydrazine, m.p. 281°). Reduction (Zn-Hg) of the keto-compound affords 7-methoxy-8-methyl-1:2:3:4-tetrahydrophenanthrene, m.p. 111—112°, dehydrogenated (Se) to 2-methoxy-1-methylphenanthrene, m.p. 161°, which is demethylated to the 2-OH-compound, m.p. 196—197°. 4-Methylphenanthrene (cf. Radcliffe *et al.*, A., 1931, 1282) has m.p. 49—50°.

II. β-C<sub>10</sub>H<sub>7</sub>·OMe, succinic anhydride, and AlCl<sub>3</sub> in CS<sub>2</sub> give β-(2-methoxy-1-naphthoyl)propionic acid, m.p. 136·5—137·5° (*Et* ester, m.p. 41—42°), whilst in PhNO<sub>2</sub>, a mixture of 1 part of this acid with 4 parts of β-(2-methoxy-6-naphthoyl)propionic acid (I), m.p. 148·5—149° (*Me* ester, m.p. 98°), is formed (cf. Fieser and Peters, A., 1933, 67). The *Et* ester of (I) and MgMeI, followed by acidification, yield γ-(2-methoxy-6-naphthyl)-Δ<sup>β</sup>-pentenoic acid, m.p. 171—171·5°, reduced (PtO<sub>2</sub>-H<sub>2</sub>) to γ-(2-methoxy-6-naphthyl)-*n*-valeric acid, m.p. 121·5°, which is dehydrated (P<sub>2</sub>O<sub>5</sub>) to 4-keto-7-methoxy-1-methyl-1:2:3:4-tetrahydrophenanthrene, b.p. 195°/0·8 mm. [2:4-dinitrophenylhydrazine, m.p. 241° (decomp.)]. Reduction (Zn-Hg)

and dehydrogenation (Se) of the cyclic ketone gives 7-methoxy-1-methylphenanthrene, m.p. 133.5–134.5°, demethylated to the 7-OH-compound, m.p. 190–191° [acetate, m.p. 135.5–136°, *acetoxiquinone*, m.p. 202–207° (decomp.), and *acetoxiquinoxaline*, m.p. 244.5–246.5°]. Mg *o*-tolyl iodide and 2-methylcyclohexanone give 1-*o*-tolyl-2-methylcyclohexanol, b.p. 153–154°/14 mm., dehydrogenated (S) to 2:2'-dimethyldiphenyl. 2-Methylcyclohexanone and the Grignard compound of 6-bromo-*m*-tolyl Me ether afford 1-(5'-methoxy-*o*-tolyl)-2-methyl- $\Delta^1$ -cyclohexene, b.p. 154–155°/13 mm., dehydrogenated (HI) to 4-hydroxy-2:2'-dimethyldiphenyl, m.p. 105°.

III. *Et diphenyl-2-acetate*, b.p. 154–155°/4 mm. (from 2-phenylcyclohexanone,  $\text{CH}_2\text{Br}\cdot\text{CO}_2\text{Et}$ , and Zn), with  $\text{H}_2\text{SO}_4$  forms 9-hydroxyphenanthrene. The Grignard compound of 3-bromo-*p*-tolyl Me ether and cyclohexanone afford 1-(4'-methoxy-*m*-tolyl)- $\Delta^1$ -cyclohexene, dehydrated ( $\text{KHSO}_4$ ) to 1-(4'-methoxy-*m*-tolyl)- $\Delta^1$ -cyclohexene, b.p. 163°/20 mm., which is oxidised ( $\text{BzO}_2\text{H}$ ) to the oxide, isomerised to 2-(4'-methoxy-*m*-tolyl)cyclohexanone (*semicarbazone*, m.p. 199–200°).

F. R. S.

Manufacture of pyrene compounds [hydroxy-pyrenes and their sulphonic acids].—See B., 1936, 361.

Preparation of *sec*.-alkyl- and chloro-*sec*.-alkyl-resorcinols.—See B., 1936, 443.

Colour reactions of quinol in solid state. S. J. FRENCH and D. J. SAUNDERS (J. Amer. Chem. Soc., 1936, 58, 689–690).—The colours produced (cf. Mالدینی, A., 1914, ii, 681) when solid quinol (I) is mixed with various solid salts depend on the presence of traces of  $\text{H}_2\text{O}$  (cf. *loc. cit.*); anhyd. salts give no colour, whilst an excess of  $\text{H}_2\text{O}$  leads to yellow solutions. The colour varies from grey through blue and green to black, is roughly  $\propto$  the increasing alkalinity of the salt [also shown by using solid buffers of  $p_{\text{H}}$  (in solution)  $> 10.4$ ], and is given only by salts of acids having ionisation consts.  $<$  that of (I) (primary stage). The reaction can be used to distinguish between, e.g.,  $\text{Na}_3\text{PO}_4$  and  $\text{Na}_2\text{HPO}_4$  (no colour),  $\text{Na}_2\text{CO}_3$  and  $\text{NaHCO}_3$  (no colour), (I) and *o*- or *m*- $\text{C}_6\text{H}_4(\text{OH})_2$  (which do not show similar colour reactions), hydrated and anhyd. salts. H. B.

Oxidation of quinol and of chloroquinol in presence of ammonium sulphite. Oxidation of a quinoldisulphonic acid in presence of ammonia. (Mlle.) Y. GARREAU (Compt. rend., 1936, 202, 1186–1188).—Quinol or chloroquinol in dil. aq.  $\text{NH}_3$  containing  $(\text{NH}_4)_2\text{S}$ , and  $\text{Cu}(\text{OH})_2$  afford  $\alpha$ -(I) (cf. A., 1935, 338) and  $\beta$ -diaminobenzoquinonedisulphonic acid [ $+2\text{H}_2\text{O}$ ;  $(\text{NH}_4)_2$  salt  $+3\text{H}_2\text{O}$ , decomp. at 240°, which loses  $1\text{H}_2\text{O}$  at 120°;  $\text{NH}_4$  salt  $+1\text{H}_2\text{O}$  (II)] either of which with warm KOH gives a K quinoldisulphonate. (II) affords ppts. with some bases of biological interest (cf. this vol., 337). J. L. D.

New method of condensation. C. MARSCHALK (Bull. Soc. chim., 1936, [v], 3, 121–124).—Condensation of two mols. of a  $\text{C}_6\text{H}_6$  or  $\text{C}_{10}\text{H}_8$  derivative takes place in presence of  $\text{H}_3\text{BO}_3$ – $\text{H}_2\text{SO}_4$ –anthraquinone-1:5- or -1:8-disulphonic acid, the H eliminated converting the latter into a leuco-derivative from

which the sulphonic acid may be regenerated. In this way  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{OEt}$  gives 4:4'-diethoxy- $\alpha$ -dinaphthyl (A., 1922, i, 1336), and 1:5- $\text{C}_{10}\text{H}_6(\text{OH})_2$  yields a compound, readily oxidised by the air, insol. in boiling  $\text{H}_2\text{O}$ , sol. in alkalis, but which does not couple with diazotised  $p$ - $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$ . The method is suitable for compounds sensitive to oxidising agents.

H. G. M.

Metabolism of polycyclic compounds. II. Production of dihydroxydihydroanthraceneglycuronic acid from anthracene. E. BOYLAND and A. A. LEVI (Biochem. J., 1936, 30, 728–731).—The glycuronic acid compound (I) excreted when rabbits are fed a diet containing anthracene (A., 1936, 234), when warmed with dil. HCl gave anthrylglycuronic acid (II),  $\alpha_{\text{D}}^{20}$   $-52^\circ$  in dioxan, Na salt,  $-79^\circ$  (in water), which with boiling 0.2N- $\text{H}_2\text{SO}_4$  yielded a compound, probably  $\alpha$ -anthrol (*Ac* derivative, m.p. 127°). Oxidation of (I) with  $\text{CrO}_3$ – $\text{AcOH}$  and of (II) with alkaline  $\text{KMnO}_4$  gave compounds, m.p. 185–186° and 193°, respectively, probably both 1-hydroxyanthraquinone. (I) with alkaline  $\text{KMnO}_4$  gave 2:3- $\text{C}_{10}\text{H}_6(\text{CO}_2\text{H})_2$ . (I) is reduced with  $\text{H}_2$  (Pd) to a compound,  $\text{C}_{20}\text{H}_{22}\text{O}_8\cdot 2\text{H}_2\text{O}$ , m.p. 188°, probably 1:2-dihydroxy-1:2:3:4-tetrahydroanthraceneglycuronic acid, which with 2N-HCl yielded a compound, m.p. 149°, probably 2-keto-1:2:3:4-tetrahydroanthracene. Rats fed the same diet excrete much less glycuronic acid, but it is probable that they excrete an analogous levorotatory compound which is readily hydrolysed to (II). It is concluded that (I) is 1:2-dihydroxy-1:2-dihydroanthracene-1-glycuronic acid.

P. W. C.

Action of thionyl chloride on cyclohexanol. P. CARRÉ and D. LIBERMANN (Bull. Soc. chim., 1936, [v], 3, 144).—The dehydration of cyclohexanol to cyclohexene by  $\text{SOCl}_2$ , and the decomp. of cyclohexyl sulphite when distilled under reduced pressure, are confirmed (cf. A., 1935, 480, 1492).

H. G. M.

cycloHexylvinylcarbinol. S. N. DANILOV and S. M. RIZOV (J. Gen. Chem. Russ., 1935, 5, 1696–1698).—Mg cyclohexyl bromide and acetaldehyde in  $\text{Et}_2\text{O}$  yield cyclohexylvinylcarbinol, b.p. 89–91°/12 mm., the acetate, b.p. 94–103°/14 mm., of which was brominated, and the product treated with  $\text{AgOAc}$  in  $\text{AcOH}$  at 120°, to yield probably  $\text{C}_6\text{H}_{11}\cdot\text{CH}(\text{OAc})\cdot\text{CBr}\cdot\text{CH}_2$ , b.p. 143–145°/2 mm.

R. T.

Mutual influence of radicals on their migration. Dehydration of phenyltert.-amylcarbinol. A. E. FAVORSKI and P. A. TICHOMOLOV (J. Gen. Chem. Russ., 1935, 5, 1679–1684).— $\text{COPhPr}$ ,  $\text{NaNH}_2$ , and MeI afford *Ph* tert.-amyl ketone, b.p. 106–107°/8 mm., reduced by Na in  $\text{EtOH}$  to the corresponding carbinol (I), b.p. 124.5–125.5°/12–13 mm. (I) is converted by distillation from  $\text{KHSO}_4$  into  $\alpha$ 3-dimethyl- $\beta$ -ethylstyrene, b.p. 99.5–100°/22.5 mm., 206.5–207°/764 mm., which yields  $\text{COPhMe}$  and  $\text{COMeEt}$  when ozonised.

R. T.

Manufacture of [triarylmethane] dyes.—See B., 1936, 361.

dl-Tolylalanine and its bacterial decomposition. T. SASAKI and I. OTSUKA (J. Biochem. Japan,

1936, 23, 139—146).—Glycine anhydride condensed with *o*-tolualdehyde (Sasaki, A., 1921, i, 196) yields 3:6-di-(*o*-methylbenzylidene)-2:5-diketopiperazine, m.p. 273—274° [corresponding *m*-, m.p. 246—247° (decomp.), and *p*-compounds], reduced and hydrolysed to β-(*o*-tolyl)-α-alanine, m.p. 259—260° (decomp.) (anhydride, m.p. 228—230°) [corresponding *m*- (Böhm, A., 1914, i, 358) and *p*-compound (Dakin, A., 1911, ii, 416), and their anhydrides, m.p. 187—188° and 257—258°, respectively]. With *B. proteus*, only *p*-tolyl-alanine of the three isomerides yields β-(*p*-tolyl)-α-lactic acid, m.p. 79—80° (uncorr.),  $[\alpha]_{D}^{20} +27.82^\circ$  (Na salt in H<sub>2</sub>O). F. O. H.

**Complex formation between polynitro-compounds and aromatic hydrocarbons. II. The system 2:4-dinitro-2'-methylthiophenyl-6-carboxylic acid-benzene.** D. L. HAMMICK and R. B. WILLIAMS (J.C.S., 1935, 1856—1860).—*r*-2:4-Dinitro-2'-methylthiophenyl-6-carboxylic acid (I) [improved prep.; monohydrate, m.p. 120° (decomp.) on rapid heating; mono-MeOH complex, m.p. 130—135° (decomp.) on rapid heating] forms complexes with C<sub>6</sub>H<sub>6</sub> in the molar ratios 2:1 and 1:1, m.p. about 138° and 128°, respectively (cf. A., 1930, 1287). (I) when resolved with brucine gives an active acid,  $[\alpha]_{5791} -19.4^\circ$  (cf. *loc. cit.*), but with *d*-α-phenylethylamine an acid (II), m.p. 135°,  $[\alpha]_{5791} +89.1^\circ$  in EtOH [d-α-phenylethylamine salt, m.p. 218°,  $[\alpha]_{5791} +57.1^\circ$  in CMe<sub>2</sub>; monohydrate, m.p. 80—85° (decomp.),  $[\alpha]_{5791} +84.6^\circ$ ; mono-MeOH complex, m.p. 90—100° (decomp.) on rapid heating], was obtained. The activity in EtOH of (II) is unchanged by complex formation with H<sub>2</sub>O, MeOH, or C<sub>6</sub>H<sub>6</sub> (cf. *loc. cit.*). Crystallisation of a mixture of (I) and (II) from C<sub>6</sub>H<sub>6</sub> gives mother-liquors richer in (II), the C<sub>6</sub>H<sub>6</sub> complex of (I) being sparingly sol. Only partial separation, however, can thus be obtained. Similarly 4:6:4'-trinitrodiphenic acid can be further resolved by crystallisation from C<sub>6</sub>H<sub>6</sub>. When resolved by quinine, the acid has  $[\alpha]_{5461} -24.6^\circ$  in Et<sub>2</sub>O, but after recrystallisation from C<sub>6</sub>H<sub>6</sub> the mother-liquors gave an acid of  $[\alpha]_{5461} -42.2^\circ$  in Et<sub>2</sub>O. H. G. M.

**Apparent cases of liquid-crystal formation in *p*-alkoxybenzoic acids.** B. JONES (J.C.S., 1935, 1874).—The following *p*-alkoxybenzoic acids, prepared by refluxing *p*-OH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H with KOH-H<sub>2</sub>O and the appropriate alkyl iodide, melt sharply to milky liquids which at a higher temp. suddenly become clear. When the temp. is lowered 0.5—1.0° the clear liquid appears to become a mass of fine crystals (cf. A., 1930, 87). The transition point is given in parentheses. *p*-*n*-Amyloxy- (122°), m.p. 148°, *p*-*n*-hexyloxy- (105°), m.p. 150°, *p*-*n*-heptyloxy- (91°), m.p. 145°, *p*-*n*-octyloxy- (100°), m.p. 145°, *p*-cetyloxy-benzoic acid (99°), m.p. 131°. H. G. M.

**Action of sulphuric acid on diarylphthalins. II. Mechanism of reaction.** F. F. BLICKE and R. A. PATELSKI (J. Amer. Chem. Soc., 1936, 58, 559—562).—The production of a 2:5-diaryl-3:4-benzofuran (I) from a diarylphthalin (II) and conc. H<sub>2</sub>SO<sub>4</sub> is considered to occur thus: (II) is converted into ArH and an α-arylphthalide (by way of the benzhydrol-2-carboxylic acid), which then recombine to give either the 2-arylbzhydrol (III) or 2-hydroxy-

2:5-diaryl-2:5-dihydro-3:4-benzofuran (IV); (III) or (IV) is then dehydrated to (I). This view is supported by the prep. of 2:5-dianisyl-3:4-benzofuran (V) from α-anisylphthalide (VI), PhOMe, and conc. H<sub>2</sub>SO<sub>4</sub>; (V) is oxidised (Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, AcOH-H<sub>2</sub>SO<sub>4</sub>) to 4'-methoxy-2-anisoylbzphenone (VII). Similarly, (VI) and PhOH or α-*p*-hydroxyphenylphthalide (VIII) and PhOMe give 2-*p*-hydroxyphenyl-5-anisyl-3:4-benzofuran, converted by successive oxidation and methylation (Me<sub>2</sub>SO<sub>4</sub>, 10% NaOH) into (VII); (VIII) and PhOH afford 2:5-di-*p*-hydroxyphenyl-3:4-benzofuran, oxidised to 4'-hydroxy-2-*p*-hydroxybenzoylbzphenone. Attempted prep. of compounds of type (III) results in the production of (I). Thus, *o*-CN·C<sub>6</sub>H<sub>4</sub>·CHO (IX) (*p*-bromophenylhydrazine, m.p. 194—195°), from *o*-CN·C<sub>6</sub>H<sub>4</sub>·CHBr<sub>2</sub> and AgNO<sub>3</sub> in 95% EtOH, with MgPhBr gives the imine, m.p. 126—127°, of 2-benzoylbzhydrol; this is hydrolysed (HCl-COMe<sub>2</sub>) to 2:5-diphenyl-3:4-benzofuran, oxidised to 2-benzoylbzphenone. Similarly, the crude imine from (IX) and *p*-OMe·C<sub>6</sub>H<sub>4</sub>·MgI is hydrolysed to (V). 2-Benzoylbzphenone and MgPhBr afford 2-benzyltriphenylcarbinol (X), m.p. 133—134°, which is converted by cold conc. H<sub>2</sub>SO<sub>4</sub> or hot AcOH into 9:9-diphenyl-9:10-dihydroanthracene. (X) is oxidised by dil. HNO<sub>3</sub> to 9:9-diphenyl-10-anthrone. H. B.

**Ester condensation and ketal acetals. Existence of carbon monoxide acetals.** F. ADICKES (Ber., 1936, 69, [B], 654—656).—A reply to Scheibler (cf. this vol., 66), whose "phenylketen methyl benzoyl acetal" is probably *Me* β-benzoyloxy-α-β-diphenylacrylate. H. W.

**Action of nitrogen dioxide on tetraphenylsuccinonitrile.** G. WITTIG and U. PÖCKELS (Ber., 1936, 69, [B], 790—792).—(CPh<sub>2</sub>·CN)<sub>2</sub> does not react with NO in boiling xylene alone or in presence of Cu powder or I. It is very readily converted by NO<sub>2</sub> in CHCl<sub>3</sub> into nitrodiphenylacetone (I), m.p. 44—46°, the change affecting both radical and undissociated mol. Boiling, somewhat dil AcOH transforms (I) into benzilonitrile (II), m.p. 127—130° (decomp.), converted by alkali or boiling H<sub>2</sub>O into CPh<sub>2</sub> and HCN. (II) could not be obtained from CPh<sub>2</sub> and HCN in acid medium. LiPh and BzCN react very readily, but even at -60° the adduct passes into LiCN and CPh<sub>2</sub>, transformed further into CPh<sub>2</sub>·OH. H. W.

**Electrosynthesis of aromatic carboxylic acids. I. Electrolysis of opianic acid.** V. M. RODIONOV, V. N. BELOV, and V. V. LEVTSCHENKO (J. Gen. Chem. Russ., 1935, 5, 1817—1829).—When K opianate is electrolysed with a constantly renewed Hg cathode, α-, m.p. 244—245°, and β-dimeconyl, m.p. 215°, are obtained; the compounds represent the racemic and meso-forms of dimeconyl. The α-isomeride is synthesised from opianyl chloride and Na-Hg in C<sub>6</sub>H<sub>6</sub> at room temp. R. T.

**Carbon syntheses with malonic acid and related compounds. II. Aromatic aldehydes.** A. MICHAEL and N. WEINER (J. Amer. Chem. Soc., 1936, 58, 680—684; cf. A., 1933, 1142).—ArCHO cannot be condensed (using Ac<sub>2</sub>O-conc. H<sub>2</sub>SO<sub>4</sub>; Meldrum, J.C.S., 1908, 93, 605) with CH<sub>2</sub>(CO<sub>2</sub>H)<sub>2</sub>,

hydration of the  $\cdot O \cdot$  ring and subsequent loss of  $2H_2O$  by 50% AcOH at  $100^\circ$  into an *anhydrolactone* (VI),  $C_{23}H_{30}O_6$ , m.p.  $260-284^\circ$ ,  $[\alpha]_D^{25} +98^\circ$  in  $C_5H_5N$  [(3-*benzoate*, m.p.  $265^\circ$ ; (5-*sulphite*, m.p.  $242-243^\circ$ , obtained using  $SOCl_2$  at  $0^\circ$ ). (VI) is also obtained from (II) and 0.1*N*-NaOH followed by 5%  $KMnO_4$  in  $C_5H_5N$ . Oxidation (Kiliani's  $CrO_3$  solution; 90% AcOH) of (VI) gives a *ketoanhydrolactone*,  $C_{23}H_{28}O_6$ , m.p.  $251^\circ$ , thus showing the presence of  $C_{(3)}H \cdot OH$ ; catalytic reduction results in the uptake of 1 mol. of  $H_2$ . (VI) thus appears to contain the  $\Delta^{14:15}$  (or  $\Delta^{7:8}$ ) double linking and the  $C_{(10)} \cdot CO \cdot O \cdot C_{(8)}$  (or  $C_{(10)} \cdot CO \cdot O \cdot C_{(14)}$ ) group. (V) and 50% AcOH at  $100^\circ$  followed by a little 5%  $H_2SO_4$ , give (by fission of  $\cdot O \cdot$  ring and then loss of  $2H_2O$ ) a *dianhydrolactone Me ester*,  $C_{24}H_{32}O_6$ , m.p.  $199^\circ$  (softens about  $190^\circ$ ), which probably contains  $C_{(10)} \cdot CO_2Me$  and the  $\Delta^{7:8}$  and  $\Delta^{14:15}$  double linkings. Reduction ( $H_2$ ,  $PtO_2$ , EtOH) of (II) furnishes the *trihydroxylactone oxide* (A,  $R=CH_2 \cdot OH$ ), m.p.  $265^\circ$ ,  $[\alpha]_D^{25} +47^\circ$  in  $C_5H_5N$  [*dibenzoate* (VII), softens about  $145-150^\circ$  and then melts slowly], converted by hot 50% AcOH into an isomeric *trihydroxylactone oxide* (VIII), m.p.  $282^\circ$  (decomp.),  $[\alpha]_D^{25} +83^\circ$  in  $C_5H_5N$  (*benzoate*, m.p.  $274-275^\circ$ ), which is oxidised ( $CrO_3$ , 90% AcOH) to a *ketodihydroxylactone oxide*,  $C_{23}H_{32}O_6$ , m.p.  $272^\circ$  (decomp.) (softens about  $260^\circ$ ). (VIII) thus appears to contain OH groups at  $C_{(3)}$ ,  $C_{(5)}$ , and  $C_{(14)}$  (or  $C_{(8)}$ ) and the  $C_{(10)} \cdot CH_2 \cdot O \cdot C_{(8)}$  (or  $C_{(10)} \cdot CH_2 \cdot O \cdot C_{(14)}$ ) group. (VII) and 75% AcOH-10%  $H_2SO_4$  give, however, the *dibenzoate*, m.p.  $210-211^\circ$ , of a pentahydroxylactone, i.e.,  $C_{(3)} \cdot OBz$ ,  $C_{(10)} \cdot CH_2 \cdot OBz$ , and OH at  $C_{(5)}$ ,  $C_{(8)}$ , and  $C_{(14)}$ . Oxidation ( $BzO_2H$  or  $KMnO_4$ -AcOH) of  $Me_2$  anhydro- $\beta$ -isostrophanthic lactone acid ester (A., 1929, 1456) also affords an *oxide*, m.p.  $244-245^\circ$  (softens at  $240^\circ$ ),  $[\alpha]_D^{25} -26^\circ$  in  $C_5H_5N$ , converted by 50% AcOH-10%  $H_2SO_4$  into the *dianhydrolactone Me ester* (IX), m.p.  $178-180^\circ$ .

It is concluded that (I), (III), and (IV) contain either the  $\Delta^{14:15}$  or  $\Delta^{8:14}$  double linking; the former may predominate in alkaline, the latter in neutral and acid, solution; alternatively, both forms may occur simultaneously but oxidation proceed at different rates. The  $\beta$ -anhydrodigitoxigenin (X) of Smith (A., 1935, 1226) can be converted into the  $\alpha$ -isomeride (XI) by conc. acid. Dehydration of digitoxigenin may thus give (X) and then (by isomerisation) (XI). The change (X)  $\rightarrow$  (XI) may, however, involve merely a shift of the double linking.

XXXIV. Dihydrostrophanthidin with KCN and  $NH_4Cl$  in aq. EtOH gives a cyanohydrin (not isolated), hydrolysed (hot aq. AcOH) to  $\alpha$ -, m.p.  $254^\circ$  (decomp.),  $[\alpha]_D^{25} -36^\circ$  in  $C_5H_5N$  [*benzoate* (I), m.p.  $320^\circ$ ], and  $\beta$ -, m.p.  $235^\circ$  (decomp.) (softens about  $175^\circ$ ),  $[\alpha]_D^{25} +30^\circ$  in  $C_5H_5N$ , *homodilactones* [as (B)], the isomerism being due to the creation of a new centre of asym-

metry at  $C^*$ . These are both oxidised (Kiliani's  $CrO_3$  solution; 90% AcOH) to the *diketohomodilactone*

[(B) with  $C_{(3)}H \cdot OH$  and  $C^*H \cdot OH$  both  $=CO$ ], m.p.  $189-190^\circ$  (decomp.),  $[\alpha]_D^{25} +75^\circ$  in  $C_5H_5N$ , and are dehydrated (loss of  $H_2O$  between  $C_{(14)}$  and  $C_{(15)}$ ) to  $\alpha$ -, m.p.  $302-303^\circ$ ,  $[\alpha]_D^{25} -72^\circ$  in  $C_5H_5N$ , and  $\beta$ -, m.p.  $305^\circ$  (decomp.) (previous softening), -*anhydrohomodilactones*, respectively, by aq. EtOH-HCl. (II) is similarly oxidised to the *anhydroidiketohomolactone*, m.p.  $196^\circ$  (decomp.) (softens about  $191^\circ$ ). Dihydrostrophanthidin benzoate with KCN and  $NH_4Cl$  in aq.  $C_5H_5N$  affords a *cyanohydrin*, m.p.  $258^\circ$  (decomp.), hydrolysed (repeated evaporation with 50% AcOH) to a *homodilactone benzoate*, m.p.  $305-306^\circ$  (decomp.) [isomeric with (I)], dehydrated to the *anhydrohomodilactone benzoate*, m.p.  $265-268^\circ$  (slight previous softening),  $[\alpha]_D^{25} -38^\circ$  in  $C_5H_5N$ .

XXXV. The acid,  $C_{23}H_{30}O_8$ , previously obtained (A., 1924, i, 65) by successive alkaline hydrolysis and oxidation ( $KMnO_4$ ) of strophanthidin acid,

is now shown to be a monobasic *lactonic acid*,  $C_{21}H_{28}O_7$  [(I) (C) with lactone group between  $C_{(14)} \cdot OH$  and  $CO_2H^*$ ]; its Me ester (cf. *loc. cit.*) (*p*-bromophenylhydrazone, m.p.  $273^\circ$ ) is oxidised ( $C_{(3)}H \cdot OH \rightarrow CO$ ) to the corresponding *diketolactonic ester*, m.p.  $228^\circ$  [*dioxime*, m.p.  $233^\circ$  (decomp.) (sinters about  $210^\circ$ )]. Alkaline hydrolysis of (I) thus gives the dibasic keto-acid (C) (in which  $C_{(14)} \cdot OH$  and  $C_{(17)} \cdot CO \cdot CO_2H$  are *trans*, thus preventing relactonisation), which affords a compound with *o*-phenylenediamine, m.p.  $222-224^\circ$  (decomp.), and is oxidised (dil.  $H_2O_2$ ) to the *dicarboxylic acid* [(C) with  $\cdot CO \cdot CO_2H = CO_2H$ ], m.p.  $295^\circ$  (decomp.) ( $Me_2$  ester, m.p.  $200^\circ$ ). The formulæ for other derivatives (*loc. cit.*) of (I) are revised.

H. B.

Synthesis of conjugated bile acids. II. Glycodeoxycholic acid. F. CORTESE and L. BATT-  
MAN (J. Biol. Chem., 1936, 113, 779-785).—The unstable *chloride*, m.p.  $104^\circ$  (corr.; slight decomp.), of diformyldeoxycholic acid (I) with conc. aq.  $NH_3$  and a little conc. aq. NaOH gives deoxycholamide, m.p.  $188-189^\circ$  (corr.) (softens about  $162^\circ$ ). Glycodeoxycholic acid ( $+H_2O$ ) (II) [prep. essentially by procedure described (A., 1935, 1237) for glycodeoxycholic acid] appears to exist in normal, m.p.  $107^\circ$ , and para, m.p.  $186-187^\circ$  (corr.), forms. (II) forms mixed crystals with small amounts of stearic (III) and the choleic acids from (III) and oleic acid. The "glycodeoxycholic acids" of Wahlgren (A., 1903, i, 302) and Sekitoo (A., 1931, 1179) are mixtures of (II) and a small amount of fatty acid; xylene-glycodeoxycholic acid

(Sekitoo, *loc. cit.*) is probably impure (II). Et deoxycholate, (I), and (II) do not form co-ordination compounds with (III); free OH and CO<sub>2</sub>H groups thus appear necessary (as in deoxycholic acid) for such reaction. The so-called "choleic acid principle" (Wieland and Sorge, A., 1916, i, 710) appears to be of no practical importance either in digestion or in the transport of cholesterol in bile. H. B.

**Synthesis of cyclohexane-1:1:4:4-tetracarboxylic and -1:4-dicarboxylic acids.** V. V. FEOLAKTIKOV and A. A. IVANOV (J. Gen. Chem. Russ., 1935, 5, 1558—1561).—Mg[CH(CO<sub>2</sub>Et)<sub>2</sub>]<sub>2</sub> and C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub> in EtOH yield Et<sub>4</sub> cyclohexane-1:1:4:4-tetracarboxylate, m.p. 75.5—76.5°, converted by alkaline hydrolysis into the free acid, which decomposes at 240° to yield *cis-trans-cyclohexane-1:4-dicarboxylic acid*. R. T.

**Hydrogen cyanide. VII. Aldehydes from aromatic hydrocarbons.** L. E. HINKEL, E. E. AYLING, and J. H. BEYNON (J.C.S., 1936, 339—346).—The application of the HCN synthesis of aromatic aldehydes has been extended to substituted benzenes and to polynuclear hydrocarbons. By the introduction of suitable liquid reaction media, such as C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub>, PhCl, and *o*-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub>, it has been possible to extend the synthesis to solid hydrocarbons and to facilitate the complete conversion of hydrocarbon into aldehyde. The influence of the solvent on the reaction, with reference to the secondary action of the AlCl<sub>3</sub> on the hydrocarbon and the temp. and reaction period, is discussed. C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub> appears to enhance the aldehyde synthesis with most hydrocarbons, but with certain hydrocarbons it increases the tendency to polymerisation.

The following have been prepared: 1:6-dimethyl-4-naphthaldehyde, b.p. 191.5°/16 mm. (oxime, m.p. 123°; semicarbazone, m.p. 202°; phenylhydrazone, m.p. 110°); 2:6-dimethyl-1-naphthaldehyde, m.p. 57° (oxime, m.p. 122—123°; semicarbazone, m.p. 214°; phenylhydrazone, m.p. 122°; NH<sub>2</sub>Ph derivative, m.p. 78°); anthracene-9-aldehyde, m.p. 104—105° (NH<sub>2</sub>Ph derivative, m.p. 175°; phenylhydrazone, m.p. 207°; oxime, m.p. 186—187°; semicarbazone, m.p. 291°); acenaphthene-3-aldehyde, m.p. 87° (phenylhydrazone, m.p. 140°; 2:4-dinitrophenylhydrazone, m.p. 273°; oxime, m.p. 126.5°; semicarbazone, m.p. 234°; NH<sub>2</sub>Ph derivative, m.p. 97°); fluorene-2-aldehyde, m.p. 90° (NH<sub>2</sub>Ph derivative, m.p. 158°; phenylhydrazone, m.p. 202—203°; oxime, m.p. 156—157°; semicarbazone, m.p. 278°). The prep. of the aldehydes by the substitution of chloromethyleneformamide for HCN and HCl has been extended to acenaphthene, anthracene, hydrindene, and C<sub>10</sub>H<sub>8</sub>; but with Ph<sub>2</sub> in PhCl, diphenyl-4-aldehyde, and in C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub>, diphenyl-4:4'-dialdehyde are obtained. F. R. S.

**Action of mixed organo-magnesium derivatives on benzaldehydesemicarbazone.** (MLLE.) D. BIQUARD (Bull. Soc. chim., 1936, 3, [v], 666—668).—The action of MgEtBr on CHPh·N·NH·CO·NH<sub>2</sub> (I) establishes the presence of 3 active H and leads to CPhEt and EtCO·NH<sub>2</sub>. Similarly (I) and MgBuCl afford CPhBu and BuCO·NH<sub>2</sub>. The possible intermediate formation of CO(NH<sub>2</sub>)<sub>2</sub> is negatived by the non-formation of the amides from

this source, whilst the products from NH<sub>2</sub>·CO·NHPh are quite different from those from (I). The suggested mechanism is therefore

**Formation of half-acetals of aldehydes, CH<sub>2</sub>R·CHO.** Nature of their solution in benzyl alcohol. II. Constitution of phenyl- and *p*-tolyl-acetaldehyde and hydratropaldehyde on the basis of their electron distribution. A. MÜLLER (Helv. Chim. Acta, 1936, 19, 225—234; cf. A., 1934, 1301).—When CH<sub>2</sub>Ph·OH (I) is mixed with *p*-C<sub>6</sub>H<sub>4</sub>Me·CH<sub>2</sub>·CHO (II), CH<sub>2</sub>Ph·CHO (III), or CHPhMe·CHO (IV), gradual evolution of heat and change in  $\eta$ , capillariscopic behaviour, and  $n$  occur. Enolisation is involved in the change, since the mixture of (I) and (III) does not immediately absorb acid-free Br in CCl<sub>4</sub>; after some time rapid absorption occurs. The relative amounts of the changes in physical consts. show that the order of reactivity is (III) > (II) > (IV). Compound formation is proved by isolation of an unstable 1:1-additive compound of (I) and (II), m.p. 61–62° after sintering at 58°, formulated as *p*-C<sub>6</sub>H<sub>4</sub>Me·CH·CH·OH ···· CH<sub>2</sub>Ph·OH, but no such product could be obtained from (III) or (IV). The above phenomena, allied to electronic considerations which are in line with the relative reactivities, confirm the previously (*loc. cit.*) propounded mechanism: CH<sub>2</sub>R·CHO + R'·OH → CH<sub>2</sub>R·CHO ···· R'·OH → CHR·CH·OH ···· R'·OH → CH<sub>2</sub>R·CH(OH)·OR'. R. S. C.

**Cannizzaro reaction. IV. Halogeno-derivatives of *m*-hydroxybenzaldehyde.** G. LOCK [with G. NOTTES] (Monatsh., 1936, 67, 320—327; cf. A., 1935, 1238).—Treatment of *m*-OH·C<sub>6</sub>H<sub>4</sub>·CHO with Cl<sub>2</sub> in AcOH at 100° and of the crude product with SnCl<sub>2</sub> in conc. HCl gives 3:2:4:5:6-OH·C<sub>6</sub>H<sub>4</sub>·CHO, m.p. 197—198°, in 88.5% yield; it is converted by 50% KOH at 100° into 2:3:4:6-C<sub>6</sub>H<sub>4</sub>Cl·OH and HCO<sub>2</sub>K. 3:2:4:5:6-OEt·C<sub>6</sub>H<sub>4</sub>·CHO, m.p. 68.5°, similarly gives 2:3:4:6-C<sub>6</sub>H<sub>4</sub>Cl·OEt and HCO<sub>2</sub>K. 3:6-OH·C<sub>6</sub>H<sub>4</sub>Br·CHO (I) and Cl<sub>2</sub> in AcOH at 40—50° give 2-chloro-6-bromo-3-hydroxybenzaldehyde, m.p. 137° (corr.) (Et ether, m.p. 87°; phenylhydrazone, m.p. 107°), transformed by 50% KOH at 100° into 2:4-C<sub>6</sub>H<sub>3</sub>ClBr·OH and HCO<sub>2</sub>K. Further chlorination of (I) affords 2:4-dichloro-6-bromo-3-hydroxybenzaldehyde, m.p. 111° [Et ether, m.p. 73°; oxime, m.p. 181° (corr.)], which yields 2:6:4-C<sub>6</sub>H<sub>2</sub>Cl<sub>2</sub>Br·OH and HCO<sub>2</sub>K. 3:2-OH·C<sub>6</sub>H<sub>3</sub>I·CHO and 50% KOH at 100° give 2-iodo-3-hydroxybenzyl alcohol, m.p. 154° (corr.), and 3:2-OH·C<sub>6</sub>H<sub>3</sub>I·CO<sub>2</sub>H. 4:6-Dibromo-2-iodo-3-hydroxybenzaldehyde, m.p. 133.5° (corr.) (oxime, m.p. 168°), gives 4:6:2-C<sub>6</sub>H<sub>2</sub>Br<sub>2</sub>I·OH. H. W.

**Preparation of aldehydes from nitriles (Stephen's method).**  $\gamma$ -Phthalimidobutaldehyde. F. E. KING, P. L'ECUYER, and (in part) H. T. OPENSHAW (J.C.S., 1936, 352—354).—The modification recently introduced into Stephen's method for the prep. of aldehydes from nitriles (A., 1934, 89) has been applied to the prep. of  $\alpha$ -C<sub>10</sub>H<sub>7</sub>·CHO

(2:4-dinitrophenylhydrazones) and  $o$ -C<sub>6</sub>H<sub>4</sub>Me·CHO (2:4-dinitrophenylhydrazone, m.p. 193—194°), for which the original process is unsatisfactory, but without any marked improvement.  $\gamma$ -Phthalimido-butanaldehyde (2:4-dinitrophenylhydrazone, m.p. 184°) is prepared from the nitrile and SnCl<sub>2</sub>·HCl.

F. R. S.

**Preparation of acenaphthylene glycol and some condensation reactions of naphthalene-1:8-dialdehyde.** B. K. BLOUNT and A. WEISSBERGER (J.C.S., 1936, 336—337).—Reduction of acenaphthenequinone with Na-Hg and EtOH in N<sub>2</sub> gives *cis*-acenaphthylene glycol, oxidised to 1:8-C<sub>10</sub>H<sub>6</sub>(CHO)<sub>2</sub>, which condenses with acetonedicarboxylic acid and MeNH<sub>2</sub> to 1-methyl-2:6(1':8')-naphthapiperid-4-one, isolated as the *picrate*, m.p. 197°, and the *picrate*, m.p. 165—166°, of a base, C<sub>13</sub>H<sub>13</sub>N.

F. R. S.

**Beckmann rearrangement of 2-alkyl-cyclopentanone- and -cyclohexanone-oximes.** J. G. HILDEBRAND, jun., and M. T. BOBERT (J. Amer. Chem. Soc., 1936, 58, 650—652).—Et 2-propylcyclopentanone-2-carboxylate, b.p. 136.5—138°/28 mm. (*semicarbazone*, m.p. 160—161°), prepared by propylation of Et cyclopentanone-2-carboxylate (improved prep.), is hydrolysed (conc. HCl) to 2-propylcyclopentanone [oxime (I), b.p. 120—121.5°/13 mm.]. 2-Methyl- and 2-ethyl-cyclopentanoneoximes and (I) are converted by hot 75—80% H<sub>2</sub>SO<sub>4</sub> into 6-methyl-, 6-ethyl-, m.p. 88.5—89.6° (corr.), and 6-propyl- (II), m.p. 91.5—92.4°, -2-piperidone, respectively (59—76% yield); none of the 3-alkyl-2-piperidone is produced. 2-Methylcyclohexanoneoxime and 96.4% H<sub>2</sub>SO<sub>4</sub> give 97% of the *lactam*, m.p. 90.5—91.5° (cf. Wallach, A., 1906, i, 514), of  $\epsilon$ -aminoheptonic acid, m.p. 196—197.5° (corr.), which is deaminated (98% HI) to  $n$ -C<sub>6</sub>H<sub>13</sub>·CO<sub>2</sub>H. (II) is also obtained when homoconic (8-amino-octic) acid (Baum, A., 1886, 562) is heated at 165°.

H. B.

**Behaviour of keten in the Friedel-Crafts reaction.** F. S. SPRING and T. VICKERSTAFF (J.C.S., 1935, 1873—1874).—Keten (cf. A., 1934, 1091) when passed at 0° into C<sub>6</sub>H<sub>6</sub>-AlCl<sub>3</sub> gives C<sub>6</sub>H<sub>5</sub>Me and some  $p$ -C<sub>6</sub>H<sub>4</sub>Et·COMe (*semicarbazone*, m.p. 196°); the latter is considered to be due to the presence of C<sub>2</sub>H<sub>4</sub> in keten. PhOH when treated with keten at 80° gives its Ac derivative (cf. *loc. cit.*).

H. G. M.

**Influence of cyclisation on the "colour" of molecules.** Ultra-violet absorption of derivatives of diphenylmethane and fluorene. (MME.) RAMART-LUCAS and M. J. HOCH (Bull. Soc. chim., 1935, [v], 2, 1376—1380).—Comparison of the ultra-violet absorption spectra of CH<sub>2</sub>Ph<sub>2</sub>, CHPh<sub>2</sub>, CMePh<sub>2</sub>·OH, CPh<sub>2</sub>·CHMe, C<sub>6</sub>Ph<sub>2</sub>, and CPh<sub>2</sub>·N·OH in EtOH or C<sub>6</sub>H<sub>12</sub> with the spectra of, respectively, fluorene (I), 9-phenylfluorene, 9-hydroxy-9-ethylfluorene, 9-ethylidenefluorene, fluorenone (*semicarbazone*, m.p. 245°), and its oxime, shows that an *o*-linking between the two Ph in CH<sub>2</sub>Ph<sub>2</sub> causes a large displacement of absorption towards the visible and an alteration in the form of the absorption curves. The absorption spectra of (I) in the lit. show fine bands which are due to an impurity.

J. W. B.

**Walden inversion. XIII. Configurative relationship between optically active desylamine and benzoin.** A. MCKENZIE and D. J. C. PRIE (Ber., 1936, 69, [B], 876—879).—(–)-Benzoin and (+)-desylamine have the same configuration. Reduction of desylamine hydrochloride by Na-Hg in EtOH-AcOH affords  $\beta$ -hydroxy- $\alpha\beta$ -diphenylethylamine (I), m.p. 164° (identical with the product from  $\beta$ -benzilmonoxime), and a trace of the *iso*-compound, m.p. 130°; reduction in presence of Pt gives (I) exclusively. (–)-Desylamine hydrochloride gives (+)- $\beta$ -hydroxy- $\alpha\beta$ -diphenylethylamine, m.p. 141—143°, [ $\alpha$ ]<sub>D</sub> +10.4° in EtOH. (–)-Benzoin- $\alpha$ -oxime affords (–)- $\beta$ -hydroxy- $\alpha\beta$ -diphenylethylamine, m.p. 141—142°, [ $\alpha$ ]<sub>D</sub> –10° in EtOH, also obtained from the corresponding  $\beta$ -oxime.

H. W.

**Retene. V. Structure of 6-acetylretene.** D. E. ADELSON and M. T. BOBERT (J. Amer. Chem. Soc., 1936, 58, 653—654).—The acetylretene (I), m.p. 99.5—100° (corr.), obtained by a slight modification of the method previously used (A., 1931, 1297) is the 6-derivative, since its oxime is converted by PCl<sub>5</sub> in Et<sub>2</sub>O into the *Ac* derivative, m.p. 240—240.5° (corr.) (decomp.), of 6-aminoretene (II), m.p. 139.5—140° (corr.). (II) is converted (diazo-method) into 6-retenol. Retene-6-carboxylic acid is conveniently prepared from (I) and I-KI in dioxan-10% NaOH.

H. B.

**Uneven halides. II. Uneven halides of the benzanthrone series.** K. BRASS and E. CLAR (Ber., 1936, 69, [B], 690—692).—Benzanthrone unites with Br and I in the ratio 1:1 giving dark, moderately stable compounds. With excess of I compounds of indefinite stoicheiometric composition are obtained which lose the excess of halogen when warmed in vac. and give the compound with ratio 1:1. 1-Bromobenzanthrone combines with Br and I in the ratios 2:1 and 3:2, respectively. All the substances yield the halogen quantitatively to mild reducing agents and pass into the initial materials. The observations confirm the conclusion that the trihalides of perylene (A., 1933, 57) have the composition C<sub>20</sub>H<sub>12</sub>Br+Br<sub>2</sub> and C<sub>20</sub>H<sub>12</sub>I+I<sub>2</sub>, respectively.

H. W.

**Novel ring systems. II. 1:8-Naphthaloylnaphthalene.** W. KNAPP (Monatsh., 1936, 67, 332—343).—1:8-C<sub>10</sub>H<sub>6</sub>(CO)<sub>2</sub>O is converted by MgPhBr in Et<sub>2</sub>O into 8-benzoyl-1-naphthoic acid, m.p. 129—130°, which is scarcely affected by warm, conc. H<sub>2</sub>SO<sub>4</sub>, P<sub>2</sub>O<sub>5</sub> in PhMe, or AlCl<sub>3</sub>-NaCl at 130°. 8-1'-Naphthoyl-1-naphthoic acid and P<sub>2</sub>O<sub>5</sub> in boiling PhMe afford 1:8-naphthaloylnaphthalene (I), m.p. about 350° (incipient decomp.), in about 10% yield, also obtained by use of AlCl<sub>3</sub>-NaCl at 140° or of conc. H<sub>2</sub>SO<sub>4</sub> at 150°. (I) dissolves in conc. NaOH with production of a Na salt. The Mg derivative of 1:2-C<sub>10</sub>H<sub>6</sub>Br·OMe, m.p. 83—84° (prep. from  $\beta$ -C<sub>10</sub>H<sub>7</sub>·OMe and Br in AcOH described), and 1:8-C<sub>10</sub>H<sub>6</sub>(CO)<sub>2</sub>O give 8-2-methoxynaphthaloylnaphthoic acid, m.p. 215—217°, converted by P<sub>2</sub>O<sub>5</sub> in boiling PhMe into 2-methoxy-1:8-naphthaloylnaphthalene (II), m.p. about 370° (Na salt). 1:8-C<sub>10</sub>H<sub>6</sub>(CO)<sub>2</sub>O,  $\beta$ -C<sub>10</sub>H<sub>7</sub>·OH, and AlCl<sub>3</sub> at 200—210° yield 2-hydroxy-1:8-naphthaloylnaphthalene, m.p. about 360° (decomp.) (Na salt), transformed with difficulty by

Me<sub>2</sub>SO<sub>4</sub> into (II). 1 : 8-C<sub>10</sub>H<sub>6</sub>(COCl)<sub>2</sub>, β-C<sub>10</sub>H<sub>7</sub>OMe, and AlCl<sub>3</sub> in boiling C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub> give a product C<sub>22</sub>H<sub>12</sub>O<sub>3</sub>, m.p. about 340°, which yields very small amounts of a hydrocarbon, m.p. 155–158°, when distilled with Zn dust.

H. W.

**Formation of s-dibenzocyclodocosanedione.** M. UENAKA and B. KUBOTA (Bull. Chem. Soc. Japan, 1936, 11, 19–26).—o-Phenylenediacrylic acid is obtained together with some phthalyl alcohol Et<sub>2</sub> ether and o-ethoxymethylcinnamic acid, m.p. 130–130.5° (corr.) [Et ester, b.p. 140–141°/2 mm.; dibromide, m.p. 168–169° (corr.); dihydro-derivative, m.p. 85°], from o-C<sub>6</sub>H<sub>4</sub>(CH<sub>2</sub>Br)<sub>2</sub>, CClna(CO<sub>2</sub>Et)<sub>2</sub> (containing some Cl<sub>2</sub>-ester), and KOH-EtOH, and is reduced (Na-Hg) to o-phenylenedipropionic acid (I). The formation of some β-(o-ethylphenyl)propionic acid was also observed. The Et<sub>2</sub> ester of (I) is reduced (Na-EtOH) to o-phenylenedipropyl alcohol, m.p. 56–57° (p-xenylcarbamate, m.p. 187°), converted by HBr into the dibromide, b.p. 187–189°/7.5 mm., which on malonation and subsequent hydrolysis and heating gives o-phenylenedivaleric acid, m.p. 148–149° (corr.). The Th salt of this acid, when heated at 0.008–0.009 mm. pressure, gives s-dibenzocyclodocosanedione, m.p. 133.5° (corr.) [semicarbazone, decomp. 205–208° (corr.); p-nitrophenylhydrazone, m.p. 168–172°]. An 11-membered ring-monoketone was not formed.

H. G. M.

**Preparation of βγ-Δ<sup>5</sup>-unsaturated ketones of the sterol series.** 17-Ethyltestosterone. A. BUTENANDT and J. SCHMIDT-THOMÉ (Ber., 1936, 69, [B], 882–888).—βγ-Δ<sup>5</sup>-Unsaturated ketones of the sterol group are readily obtained when 5 : 6-dibromoketones are debrominated by short treatment with Zn dust in warm MeOH or EtOH; under these conditions displacement of the double linking is not observed. Thus, cholesterol dibromide is transformed into Δ<sup>5</sup>-cholestenone (I), m.p. 127° after softening (? partial isomerisation to the Δ<sup>4</sup>-compound), [α]<sub>D</sub><sup>20</sup> –4.2° in CHCl<sub>3</sub> [oxime, m.p. 188° (decomp.)]. Analogously, dehydroandrosterone is brominated at the double linking and debrominated by Zn dust in MeOH after oxidation of OH to Δ<sup>5</sup>-androstene-3 : 17-dione, m.p. 158° after softening at 140° (dioxime, m.p. about 205° after incipient decomp. at 180°). The constitution of the ketones is established by the observations that (I) yields a dibromide identical with that obtained by the oxidation of cholesterol dibromide and that debromination of the latter with Zn dust and MeOH affords cholesterol. The βγ-Δ<sup>5</sup>-unsaturated ketones are readily isomerised to the Δ<sup>4</sup>-compounds when heated in dil. (mineral) acidic or alkaline solution. In neutral solvents they can be crystallised unchanged. 29-Unsaturated ketones can be obtained from the 5 : 6-dibromides by feebly acidic MeOH or EtOH in place of the usual AcOH. 17-Ethyl-Δ<sup>5</sup>-androstene-17-ol-3-one (previously regarded as the Δ<sup>4</sup>-compound) is converted by short warming with EtOH containing a little H<sub>2</sub>SO<sub>4</sub> into the isomeric 17-ethyltestosterone, m.p. 139° [semicarbazone, m.p. 230° (decomp.)], also obtained directly from 17-ethylandrostenediol by successive bromination, oxidation, and debromination by Zn dust in MeOH-H<sub>2</sub>SO<sub>4</sub>. When distilled in a

high vac. it gives the doubly unsaturated ketone, C<sub>21</sub>H<sub>30</sub>O, m.p. 135° [semicarbazone, m.p. about 225° (decomp.)].

H. W.

**Δ<sup>5</sup>-Pregnene-3 : 20-dione, an isomeride of progesterone.** U. WESTPHAL and J. SCHMIDT-THOMÉ (Ber., 1936, 69, [B], 889–892).—Δ<sup>5</sup>-Pregnene-3-ol-2-one is brominated (=2Br) in AcOH and then oxidised with CrO<sub>3</sub>; the product is debrominated by Zn dust in MeOH to Δ<sup>5</sup>-pregnene-3 : 20-dione (I), m.p. 158–160°, [α]<sub>D</sub><sup>20</sup> +65.5° in CHCl<sub>3</sub> [dioxime, m.p. 203–205° (darkening), complete decomp. 207°]. (I) is so readily transformed by H<sub>2</sub>SO<sub>4</sub>-EtOH into α- and β-progesterone that the process can be followed polarimetrically. After being heated above its m.p. in a glass tube (I) shows an increase in [α], probably due to partial wandering of the double linking.

H. W.

**Chelation. IV. Some properties of 2 : 3-dihydroxyphenyl ketones.** W. BAKER and A. R. SMITH (J.C.S., 1936, 346–348).—The volatility and solubility of 2 : 3-dihydroxyacetophenone indicate a greater degree of chelation than the normal for a pyrocatechol derivative. 2 : 3-Dimethoxybenzaldehyde (I) and MgPhBr give 2 : 3-dimethoxy-benzhydrol, m.p. 79°, oxidised (K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>-H<sub>2</sub>SO<sub>4</sub>) to the benzophenone (2 : 4-dinitrophenylhydrazone, m.p. 152°), which is demethylated to 2 : 3-dihydroxybenzophenone, m.p. 65°. (I) and Mg anisyl bromide form 2 : 3 : 4'-trimethoxy-benzhydrol, b.p. 250°/17 mm., which is oxidised to the benzophenone, m.p. 86°, demethylated to 2 : 3 : 4'-trihydroxybenzophenone, m.p. 169°. The OH-ketones give strong yellow dyeings with Al<sub>2</sub>O<sub>3</sub> mordant.

F. R. S.

**Stereochemical investigations in the anisoin group.** A. MCKENZIE and D. J. C. PIRIE (Ber., 1936, 69, [B], 861–875).—Me r-p-methoxymandelate, m.p. 37–38°, obtained from MeI and p-OMe-C<sub>6</sub>H<sub>4</sub>·CH(OH)·CO<sub>2</sub>Ag [treatment of the acid with MeOH (EtOH) and H<sub>2</sub>SO<sub>4</sub> gives impure products], is transformed by NH<sub>3</sub>-EtOH at 0° into p-methoxymandelamide, m.p. 163–164°, which with Mg anisyl bromide affords r-anisoin (I), m.p. 112–113°. r-p-Methoxymandelic acid is resolved into its optical antipodes by cinchonine in H<sub>2</sub>O. d-p-Methoxymandelic acid has m.p. 104–105°, [α]<sub>D</sub><sup>20</sup> +176.2° in H<sub>2</sub>O, [α]<sub>D</sub><sup>20.3</sup> +213.7° in CHCl<sub>3</sub> (other vals. recorded), whilst the l-acid has m.p. 104–105°, [α]<sub>D</sub> –146.5° in H<sub>2</sub>O. Me (+)-p-methoxymandelate has m.p. 63–64°, [α]<sub>D</sub><sup>20</sup> +245°, [α]<sub>D</sub><sup>20.5</sup> +295.8° in CS<sub>2</sub>, [α]<sub>D</sub><sup>20</sup> +119.7°, [α]<sub>D</sub><sup>20.3</sup> +144.1° in COMe, [α]<sub>D</sub><sup>20.6</sup> +140.3°, [α]<sub>D</sub><sup>20.6</sup> +168.9° in EtOH, whereas m.p. 63–64°, [α]<sub>D</sub><sup>20</sup> –245.8° in CS<sub>2</sub> are recorded for the corresponding (–)-ester. (+)-p-Methoxymandelamide, m.p. 143–144°, [α]<sub>D</sub><sup>21</sup> +79.2°, [α]<sub>D</sub><sup>21.1</sup> +93.4° in COMe<sub>2</sub>, [α]<sub>D</sub><sup>21</sup> +90.6°, [α]<sub>D</sub><sup>21.1</sup> +107.6° in H<sub>2</sub>O, is slowly racemised by EtOH-KOH, the steady fall in [α] being preceded by a slight rise. (–)-p-Methoxymandelamide has m.p. 143–144°, [α]<sub>D</sub><sup>20</sup> –78.3° in COMe<sub>2</sub>, (+)-Anisoin (II) has m.p. 132–133°, [α]<sub>D</sub><sup>20.5</sup> +60.9°, [α]<sub>D</sub><sup>20.5</sup> +72.8° in COMe<sub>2</sub>, [α]<sub>D</sub><sup>20.5</sup> +78°, [α]<sub>D</sub><sup>20.5</sup> +93.3° in EtOH, [α]<sub>D</sub><sup>20.3</sup> +102.4°, [α]<sub>D</sub><sup>20.3</sup> +122.4° in CHCl<sub>3</sub>, [α]<sub>D</sub><sup>20.5</sup> +292°, [α]<sub>D</sub><sup>20.5</sup> +357.2° in CS<sub>2</sub>, whilst for (–)-anisoin (III), m.p. 132–133°, [α]<sub>D</sub><sup>19.5</sup> –60.2°, [α]<sub>D</sub><sup>19.5</sup> –72.5° are recorded. (I) is transformed by

warm 0.1N-KOH-EtOH into anisil (IV) and anisic acid. Under somewhat similar conditions (II) is slowly inactivated with production of (I) and (IV). (II) when heated at 140° for 10 min. in glass appears unchanged but gives (I) when heated for 2.5 hr. at 150°. (III) is fairly rapidly inactivated in piperidine or by a little  $\text{SOCl}_2$  in  $\text{CHCl}_3$ . (—)-Anisoil Me ether, m.p. 60–61°,  $[\alpha]_D^{20} -58.2^\circ$ ,  $[\alpha]_{5461}^{20} -67.1^\circ$  in  $\text{CHCl}_3$ ,  $[\alpha]_D^{20} -63.9^\circ$ ,  $[\alpha]_{5461}^{20} -74.6^\circ$  in EtOH,  $[\alpha]_D^{18} +66^\circ$  in heptane, is rapidly racemised by KOH-EtOH. r-Anisoil acetate, obtained by use of  $\text{AcCl}$ , has m.p. 94–95°. The corresponding (—)-compound, m.p. 77.5–78.5°,  $[\alpha]_D^{16} -152^\circ$ ,  $[\alpha]_{5461}^{16} -187^\circ$  in  $\text{CHCl}_3$ ,  $[\alpha]_D^{16} -139^\circ$ ,  $[\alpha]_{5461}^{16} -171^\circ$  in EtOH, is rapidly hydrolysed by KOH-EtOH to (I). (II) is transformed by  $\text{MgMeI}$  into  $\beta$ -(—)-methylhydroanisoil, m.p. 102–103.5°,  $[\alpha]_D^{20} -18.2^\circ$ ,  $[\alpha]_{5461}^{20} -22.7^\circ$  in  $\text{COMe}_2$ . r- $\beta$ -Methylhydroanisoil, m.p. 82–83°, is amorphous. Catalytic reduction ( $\text{Pt-PtO}_2$  in EtOH at 50–60°) of (III) leads to hydroanisoil, m.p. 172°, and, possibly, (+)-isohydroanisoil. Reduction of non-cryst. r-anisoiloxime by Na-Hg in EtOH-AcOH affords dianisylhydroxyethylamine (IV),  $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CH}(\text{OH})\cdot\text{CH}(\text{NH}_2)\cdot\text{C}_6\text{H}_4\cdot\text{OMe}$ , m.p. 143–144° [hydrochloride, m.p. 212–213°; platinichloride, m.p. 177° (decomp.)], and the iso-base, m.p. 135–136°. Deamination of (IV) by  $\text{NaNO}_2$  in dil.  $\text{H}_2\text{SO}_4$  gives a substance, m.p. 100–101.5°, and *cis*- $\alpha$ - $\beta$ -di-*p*-methoxyphenylethylene oxide, m.p. 142–143°.

H. W.

Catalytic oxidations in aqueous solution. III. Oxidation of anthracene, quinol, and substituted quinols. H. W. UNDERWOOD, jun., and W. L. WALSH (J. Amer. Chem. Soc., 1936, 58, 646–647).—*p*-Benzoquinone and its Me, Cl-, and Br-derivatives are obtained in 90–94% yield by oxidation of the quinols with  $\text{NaClO}_3$  and a little  $\text{V}_2\text{O}_5$  in cooled 2%  $\text{H}_2\text{SO}_4$ ; 1:4- $\text{C}_{10}\text{H}_6(\text{OH})_2$  gives 93% of 1:4-naphthaquinone. Anthracene (in hot AcOH+2%  $\text{H}_2\text{SO}_4$ ; caution necessary) similarly affords 90% of anthraquinone. Poor yields of oxidation products are obtained from  $\text{NH}_2\text{Ph}$ , *p*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$ , *p*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$ , and 1:4- $\text{NH}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{OH}$ . PhMe, phenanthrene, cyclohexanol, borneol, and camphor were unaffected even on prolonged heating.

H. B.

Synthesis of plumbagin. L. F. FIESER and J. T. DUNN (J. Amer. Chem. Soc., 1936, 58, 572–575).—The product from *m*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{COCl}$  and Et sodio- $\alpha$ -acetylsuccinate in  $\text{Et}_2\text{O}$  is hydrolysed (aq. KOH) to  $\beta$ -*m*-toluoylpropionic acid, m.p. 115–117° (purified through the semicarbazone, m.p. 191–193°), reduced (modified Clemmensen) to  $\gamma$ -*m*-tolylbutyric acid, m.p. 35–36°, the chloride of which is converted (method: Org. Synth., 1935, 15, 77) into 1-keto-6-methyl-1:2:3:4-tetrahydronaphthalene, b.p. 129–132°/5 mm. This and Br in  $\text{CS}_2$  at 5° give the 2-Br-derivative, m.p. 75–76°, converted by  $\text{NPhEt}_3$  into 6-methyl- $\alpha$ -naphthol, m.p. 83–84°. Oxidation ( $\text{CrO}_3$ , AcOH at 0°–room temp.) of 6:1- $\text{C}_{10}\text{H}_6\text{Me}\cdot\text{OAc}$ , b.p. about 124°/2 mm., affords 5-acetoxy-2-methyl-1:4-naphthaquinone, m.p. 117–118°, which with Zn dust and  $\text{Ac}_2\text{O}$ -NaOAc gives 1:4:5-triacetoxy-2-methylnaphthalene, m.p. 125–126°. Successive hydrolysis (5% NaOH and trace of  $\text{Na}_2\text{S}_2\text{O}_4$  in  $\text{N}_2$ )

and oxidation ( $\text{K}_2\text{Cr}_2\text{O}_7$ , dil.  $\text{H}_2\text{SO}_4$ ) of this affords 5-hydroxy-2-methyl-1:4-naphthaquinone (I), m.p. 78–79°, which is identical with plumbagin [Ac derivative, m.p. 117–118° (lit. 115° and 138°)].  $\beta$ -*p*-Toluoylpropionic acid, m.p. 124–126° [from  $(\cdot\text{CH}_2\cdot\text{CO})_2\text{O}$  and PhMe by the Friedel-Crafts reaction], is similarly converted into  $\gamma$ -*p*-tolylbutyric acid, m.p. 60–61°, and thence into 1-keto-7-methyl-1:2:3:4-tetrahydronaphthalene, an oil, 7-methyl- $\alpha$ -naphthol, m.p. 108–109° (acetate, m.p. 38–39°), and 8-hydroxy-2-methyl-1:4-naphthaquinone, m.p. 157–158° (acetate, m.p. 115–116°) [which, like (I), forms a coloured boroacetate complex].

H. B.

Anthracene. X. Preparation and hydrolysis of polyhydroxyanthraquinoneglucosides. H. FOSTER [with J. H. GARDNER] (J. Amer. Chem. Soc., 1936, 58, 597–599).—1:5-Dihydroxyanthraquinone and acetobromo-*d*-glucose give (method: Takahashi, J. Pharm. Soc. Japan, 1925, 585, 969) the tetraacetate, m.p. 214.4°, of 1:5-dihydroxyanthraquinone- $\beta$ -*d*-glucoside (I), m.p. 255.2°. Hydrolysis (method: A., 1935, 983) of (I) and 1:8-dihydroxy-, m.p. 240°, and 1:8-dihydroxy-3-methyl-, m.p. 255.2°, -anthraquinone- $\beta$ -*d*-glucosides occurs in decreasing ease with 0.05N-KOH, dil. borax, and 0.05N-HCl, and gives the original dihydroxyanthraquinones; no reduction takes place. These results indicate that barbaloin is not an aloemodinarabinoside (Léger, A., 1917, i, 276). All m.p. are corr.

H. B.

Synthesis of 1:2-phthaloylanthraquinone-6-carboxylic acid. R. SCHOLL, G. VON HORNDORF, and H. K. MEYER (Ber., 1936, 69, [B], 706–712).—1-Benzoylanthraquinone-2':4'-dicarboxylic acid, m.p. 306–307° (decomp.), is obtained by chlorination of *m*-xylyl anthraquinonyl ketone (I) to  $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_3\cdot\text{CO}\cdot\text{C}_6\text{H}_3(\text{CCl}_2)_2$  in  $\text{C}_6\text{H}_5\text{Cl}_3$  at 150° and treatment of the product with boiling 75% AcOH or by oxidising (I) with dil.  $\text{HNO}_3$  at 180°; it is reduced by Zn dust and 30% NaOH at 170° to 1-benzylanthracene-2':4'-dicarboxylic acid (II), m.p. 243–245° (decomp.), converted by boiling  $\text{POCl}_3$  into naphth-2':3'-1:2-anthr-10-one-6-carboxylic acid (III), which does not dissolve in  $\text{NH}_3\cdot\text{H}_2\text{O}$ , but is slowly sol. in boiling KOH- $\text{H}_2\text{O}$  or KOH-EtOH with production of naphth-2':3'-1:2-anthr-10-ol-6-carboxylic acid (III), more readily obtained from (II) and  $\text{ZnCl}_2$  at 175°. Still more readily (II) is transformed by boiling  $\text{Ac}_2\text{O}$  containing a trace of HI (*d* 1.7) into acetic naphth-2':3'-1:2-acetanthr-10-ol-6-carboxylic anhydride, decomp. about 305° after softening at 190°, converted by boiling  $\text{C}_5\text{H}_5\text{N}\cdot\text{H}_2\text{O}$  into naphth-2':3'-1:2-acetanthr-10-ol-6-carboxylic acid, decomp. 315°, which is hydrolysed by boiling NaOH to (IV). (III) is converted by red P and HI (*d* 1.7) at 190° into 9:10:1':4'-tetrahydronaphth-2':3'-1:2-anthr-6-carboxylic acid, m.p. 290–300° after softening, which is oxidised by  $\text{CrO}_3$  in AcOH to 1:2-phthaloylanthraquinone-6-carboxylic acid, incipient decomp. 340° ( $\text{NH}_4$  salt; corresponding diazine,  $\text{C}_{23}\text{H}_{10}\text{O}_4\text{N}_2$ ); attempts to decarboxylate it to ang-phthaloylanthraquinone were unsuccessful. 4-Benzyl-1-methylnaphthalene-2'-carboxylic acid is converted by boiling  $\text{Ac}_2\text{O}$  containing HI or HCl into 3-methyl-1:2-benz-anthr-10-yl acetate, m.p. 195°.

H. W.

**Catalytic hydrogenation under high pressure. Essential oils and esters.** L. PALFRAY and S. SABETAY (Bull. Soc. chim., 1936, [v], 3, 682—687).—Catalytic hydrogenation (Ni) of certain essential oils under high pressure at about 240° causes partial reduction of esters to primary alcohols. Under similar conditions Et laurate affords dodecanol in 62% yield and some hydrocarbon, whilst  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{Et}$  gives  $\beta$ -cyclohexylethyl alcohol, also obtained from  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{OH}$ . H. W.

**Formation of nitrosites.** T. K. GAPONENKOV (J. Gen. Chem. Russ., 1935, 5, 1485—1486).—Max. yields of nitrosite are obtained from  $\beta$ -phellandrene,  $\text{NaNO}_2$ , and AcOH when the solvent is 1:1 light petroleum-Et<sub>2</sub>O, at low temp., and in absence of excess of AcOH. R. T.

**Polymerisation of pinene.** H. I. WATERMAN, J. J. LEENDERTSE, and W. A. A. B. KOELENMID (Rec. trav. chim., 1936, 55, 7—12).—Polymerisation of pinene in  $\text{C}_5\text{H}_{12}$  occurs at  $-15^\circ$  with  $\text{AlCl}_3$ . No gases are evolved, and some light-coloured resin, almost free from O, is formed. The fractions of the product have been studied before and after hydrogenation. Vals. for  $r_L$  after hydrogenation suggest that polymerisation takes place without the opening or closing of rings. Pinene when hydrogenated (Nickelsguhr) at 200—250° (pressure about 100 kg. per sq. cm.) gives a product agreeing fairly well in properties with pinane in the lit. H. G. M.

**endo-exo-Isomerism in alicyclic alcohols of borneol type.** I. G. KOMPPA and S. BECKMANN (Annalen, 1936, 522, 137—150; cf. Biltz, A., 1899, i, 297, ii, 634; Hückel *et al.*, A., 1935, 745).—The mol. wts. of the 14 sec.-alcohols containing the 1:2:2-dicycloheptane ring are determined (f.p. method in  $\text{C}_6\text{H}_6$ ) for different concns. and the % association (*A*) calc. for a concn. of 0.06 mol. per 100 g.  $\text{C}_6\text{H}_6$ . The alcohols form 3 groups: (i) *A* = 54—58, those with no substituent near the OH; (ii) *A* = 33—44, those with the OH "screened" by 1 substituent; (iii) *A* = 19—24, those with the OH "hindered" by substituents from 2 sides. The effect of, e.g.,  $\text{C}_7\text{Me}$  is of decisive importance;  $\text{C}_8$  has little or no effect. Borneol, 4-methylborneol, and  $\alpha$ -fenchocamphorol (*apoborneol*) are considered to have *endo*-OH, whilst *isoborneol*, 4-methylisoborneol, and *isofenchol* have *exo*-OH.  $\alpha$ -Santenone alcohol and  $\alpha$ -santenol have *endo*- and *exo*-OH, respectively; both contain  $\text{C}_7\text{Me}$  in the *trans* position. Definite conclusions are not yet possible for  $\alpha$ - and  $\beta$ -norborneols, camphenilols I and II,  $\beta$ -fenchocamphorol, and  $\alpha$ -fenchol. H. B.

**Racemisation and camphene transformation.** J. HOUBEN and E. PFANKUCH (Ber., 1936, 63, [B], 899—901).—A reply to Nametkin *et al.* (A., 1935, 89). H. W.

**Hydrogenation of carbonyl compounds.**—See this vol., 686.

**Preparation of *d-trans*- $\pi$ -oxocamphor from isoketopinic acid.**—See B., 1936, 444.

**4-Methylisantenol and 4-methylsantenylamine.** G. KOMPPA and G. A. NYMAN (Ber., 1936, 69, [B], 712—716; cf. A., 1935, 865).—4-Methylsantenol, m.p. 33—34.5° (*loc. cit.*), is transformed by

$o\text{-C}_6\text{H}_4(\text{CO})_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  at 100° into 4-methylsantenyl *H phthalate*, m.p. 135—136°, hydrolysed to the alcohol, m.p. 36—37°. Reduction of 4-methylsantenone with Na and EtOH affords 4-methylisantenol, b.p. 200—200.5°, m.p. 40—42° (*H phthalate*, m.p. 143—144°; phenylurethane, m.p. 93—94.5°). 4-Methylsantenoneoxime, m.p. 110.5—111.5° (*Bz derivative*, m.p. 83—84°), is reduced by Na and boiling abs. EtOH to 4-methylsantenylamine, b.p. 62°/8 mm. [*hydrochloride* (I); *aurichloride*, m.p. about 163° after softening; *platinichloride*, m.p. 266—269°; *picrate*, m.p. 242—244° (decomp.); *Bz derivative*, m.p. 153.5—154.5°]. Treatment of (I) with  $\text{HNO}_2$  does not give a homogeneous alcohol. H. W.

**Diterpene alcohol from the wood of *Dacrydium biforme*.** II. Ozonisation of manool. J. R. HOSKING (Ber., 1936, 69, [B], 780—785; cf. A., 1935, 1127).—Ozonisation of manool (I) in  $\text{CCl}_4$  at 0° and decomp. of the ozonide by  $\text{H}_2\text{O}$  at 100° gives the non-cryst. diketone (II), b.p. 159—160°/0.1 mm. (non-cryst. compounds with  $\text{NH}_2\cdot\text{CO}\cdot\text{NH}\cdot\text{NH}_2$  and  $\text{NH}_2\text{OH}$  and ill-defined derivatives with aminoguanidine or picric acid), which does not reduce dil.  $\text{KMnO}_4$  at 20°. If (II) is warmed with NaOEt or heated with HCl at 0° followed by NaOH-EtOH it is transformed into

the cryst. ketone (III), m.p. 71° (*semicarbazone*, m.p. 188°). Treatment of (II) with 2% NaOH-EtOH at 20° or with piperidine in  $\text{C}_6\text{H}_6$  affords the compound (IV), m.p. 199°, which is saturated and contains 1 active OH (Zerevitinov). Excess of  $\text{MgMeI}$  converts (IV) with loss of  $2\text{H}_2\text{O}$  into the liquid hydrocarbon (V), b.p. 127—130°/0.1 mm. (hydrogenated to the substance  $\text{C}_{18}\text{H}_{32}$ , b.p. 120°/0.1 mm.), which is dehydrogenated by Se at 340° to 1:7-dimethylphenanthrene. Oxidation of (I) by  $\text{KMnO}_4$  (=80) in  $\text{COMe}_2$  gives an unsaturated ketone,  $\text{C}_{17}\text{H}_{28}\text{O}$ , b.p. 137—138°/0.1 mm. (*semicarbazone*, m.p. 185—186°), hydrogenated ( $\text{PtO}_2$  in EtOAc) to a saturated ketone (*semicarbazone*, m.p. 199—200°). H. W.

**Biochemistry of micro-organisms. XLIX. Palitantin, a metabolic product of *Penicillium palitans*.** Westling. J. H. BIRKINSHAW and H. RAISTRICK (Biochem. J., 1936, 30, 801—808).—Three strains of the mould, grown in Raulin-Thom glucose medium, yielded palitantin (I),  $\text{C}_{14}\text{H}_{22}\text{O}_4$ , m.p. 163—165° [*semicarbazone*, m.p. 212—213° (decomp.); *phenylhydrazone*, m.p. 175—176°; *oxime*, m.p. 104—106°; 2:4-dinitrophenylhydrazones, m.p. 209°; *di-p-bromobenzoate*, m.p. 153—154°]. (I), which contains  $\cdot\text{CHO}$ , 2 OH, and  $\times$  two double linkings, is hydrogenated ( $\text{Pd-C}$ ) to tetrahydropalitantin (II), m.p. 116°

(semicarbazone, m.p. 188—189°), further reduced (Na-Hg) to  $\alpha$ -, m.p. 142—143°, and  $\beta$ -hexahydro-palitanin, m.p. 98—99°, and oxidised (NaOI) to tetrahydropalitanic acid, m.p. 110° (to an opaque liquid clearing at 135°). Oxidation of (I) by  $\text{HgI}_2$ -KI affords palitanic acid,  $\text{C}_{14}\text{H}_{22}\text{O}_5$ , m.p. 145—148°, whilst that by  $\text{Ag}_2\text{O}$  followed by esterification with  $\text{CH}_2\text{N}_2$  and treatment with aq.  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$  yields the dihydrazide, m.p. 201—202°, of a dicarboxylic acid,  $\text{C}_{13}\text{H}_{20}\text{O}_5$  (or of its lactone); similar treatment of (II) gives the dihydrazide, m.p. 188—190°, of a dicarboxylic acid,  $\text{C}_{13}\text{H}_{24}\text{O}_5$  (or of its lactone).

F. O. H.

**Bitter principles of Colombo root.** IV. K. FEIST and R. BRACHVOGEL (Annalen, 1936, 522, 185—190).—KOH-fusion of columbin (I) gives some 2-methylterephthalic acid in addition to 2:4- $\text{C}_6\text{H}_3\text{Me}_2\text{CO}_2\text{H}$  (A., 1935, 1245). (I) is reduced by Pd-black and boiling tetrahydronaphthalene to hydrochasanthnic acid (*ibid.*, 864), and thus contains a lactone ring. Chasmanthin is not oxidised by  $\text{SeO}_2$ , but its Me ether with 5%  $\text{KMnO}_4$  in a slightly alkaline medium affords merochasmanthnic acid Me ether,  $\text{C}_{16}\text{H}_{20}\text{O}_8$ , m.p. 248° (decomp.) ( $\text{Me}_2$  ester, m.p. 254—255°, hydrolysed with difficulty, which appears to be a saturated lactonic dicarboxylic acid.

H. B.

**Vegetable cardiac poisons.** IX. Constitution of digoxigenin. R. TSCHESCHE and K. BOHLE [with, in part, H. GRASSHOFF] (Ber., 1936, 69, [B], 793—797).—Digoxigenin (I) (prep. from digilanid described) is converted into anhydrodigoxigenin, which is hydrogenated ( $\text{PtO}_2$ ) to tetrahydroanhydrodigoxigenin. The latter compound is oxidised ( $\text{CrO}_3$  in  $\text{AcOH}$ ) to tetrahydroanhydrodigoxigenone (II), m.p. 290°, which is reduced (Clemmensen) to the lactone, m.p. 185°,  $[\alpha]_{\text{D}}^{25} +34.5^\circ$  in  $\text{CHCl}_3$ , obtained from digitoxigenin (III). (I) and (III) have therefore the same skeleton. Oxidation of (II) with  $\text{CrO}_3$  in  $\text{AcOH}$

gives the acid (IV), m.p. 306° ( $\text{Me}$  ester, m.p. 160—161°), which passes when heated into the ketone,  $\text{C}_{22}\text{H}_{30}\text{O}_4$ , m.p. 228—229°, and is hydrogenated to the substance,  $\text{C}_{23}\text{H}_{34}\text{O}_7$ , m.p. 266—267°. (I) has probably the structure shown.

H. W.

**Saponins of the cyclopentanohydrophenanthrene group.** IV. Constitution of digitogenin and digitogin. R. TSCHESCHE and A. HAGEDORN (Ber., 1936, 69, [B], 797—805).—Mainly theoretical. Reasons are advanced for assigning the structure (I) to digitogenin. Digitogenic acid, obtained by cautious oxidation of (I) with  $\text{CrO}_3$ , is shown to be a  $\gamma$ -CO-acid (II), which accounts for its inability to lose  $\text{CO}_2$  (cf. Windaus *et al.*, A., 1925, i, 1082). Oxydigitogenic acid, obtained from (II) and  $\text{KMnO}_4$ , its decarboxylation product, and the enol-lactone

obtained by heating its esters are formulated according to (III), (IV), and (V).

Digitic acid (VI) obtained by drastic oxidation of (III) contains a new *tert*-OH (Zerevitinov) probably at 8-C or 9-C. The constitutions (VI) and (VII) are

assigned to it and anhydrodigitic acid obtained from it by loss of  $\text{CO}_2$  and  $\text{H}_2\text{O}$  when treated with  $\text{AcOH}$  and  $\text{HCl}$ . The pentacarboxylic acid,  $\text{C}_{26}\text{H}_{38}\text{O}_{12}$ , of Windaus *et al.* (*loc. cit.*) is shown to be a tetracarboxylic acid (VIII)+ $\text{H}_2\text{O}$  very firmly attached. It loses  $\text{CO}_2$  when heated and gives the tricarboxylic acid (IX)+ $\text{H}_2\text{O}$ , the composition of which is confirmed by analyses of the anhydrous  $\text{Me}$  ester.

The lactol nitrate obtained by oxidation of digitonic acid with  $\text{HNO}_3$  (Windaus and Shah, A., 1926, 404) and the ketocarboxylic acid obtained by treating it with  $\text{KMnO}_4$  are formulated according to (X) and (XI), respectively.

The production of  $\text{CO}_2\text{H}\cdot\text{CHMe}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  from gigtogenin and (I) is readily understood but  $\text{CO}_2\text{H}\cdot\text{CHMe}\cdot[\text{CH}_2]_2\cdot\text{CO}_2\text{H}$  appears to be derived by complete rupture of the whole ring system. H. W.

**Phenol- and methylglycol- [ $\beta$ -methoxyethyl alcohol]-lignin from spruce wood.** W. FUCHS (J. Amer. Chem. Soc. 1936, 58, 673—680).—PhOH-lignin (I) [large-scale prep. from spruce wood flour (A), PhOH, and conc. HCl at 85—90°] is partly adsorbed by activated C from an EtOH-solution. The unadsorbed material is then fractionated by  $\text{Et}_2\text{O}$ , EtOAc, and aq.  $\text{Na}_2\text{CO}_3$ ; successive extraction of the C with EtOH gives further fractions. Similarly, methylglycol-lignin (II) [prep. from (A),  $\text{OMe}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$ , and conc. HCl at 121° under pressure] is partly adsorbed by C from a  $\text{COMe}_2$  solution; fractionation of the unadsorbed part is effected with  $\text{Et}_2\text{O}$ ,  $\text{CHCl}_3$ , and aq.  $\text{Na}_2\text{CO}_3$ . Several of the fractions are analysed for C, H, and OMe (using AcOH—HI; elimination of  $\text{OMe}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$  does not occur to any appreciable extent); acetylation ( $\text{Ac}_2\text{O} + 0.2\%$  conc.  $\text{H}_2\text{SO}_4$  at 100°) gives products which are insol. in dil. alkali (showing absence of  $\text{CO}_2\text{H}$ ) but sol. in  $\text{C}_6\text{H}_6$  (cf. Wedekind and Katz, A., 1929, 799). Potentiometric titration indicates, however, that the fractions are mixtures of several compounds. Contrary to Hägglund, the combined PhOH (2.4—26.5%) in fractions of (I) is eliminated by treatment with red P and AcOH—HI (or AcOH—HBr, whereby a sugar-like substance is also produced), thus proving the presence of  $>\text{C}(\text{OPh})_2$  (cf. A., 1929, 1282) or  $:\text{C}(\text{OPh})$  (cf. Brauns and Hibbert, A., 1935, 1373). KOH-fusion of fractions from (I) and (II) gives  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  (0.8—11% of lignin), 3:4-(OH) $_2\text{C}_6\text{H}_3\cdot\text{CO}_2\text{H}$  (4.3—16.1% of lignin),  $o\text{-C}_6\text{H}_4(\text{OH})_2$ , and (probably) phenol-2:4-dicarboxylic acid; oxidation (AcOH— $\text{HNO}_3$ ) affords picric and benzenecarboxylic acids. A possible structure for spruce lignin is given. The original must be consulted for details.

H. B.

**Picrotoxin. II. Picrotone and picrotonol.** D. MERCER and A. ROBERTSON (J.C.S., 1936, 288—294).—Oxidation ( $\text{KMnO}_4$ ) of picrotonol yields  $\alpha\alpha$ -4-trimethylphthalide-3-acetic acid (I), decarboxylated to tetramethylphthalide, in agreement with Horrmann and Hagendorn (A., 1921, i, 347) and contrary to Angelico (A., 1910, i, 404).  $\beta$ -o-Tolylpropionyl chloride, obtained from *o*-toluoyl chloride and Et sodiomalonate, with  $\text{AlCl}_3\text{-C}_6\text{H}_6$  followed by amyl nitrite-HCl, gives 2-oximino-4-methyl-1-hydrindone, m.p. 215° (decomp.). The oximino-compound with *p*-toluenesulphonyl chloride yields *o*-tolylacetone-trile-3-carboxylic acid, m.p. 142—143°, hydrolysed to 6-methylbromophthalic acid, m.p. 195—196° (anhydride, m.p. 150°), also obtained with  $\text{COMe}_2$  from (I) and KOH. Hydrolysis of picrotoxinin ozonide gives  $\text{CH}_2\text{O}$ ,  $\text{HCO}_2\text{H}$ , and picrotoxinone, indicating the presence of  $:\text{C}(\text{CH}_2\text{CO}_2\text{H})$  in picrotoxinin (II). Hydrogenation (Pt) of (II) affords  $\alpha$ -dihydropicrotoxinin, m.p. 252°, which with  $\text{H}_2\text{SO}_4$  forms dihydropicrotoxic acid (III), whilst with a Pd catalyst in EtOAc,  $\beta$ -dihydropicrotoxinin, m.p. 256—

257°,  $[\alpha]_D^{20} - 24.69^\circ$  in  $\text{COMe}_2$ , is obtained, unaffected by  $\text{H}_2\text{SO}_4$ . Hydrogenation with Pd in EtOH—HCl gives a substance, which is a mixture of at least three compounds, and with  $\text{H}_2\text{SO}_4$  yields (III) and picrotonol (*p*-nitrobenzoate, m.p. 155°). (III) and MeI— $\text{Ag}_2\text{O}$  form *Me O-dimethyldihydropicrotozoate*, m.p. 146—147°,  $[\alpha]_D^{20} + 95.93^\circ$  in  $\text{CHCl}_3$ , hydrolysed to the acid, m.p. 206—207°. The possible structure of picrotoxinin is discussed on the basis of the C-skeleton for picrotonol.

F. R. S.

**Gentiopiecin. I.** Y. ASAHINA, J. ASANO, Y. TANASE, and Y. UENO (Ber., 1936, 69, [B], 771—779).—Gentiopiecin (I), obtained from the root of *Gentiana scabra*, Bunge, var. *Buergeri*, Maxim, has m.p. (anhyd.) 191°, m.p. (+0.5 $\text{H}_2\text{O}$ ) 121°. It gives a dark red condensation product with  $\text{NHPh}\cdot\text{NH}_2$ , a *p*-nitrophenylhydrazide,  $\text{C}_{22}\text{H}_{27}\text{O}_{11}\text{N}_2$ , m.p. 199° (decomp.), and an isopropylidene derivative, m.p. 228°. When hydrolysed by emulsin at room temp. it affords insol. gentiogenin (II) (cf. Tanret, A., 1905, i, 655) and sol. *eugentiogenin* (III),  $\text{C}_{10}\text{H}_{10}\text{O}_4$ , m.p. 123°,  $[\alpha]_D^{20} \pm 0^\circ$  in  $\text{CHCl}_3$  (*p*-nitrophenylhydrazone, decomp. 180°), which does not give Tanret's reaction or a blue colour after dissolution in alkali and acidification with conc.  $\text{H}_2\text{SO}_4$ . (II), m.p. 184° (decomp.), is  $(\text{C}_{10}\text{H}_{10}\text{O}_4)_2$  and is regarded as a dimeric product from (III). Hydrolysis of (I) with KOH—EtOH establishes the presence of 1 Ac. Oxidation of (I) with  $\text{KMnO}_4$  after hydrolysis yields AcOH, whereas  $\text{H}_2\text{O}_2$  affords  $(\text{CH}_2\cdot\text{CO}_2\text{H})_2$ . (I) and  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  at 100° give *gentiopiecin tetra-acetate* (IV), m.p. 139°,  $[\alpha]_D^{17} - 164.7^\circ$  in  $\text{CHCl}_3$ , which yields  $\text{CH}_2\text{O}$  after ozonolysis. Hydrogenation (Pd—C in EtOAc) of (I) leads to *tetrahydropiecin* (V), m.p. 190°,  $[\alpha]_D^{20} - 75.13^\circ$  in abs. EtOH, which does not yield a volatile acid when boiled with excess of  $\text{Ba}(\text{OH})_2\cdot\text{H}_2\text{O}$ , and is converted by  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  into *tetrahydropiecin tetra-acetate*, m.p. 208°, also obtained by hydrogenation of (IV). Oxidation of (V) with  $\text{KMnO}_4$  affords  $\text{EtCO}_2\text{H}$ , whilst dry distillation of it gives  $\text{Pr}^n\text{CHO}$ . (V) is hydrolysed by emulsin to *tetrahydroprotopiecin* (VI)  $\text{C}_{10}\text{H}_{14}\text{O}_4$ , m.p. 98°,  $[\alpha]_D^{20} + 214.9^\circ$  [*p*-nitrophenylhydrazone, m.p. 184° (decomp.)], which immediately reduces  $\text{MnO}_4^-$  but does not give a colour with  $\text{FeCl}_3$ . Hydrogenation (Pd—C in  $\text{H}_2\text{O}$ ) of (I) affords *hexahydroprotopiecin* (VII),  $\text{C}_{10}\text{H}_{16}\text{O}_4$ , m.p. 140°,  $[\alpha]_D^{19} + 161.0^\circ$  in abs. EtOH, which does not reduce  $\text{NH}_3\text{-Ag}_2\text{O}$  or  $\text{KMnO}_4$  in  $\text{COMe}_2$  [also obtained from (VI)], hexahydropiecin and glucose. Oxidation of (VII) by  $\text{CrO}_3$  in AcOH gives a compound,  $\text{C}_{10}\text{H}_{14}\text{O}_4$ , m.p. 93°,  $[\alpha]_D^{20} - 30.53^\circ$  in abs. EtOH.

H. W.

**Saponins. XI. Sapogenin of the roots of *Momordica cochinchinensis* (Laur), Spreng. S.** KUWADA and Y. FUWA (J. Pharm. Soc. Japan, 1935, 55, 467—473).—Momordin (saponin from *M. cochinchinensis*) is hydrolysed to *momorgenin* (I),  $\text{C}_{30}\text{H}_{48}\text{O}_3$ , decomp. 309.8° (corr.),  $[\alpha]_D^{20} + 78.3^\circ$  in  $\text{COMe}_2$  [K salt; monoacetate, m.p. 266° (corr.); Me ester (II), m.p. 203° (Ac derivative, m.p. 220°); benzoate, m.p. 261° (Me ester, m.p. 269°)]. (II) does not depress the m.p. of Me oleanolate and (I) resembles oleanolic acid in many respects.

CH. ABS. (r)

**Saponin of the seeds of *Eschulus turbinata*, Blume.** I. T. MATSUKAWA (J. Pharm. Soc. Japan, 1935, 55, 350—357).—*Japoescinin*,  $C_{65}H_{101}O_{30}$ , m.p. about  $200^{\circ}$  (decomp.), is obtained from Japanese *E. turbinata* by an improved method; it is hydrolysed to a *prosapogenin*,  $C_{59}H_{94}O_{25}$ , m.p.  $210^{\circ}$  (corr.) (*di-bromide*, m.p.  $175^{\circ}$ ), further hydrolysed to *japoescigenin* (I),  $C_{35\text{ or }36}H_{58\text{ or }60}O_7$ , m.p.  $258^{\circ}$  (corr.), possibly isomeric with Winterstein's escigenin (A., 1931, 1159). (I) contains 4 active H (Zerevitinov) and on hydrolysis yields *japoescigenol* (II),  $C_{30\text{ or }31}H_{52\text{ or }51}O_6$ , m.p.  $307^{\circ}$  [*monobromide*, m.p.  $196^{\circ}$  (decomp.)]; *tetra-acetate*, m.p.  $198^{\circ}$  (corr.), and *tiglic acid*. (II) contains 5 active H (probably 5 OH, the remaining O being in a bridge) and one double linking. CH. ABS. (r)

**Hydrogenation of acetylene derivatives.** XXII. **Dihydroxycyclohexylacetylene.** J. S. SALKIND [with T. E. ZALESSKAJA, D. I. ROZANOV, and G. V. TSHELINCEV] (J. Gen. Chem. Russ., 1935, 5, 1723—1727).—1:1'-Dihydroxy-1:1'-dicyclohexylacetylene (I) ( $Ac_2$  derivative, b.p.  $164$ — $170^{\circ}$ , m.p.  $45.5$ — $46.5^{\circ}$ ) and Br in  $CHCl_3$  afford  $\alpha\beta$ - *dibromo- $\alpha\beta$ -dicyclohexylethylene 1:1'-oxide*, m.p.  $106.5$ — $107.5^{\circ}$ . (I) is readily hydrogenated (Pd) to 1:1'-*dihydroxy-1:1'-dicyclohexylethylene*, m.p.  $152^{\circ}$ , which yields adipic acid when oxidised with  $KMnO_4$ . R. T.

**Conversion of furfuraldehyde into hydrocarbons.** N. A. ORLOV and O. A. RJABTSCHENKO (J. Appl. Chem. Russ., 1936, 9, 249—253).—Furfuraldehyde reacts with  $H_2$  in presence of  $MoS_3$  ( $270^{\circ}$ /150 atm.; 3—4 hr.) to yield sylvan, tetrahydrosylvan, EtOH, and  $CHMePr\cdot OH$ ; at  $330$ — $350^{\circ}$  (1.5—2 hr.) the product consists chiefly of *n*-pentane, together with unsaturated condensation products. R. T.

**True effect of cyclisation on the "colour" of molecules.** Ultra-violet absorption of *o*-methoxyacetophenone,  $\beta$ -coumaranone, and  $\gamma$ -chromanone. (MME.) RAMART-LUCAS and M. VAN COWENBERGH (Bull. Soc. chim., 1935, [v], 2, 1381—1383).—The ultra-violet absorption spectra of *o*-OMe- $C_6H_4\cdot COMe$ ,  $\gamma$ -chromanone, and  $\beta$ -coumaranone in EtOH are closely similar, displacement towards the visible increasing in the order given, i.e., being the greater the smaller is the no. of atoms in closed chain. J. W. B.

**Synthesis of 1:2-diphenylcoumarones.** B. I. ARVENTI (Bull. Soc. chim., 1936, [v], 3, 598—603).—When heated at  $250$ — $290^{\circ}$  *o*-benzoyloxydiphenylacetic acids lose  $CO_2$  and  $H_2O$  with production of 1:2-diphenylcoumarones. Thus, *o*-benzoyloxydiphenylacetic acid at  $290^{\circ}$  gives  $CO_2$ ,  $H_2O$ , BzOH, 1:2-diphenylcoumarone, m.p.  $123^{\circ}$  (identified by oxidation with  $CrO_3$  to *o*- $C_6H_4\cdot Bz\cdot OH$ ), and *o*-hydroxydiphenylacetolactone. *p*- $C_6H_4\cdot Cl\cdot OH$  and  $OH\cdot CHPh\cdot CO_2H$  yield 4-chloro-2-hydroxydiphenylacetic acid, the Bz derivative of which at  $260$ — $280^{\circ}$  gives 4-chloro-1:2-diphenylcoumarone, m.p.  $118^{\circ}$ , oxidised to 5-chloro-2-benzoyloxybenzophenone, m.p.  $112^{\circ}$ , whence 5-chloro-2-hydroxybenzophenone, m.p.  $94$ — $95^{\circ}$ . 1:2-Diphenyl-4-methylcoumarone, m.p.  $114^{\circ}$ , and 1:2-diphenyl-5-methylcoumarone, m.p.  $93^{\circ}$ , are described. H. W.

**Reaction between quinones and sodium enolates.** IV.  $\psi$ -Cumoquinone and sodio-acetoacetic and -malonic esters. L. I. SMITH and C. W. MACMULLEN (J. Amer. Chem. Soc., 1936, 58, 629—635).—Trimethyl-*p*-benzoquinone ( $\psi$ -cumoquinone) (I) and  $CHNa\cdot Ac\cdot CO_2Et$  in EtOH give 4-hydroxy-1:3:5:6-tetramethylcoumarone (II), m.p.  $138$ — $139^{\circ}$  (*benzoate*, m.p.  $145$ — $145.5^{\circ}$ ; *Me ether*, m.p.  $60$ — $61^{\circ}$ ), some 4-hydroxy-3:5:6-trimethylisocoumaranone (III), m.p.  $197$ — $198^{\circ}$ , and a resin [which when treated with Zn dust and aq. AcOH affords a considerable amount of (III)]. When the reaction is carried out in  $C_6H_6$ , (II) is the main product. (II) and (III) arise by ring-closure (in two ways) of the intermediate 2:5:3:4:6-(OH) $_2C_6Me_3\cdot CHAc\cdot CO_2Et$  and subsequent ketone or acid fission; a coumarin is not produced (cf. this vol., 480). (III) is the sole product from (I) and  $CHNa(CO_2Et)_2$ . Methylation ( $Me_2SO_4$ ,  $MeOH\cdot KOH$ ) of (III) gives 3:6-dimethoxy-2:4:5-trimethylphenylacetic acid (IV), m.p.  $158$ — $159^{\circ}$ . 2:4:5- $C_6H_2Me_3\cdot CHO$  (V) [from  $\psi$ -cumene (VI),  $Zn(CN)_2$ , and  $HCl$  in  $C_6H_6$ ] is reduced (Zn, aq. AcOH) to the impure acetate, b.p.  $141$ — $150^{\circ}/9$  mm., of 2:4:5-trimethylbenzyl alcohol, m.p.  $83$ — $83.5^{\circ}$  (cf. Krömer, A., 1891, 1351); the chloride, b.p.  $110^{\circ}/5$  mm. [prepared using conc.  $HCl$  or by chloromethylation (method: von Braun and Nelles, A., 1934, 879) of (VI)], with aq. EtOH-NaCN gives the nitrile, b.p.  $133$ — $137^{\circ}/4$  mm., m.p.  $9$ — $10^{\circ}$ , of 2:4:5-trimethylphenylacetic acid (VII), m.p.  $128$ — $129^{\circ}$  (lit.  $118^{\circ}$ ). (VII) is also obtained by reduction (red P, 45%  $HI$ , AcOH) of 2:4:5-trimethylmandelic acid, m.p.  $133$ — $135^{\circ}$  [from (V); method: Corson *et al.*, Org. Synth., 1932, 1, 329], and from 2:4:5- $C_6H_2Me_3\cdot COMe$  by Willgerdt and Scholtz' method (A., 1910, i, 392). 3:6-Dinitro-2:4:5-trimethylphenylacetic acid, m.p.  $203$ — $203.5^{\circ}$ , from (VII) and fuming  $HNO_3$  in  $CHCl_3$  + conc.  $H_2SO_4$  at  $0^{\circ}$ —room temp., is reduced by  $H_2$  (40 lb.),  $PtO_2$ , EtOH to 5-nitro-, and by  $H_2$  (1300 lb.), Raney Ni, EtOH at  $80^{\circ}$  to 5-amino-, m.p.  $260$ — $261^{\circ}$ , -4:6:7-trimethyl-oxindole. The latter is hydrolysed by aq.  $Ba(OH)_2$  at  $160^{\circ}$  to 3:6-diamino-2:4:5-trimethylphenylacetic acid; diazotisation of this and heating the resulting solution gives a product, m.p.  $176$ — $183^{\circ}$ , which with Zn and AcOH affords (III).  $HCl$  passed into 3:6-dimethoxy- $\psi$ -cumene, aq.  $CH_2O$ , and conc.  $HCl$  at  $70^{\circ}$  gives 3:6-dimethoxy-2:4:5-trimethylbenzyl chloride, b.p.  $134$ — $135^{\circ}/3.5$  mm., m.p.  $63$ — $63.5^{\circ}$ , converted by aq. EtOH-NaCN into the nitrile, m.p.  $90$ — $91^{\circ}$ , of (IV). H. B.

**Hydroxy-carbonyl compounds.** XI. Phosphoryl chloride as a condensing agent. (Miss) I. GOODALL and A. ROBERTSON (J.C.S., 1936, 426—428).—*p*-Xylenol does not condense with  $CH_2Ac\cdot CO_2Et$  in presence of  $POCl_3$  but with Et  $\alpha$ -methyl- (I), Et  $\alpha$ -ethyl- (II), and Et  $\alpha$ -benzyl-acetoacetate (III), and Et benzoylacetate (IV), chromones are obtained, identical with the respective compounds derived by the  $P_2O_5$  method. Condensation of (I) and (II) with *m*-4-xylenol ( $POCl_3$ ) also yields chromones, but  $CH_2Ac\cdot CO_2Et$  gives 4:6:8-trimethylcoumarin: (III) and (IV) do not react. It is concluded that with  $POCl_3$  the course of the reaction tends to follow that obtaining with  $P_2O_5$ . The following have been pre-

pared: 2:5:8-trimethyl-, m.p. 81°, 2:3:5:8-tetramethyl-, m.p. 96.5—97.5°, 2:5:8-trimethyl-3-ethyl-, m.p. 86.5°, 3-benzyl-2:5:8-trimethyl-chromone, m.p. 101°, and 2-(3':4'-methylenedioxy)styryl-5:8-dimethyl-, m.p. 183°, -3:5:8-trimethyl-, m.p. 226°, -5:8-dimethyl-3-ethyl-, m.p. 153°, and -3-benzyl-5:8-dimethyl-chromone, m.p. 222°, and 5:8-dimethylflavone, m.p. 171°.

F. R. S.

**Synthesis of a natural colouring matter.** R. ROBINSON (Proc. Roy. Inst., 1936, 29, 41—56).—An account of the synthesis of pelargonin chloride.

**Amino-alcohols derived from 1:2:3:4-tetrahydrodibenzfuran.** R. A. ROBINSON and E. MOSSETTIG (J. Amer. Chem. Soc., 1936, 58, 688—689; cf. this vol., 209).—7-Bromoacetyl-1:2:3:4-tetrahydrodibenzfuran, m.p. 81—82° (all m.p. are corr.), and the appropriate base give 7-dimethylamino- (hydrochloride, m.p. 244—247°), 7-diethylamino- (hydrochloride, m.p. 202—210°), 7-piperidino- (hydrochloride, m.p. 235—239°), and 7-1':2':3':4'-tetrahydroisoquinolino- (hydrochloride, m.p. 260—264°), -acetyl-1:2:3:4-tetrahydrodibenzfurans. 7-β-Dimethylamino- (hydrochloride, m.p. 220—222°), 7-β-piperidino- (hydrochloride, m.p. 230—232°), and 7-β-1':2':3':4'-tetrahydroisoquinolino- (hydrochloride, m.p. 197—200°), -α-hydroxyethyl-1:2:3:4-tetrahydrodibenzfurans are prepared (with difficulty) by catalytic reduction of the  $\text{NR}_2\cdot\text{CH}_2\cdot\text{CO}$  derivatives. H. B.

**Constitution of oroxylin.** R. C. SHAH, C. R. MEHTA, and T. S. WHEELER (Current Sci., 1935, 4, 406).—Oroxylin, m.p. 231—232° (lit. 225°), from the root bark of *Oroxylum indicum*, Vent., has 1 OMe (cf. J.C.S., 1901, 79, 954) and is shown by demethylation and by methylation to be 5:7-dihydroxy-6-methoxyflavone. The colour reaction obtained by previous workers from (I) with dil. alkali is due to baicalein (5:6:7-trihydroxyflavone) present as an impurity.

H. G. M.

**Natural coumarins.** XVII. **Synthesis of xanthotoxin.** E. SPÄTH and M. PAILER (Ber., 1936, 69, [B], 767—770).—Hydrogenation (Pd-C in AcOH at 40—45°) of 6:7-dihydroxycoumaranone affords 6:7-dihydroxycoumaran (I), m.p. 112°, and a substance, m.p. 132° (I), lactic acid, and conc.  $\text{H}_2\text{SO}_4$  at 120° afford 4':5'-dihydroxanthotoxinol (II), m.p. 202°, converted by  $\text{CH}_3\text{N}_2$  in MeOH into 4':5'-dihydroxanthotoxin, m.p. 163°, which is dehydrogenated (Pd-sponge at 170°) to xanthotoxin, m.p. 146°.

H. W.

**Analogues of rotenone and related compounds.** I. Chromeno-(3':4':4:3)-coumarins. W. HILTON, R. W. H. O'DONNELL, F. P. REED, A. ROBERTSON, and G. L. RUSBY (J.C.S., 1936, 423—426).—Resorcinol and Et 3-hydroxy-6:7-dimethoxy-Δ<sup>3</sup>-chromene-4-carboxylate (I) with  $\text{H}_2\text{SO}_4$  give 7-hydroxy-6':7'-dimethoxychromeno-(3':4':4:3)-coumarin (+ $\text{H}_2\text{O}$ ), m.p. 245° (acetate, m.p. 220—221°). Similar condensation of (I) with the appropriate phenol and either  $\text{H}_2\text{SO}_4$  or HCl-EtOH leads to the following chromeno-(3':4':4:3)-coumarins: 7:8-dihydroxy- (+ $\text{H}_2\text{O}$ ), m.p. 274° (decomp.) (diacetate, m.p. 232—

233°), and 5:7-diacetoxy-6':7'-dimethoxy-, m.p. > 300°; 7-hydroxy-6':7'-dimethoxy-, m.p. 230—231° (acetate, m.p. 137°), 7-hydroxy-7'-methoxy-, m.p. 228° (acetate, m.p. 219°), and 7-hydroxy-8'-methoxy-8-isomethyl-, m.p. 245° (acetate, m.p. 188°); 7-hydroxy-, m.p. 266° (acetate, m.p. 222°), 7:8-dihydroxy-, m.p. 254° (diacetate, m.p. 231.5°), and 5:7-dihydroxy-7'-methoxy-, m.p. 309° (diacetate, m.p. 253°); 7-hydroxy-, m.p. 269° (acetate, m.p. 232°), 7:8-dihydroxy-, m.p. 277° [diacetate, m.p. 264° (decomp.)], and 5:7-dihydroxy-8'-methoxy- (diacetate, m.p. 224°). Et phenoxycetic-2-acetate, m.p. 48—49°, and Na in PhMe afford Et chroman-3-one-4-carboxylate, which with resorcinol in HCl-EtOH yields 7-hydroxychromeno-(3':4':4:3)-coumarin, m.p. 276—278° (acetate, m.p. 214—215°).

F. R. S.

**Synthesis of rotenone and its derivatives.** IX. R. W. H. O'DONNELL, F. P. REED, and A. ROBERTSON (J.C.S., 1936, 419—422).—The Et ester of 6-methoxyphenoxyacetic-2-acetic acid, m.p. 166°, prepared from the azlactone of Et 2-aldehyde-6-methoxyphenoxyacetate, NaOH, and  $\text{H}_2\text{O}_2$ , is cyclised (Na) to Et 3-hydroxy-8-methoxy-Δ<sup>3</sup>-chromene-4-carboxylate (I), m.p. 87°, the Ac derivative, m.p. 72°, of which is reduced ( $\text{H}_2$ -Pt) and hydrolysed to 8-methoxychroman-4-carboxylic acid, m.p. 110°. (I) is reduced ( $\text{H}_2$ -Pt) to Et 3-hydroxy-8-methoxychroman-4-carboxylate, m.p. 85° (Ac derivative, m.p. 94°), hydrolysed to the acid, m.p. 197° (decomp.), which with  $\text{Ac}_2\text{O}$  and  $\text{C}_5\text{H}_5\text{N}$  gives 8-methoxy-Δ<sup>3</sup>-chromene-4-carboxylic acid, m.p. 170°. 5-Methoxyphenoxyacetic-2-acetic acid, m.p. 163°, obtained by oxidation of the pyruvic acid, gives an Et ester, b.p. 178—180°/1 mm., m.p. 37°, which is cyclised to Et 3-hydroxy-7-methoxy-Δ<sup>3</sup>-chromene-4-carboxylate (II), m.p. 62—63° (Ac derivative, m.p. 51°). This acetate is reduced to 7-methoxychroman-4-carboxylic acid, m.p. 78°, whilst (II) is hydrogenated to Et 3-hydroxy-7-methoxychroman-4-carboxylate, m.p. 97°, hydrolysed to 7-methoxy-Δ<sup>3</sup>-chromene-4-carboxylic acid, m.p. 131°. The course of the reduction of enol acetates is discussed.

F. R. S.

**Reduction experiments with 2:3:4:5-tetraphenylthiophen.** E. BERGMANN (J.C.S., 1936, 505).—Reduction (Na-amyl alcohol) of tetraphenylthiophen gives αβγδ-tetraphenylbutane, m.p. 86°, and 1:2-diphenyl-3-benzylhydrindene, m.p. 182°, but no reduction occurs with Zn-HCl (cf. Fromm and Achert, A., 1903, i, 340).

F. R. S.

**Hydroxypyrrole nitrones.** II. A. H. BLATT (J. Amer. Chem. Soc., 1936, 58, 590—594).—When 2-hydroxy-2:3:5-triphenylpyrrolene nitrone (I), m.p. about 180° (decomp.) (prep. A., 1935, 355, whereby a little of a N-free substance, m.p. 204°, is also formed), is dissolved in aq. 5% NaOH and the solution acidified with AcOH, the oxime (II), m.p. about 180° (decomp.), of αβ-dibenzoyl-α-phenylethylene (loc. cit.) is pptd.; acidification with HCl or HBr gives (I). (II) is best converted into (I) by a little HCl in  $\text{COMe}_2$ . Methylation ( $\text{MeI}$ ,  $\text{MeOH-NaOMe}$ ) of (II) affords the Me ether (III) (loc. cit.) of (I); with  $\text{Me}_2\text{SO}_4$  and aq. NaOH, (III) (formation favoured by low alkali concn. and rise of temp.) and the Me ether, m.p. 121°, of (II) result. (I) and  $\text{Ac}_2\text{O}$  at 80° give 1:4-diacetoxy-2:3:5-triphenylpyrrole (IV), m.p.

151°, reduced (Zn dust, AcOH, little CuSO<sub>4</sub>) to 4-acetoxy-2:3:5-triphenylpyrrole, m.p. 188°, and thence (red P, I, AcOH) to 2:3:5-triphenylpyrrole (V). (II) and Ac<sub>2</sub>O afford the normal acetate (VI) (*loc. cit.*). The production of (IV) from (I) is explained by the following reactions: (a) acetylation of 2-OH, (b) addition of Ac<sub>2</sub>O to the nitron system, (c) migration of OAc from C2 to C4, (d) loss of AcOH between C4 and C5. (I), (II), or (VI) and AcCl give diacetylhydroxamic acid, 4-chloro-2:3:5-triphenylfuran, and (mainly) 4-chloro-1-acetoxy-2:3:5-triphenylpyrrole, m.p. 152°, which is reduced (Zn dust, AcOH, traces of CuSO<sub>4</sub>, and HCl) to 4-chloro-2:3:5-triphenylpyrrole, m.p. 140–141°, and thence (P, HI) to (V).

H. B.

**Extension of Michael's reaction.** V. T. N. GHOSH (J. Indian Chem. Soc., 1935, 12, 692–698; cf. A., 1934, 1010).— $\alpha\alpha'$ -Et<sub>2</sub> acetonetetracarboxylic dianilide (I) with boiling AcOH-Ac<sub>2</sub>O gives Et<sub>2</sub> 2:4-diphenylcarbamidocyclobutanone-2:4-carboxylate, m.p. 248° (decomp.) (semicarbazone, m.p. > 270°). Similarly, (I) with MeCHO, *o*-OMe·C<sub>6</sub>H<sub>4</sub>·CHO, and CHPh·CH·CHO, respectively, instead of CH<sub>2</sub>O, gives Et<sub>2</sub> 2:4-diphenylcarbamido-3-methyl-, m.p. 200–202° (decomp.), -3-*o*-anisyl-, m.p. 205–206°, and -3- $\beta$ -phenylvinyl-, m.p. 249–250° (decomp.), -cyclobutanone-2:4-dicarboxylate. (I) with COMePh-Ac<sub>2</sub>O (reflux; 2 hr.) gives traces of two compounds, m.p. 224–225° (decomp.) and 303–304° (decomp.), the former being sol. and the latter insol. in alkali. CO(CH<sub>2</sub>-CO<sub>2</sub>Et)<sub>2</sub> (II) when treated in Et<sub>2</sub>O successively with Na and  $\alpha$ -C<sub>10</sub>H<sub>7</sub>·NCO (III) gives 3-carbethoxy-2:4:6-triketo-1- $\alpha$ -naphthylpiperidine (IV), m.p. 191–192° (decomp.) (Na salt), also obtained directly from (II) and (III), and hydrolysed to 2:4:6-triketo-1- $\alpha$ -naphthylpiperidine (V), m.p. 249–250° (decomp.). (IV) when refluxed with CHPh·CH·CHO or with *o*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CHO yields, respectively, 3-carbethoxy-2:4:6-triketo-1- $\alpha$ -naphthyl-3:5-cinnamylidene-, m.p. 236–237° (decomp.), and -3:5-*o*-nitrobenzylidene-, m.p. > 300°, -piperidine. Similarly, 2:4:6-triketo- $\alpha$ -naphthyl-3:5-cinnamylidene-, m.p. 263–264°, and -3:5-*o*-nitrobenzylidene-, m.p. 233–235°, -piperidine, both insol. in alkali, were prepared from (V). (II) when treated in abs. Et<sub>2</sub>O successively with Na and carbethoxythiocarbimide in PhMe yields Et<sub>2</sub> 2:6-dicarbethoxyiminothiopyran-4-one-3:5-dicarboxylate, m.p. 122–123°. The ring structure is proved by the absence of mercaptan properties and stability to HgO. The Na<sub>2</sub>-derivative of Et 2:6-diketo-4:4-dimethylcyclohexane-3:5-dicarboxylate does not react with PhNCO.

H. G. M.

**Production of piperidine derivatives.**—See B., 1936, 476.

**Syntheses in the pyridine series.** A. E. TSCHITSCHIBABIN (Bull. Soc. chim., 1936, [v], 3, 762–779).—A lecture.

**Action of carbon disulphide on methylpyridonimine.** K. S. TOPSCHIEV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 23–26).—Methylpyridonimine (prepared from 2-C<sub>5</sub>H<sub>4</sub>N·NH<sub>2</sub> and MeI) with CS<sub>2</sub>-EtOH gives the methylpyridonimine salt (I), m.p. 160°, of N-methylpyridinedithiocarbamic acid, but with CS<sub>2</sub> alone gives N-methylpyridodithiadiazole (II),

m.p. 135°, b.p. 173°/3 mm. without decomp., sparingly sol. in H<sub>2</sub>O and unaffected by conc. aq. NaOH.

H. G. M.

**$\beta$ -(2-Pyridyl)alanine.** J. OVERHOFF, J. BOEKE, and A. GORTER (Rec. trav. chim., 1936, 55, 293–296).— $\omega$ -(2-Pyridyl)methylamine [from 2-cyanopyridine and Cr(OAc)<sub>3</sub>] is converted by NaNO<sub>2</sub>-HCl into chloro-(2-pyridyl)methane, b.p. 73–76°/10 mm. (picrate, m.p. 152–153°); interaction with C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>N·CNa(CO<sub>2</sub>Et)<sub>2</sub> then affords Et<sub>2</sub>  $\alpha$ -(2-pyridyl)- $\beta$ -phthalimidoethane- $\beta\beta$ -dicarboxylate, m.p. 120°, hydrolysed by HCl to  $\beta$ -(2-pyridyl)alanine dihydrochloride (I), m.p. 209–210°; (I) with 2 equivs. of Ag<sub>2</sub>O affords  $\beta$ -(2-pyridyl)alanine, m.p. 216–217° (decomp.). {Picrate [from (I) and OH·C<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>3</sub>], m.p. 164–165°; monohydrochloride [from (I) and 1 equiv. of Ag<sub>2</sub>O], m.p. 190–191°} P. G. C.

**Nitration method of 8-nitro-6-methoxyquinoline.** K. S. TOPSCHIEV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 263–264).—Addition of HNO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub> to 8-nitro-6-methoxyquinoline in H<sub>2</sub>SO<sub>4</sub> below 40° gives 5:8-dinitro-6-methoxyquinoline, m.p. 234°, in good yield.

H. G. M.

**Cases of mobility of the nitro-group.**  
**Mobility of the nitro-group in 5:8-dinitro-6-methoxyquinoline.** K. S. TOPSCHIEV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 264–266; cf. preceding abstract).—5:8-Dinitro-6-methoxyquinoline when heated with  $\delta$ -amino- $\alpha$ -diethylaminopentane gives 5-nitro-8-(8-diethylamino- $\alpha$ -methylbutyl)amino-6-methoxyquinoline, reduced by SnCl<sub>2</sub>-HCl to the corresponding 5-NH<sub>2</sub>-derivative, b.p. 250°/3 mm., which gives a salt, m.p. 165°, with 1 mol. of di-(2-hydroxy-3-carboxynaphthyl)methane. This salt is also obtained by similar methods from the nitration product of 8-(8-diethylamino- $\alpha$ -methylbutyl)amino-6-methoxyquinoline.

H. G. M.

**Changes of "colour" which accompany the conversion of amino-acids and amides into lactams in the benzene series.** (MME.) RAMART-LUCAS and (MLEE.) BIQUARD (Bull. Soc. chim., 1935, [v], 2, 1383–1388).—The ultra-violet absorption spectra of Na *o*-aminophenylacetate and -propionate closely resemble that of *o*-C<sub>6</sub>H<sub>4</sub>Me·NH<sub>2</sub>. Cyclisation of the side-chain affects the spectra (1) by altering the nature of the chromophores, and (2) by the true effect of cyclisation. The absorption spectra of the corresponding cyclic compounds oxindole and its *N*-Me and 1:3:3-Me<sub>3</sub> (I) derivatives are closely similar, as are also the spectra of 2-keto-1:2:3:4-tetrahydroquinoline and its 1-Me and 1:4-Me<sub>2</sub> (II) derivatives. All these, therefore, have a lactam structure, and conversion of an NH<sub>2</sub>-acid into the lactam is accompanied by a hypsochromic effect. Comparison of the spectra of *o*-C<sub>6</sub>H<sub>4</sub>Me·NMe·CO·CMe<sub>2</sub>Bu<sup>a</sup> with those of (I) and (II) shows that the true effect of cyclisation is a bathochromic one.

J. W. B.

**Synthesis of Plasmocide** [8-( $\gamma$ -*N*-diethylaminopropyl)amino-6-methoxyquinoline methylene bis-salicylate]. O. J. MAGIDSON, I. T. STRUKOV, M. D. BOBISCHEV, and S. F. TORF (J. Appl. Chem. Russ., 1936, 9, 304—321).—8-Amino-6-methoxyquinoline (I) is prepared on the industrial scale by the steps:  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{NO}_2 \rightarrow p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{OMe} \rightarrow p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OMe} \rightarrow p\text{-NHAc}\cdot\text{C}_6\text{H}_4\cdot\text{OMe} \rightarrow m\text{-nitro-}p\text{-anisidine} \rightarrow 8\text{-nitro-6-methoxyquinoline} \rightarrow$  (I).  $\text{NEt}_2\cdot[\text{CH}_2]_3\text{Cl}$  (II) was obtained as follows: glycerol  $\rightarrow$  diformin  $\rightarrow$  allyl formate  $\rightarrow \text{CH}_2\text{:CH}\cdot\text{CH}_2\text{Cl} \rightarrow \text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{CH}_2\text{Br} \rightarrow$  (II). (I) and (II) are condensed to yield 8-( $\gamma$ -*N*-diethylaminopropyl)amino-6-methoxyquinoline, the methylene bis-salicylate of which has marked plasmocidal properties. R. T.

**Syntheses in the 2-phenylquinoline series.** I. **Synthesis of bromine-substituted 2-phenylquinoline-4-carboxylic acids.** Reactivity of the bromine therein. Curtius degradation of 6- and 4'-bromoatophan. K. FEIST and M. KUKLINSKI (Arch. Pharm., 1936, 274, 244—255).—5-Bromoisatin,  $\text{COPhMe}$ , and 33%  $\text{KOH}$  at  $100^\circ$  give 6-bromo-2-phenylquinoline-4-carboxylic acid (I), m.p.  $239.5^\circ$ , which affords successively the *Et* ester, m.p.  $97.5^\circ$ , hydrazide, +  $\text{EtOH}$ , m.p.  $226^\circ$  [benzylidene, m.p.  $271^\circ$ , and salicylidene derivative, +  $2\text{EtOH}$  (lost only slowly at  $130^\circ$ ), double m.p.  $153^\circ$  and  $237^\circ$ ], azide, m.p.  $113^\circ$ , and urethane, m.p.  $192^\circ$ , and 6-bromo-4-amino-2-phenylquinoline, m.p.  $209^\circ$  (hydrochloride, m.p.  $328^\circ$ ;  $\text{Ac}_2$  derivative, m.p.  $166^\circ$ ). Isatin and  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{COMe}$ , m.p.  $53.5^\circ$ , afford similarly 2-p-bromophenylquinoline-4-carboxylic acid (II), m.p.  $241^\circ$ , the *Et* ester, m.p.  $95^\circ$ , hydrazide, m.p.  $247.5^\circ$  (benzylidene, +  $\text{EtOH}$ , m.p.  $245^\circ$ , and salicylidene derivative, m.p.  $274^\circ$ ), azide, m.p.  $96^\circ$ , and urethane, m.p.  $154^\circ$ , and 4-amino-2-p-bromophenylquinoline, m.p.  $164^\circ$  (hydrochloride, m.p.  $326^\circ$ ;  $\text{Ac}_2$  derivative, m.p.  $231.5^\circ$ ). The Br in (I) is unreactive, since with  $\text{NH}_2\text{Me}$  in  $\text{EtOH}$  at  $200^\circ$  it affords only the methylamide, m.p.  $244^\circ$ , hydrolysed to (I) by alkali. Further, activated Mg does not react with (I), (II), 4-bromo-2-phenylquinoline, or *Et* 3-bromo-2-phenylquinoline-4-carboxylate, m.p.  $88.5^\circ$ . The prep. of 3-bromo-2-phenylquinoline-4-carboxylic acid, m.p.  $236^\circ$  (lit.  $231^\circ$ ), is improved. R. S. C.

**Acridones.** VII. **Acridol**, a tautomeric form of acridone. I. TANASESCU and E. RAMONTIANU (Bull. Soc. chim., 1935, [v], 2, 1485—1488).—The red substance, m.p.  $350^\circ$ , obtained from 5-chloroacridine in boiling  $\text{PhNO}_2$  (Marzin, A., 1933, 1059, where the m.p.  $250^\circ$  is an error) is really acridone, m.p.  $354^\circ$ , and not 5-hydroxyacridine, the colouring matter being an impurity. J. W. B.

**Meso-derivatives of acridine.** IV. **9-Phenoxyacridines.** V. **Derivatives of 9-aminoacridine.** N. S. DROZDOV and O. M. TSCHERNITZOV (J. Gen. Chem. Russ., 1935, 5, 1576—1580, 1736—1743).—IV. 5-Chloroacridine and  $\text{PhOH}$  at  $100^\circ$  yield the hydrochloride of 5:5-diphenoxy-5:10-dihydroacridine, converted by aq.  $\text{NH}_3$  into 5-phenoxyacridine (I), m.p.  $125\text{—}126^\circ$  (lit.  $112^\circ$ ). The following derivatives of (I) have been prepared analogously: 5-phenoxy-3-methoxy- (II), m.p.  $151\text{—}152^\circ$  (hydrochloride, m.p.  $222\text{—}225^\circ$ ), 2-chloro-, m.p.  $169\text{—}170^\circ$ , and 3-nitro-5-phenoxy-7-methoxy-acridine (III), m.p.  $173^\circ$ , 2-

chloro-, m.p.  $191\text{—}194^\circ$ , and 3-nitro-5:5-diphenoxy-7-methoxy-5:10-dihydroacridine hydrochloride, m.p.  $173^\circ$ . The above substances are converted into the corresponding acridones by boiling with dil. acids.

V. 5-Aminoacridine (IV) is obtained in theoretical yield by adding  $\text{NH}_4\text{Cl}$  to (I) in fused  $\text{PhOH}$  at  $100^\circ$ , and treating the hydrochloride of (IV) so obtained with aq.  $\text{NH}_3$ . The following derivatives of (IV) are obtained analogously: from (II) and  $\text{NH}_4\text{Cl}$ ,  $\text{NH}_2\text{Me}\cdot\text{HCl}$ , or  $\text{NH}_2\text{Ph}\cdot\text{HCl}$ , 5-amino-, m.p.  $231^\circ$ , 5-methylamino-, m.p.  $176^\circ$  (hydrochloride, +  $2\text{H}_2\text{O}$ , m.p.  $272\text{—}275^\circ$ ), and 5-anilino-3-methoxyacridine, m.p.  $202\text{—}203^\circ$  (hydrochloride, m.p.  $262\text{—}266^\circ$ ); from 3:5-dichloro-7-methoxyacridine,  $\text{PhOH}$ , and  $\gamma$ -piperidino- $\beta$ -hydroxypropylamine, 1-phenyl-2:3-dimethyl-5-pyrazolone, or *p*-anisidine, 3-chloro-5-( $\gamma$ -piperidino- $\beta$ -hydroxypropyl)amino- (hydrochloride, m.p.  $105\text{—}110^\circ$ ), 3-chloro-5-(1'-phenyl-2':3'-dimethyl-5'-pyrazolonyl)- (hydrochloride, m.p.  $250^\circ$ ), or 3-chloro-*p*-anisidino-7-methoxyacridine, m.p.  $203\text{—}204^\circ$  [hydrochloride, m.p.  $277\text{—}278^\circ$  (decomp.)]; from (III) and  $\text{NHPh}_2$  or *p*-anisidine hydrochloride, 3-nitro-5-anilino-, m.p.  $224^\circ$  (+  $\text{EtOH}$ , decomp.  $105\text{—}110^\circ$ ), and 3-nitro-5-*p*-anisidino-7-methoxyacridine, m.p.  $212\text{—}213^\circ$ . 5-Piperidino-3-methoxyacridine, m.p.  $102\text{—}103^\circ$ , is prepared by heating (II) with  $\text{PhOH}$  and piperidine at  $100^\circ$ . R. T.

**Copper lake of alizarin-blue base** (1:2-dihydroxyanthraquinone-3-quinoline). I. CHEMLITZKAJA, M. KOROVIN, and E. GOLDMAN (Anilinokras. Prom., 1935, 5, 135—137).

—The salt of annexed constitution is pptd. when a solution of the base in conc.  $\text{H}_2\text{SO}_4$  is added to aq.  $\text{CuSO}_4$ . R. T.

**Isomerisation of saturated and unsaturated hydantoins.** D. A. HAHN and M. K. SEIKEL (J. Amer. Chem. Soc., 1936, 58, 647—649).—Successive treatment of 5-benzylidene-3-methylhydantoin with  $\text{EtOH}\text{--}\text{NaOEt}$  and  $\text{CHPhBr}\cdot\text{CO}_2\text{Et}$  gives *Et* 5-benzylidene-3-methylhydantoin-1-phenylacetate (I), m.p.  $134\text{—}135^\circ$ ; an isomeride (II), m.p.  $106.5\text{—}107.5^\circ$ , is obtained from (VI) or (VIII), below, and  $\text{EtOH}\text{--}\text{HCl}$ . Hydrolysis (aq.  $\text{EtOH}\text{--}\text{NaOH}$ ) of (I) affords the *Na* salts, m.p.  $288^\circ$  (decomp.) (III) and  $217^\circ$  (decomp.) (IV) [corresponding *Ba* salts, m.p.  $213\text{—}215^\circ$  (decomp.) (V) and  $312\text{—}320^\circ$  (decomp.) (VI)], of two forms of 5-benzylidene-3-methylhydantoin-1-phenylacetic acid, m.p.  $186\text{—}187^\circ$  (VII) and  $170^\circ$  (VIII). The various pairs in the series (I)—(VIII) are geometrical isomerides. Reduction [red P and  $\text{HI}$  (d 1.7) at  $105\text{—}110^\circ$ ] of (I), (VII), or (VIII) gives 5-benzyl-3-methylhydantoin-1-phenylacetic acid (+  $\text{H}_2\text{O}$ ) (IX), m.p. (anhyd.)  $147\text{—}147.5^\circ$ ; an isomeride (X), m.p.  $129\text{—}131^\circ$ , is obtained by acidification of (XIV) and (XVI) (below). Crude (IX) and  $\text{EtOH}\text{--}\text{HCl}$  afford isomeric *Et* esters, m.p.  $123.5\text{—}124.5^\circ$  (XI) and  $60\text{—}61.5^\circ$  (XII), which are hydrolysed (aq.  $\text{EtOH}\text{--}\text{NaOH}$ ) to the corresponding *Na* salts, m.p.  $156\text{—}157^\circ$  (XIII) and  $293\text{—}295^\circ$  (XIV) [corresponding *Ba* salts, m.p.  $284^\circ$  (decomp.) (XV) and  $300\text{—}307^\circ$  (decomp.) (XVI)], of (IX) and (X), respectively.

The various pairs of (IX)—(XVI) are stereoisomeric forms. (IX) is hydrolysed by aq. Ba(OH)<sub>2</sub> to  $\beta$ -phenylalanine-*N*-phenylacetic acid. H. B.

**Relation of structure of dialkylbarbituric acids to length of their [anæsthetic] action.** H. A. SHONLE, J. H. WALDO, A. K. KELTCH, and H. W. COLES (J. Amer. Chem. Soc., 1936, 58, 585—587).—The appropriate bromide and CNaEt(CO<sub>2</sub>Et)<sub>2</sub> in EtOH give *Et ethyl- $\alpha\delta$* -, *- $\alpha\gamma$* -, and *- $\beta\delta$ -dimethylamyl*-, b.p. 133—134°/7.5 mm., 126—127°/4 mm., and 140—141°/10 mm., respectively, *- $\alpha$ -propylbutyl*-, b.p. 110—111°/3 mm., *- $\delta$ -methylheptyl*-, b.p. 115—116°/1 mm., *- $\beta\delta$ -dimethylhexyl*-, b.p. 107—109°/1 mm., *- $\beta$ -ethylhexyl*-, b.p. 127—130°/4 mm., *- $\beta$ - and  $\delta$ -methylamyl*-, b.p. 103—105°/2 mm. and 108°/2 mm., respectively, *- $\gamma$ - and  $\epsilon$ -methyl- $\beta$ -ethylhexyl*-, b.p. 120—123°/2.5 mm. and 125—128°/1 mm., respectively, *- $\alpha\gamma$ -dimethylbutyl*-, b.p. 97.5—99°/3 mm., and *- $\beta$ -ethylbutyl*-, b.p. 167°/30 mm., *-malonates*. The following bromides (primary prepared with PBr<sub>3</sub> or HBr-conc. H<sub>2</sub>SO<sub>4</sub>; *sec.* usually obtained with dry HBr) are new:  *$\alpha\delta$* -,  *$\alpha\gamma$* -, and  *$\beta\delta$ -dimethylamyl*-, b.p. 67—72°/40 mm., 67—71°/40 mm., 65—66°/27 mm., respectively,  *$\delta$ -methylheptyl*-, b.p. 73—74°/16 mm.,  *$\beta\delta$ -dimethylhexyl*-, b.p. 76—81°/22 mm.,  *$\beta$ -ethylhexyl*-, b.p. 93—98°/40 mm., and  *$\gamma$ - and  $\epsilon$ -methyl- $\beta$ -ethylhexyl*-, b.p. 88—92°/20 mm. and 84—92°/20 mm., respectively. The above malonates and CO(NH<sub>2</sub>)<sub>2</sub> in EtOH—NaOEt give *5-ethyl-5- $\alpha\delta$* -, *- $\alpha\gamma$* -, and *- $\beta\delta$ -dimethylamyl*-, m.p. 136—136.6°, 126—127°, and 124.8—125°, respectively, *-5- $\alpha$ -propylbutyl*-, m.p. 129—131.5°, *-5- $\delta$ -methylheptyl*-, m.p. 77—79°, *-5- $\beta\delta$ -dimethylhexyl*-, m.p. 105—115°, *-5- $\beta$ -ethylhexyl*-, m.p. 116—116.5°, *-5- $\beta$ - and  $\delta$ -methylamyl*-, m.p. 151—154° and 108—110° [176—178° when original alcohol used was synthesised from MgBu<sup>8</sup>Br and (CH<sub>2</sub>)<sub>2</sub>O or from Mg isoamyl bromide and CH<sub>2</sub>O], respectively, *-5- $\gamma$ - and  $\epsilon$ -methyl- $\beta$ -hexyl*-, m.p. 150—152° and 134.8—135.6°, respectively, *-5- $\alpha\gamma$ -dimethylbutyl*-, m.p. 173.5—174.5°, and *-5- $\beta$ -ethylbutyl*-, m.p. 134—134.5° (lit. 125°), *-barbituric acids*. Some of these acids are also prepared from CN·C<sub>2</sub>H<sub>5</sub>·CO<sub>2</sub>Et; the esters with R= $\beta\delta$ -dimethylamyl, b.p. 128°/3—4 mm.,  $\alpha$ -propylbutyl, b.p. 131°/2—3 mm., and  $\beta$ -ethylhexyl, b.p. 152—153°/4 mm., are described. Et  $\alpha$ -propylbutylcyanoacetate has b.p. 123—125°/3 mm. Pharmacological data for the acids are given; the duration of anæsthetic action bears no direct relationship to the amount of acid required to produce anæsthesia or to the mol. wt. of the complex alkyl group. H. B.

**Preparation of a barbituric acid and salts thereof.**—See B., 1936, 395.

**Ferric complexes of antipyrine.** J. V. DUBSKÝ, E. KRAMETZ, and J. TRTÍLEK (Coll. Czech. Chem. Comm., 1936, 8, 141—148; cf. A., 1935, 1252).—Dark brown [Fe(CN)<sub>5</sub>NO<sub>2</sub>]Fe<sub>4</sub>B<sub>4</sub>H<sub>2</sub>O (B=antipyrine), decomp. 110°, is pptd. by addition of cold aq. FeCl<sub>3</sub> to [Fe(CN)<sub>5</sub>NO<sub>2</sub>]Na<sub>3</sub> and antipyrine, whilst greyish-brown [Fe(CN)<sub>5</sub>NO<sub>2</sub>]Fe<sub>2</sub>·3B may be similarly obtained from [Fe(CN)<sub>5</sub>NO<sub>2</sub>]K<sub>3</sub>. [Fe(CN)<sub>5</sub>NO<sub>2</sub>]Na<sub>4</sub> gives a compound of the Prussian-blue type with FeCl<sub>3</sub> whilst [Fe(CN)<sub>5</sub>NH<sub>3</sub>]Na<sub>3</sub> yields greenish-blue [Fe(CN)<sub>5</sub>NH<sub>3</sub>]Fe<sub>2</sub>·8H<sub>2</sub>O. The compounds

[Fe(CN)<sub>5</sub>NH<sub>3</sub>]Fe<sub>2</sub>·3B, [Fe(CN)<sub>6</sub>]Fe<sub>2</sub>·3B·8H<sub>2</sub>O, and [Cr(SCN)<sub>6</sub>]Fe<sub>2</sub>·3B·8H<sub>2</sub>O have also been prepared.

R. S.

**Glucosides of the glyoxaline series.** E. BERGMANN and H. HEIMHOLD (J.C.S., 1936, 505—506).—Ag glyoxaline with tetra-acetobromoglucose gives *tetra-acetoglucosidoglyoxaline*, m.p. 205—208°, deacetylated to *glucosidoglyoxaline*, m.p. 217°; similarly *triacetorhamnosidoglyoxaline*, m.p. 177—179°, is deacetylated to *rhamnosidoglyoxaline*, m.p. 153—156°.

F. R. S.

**Action of isatin on  $\alpha$ -naphthyl ethyl ether.** C. MARSHALK (Bull. Soc. chim., 1936, [v], 3, [A], 124—129, [B], 129—134).—[A] 4:4'-Diethoxy-1:1'-dinaphthyl (I) is formed from  $\alpha$ -C<sub>10</sub>H<sub>7</sub>·OEt (II) and isatin with cold 83% H<sub>2</sub>SO<sub>4</sub>, but not with conc. H<sub>2</sub>SO<sub>4</sub> when other products, one (III) of which is insol. in cold H<sub>2</sub>O, alkalis, and boiling PhMe, are formed (cf. A., 1927, 673). The formation of (I) is probably due to the interaction of excess of (II) with (III), and not to oxidation by H<sub>2</sub>SO<sub>4</sub>. The reaction is analogous to that previously described (this vol., 721). Isatin (III) itself, however, does not act as the H-acceptor. (I) is also obtained when (II) is treated with phenanthraquinone and H<sub>2</sub>SO<sub>4</sub> in the cold.

[B] (II), (III), and 93.5% H<sub>2</sub>SO<sub>4</sub> give a compound, m.p. 255—256° when carefully purified, identical with 3-(4'-ethoxy-1'-naphthyl)dioxindole, obtained from OEt·C<sub>10</sub>H<sub>6</sub>·MgBr and (III). This with (II) and 84% H<sub>2</sub>SO<sub>4</sub> gives (I) and a compound, m.p. 214—215°, also obtained in the reaction between (II), (III), and 84% H<sub>2</sub>SO<sub>4</sub>. The formation of (I) requires 3 mols. of (II) for one of (III). H. G. M.

**Complex salts of dipyriddy with bivalent and trivalent cobalt.**—See this vol., 692.

**Quinazolines. XLI. Synthesis of some new 4-quinazoline derivatives from *p*-bromoaniline, formaldehyde, and hydrochloric acid.** S. E. CAIRNCROSS and M. T. BOGERT (Coll. Czech. Chem. Comm., 1935, 7, 548—554).—6-Bromo-3-*p*-bromophenyl-4-quinazoline (I), m.p. 257°, but not the expected quinazoline, is formed together with two other bases, m.p. 204° and 193—196°, when *p*-C<sub>6</sub>H<sub>4</sub>Br·NH<sub>2</sub> is heated (70°, 1 hr.) with HCl—H<sub>2</sub>SO<sub>4</sub>—H<sub>2</sub>O and CH<sub>2</sub>O, methylal, or CH<sub>2</sub>Cl<sub>2</sub>, and is also obtained when 5-bromoanthranilic acid and *p*-C<sub>6</sub>H<sub>4</sub>Br·NH·CHO are heated in an evacuated flask (2 hr.). It is unaffected when heated with H<sub>2</sub>SO<sub>4</sub> at 60°, HCO<sub>2</sub>H—H<sub>2</sub>SO<sub>4</sub>, Ac<sub>2</sub>O, AcCl—NaOAc, KMnO<sub>4</sub> at 70°, or by HNO<sub>3</sub>, but is reduced (Pd—CaCO<sub>3</sub>, H<sub>2</sub> 19 lb. per sq. in.) to 3-phenyl-4-quinazoline, also obtained by heating anthranilic acid with NHPh·CHO. (I) when heated (sealed vessel, 6 hr., 85—90°) with N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O in EtOH yields 6-bromo-3-amino-4-quinazoline, m.p. 227—228.2°, reduced (Pd—CaCO<sub>3</sub>—H<sub>2</sub>) to 3-amino-4-quinazoline, m.p. 210—211°, which when diazotised and coupled with  $\beta$ -C<sub>10</sub>H<sub>7</sub>·OH gives a reddish-brown dye, and is also obtained on heating 3-phenyl-4-quinazoline with N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O (cf. Paal *et al.*, who considered the product to be a hydrazone; A., 1890, 71). H. G. M.

**Imidochlorides. III. Reaction of anilide imidochlorides and ethyl sodiomalonate.** R. C.

SHAH and V. R. HEERAMANECK. IV. Condensation of anilide imidochlorides with urethanes. New synthesis of 4-hydroxy-2-phenylquinazolines. R. C. SHAH and M. B. ICHAPORIA (J.C.S., 1936, 428—430, 431—432).—III. Condensation of anilide imidochlorides with  $\text{CH}_2(\text{CO}_2\text{Et})_2$  and its Na derivative in PhMe gives chiefly mono- and little di-condensation products; the mono-condensation products are cyclised to the corresponding quinolines. *p*- $\text{C}_6\text{H}_4\text{MeNH}_2$  and Et (anilobenzyl)malonate (I) afford (anilobenzyl)malonodi-*p*-toluidide, m.p. 208—210°, or on further heating the *p*-toluidide of 4-hydroxy-2-phenylquinoline-3-carboxylic acid, m.p. 255—257°. (I) with BzCl and Na yields Et benzoyl(anilobenzyl)malonate, m.p. 156—158°. The following have been similarly prepared: Et (anilo-*p*-nitrobenzyl)malonate, m.p. 101°, Et 4-hydroxy-2-(*p*-nitrophenyl)quinoline-3-carboxylate, m.p. 239—241°, and the carboxylic acid, m.p. 197—199° (efferv.); Et (anilo-*o*-chlorobenzyl)malonate, m.p. 77°, Et 4-hydroxy-2-*o*-chlorophenylquinoline-3-carboxylate, m.p. 239—242°, and the carboxylic acid, m.p. 242—244°; Et (*p*-nitroanilobenzyl)malonate, m.p. 103°, Et 6-nitro-4-hydroxy-2-phenylquinoline-3-carboxylate, m.p. >300°, and the carboxylic acid, m.p. 295—297°; 4-hydroxy-2-phenyl-8-methylquinoline-3-carboxylic acid, m.p. 201—203° (decomp.); Et (m-, m.p. 67—68°, and Et (*p*-tolyliminobenzyl)malonate, m.p. 62—63°, Et 4-hydroxy-2-phenyl-(5 or 7-), m.p. 237—240°, and -(7 or 5)-methylquinoline-3-carboxylate, m.p. 225—228°, 4-hydroxy-2-phenyl-6-methylquinoline-3-carboxylic acid, m.p. 209—211° (decomp.); benzo-*o*-chloroanilide imidochloride, b.p. 214—215°/40 mm., *o*-chlorophenylbenzamidide, m.p. 113—114° (hydrochloride, m.p. 219—220°); Et (*o*-chloroanilobenzyl)malonate, m.p. 104—105°, Et 8-chloro-4-hydroxy-2-phenylquinoline-3-carboxylate, m.p. 155—156°, and the carboxylic acid, m.p. 184—186°; benzo-*m*-chloroanilide imidochloride, b.p. 229—231°/50 mm., *m*-chlorophenylbenzamidide, m.p. 123—124° (hydrochloride, m.p. 233—235°); Et (5 or 7)-chloro-4-hydroxy-2-phenylquinoline-3-carboxylate, m.p. 234—237°; Et (*p*-chloroanilobenzyl)malonate, m.p. 75°, Et 6-chloro-4-hydroxy-2-phenylquinoline-3-carboxylate, m.p. 251—252°, and the carboxylic acid, m.p. 300°.

IV. Benzanilide imidochloride and the Na derivative of urethane condense to (anilobenzyl)urethane (hydrochloride, m.p. 215—217°), which with  $\alpha\text{-C}_{10}\text{H}_7\text{NH}_2$  forms *s*-(anilobenzyl)- $\alpha$ -naphthylcarbamide, m.p. 258—260°. (I) similarly condenses with Me carbamate to Me (anilobenzyl)carbamate, and with acetylurethane to acetyl(anilobenzyl)urethane, m.p. 85—88°, cyclised to 3-acetyl-2-phenyl-4-quinazoline, m.p. 233°. Benzo- $\alpha$ -naphthalide imidochloride and urethane afford  $\alpha$ -naphthyliminobenzylurethane, cyclised to 4-hydroxy-2-phenyl-1:3-naphthaisodiazine, m.p. 300°; ( $\beta$ -naphthyliminobenzyl)urethane, cyclised to 4-hydroxy-2-phenyl-2:4-naphthaisodiazine, m.p. 295—298°, is similarly obtained. F. R. S.

A reaction of certain diazosulphonates derived from  $\beta$ -naphthol-1-sulphonic acid. XIII. Fission of the naphthalene nucleus and subsequent closure in two directions. F. M. ROWE, W. C. DOVEY, B. GARFORTH, E. LEVIN, J. D. PASK, and A. T. PETERS. XIV. Preparation of 1:4-diketo-

3-(nitroaryl)tetrahydrophthalazines or 4-keto-1-hydroxy-3-(nitroaryl)-3:4-dihydrophthalazines and related compounds. F. M. ROWE, J. G. GILLAN, and A. T. PETERS (J.C.S., 1935, 1796—1808, 1808—1815; cf. A., 1935, 1253).—XIII. 2:1- $\text{OH}\cdot\text{C}_{10}\text{H}_6\cdot\text{SO}_3\text{Na}$  and diazotised *o*-nitroaniline give 2'-nitrobenzene- $\beta$ -naphthol-1-diazosulphonate, which dissolves in aq.  $\text{Na}_2\text{CO}_3$  giving Na 1-(2'-nitrobenzeneazo)- $\beta$ -naphthaquinone-1-sulphonate (I). This when treated with cold conc. NaOH and then HCl gives Na benzaldehyde-2'-nitrophenylhydrazono- $\omega$ -sulphonate-2- $\beta$ -acrylic acid (II) (the corresponding 4'- and 5'-chloro-2'-nitro-compounds were similarly prepared), which when boiled with HCl (8 hr.) yields benzo-2'-nitrophenylhydrazide-2- $\beta$ -acrylic acid (III), m.p. 220—225° (4'-Cl-derivative, m.p. 272—278°), and 2-(2'-nitrophenylamino)isoindolinone-3-acetic acid (IV), m.p. 224—225° [Me, m.p. 164°, and Et ester, m.p. 153°; anilide, m.p. 272°; 4'-Cl-derivative, m.p. 278° (Me ester, m.p. 152°; anilide, m.p. 268°); 5'-Cl-derivative, m.p. 248° (Me, m.p. 182°, and Et ester, m.p. 184°)], obtained when (III) melts, or is boiled with  $\text{PhNO}_2$  or aq.  $\text{Na}_2\text{CO}_3$  (a similar interconversion occurs also with the 4'-Cl-derivatives). (IV) [or (III)] when refluxed with  $\text{Ac}_2\text{O}$ , or better with  $\text{Ac}_2\text{O}\cdot\text{C}_5\text{H}_5\text{N}$  (3 hr.), or with  $\text{PCl}_5\cdot\text{PhMe}$  (2 hr.) yields 2:5-diketo-3-(2'-nitrophenyl)isoindolinopyrazolidocoline (V), m.p. 209° (4'-, m.p. 248—249°, and 5'-Cl-derivatives, m.p. 209°), hydrolysed to (IV) and reduced by  $\text{Fe}\cdot\text{AcOH}\cdot\text{H}_2\text{O}$  to 2:5-diketo-3-(2'-aminophenyl)isoindolinopyrazolidocoline (VI), m.p. 234—236° [Ac derivative (VII), m.p. 175—176°; 4'-Cl-derivative, m.p. 253—254° (Ac derivative, m.p. 242—243°)]. This when treated (a) with  $\text{H}_2\text{SO}_4$  at 70° and then with NaOH, (b) with  $\text{PCl}_5\cdot\text{PhMe}$  under reflux (2 hr.) and then with warm dil. NaOH, gives 2:2'-anhydro-2:5-diketo-3-(2'-aminophenyl)isoindolinopyrazolidocoline, m.p. 219—221° [picrate, m.p. 234—236°, also obtained directly from (VI); 4'-Cl-derivative, m.p. 238—239° (sulphate, m.p. 278°)]. (IV) when treated with NaOH- $\text{Na}_2\text{S}_2\text{O}_5\cdot\text{H}_2\text{O}\cdot\text{EtOH}$  at 70°, or with  $\text{SnCl}_2$ , is reduced to 2-(2'-aminophenylamino)isoindolinone-3-acetic acid, m.p. 182—183° (decomp.) [4'-Cl-derivative, m.p. 195° (decomp.)], converted by  $\text{Ac}_2\text{O}$  or  $\text{Ac}_2\text{O}\cdot\text{C}_5\text{H}_5\text{N}$  into (VII), and when refluxed with  $\text{H}_2\text{SO}_4$  into 2-(2'-aminophenylamino)isoindolinone-3-acetic acid lactam, m.p. 227° (hydrobromide, m.p. 264—265°; picrate, m.p. 229—230°; 4'-Cl-derivative, m.p. 237°). (I) and (II) when kept with NaOH each yield Na H 3-(2'-nitrophenyl)-3:4-dihydrophthalazine-1-sulphonate-4-acetate [4'- and 5'- (impure) -Cl-derivatives], converted by boiling  $\text{H}_2\text{O}\cdot\text{HCl}$  into 1-hydroxy-3-(2'-nitrophenyl)-3:4-dihydrophthalazine-4-acetic acid (VIII), m.p. 248° [Me, m.p. 146°, and Et ester, m.p. 163°; anilide, m.p. 128°; 4'-Cl-derivative, m.p. 229—230° (Me, m.p. 163—164°, and Et ester, m.p. 145°; anilide, m.p. 130°); 5'-Cl-derivative, m.p. 241—242° (Me, m.p. 163°, and Et ester, m.p. 153°; anilide, m.p. 223°)]. The N-Me ether [1-keto-3-(2'-nitrophenyl)-2-methyltetrahydrophthalazine-4-acetic acid] has m.p. 207° [Me ester, m.p. 133—134°; 4'-Cl-derivative, m.p. 207° (Me ester, m.p. 129—130°); 5'-Cl-derivative, m.p. 225° (Me ester, m.p. 143°)]. (VIII) is reduced by boiling  $\text{AcOH}\cdot\text{H}_2\text{O}\cdot\text{Fe}$  (5 min.) to 1-keto-3-(2'-aminophenyl)-2-methyltetrahydrophthalazine-4-acetic acid [lactam,

m.p. 315–317°; 4'-Cl-derivative, m.p. 225°, resolidifying and melting again at 300° (decomp.) (lactam, m.p. 321°), and by boiling AcOH–H<sub>2</sub>O–Fe (10 min.), or by SnCl<sub>2</sub>, to 1-hydroxy-3-(2'-aminophenyl)-3:4-dihydrophthalazine-4-acetic acid (IX), m.p. 160°, resolidifying at 170° and melting again at 293–294° [lactam, m.p. 293°; 4'-Cl-derivative (X), m.p. 214°, resolidifying at 220°, and remelting at 304° (lactam, m.p. 304°); lactam of 5'-Cl-derivative has m.p. 303–304°]. (VIII) when refluxed with Ac<sub>2</sub>O–C<sub>5</sub>H<sub>5</sub>N yields (V); the 4'- and 5'-Cl derivatives of (VIII) undergo a similar conversion. (X) or its lactam when refluxed with dil. H<sub>2</sub>SO<sub>4</sub> yields 4'-chloro-2'-amino-3-phenylphthalaz-1-one, sublimes at 300–350° (Ac derivative, m.p. 130–131°). Similar treatment of (IX) gives a compound, m.p. 165°, with the expected properties of 2'-amino-3-phenylphthalaz-1-one despite the poor analyses. It is converted by boiling solvents into a colourless substance, m.p. >360°, and is reduced by hot H<sub>2</sub>SO<sub>4</sub>–Zn to o-benzylenebenzimidazole, also obtained from (IX) with SnCl<sub>2</sub>–conc. HCl and then Sn–HCl. 5-Chloro-o-benzylenebenzimidazole (XI), m.p. 242°, similarly prepared from (X) and also obtained from o-C<sub>6</sub>H<sub>4</sub>(CHO)<sub>2</sub>, 4:1:2-C<sub>6</sub>H<sub>3</sub>Cl(NH<sub>2</sub>)<sub>2</sub>, H<sub>2</sub>O, and Na<sub>2</sub>CO<sub>3</sub>, is oxidised by KMnO<sub>4</sub>–AcOH to 5-chloro-o-benzylenebenzimidazole, m.p. 156°, converted by boiling aq. Na<sub>2</sub>CO<sub>3</sub> into 5-chloro-2-phenylbenzimidazole-o-carboxylic acid, m.p. 285°. (VIII) when refluxed with H<sub>2</sub>SO<sub>4</sub>–H<sub>2</sub>O (2 hr.) gives, on neutralisation with NaOH, 2'-nitro-3-phenylphthalaz-1-one, m.p. 266° (picrate, m.p. 214–215°), reduced by Na<sub>2</sub>S–H<sub>2</sub>O to an intractable resin, and converted by Me<sub>2</sub>SO<sub>4</sub>–PhNO<sub>2</sub> at

(XII.)

110–120° into the compounds (XII), m.p. 135° from MeOH, and 150° from EtOH, decomposed by heat but without formation of 4-keto-1-methoxy-3-(2'-nitrophenyl)-3:4-dihydrophthalazine. Similarly 4'-chloro-2'-nitro-3-phenylphthalaz-1-one, m.p. 233° (similarly prepared), gives methylation products, m.p. 138° from MeOH, and 110° from EtOH, decomposed by heat but not to the corresponding 4-keto-compound, and is reduced by Na<sub>2</sub>S–H<sub>2</sub>O to a resin and by Zn–H<sub>2</sub>SO<sub>4</sub> to (XI). (VIII) when treated with H<sub>2</sub>SO<sub>4</sub>–H<sub>2</sub>O–Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> gives 2'-nitro-3-phenyl-4-methylphthalaz-1-one (XIII), m.p. 226° (decomp.) (picrate, m.p. 217°). This and the corresponding 4'-chloro-2'-nitro-compound (XIV), m.p. 237° (picrate, m.p. 233°), are methylated by Me<sub>2</sub>SO<sub>4</sub>, but the products do not have the expected properties. (IX) and (X) or their lactams, when treated with H<sub>2</sub>SO<sub>4</sub>–H<sub>2</sub>O–Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> give, respectively, 2'-amino-, m.p. 302°, and 4'-chloro-2'-amino-3-phenylphthalaz-1-one-4-acetic acid lactam, m.p. 314°, converted by Na<sub>2</sub>S–H<sub>2</sub>O into the NH<sub>2</sub>-acid, m.p. 287°, resolidifying and then melting at 314°. The foregoing lactams when treated with boiling Na<sub>2</sub>S–H<sub>2</sub>O or NaOH–H<sub>2</sub>O yield 2'-amino-, m.p. 218° (Ac derivative, m.p. 274°), and 4'-chloro-2'-amino-3-phenyl-4-methylphthalaz-1-one, m.p. 257° (Ac derivative, m.p. 296°), respectively, also obtained from (XIII) and (XIV) with boiling Na<sub>2</sub>S–H<sub>2</sub>O, and reduced by H<sub>2</sub>SO<sub>4</sub>–Zn–H<sub>2</sub>O to 1-keto-3-(2'-aminophenyl)-4-methyltetrahydrophthalazine, m.p. 221°, and its 4'-Cl-derivative, m.p.

200°, respectively, also obtained by a similar reduction of (XIII) and (XIV).

XIV. p-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·NH·NH<sub>2</sub> (XV) and o-C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O (XVI) in CHCl<sub>3</sub> give o-carboxybenzo-4'-nitrophenylhydrazide, m.p. 241–245°, converted by boiling PhNO<sub>2</sub> into phthalyl-4'-nitrophenylhydrazide (A., 1906, i, 588), also obtained when (XV) and (XVI) are heated at 150° (10 min.). This when refluxed (18 hr.) with NaOEt–EtOH gives 1:4-diketo-3-(4'-nitrophenyl)tetrahydrophthalazine (XVII) [Ag salt (XVIII)], also obtained by KMnO<sub>4</sub> oxidation of 1-hydroxy-3-(4'-nitrophenyl)-3:4-dihydrophthalazine-4-acetic acid, and converted by boiling Ac<sub>2</sub>O into 4-keto-1-acetoxy-3-(4'-nitrophenyl)-3:4-dihydrophthalazine, m.p. 222°, also obtained from (XVIII) and Ac<sub>2</sub>O, and hydrolysed by boiling EtOH–H<sub>2</sub>O–HCl to (XVII). (XVIII) when refluxed with MeI–MeOH gives 4-keto-1-methoxy-3-(4'-nitrophenyl)-3:4-dihydrophthalazine. The following compounds are described: o-carboxybenzo-3'-nitro-, m.p. 193–194° with ring closure, resolidifying, and remelting at 217–219°, -2'-nitro-, m.p. 290–294°, -4'-nitro-2'-methyl-, m.p. 219°, -2'-chloro-4'-nitro-, m.p. 270–275°, -2'-bromo-4'-nitro-, m.p. 232° with ring closure, resolidifying and melting again at 280–282°, -2':6'-dichloro-4'-nitro-, m.p. 192°, -2':6'-dibromo-4'-nitro-, m.p. 200°, with ring closure, resolidifying and melting again at 227°, -phenylhydrazide; phthalyl-3'-nitro-, m.p. 227–228°, -2'-nitro-, m.p. 293–294°, -4'-nitro-2'-methyl-, m.p. 228°, -2'-chloro-4'-nitro-, m.p. 267°, -2'-bromo-4'-nitro-, m.p. 282–283°, -2':6'-dichloro-4'-nitro-, m.p. 202°, -2':6'-dibromo-4'-nitro-, m.p. 230°, -phenylhydrazide; Ag salts of 1:4-diketo-3-(3'-nitrophenyl)- and -(4'-nitro-2'-methylphenyl)-tetrahydrophthalazine, also obtained from the appropriate substituted 3-phenylphthalaz-1-one; 1:4-diketo-3-(2'-nitrophenyl)-, m.p. 293–294° (Ag salt), -2'-chloro-4'-nitrophenyl-, m.p. 271–272° (Ag salt), -(2'-bromo-4'-nitrophenyl)-, m.p. 273–274°, -(2':6'-dichloro-4'-nitrophenyl)-, m.p. 309–310°, -(2':6'-dibromo-4'-nitrophenyl)-, m.p. 235–260°, -tetrahydrophthalazine; 4-keto-1-methoxy-3-(2'-nitrophenyl)-, m.p. 176–177°, -(2'-chloro-4'-nitrophenyl)-, m.p. 193–194°, -(2'-bromo-4'-nitrophenyl)-, m.p. 167–168°, -(2':6'-dichloro-4'-nitrophenyl)-, m.p. 178–179°, -phenyl-, m.p. 109–111°, -3:4-dihydrophthalazine; 2:6-dichloro-, m.p. 133° (PhCHO derivative, m.p. 153°), and 2:6-dibromo-, m.p. 135–136° (two modifications; PhCHO derivative, m.p. 168–169°), -4-nitrophenylhydrazine. The Ag salt of 1:4-diketo-3-phenyltetrahydrophthalazine when refluxed with EtI and EtOH yields 4-keto-1-ethoxy-3-phenyl-3:4-dihydrophthalazine, an O-Et ether described previously as a N-Et ether (cf. A., 1887, 668; J.C.S., 1920, 117, 719).

H. G. M.

Action of αγ-chlorobromopropane on 2-amino-pyridine. S. M. SCHERLIN and V. S. VELITSCHKIN (J. Gen. Chem. Russ., 1935, 5, 1586–1588).—2-Aminopyridine (I) and CH<sub>2</sub>Cl·CH<sub>2</sub>·CH<sub>2</sub>Br (II) are allowed to interact at room temp., the reaction mixture is boiled for 20 hr., cooled, and the upper layer of unchanged (II) is removed. The lower layer is dissolved in aq. NaOH, and unchanged (I) is removed by steam-distillation. The base (III), b.p. 144–

145°/10 mm., m.p. 55—56° (*picrate*, m.p. 172—173°; *hydrochloride*, m.p. 82—83°), is isolated from the residue. (III) is converted by Na in boiling EtOH into the corresponding  $H_6$ -derivative, b.p. 85—90°/10 mm. R. T.

**Cyanine dye series. V. Dyes derived from 9-methylphenanthridine.** L. G. S. BROOKER and G. H. KEYES (J. Amer. Chem. Soc., 1936, 58, 659—662; cf. this vol., 348).—The etho-*p*-toluenesulphonate (I) of 9-methylphenanthridine [*ethiodide* (II), m.p. 237—239° (decomp.), from (I) and aq. MeOH-KI] with 2-iodopyridine ethiodide in  $Pr^oOH-NEt_3$  gives 27% of 1:1'-*diethyl*-3':4'-*benzo*-2'-*pyrido*-2'-*cyanine iodide* (III), m.p. 221—224° (decomp.). 1:1'-*Diethyl*-3:4'-*benzo*-, m.p. 259—262° (decomp.), and 1:1'-*diethyl*-3:4:5':6'-*dibenzo*-, m.p. 250—251° (decomp.), 2:2'-*cyanine iodides* are similarly prepared from 2-iodoquinoline ethiodide (IV) [with (II)] and 2-iodo- $\beta$ -naphthquinoline ethiodide (V) [with (I)], respectively. (I) and  $CH(OEt)_3$  in  $C_5H_5N$ , followed by KI, give 1:1'-*diethyl*-3:4:3':4'-*benzo*-2:2'-*carbocyanine iodide*, m.p. 234—235° (decomp.). 1:1'-*Diethyl*-5':6'-*benzo*-2'-*pyrido*-2'-*cyanine iodide*, m.p. 268—270° (decomp.), is formed from 2-methylpyridine ethiodide, (V), and 1-methylpiperidine in EtOH. Improved preps. of 1:1'-*diethyl*-5:6'-*benzo*- [from (IV) and  $\beta$ -naphthquinoline etho-*p*-toluenesulphonate] (cf. Hamer, A., 1928, 307) and 1:1'-*diethyl*-5:6:5':6'-*dibenzo*-2:2'-*cyanine iodides* (cf. Hamer and Kelly, A., 1931, 741) are given. The dyes containing the phenanthridine nucleus have no sensitising action; the absorption max. lie nearer the blue than those of the isomerides containing the  $\beta$ -naphthquinoline nucleus. H. B.

**Orthochromatic sensitisation of photographic silver halide emulsions.**—See B., 1936, 477.

**Action of mixed organomagnesium derivatives on acetophenone semicarbazone.** (MELE.) D. BIQUARD (Bull. Soc. chim., 1935, [v], 3, 656—665).—Addition of acetophenonesemicarbazone (I) to  $MgEtBr$  or  $MgBuCl$  in anhyd.  $Et_2O$  establishes the presence of 3 and 4 active H in cold and hot solution, respectively, and affords small amounts of unchanged (I), a little  $COPhMe$ , and 60—70% yields of a substance (II),  $NH<\begin{smallmatrix} CH:CPh \\ CH=N \end{smallmatrix}>NH$ , m.p. 126° (*dibromide*, m.p. 145—148°; very hygroscopic *hydrochloride*; *platinichloride*, decomp. 252°). (II) is transformed by hot  $Ac_2O$  into the  $Ac_2$  derivative, m.p. 156° (*dibromide*, m.p. 170°), hydrolysed by HCl to (II) and by KOH to the  $Ac_1$  compound, m.p. 235°. Treatment of the product from (I) and  $MgEtBr$  with  $AcCl$  or  $Ac_2O$  ( $=MgEtBr$ ) in  $C_6H_6$  gives two compounds,  $N<\begin{smallmatrix} CH=CPh \\ CAc-NAc \end{smallmatrix}>NH$ , m.p. 273°, and  $N<\begin{smallmatrix} CH_2:CPh \\ CAc-NAc \end{smallmatrix}>N$ , m.p. 203°, readily separable from one another owing to their differing solubility in HCl. The constitutions assigned are supported by the spectroscopic evidence. H. W.

**Manufacture of isoalloxazine compounds.**—See B., 1936, 363.

**3:4:3':4''-Dipyrazolo-1':2':5':6'-naphthalene.** V. VESELY and A. MEDVEDEVA (Coll. Czech. Chem. Comm., 1936, 8, 125—129).—2:6- $C_{10}H_6Me_2$  is converted by  $HNO_3$  (*d* 1.51)- $AcOH$  at 100° into

its 1:5-( $NO_2$ )<sub>2</sub>-derivative, m.p. 179° [Mayer *et al.*, A., 1922, i, 999; the ( $NO_2$ )<sub>2</sub>-derivative, m.p. 186°, is probably the 1:8-compound], reduced by  $Fe-aq. AcOH-COMe_2$  to the ( $NH_2$ )<sub>2</sub>-derivative, the  $Ac_2$  derivative of which is converted by  $N_2O_3-AcOH$  at 40—50° into crude 1:5-*di*(nitrosoacetamido)-2:6-*dimethylnaphthalene*, m.p. 116—126° (decomp.) by boiling  $C_6H_6$  into 3:4:3':4''-*dipyrazolo*-1':2':5':6'-*naphthalene* (I) (1:1'- $Ac_2$  derivative, m.p. >330°). J. W. B.

**Leaf xanthophylls.** H. H. STRAIN (Science, 1936, 83, 241—242).—When leaf xanthophyll, freed from leaf constituents, is adsorbed on Tswett columns, three or four pigments resembling cryptoxanthin rapidly pass through the column. They are followed on the column by lutein (I) and isolutein (II), which is optically inactive and gives in  $Et_2O$  a deep blue colour with conc. HCl. Zeaxanthin (III), present in small amount, is found on the column above (II); it occurs in the leaves of barley, carrots, flaxseed, lettuce, sunflower, squash, and spinach. (III) is followed on the column by a pigment ( $[\alpha]_{D^{25}}^{20} +75^\circ$ , in  $CHCl_3$ ) having absorption curves similar to those of flavoxanthin. Another similar pigment having the same absorption curve, but with  $[\alpha]_{D^{25}}^{20} -56^\circ$  in  $CHCl_3$ , is adsorbed next on the column, and is followed by considerable amounts of a xanthophyll the absorption curves of which are intermediate in shape between those of (I) and the flavoxanthin-like pigments. Several xanthophylls occurring in small amounts are adsorbed finally. L. S. T.

**Chlorophyll. LXVI. Comparative oxidation of chlorophyllide and derivatives.** H. FISCHER and S. BREITNER. **LXVII. Active hydrogens in chlorophyll derivatives.** V. H. FISCHER and S. GOEBEL (Annalen, 1936, 522, 151—167, 168—185).—LXVI. Methylthylmaleimide (I) (accompanied, in some cases, by haematic acid) is formed in varying yield by oxidation ( $CrO_3$ , cold aq.  $H_2SO_4$ ) of methylchlorophyllide *a*, phaeophorbide *a*\*, dihydrophaeophorbide *a*, chlorins  $e_4^*$ ,  $e_6^*$ , and  $p_6^*$ , dihydrochlorins  $e_4$ ,  $e_6$ , and  $p_6$ , rhodochlorin, phaeopurpurins 7\* and 18\*, dihydrophaeopurpurins 7 and 18,  $\psi$ -chlorin  $p_6$ , rhodoverdo-, and  $\psi$ -verdo-porphyrins, and mesoporphyrin and its Cu salt. The yield is < that from derivatives from blood pigment. Certain irregularities are noted. Compounds marked \*, which contain the  $C_2-CH:CH_2$  group, generally give about 50% of the amount of (I) obtained from their dihydro-derivatives. In accordance with expectation, (I) is not formed from unreduced derivatives of chlorophyll *b*, i.e., compounds containing  $C_2-CH:CH_2$  and  $C_3-CHO$ ; rhodin *g*, and neorhodinporphyrin *g*<sub>3</sub> (II) give citraconimide (arising from ring III of the chlorophyll mol.). Dihydrorhodin *g*<sub>7</sub>, dihydrophaeophorbide *b*, and rhodinporphyrin *g*<sub>8</sub> (III) afford (I), since they contain the  $C_2-Et$  group.

The Cu salt, m.p. 237°, of rhodin *g*  $Me_3$  ester is

reduced catalytically in  $\text{COMe}_2$  or  $\text{AcOH}$  to the Cu salt,  $[\alpha] -366^\circ$ , of dihydrorhodin *g*  $\text{Me}_3$  ester. The Cu salt of rhodinporphyrin *g* has m.p.  $264^\circ$ . The oxime of (II) (as ester) is dehydrated ( $\text{Ac}_2\text{O}$ - $\text{KOAc}$ ) to the corresponding nitrile,  $\text{C}_{33}\text{H}_{23}\text{O}_2\text{N}_5$ , m.p.  $244^\circ$ . (III) is converted by 20%  $\text{HCl}$  at  $190$ – $200^\circ$  into 3-demethylphyllporphyrin (*Me* ester, m.p.  $242^\circ$ ). Phæophorbides *a* and *b*, obtained (usual method) from chlorophyll extracted by 90%  $\text{COMe}_2$  from nettles, lose  $\text{CO}_2\text{Me}$  when heated in  $\text{C}_5\text{H}_5\text{N}$ ; pyrophæophorbin *a* and *b*, which are OMe-free, are produced (cf. Conant and Hyde, A., 1930, 225). Methylphæophorbide *a* and *b* similarly lose  $\text{CO}_2\text{Me}$  and give pyrophæophorbide *a* and *b*, respectively. These results are considered to support the view (cf. Stoll, this vol., 392) that the original phytol group is attached to  $\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ . Chlorophyll *a* (but no *b*) is present in the algæ *Asacusa nori*, *Bangia fuscopurpurea*, and *Polysiphonia nigrescans*.

[With K. HERRLE.] Phyllochlorin *Me* ester is reduced ( $\text{H}_2$ , Pd,  $\text{COMe}_2$ ) to dihydrophyllochlorin *Me* ester, m.p.  $148^\circ$ ,  $[\alpha]_{\text{D}}^{20} -619^\circ$  in  $\text{COMe}_2$ , which is identical (spectrum; Cu salt; alkaline degradation to phylloporphyrin) with the synthetic phyllochlorin of Treibs and Wiedemann (A., 1928, 1383).

LXVII. The no. of active H present in about 70 compounds (derivatives of phæophorbides *a* and *b*; phæoporphyrins *a* and *b*; phylloerythrins; chlorins; chloroporphyrins; rhodins; rhodinporphyrins; purpurins; phylloporphyrins) are determined by Schmitz-Dumont's method (A., 1934, 313). In most cases the results are in agreement with structures previously proposed. The vals. for verdo- and  $\psi$ -verdo-porphyrin esters are, however, inexplicable. The following conclusions are reached. The phæophorbides contain 2NH and an enolic OH (formation of which is suppressed by oximation); the  $\text{C}_{10}\cdot\text{CO}_2\text{Me}$  exerts a strong labilising action on the  $\text{C}_{10}\cdot\text{H}$ . Chlorins and rhodins are analogously constituted, the latter having  $\text{C}_3\cdot\text{CHO}$  for  $\text{C}_3\cdot\text{Me}$ ; these results are not in agreement with those deduced by Conant *et al.* (A., 1934, 1371) from potentiometric titrations. The relationship between green and red compounds in the porphyrin and purpurin series is discussed. Absorption spectra of many of the phyllins (prepared during the above determinations) and some of the original compounds are given.

H. B.

**Porphyrin synthesis.** Synthesis of porphin. P. ROTHMUND (J. Amer. Chem. Soc., 1936, 58, 625–627; cf. A., 1935, 1510).—Pyrrole (I) and  $\text{CH}_2\text{O}$  in  $\text{MeOH}-\text{C}_6\text{H}_5\text{N}$  at  $90$ – $95^\circ$  (sealed tube) give porphin (II) (phyllin; hæmin; complex Cu salt); at  $145$ – $155^\circ$ , a porphyrin of lower HCl val., which differs spectroscopically from (II), is formed. Absorption spectra for (II) and its salts are given.  $\alpha\beta\gamma\delta$ -Tetra-methyl-, -ethyl-, -propyl-, -phenyl-, and -furyl-porphins (not described) are similarly obtained from (I) and  $\text{MeCHO}$ ,  $\text{EtCHO}$ ,  $\text{PrCHO}$ ,  $\text{PhCHO}$ , and furfuraldehyde, respectively. Porphyrin formation also occurs (shown spectroscopically) with  $\text{CCl}_3\cdot\text{CH}(\text{OH})_2$ ,  $\text{CHO}\cdot\text{CO}_2\text{H}$ , *o*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$ , vanillin, *p*- $\text{NMe}_2\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$ , and pyrrole-2-aldehyde. H. B.

**Optical absorption of porphyrins.**—See this vol., 662.

**Preparation of 1-methyl- $\alpha$ -naphthoxazole.** J. FRASER and F. M. HAMER (J.S.C.I., 1936, 55, 119–120T).—The original method (A., 1934, 115) has been improved to give a 39% yield.

**Dioximes.** CIX, CX. G. PONZIO (Gazzetta, 1936, 66, 114–119, 119–126).—CIX. The action of bases on  $\alpha$ -phenylglyoxime peroxide (I) (3-phenyl-1:2:5-oxadiazole 5-oxide) gives a product which was regarded by Wieland and Semper (A., 1908, i, 108) as a hydroxyphenylfurazan (4-hydroxy-3-phenyl-1:2:5-oxadiazole), but is now shown to be  $\alpha$ -oximino-phenylacetone nitrile oxide (II). (I) resembles (II) in behaviour towards  $\text{AcOH}$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{NH}_3$ ,  $\text{NH}_2\text{Ph}$ , etc.,  $\text{MgMeI}$ ,  $\text{Ac}_2\text{O}$ ,  $\text{Bz}_2\text{O}$ , aq.  $\text{EtOH}$ , and boiling 20%  $\text{HCl}$ , but differs from it in not combining with  $\text{NH}_2\text{Ph}$  in non-hydroxylic solvents, in not reacting with  $\text{POCl}_3$ , in not polymerising, and in being reduced by  $\text{Zn}-\text{AcOH}$  to  $\alpha$ -phenylglyoxime.

CX.  $\alpha$ -Phenylglyoxime treated with  $\text{N}_2\text{O}_4$ , with hot  $\text{MeOH}$ , and with  $\text{HCl}$ , gives (I). This, new m.p.  $111$ – $112^\circ$ , was regarded by Wieland (A., 1921, i, 606) as an unstable form from which crystallisation from  $\text{C}_6\text{H}_6$ ,  $\text{EtOH}$ , etc. gave a stable product. (I) exists, however, in one form only, and the recryst. product, m.p.  $85$ – $95^\circ$ , is a mixture of (I) and (II), as is shown by its giving chlorophenylglyoxime when treated with  $\text{HCl}$ , and by the formation of oximino-phenylacetone nitrile on reduction. Pure (I) suspended in  $\text{EtOH}$  and treated with  $\text{NH}_2\text{Ph}$  yields  $\text{OH}\cdot\text{N}:\text{CPh}\cdot\text{C}(\text{NPh})\cdot\text{NH}\cdot\text{OH}$ . In 50%  $\text{EtOH}$ , (I) gives a product which with  $\text{Cu}(\text{OAc})_2$  gives a ppt. from which  $\text{H}_2\text{SO}_4$  liberates 4-benzamido-3-phenyl-1:2:5-oxadiazole, with phenylmetazonic acid. With xylene at  $137$ – $138^\circ$  (I) gives  $\beta$ -phenylglyoxime peroxide; with  $\text{AcOH}$ , 5-hydroxy-3-phenyl-1:2:4-oxadiazole (the sole product when  $\text{EtCO}_2\text{H}$  is used) and hydroxy-phenylglyoxime. (I) is reduced by  $\text{SnCl}_2$  to 3-phenyl-1:2:5-oxadiazole. With  $\text{MgMeI}$ , the compound,  $\text{OMgI}\cdot\text{N}:\text{CPh}\cdot\text{CMe}:\text{N}\cdot\text{OMgI}$  is formed, hydrolysed by  $\text{HCl}$  to  $\text{PhCN}$  and  $\alpha$ -phenylglyoxime;  $\alpha$ -diphenylglyoxime is obtained by using  $\text{MgPhBr}$ . With  $\text{Bz}_2\text{O}$  (I) gives the  $\text{Bz}_2$  derivative, m.p.  $165$ – $166^\circ$  (decomp.), of hydroxyphenylglyoxime, hydrolysed by  $\text{EtOH}$  to the  $\text{Bz}_2$  derivative, and by  $\text{NaOH}$  to 5-hydroxy-3-phenyl-1:2:5-oxadiazole.

E. W. W.

**Action of acetic anhydride on dibenzylidenehydrazine.** J. B. EKELEY and J. W. LEFFORGE (J. Amer. Chem. Soc., 1936, 58, 562–563).—( $\text{N}:\text{CHPh}$ )<sub>2</sub> (1 mol.) and  $\text{Ac}_2\text{O}$  (about 3 mols.) at  $127^\circ/624$  mm. give ( $\text{NHAc}$ )<sub>2</sub> (19%), 2:5-dimethyl-1:3:4-oxadiazole (14%), b.p.  $165$ – $169/624$  mm. [formed by dehydration of ( $\text{NHAc}$ )<sub>2</sub>], and  $\text{NHAc}\cdot\text{N}:\text{CHPh}$  (40%). Addition of  $\text{Ac}_2\text{O}$  to  $\text{N}:\text{CHAr}$  thus gives  $\text{NAc}\cdot\text{CHAr}\cdot\text{OAc}$  (cf. A., 1932, 384).

H. B.

**1-Methylbenzthiazole.** J. FRASER and F. M. HAMER (J.C.S., 1936, 507).—1-Methylbenzthiazole has m.p.  $14^\circ$ .

F. R. S.

**Reactivity of the imino-group in 1-imino-2-methylbenzthiazoline.** L. M. CLARK (J.C.S., 1936, 507).—1-Imino-2-methylbenzthiazoline with  $\text{NH}_2\text{Ph}$  gives 1-anilo-, m.p.  $95.5^\circ$ , and with phenylthiocarbamide forms 1-phenylthiocarbamylimino-2-methylbenzthiazoline, m.p.  $184^\circ$ , and a substance, m.p.  $261^\circ$ ;

with quinaldine, it yields 2-methylthio-*p*-cyanine, m.p. 165° *platinichloride*. F. R. S.

**Chemical nature of vitamin-B<sub>1</sub>.**—See this vol., 646.

**Cyanine dye series. VI. Dyes derived from 2-methylthiazoline.** L. G. S. BROOKER (J. Amer. Chem. Soc., 1936, 58, 662—665; cf. this vol., 349).—2-Methylthiazoline ethiodide (I), m.p. 190—193° [the methiodide has m.p. 241—242° (decomp.)], and 2-iodoquinoline ethiodide in EtOH-NEt<sub>3</sub> give 3:1'-diethylthiazolino-2'-cyanine iodide (II), m.p. 226—227°. 2-Iodopyridine (Pr<sup>o</sup>OH-NEt<sub>3</sub>), 2-iodo-β-naphthquinoline (EtOH-NEt<sub>3</sub>), and quinoline (EtOH-

KOH) ethiodides with (I) afford 3:1'-diethylthiazolino-2'-pyridocyanine, m.p. 203—206°, 3:1'-diethyl-5':6'-benzthiazolino-2'-cyanine, m.p. 263—266°, and 3:1'-diethylthiazolino-4'-cyanine, m.p. 223—224°, iodides, respectively. 2-Methylthiazoline metho-*p*-toluenesulphonate and CH(OEt)<sub>3</sub> in C<sub>6</sub>H<sub>5</sub>N, followed by KI, give 3:3'-dimethylthiazolinocarbocyanine iodide, m.p. 250—252° [7-Et derivative, m.p. 248—250°, obtained using CEt(OMe)<sub>3</sub>], whilst (I) and CH(OEt)<sub>3</sub> similarly afford 3:3'-diethylthiazolinocarbocyanine iodide, m.p. 256—258° [7-Et derivative, m.p. 182—184°, formed from 2-methylthiazoline etho-*p*-toluenesulphonate and CEt(OMe)<sub>3</sub> followed by KI]. 2-*p*-Dimethylaminostyrylthiazoline ethiodide, m.p. 219—220°, is obtained from (I) and *p*-NMe<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CHO in MeOH-piperidine. The new dyes are sensitizers; they absorb at shorter λ than analogous compounds prepared from other heterocyclic bases. H. B.

***d*-Nicotinic acid.** C. S. HICKS (Austral. J. Exp. Biol., 1936, 14, 39—43).—*d*-Nicotinic acid when methylated gives nicotine methiodide and when dehydrogenated (Pt-asbestos 320—330°) yields 2-(3-pyridyl)pyrrole. W. McC.

**Tobacco bases. VI. Synthesis of myosmine.** E. SPÄTH and L. MAMOLI (Ber., 1936, 69, [B], 757—760; cf. this vol., 489).—Pyrrolidone and Bz<sub>2</sub>O at 180° give 1-benzoylpyrrolidone, m.p. 92—93°, which, condensed with Et nicotinate (NaOEt), gives 1-benzoyl-3-nicotinoylpyrrolid-2-one. This (without isolation) is treated with fuming HCl whereby decarboxylation, decarboxylation, ring fission and subsequent closure lead in one operation to myosmine (2:3'-pyridyl-4:5-dihydropyrrole).

Reply is made to Reynolds and Robinson (this vol., 486). H. W.

**Lupin. IX. Monolupine, a new alkaloid from *Lupinus caudatus*.** Kellogg. J. F. COUCH (J. Amer. Chem. Soc., 1936, 58, 686—687).—*Monolupine* (I), C<sub>16</sub>H<sub>22</sub>ON<sub>2</sub> (+0.5H<sub>2</sub>O), b.p. 257—258°/4 mm., [α]<sub>D</sub><sup>20</sup> = -40.81° in EtOH [*dihydrochloride* (+2H<sub>2</sub>O), m.p. 115—116° (rapid heating), which when dried at 110° gives the *hydrochloride*, m.p. 280°; *aurichloride* (+3H<sub>2</sub>O), m.p. 167—168° (decomp.); *methiodide* (+H<sub>2</sub>O), m.p. 257°], is isolated (method: A., 1935, 97) in 0.44—0.5% yield from the dry plant. (I) resembles anagrine, is unsaturated (KMnO<sub>4</sub>), but

could not be reduced (Adams; electrolytic). *L. caudatus* thus differs from *L. palmeri* (*loc. cit.*). H. B.

**Numbering of sparteine molecule and its derivatives.** J. F. COUCH (J. Amer. Chem. Soc., 1936, 58, 688).—Structure (I) for sparteine shows its symmetrical character and relationship to other lupin alkaloids and to cytisine (II). Lupanine, hydroxylupanine, and anagrine become 2-keto-, 10-hydroxy-2-keto-, and 2-keto-3:4:5:6-tetra-dehydro-sparteine, respectively. Possible modes of biosynthesis of (I) and (II) are indicated.

H. B.

**Gramine.** H. VON EULER, H. ERDTMAN, and H. HELLSTRÖM (Ber., 1936, 69, [B], 743—747).—Although spectroscopically similar, gramine (I) is not identical with 2-dimethylaminomethyl- or 3-dimethylamino-2-methyl-indole. Distillation of (I) with Zn dust affords skatole in too small amount to indicate its constitution. (I) gives a red pine-shaving reaction but not the Ehrlich reaction. It gives a faint red colour with *p*-SO<sub>3</sub>H·C<sub>6</sub>H<sub>4</sub>·N<sub>2</sub>Cl in alkaline solution. It appears to be hydrolysed by acids to a substance not identical with atroxindole. It does not afford AcOH when oxidised by CrO<sub>3</sub>. A completely satisfactory structure cannot at present be assigned to (I), which is regarded provisionally as 2-methylethylaminoinole. H. W.

**Cactus alkaloids. XVII. Optical activity of pellotine.** E. SPÄTH and F. KESZTLER (Ber., 1936, 69, [B], 755—757).—Attempts to resolve *dl*-pellotine into its optical antipodes by *d*-tartaric acid in MeOH under unusually cautious conditions lead to the isolation of 1-pellotine (I), [α]<sub>D</sub><sup>20</sup> = -15.2° in CHCl<sub>3</sub>, for which optical homogeneity is not claimed. (I) is slowly racemised in H<sub>2</sub>O at 15—20°, very rapidly in alkaline solution, less readily in the presence of acid. Distillation in high vac. causes complete inactivation. Since the alkaloid is very readily racemised and the accompanying alkaloids are optically active it is concluded that the plants form the active modification which becomes racemised probably within the living cell, at any rate during storage and extraction. H. W.

**Action of perbenzoic acid on cinchona-bark alkaloids.** J. BECKER and J. SUSZKO (Arch. Chem. Farm., 1934, 1, 199—205).—Oxidation takes place at the quinuclidine N, the same amino-oxides being formed as with H<sub>2</sub>O<sub>2</sub>. Advantages of the use of BzO<sub>2</sub>H are discussed. CH. ABS. (r)

**Dehydrogenation of cytisine and product of the degradation of this base.** E. SPÄTH and F. GALINOVSKY (Ber., 1936, 69, [B], 761—766).—Dehydro-

genation of cytisine with Pd-sponge at 270—280° gives 2-hydroxy-6-methylquinoline with much resinous material. Similar treatment of tetrahydro- and octahydro-hemicitysilene affords 3:5-dimethyl-2-propylpyridine (I), b.p. (bath) 100—110°/10 mm. (picrate, m.p. 150—151°; methiodide, m.p. 127—128°), oxidised by acid  $\text{KMnO}_4$  to 3:5-dimethylpyridine-2-carboxylic acid and 5-methylnicotinic acid, and 8-keto-2:4-dimethyl- $\psi$ -quinolizine (II), m.p. 83° [hemihydrate, m.p. 64—65°; picrate, m.p. 149—150° (vac.; decomp.)], which absorbs  $4\text{H}_2$  (Pd-C in AcOH) giving the substance,  $\text{C}_{11}\text{H}_{19}\text{ON}$ , b.p. 110°/0.01 mm. Dehydrogenation of dihydrode-N-dimethylecytisine (Pd-sponge at 230—270°) yields  $\text{NHMe}_2$ , (II) and small amounts of (I).  $\alpha$ -Norlupinone gives 8-keto- $\psi$ -quinolizine, m.p. 72—73° (vac.) [picrate, m.p. 136—137° (vac.; decomp.)], and conyrene. H. W.

**Cytisine group. II. Further experiments on the synthesis of Ewins' structure for cytisine. III. Exploratory experiments on the synthesis of cytisine, sparteine, lupinine, and allied alkaloids.** S. N. CHAKRAVARTI and P. L. N. RAO (J. Annamalai Univ., 1936, 5, 254—258, 259—268).—II. Further unsuccessful attempts (cf. A., 1934, 195) are described. 6-Nitro-3-methylcinnamic acid (*loc. cit.*) has been reduced ( $\text{FeSO}_4\text{-NH}_3$ ) to the 6- $\text{NH}_2$ -compound, m.p. 195°, and the hydrochloride of this diazotised and reduced ( $\text{Na}_2\text{SO}_3\text{-HCl-Zn}$ ) to 1-amino-6-methyldihydrocarbostyril, m.p. 117° (with some 6-methyldihydrocarbostyril, m.p. 132—133°), in amount insufficient for cyclisation through 8- $\text{CH}_2$ . Attempted oxidation of 6:8-dimethylquinoline to 6-methylquinoline-8-carboxylic acid by  $\text{CrO}_3$ ,  $\text{SeO}_2$ , or dil.  $\text{HNO}_3$  gives unsatisfactory results; with a large excess of  $\text{CrO}_3$ , quinoline-6:8-dicarboxylic acid, m.p. > 300° is formed. The 6:8- $\text{Me}_2$  compound is converted by  $\text{Br-HBr}$  in  $\text{CHCl}_3$  into the hydrobromide, m.p. 125—140° (decomp.), of the  $\text{Br}_2$ -compound, which loses  $\text{HBr}$  at 160°, and when heated in  $\text{CHCl}_3$  gave, in an experiment which could not be repeated, a bromodimethylquinoline, m.p. 58°.

III. The successful prep. of 2-chloropyridine (I) from 1-methylpyridone (J.C.S., 1915, 107, 690) is confirmed (cf. A., 1932, 66). Attempts to condense (I) with  $\text{CH}_2(\text{CO}_2\text{Et})_2$  or with  $\text{CH}_2[\text{CH}(\text{CO}_2\text{Et})_2]_2$  were unsuccessful. The last is converted into  $\text{CH}_2[\text{CH}(\text{CO}\cdot\text{NH}_2)_2]_2$ , which at 250° gives a poor yield of  $\text{CH}_2(\text{CH}_2\cdot\text{CO}\cdot\text{NH}_2)_2$ , reduced to a basic substance. Theoretical schemes for synthesising lupinine, sparteine, and cytisine are outlined.

E. W. W.

**Ergot alkaloids. VIII. Synthesis of 4-carbolinecarboxylic acids. IX. Structure of lysergic acid.** W. A. JACOBS and L. C. CRAIG (J. Biol. Chem., 1936, 113, 759—765, 767—778).—VIII. Largely a more detailed account of work previously reviewed (this vol., 216). 3:4-Dimethyl-3:4:5:6-tetrahydro-4-carboline-5-carboxylic acid, m.p. 248° (decomp.) (previous darkening and softening), and the non-cryst. product formed from *N*-methyltryptophan, 10%  $\text{MeCHO}$ , and  $\text{N-H}_2\text{SO}_4$ , are both oxidised ( $\text{K}_2\text{Cr}_2\text{O}_7$ , dil. AcOH) with loss of  $\text{CO}_2$  to 4-methyl-4-

carboline (*N*-methylharman), m.p. 180° (previous darkening) [sulphate, m.p. 273° (decomp.); dichromate]. 3-Methyltetrahydro-4-carboline-5-carboxylic acid (*loc. cit.*) similarly gives harman, whilst lysergic (I) and dihydrolysergic (II) acids afford amorphous acidic material.

IX. The structure previously suggested (this vol., 488) for (I) is revised to (A). Reduction ( $\text{H}_2$ , PtO<sub>2</sub>, AcOH) of the alkaloid,  $\text{C}_{19}\text{H}_{23}\text{O}_2\text{N}_3$  (ergometrine, etc.; cf. Kharasch *et al.*, this vol., 489), gives a  $\text{H}_2$ -derivative, m.p. 225—230° (decomp.) (sinters at 110°), hydrolysed (14%  $\text{MeOH-KOH}$ ) to (II). Distillation of the product from the methiodide, m.p. 253—254° (sinters at 250°) of  $\beta$ -dihydro lysergol (A., 1935, 504) and  $\text{Ag}_2\text{O}$  affords an oily base,  $\text{C}_{17}\text{H}_{22}\text{ON}_2$ , which with  $\text{MeI}$  followed by  $\text{Ag}_2\text{O}$  gives  $\text{NMe}_3$  [in accordance with structure (A)] and resin. The remainder of the paper has been abstracted previously (*loc. cit.*). H. B.

**Optical properties of ergometrine. I. BENNEKOU and S. A. SCHOU (Dansk Tidsskr. Farm., 1936, 10, 105—108).**—The blue fluorescence of ergometrine (I) solutions under ultra-violet radiation persists after its removal. The absorption max. of the spectrum of (I) solutions changes from 3160 to 2890 Å, whilst the other ergot alkaloids show a gradual decrease of absorption, owing to decomp.

M. H. M. A.

**Veratrine alkaloids. III. Preparation of cevanthrol, and X-ray crystallographic examination of cevanthrol and cevanthridine.** B. K. BLOUNT and (MISS) D. CROWFOOT (J.C.S., 1936, 414—415).—Se dehydrogenation of cevine gives a base, cevanthridine (I) (cf. A., 1935, 505), and a phenolic compound, cevanthrol (II),  $\text{C}_{17}\text{H}_{16}\text{O}$ , m.p. 197—198° (Ac derivative, m.p. 138—139°). The results of X-ray crystallographic examination of (I) and (II) support a phenanthrene ring structure for (II) and a ring system of type (a) or (b) for (I).

F. R. S.

**Solanine and solanidine. A. SOLTYS and K. WALLENFELS (Ber., 1936, 69, [B], 811—818).**—Repeated extraction of solanine (I) with  $\text{COMe}_2$  and  $\text{Et}_2\text{O}$  causes its complete separation into solanidine (II) and solanine (III). (I) should therefore be deleted from the lit. Hydrolysis of (III) gives about

37.5% of (II) and 12.5% of solanthrene ( $\text{C}_7\text{H}_{15}\text{N}$ ) (IV). It is therefore very improbable that (IV) is formed from its proper glucoside. (II) does not yield

(IV) when hydrolysed. The presence of one and two double linkings in (II) and (IV), respectively, is con-

firmed, the double linkings in (IV) being hydrogenated with equal facility. To avoid confusion it is recommended that the completely saturated tetrahydrosolanthrene be designated solanidane. (II) is therefore solanidenol and its derivatives are termed in accordance with the Geneva nomenclature except that the name solanidine is retained. (II) affords a *mono-ozonide*

which does not permit degradation of the mol., since (II) is regenerated under varied conditions of fission. With digitonin (II) gives a ppt. suggesting a constitutional relationship with the sterols; this is confirmed

by the dehydrogenation of solanidiene by Se to methylcyclopentenophenanthrene. The present established structure of (II) is as shown. Attempts to degrade the  $C_7H_{15}N$  residue were unsuccessful. *Solanine methiodide*, m.p.  $230^\circ$ , when treated with moist  $Ag_2O$  and then distilled yields (II). Since N is *tert.* and the group  $C_7H_{15}N$  is unusually stable the structure (A) is suggested for (II).

H. W.

**Deltaline**, a new alkaloid from *Delphinium occidentale*, S. Wats. J. F. COUCH (J. Amer. Chem. Soc., 1936, 58, 684—685).—Details are given for the isolation of *deltaline* (I),  $C_{19}H_{24}ON(OH)_3(OMe)_2$ , m.p.  $180-181^\circ$ ,  $[\alpha]_D^{25} -27.86^\circ$  in EtOH [*Ac*<sub>3</sub> derivative, amorphous, m.p.  $270-272^\circ$ ; *aurichloride* ( $+3H_2O$ ), m.p.  $120-125^\circ$ ], from the dry plant, which contains 0.98% of total alkaloids [mainly (I)]. (I) is isomeric but not identical with *delcosine* (Markwood, A., 1925, i, 762).

H. B.

**Chemistry and pharmacological action of *Toddalea aculeata***. B. B. DEY, P. P. PILLAY, J. C. DAVID, and N. RAJAMANIKAM (Indian J. Med. Res., 1935, 22, 765—770).—Two alkaloids, *toddaline* (I),  $C_{20}H_{21}O_2N$ , m.p.  $269-270^\circ$  (*hydrochloride*, m.p.  $205-206^\circ$ ; several other salts described), and *toddalinine*, a N-free lactone, and a glucoside have been isolated from *Toddalea* root-bark. Both alkaloids give marked colour reactions. Crude (I) is converted by rubbing with EtOH-NH<sub>3</sub> into an insol. cryst. powder, m.p.  $204-206^\circ$ , which gives the same *hydrochloride*, and is probably another form of (I). The pharmacological action of (I) is described.

R. N. C.

**Toxic principle of ragwort (*Senecio Jacobaea*, L.)**.—See this vol., 652.

**Bark of *Moringa pteryosperma***.—See this vol., 768.

**2-Chloro-6-nitrobenzaldimercurioxide**.—See B., 1936, 361.

**Constitution of mixed organo-magnesium compounds**. C. DUVAL (Compt. rend., 1936, 202, 1184—1186).—When  $MgPhBr$  (I) in Et<sub>2</sub>O in an atm. of N<sub>2</sub> at  $0^\circ$  is electrolysed (cf. A., 1935, 1088), only Mg goes to the cathode. The anodic fluid contains Mg, Br ( $Mg/Br=1/2$ ),  $C_6H_6$ , and Et<sub>2</sub>O. If 8-hydroxyquinoline is introduced into the cell, the yellow colour due to  $Mg^{II}$  is seen at the cathode, and at the anode only after hydrolysis, which indicates that part of the

Mg in (I) is non-ionisable. The formula of (I) is probably  $[MgPh_2Br_2(Et_2O)_2]Mg$  (cf. A., 1912, i, 753).

J. L. D.

**Relative reactivities of organometallic compounds. VIII. Aluminium and zinc**. H. GILMAN and K. E. MARPLE (Rec. trav. chim., 1936, 55, 133—144).— $AlPh_3$  (I) and  $(p-C_6H_4Me)_3Al$  (II), best prepared from  $HgR_2$  and Al in xylene, under N<sub>2</sub>, and *Al tri-n-propyl*, b.p.  $137-138^\circ/22$  mm., obtained from  $MgPr^aBr$  and  $AlCl_3$  in Et<sub>2</sub>O, combine with  $PhNCO$  to form  $NHPhBz$ ,  $p-C_6H_4Me\cdot CO\cdot NHPh$ , and  $COPr^a\cdot NHPh$ ; with  $CO_2$ , (II) gives  $p-C_6H_4Me\cdot CO_2H$ , and with  $COPh_2$ ,  $p-C_6H_4Me\cdot CPh_2\cdot OH$ ; (I) similarly yields  $CPh_3\cdot OH$ . Passage of O<sub>2</sub> into a solution of (II) in cold xylene gives only 8% of *p*-cresol. (II) combines with  $PhCHO$  to form  $p-C_6H_4Me\cdot CHPh\cdot OH$ , and with  $PhCN$  to form  $p-C_6H_4Me\cdot CPh$ . With EtOBz or  $PhOBz$ , unidentified products are obtained.  $ZnPh_2$ ,  $ZnEt_2$ , and  $ZnPr^a_2$  react similarly with  $PhNCO$ ; and  $ZnPh_2$  and  $(p-C_6H_4Me)_2Zn$  with  $CO_2$ ,  $COPh_2$ , and  $PhCN$ . Rates of reaction of the above Al and Zn compounds are slower than those of Grignard compounds. Relative rates of combination of  $AlPh_3$ ,  $BPh_3$ ,  $ZnPh_2$ ,  $AlPr^a_3$ ,  $BPr^a_3$ ,  $ZnPr^a_2$ ,  $(p-C_6H_4Me)_3Al$ , and  $(p-C_6H_4Me)_2Zn$  with Michler's ketone are tabulated, and the colour reaction with the latter is examined and used as a means of studying rates of reaction with  $PhCHO$ ,  $COPh_2$ , and  $PhCN$ . The decreasing orders of reactivity  $\cdot CHO > \cdot CPh > \cdot CN$ , and  $AlR_3 > BR_3 > ZnR_2$ , are observed. Al displaces Hg more rapidly from  $HgR_2$  compounds ( $R=aryl$ ) than does Zn. The low reactivity of  $AlR_3$  compounds makes it improbable that these are intermediates in the Friedel-Crafts reaction.

E. W. W.

**Acridine salts of adenosinepolyphosphoric acids**. T. WAGNER-JAUREGG (Z. physiol. Chem., 1936, 239, 188—194).—The acids yield cryst.  $H_2O$ -sol. (hot) salts with acridine (I) as follows: adenosine-tri- (II) + 2(I), m.p.  $209^\circ$ , di- (III) + (I), m.p.  $215^\circ$ , -mono-phosphoric acid + (I), m.p.  $208^\circ$ , and also  $2H_4P_2O_7 + 3(I)$ , m.p.  $258-260^\circ$ . The salt of (III) is least sol. in hot  $H_2O$ . (II) also yields a salt with 3(I).  $NaNO_2$  in 55% AcOH converts (II) into inosinetriphosphoric acid (cf. Lohmann, A., 1931, 1184) and not into an isomeride of (II) (cf. Barrenscheen *et al.*, A., 1933, 1202).

W. McC.

**Structure of yeast nucleic acid**. K. HAGEN-GUTH (Z. physiol. Chem., 1936, 239, 127—134).—Small yields of cytosylic ( $Hg^{II}$ ,  $UO_2$ ,  $Pb$ , and *brucine*, m.p.  $189-190^\circ$ , salts) and uracylic acid (*Pb* salt) are obtained from yeast nucleic acid by hot acid hydrolysis followed by pptn. with  $Ag_2SO_4$ , etc. W. McC.

**Isolation of a fourth crystallisable jack bean globulin by digestion of canavalin with trypsin**.—See this vol., 768.

**Determination of nitrogen in compounds containing halogens by the hydrogenation method**. H. TER MEULEN and H. J. RAVENSWAAY (Chem. Weekblad, 1936, 33, 248—249).—Satisfactory results are obtained with compounds of high halogen contents when a few g. of soda-lime are placed in front of the catalyst as well as behind it.

S. C.

**Determination of nitrogen by Kjeldahl's method. Ammonia distillation.**—See this vol., 694.

**Determination of organic sulphur. I. Parr bomb method.** H. C. CHIANG and C. L. TSENG (Sci. Rep. Nat. Univ. Peking, 1936, 1, 19—41).—S in  $\text{CS}(\text{NH}_2)_2$ ,  $\text{SHBu}^a$ , and  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\text{Cl}$  is determined by explosion with  $\text{Na}_2\text{O}_2$  and lactose with or without  $\text{KClO}_3$  or  $\text{KClO}_4$  and subsequent gravimetric or volumetric determination of  $\text{SO}_4^{2-}$ . R. S. C.

**Principles and methods of a chemical morphology of carbon compounds.** C. WEYGAND (Angew. Chem., 1936, 49, 243—251).—The morphological study of cryst. org. compounds is suggested as an aid to identification, and suitable microscopic methods are described. M. S. B.

**Analysis of S-methyl compounds by demethylation with hydrogen iodide.** (MLLE.) A. LACOURT (Bull. Soc. chim. Belg., 1935, 44, 665—673).—Details are given for the semi-micro-determination of SMe by heating the compound with HI ( $d\ 1.7$ ); the resulting MeI vapours are freed from HI and  $\text{H}_2\text{S}$  by means of  $\text{Na}_2\text{CO}_3\text{--Na}_2\text{S}_2\text{O}_3$  and  $\text{CdSO}_4\text{--Na}_2\text{S}_2\text{O}_3$  solutions and are determined in the usual way. SMe compounds are demethylated at a lower temp. than NMe compounds, permitting the separate determination of these groups in compounds containing them both. H. G. M.

**Oxidimetric analysis of binary mixtures of organic compounds.** H. C. S. SNETHLAGE (Rec. trav. chim., 1936, 55, 58—60).—The method described for pure substances (A., 1935, 1390) may be used for binary mixtures by using  $\text{K}_2\text{Cr}_2\text{O}_7$  in 40% and 80%  $\text{H}_2\text{SO}_4$ , provided one of the components is not attacked and the other completely oxidises under the milder conditions. H. G. M.

**Titrimetric colorimetry.**—See this vol., 692.

**Diazometric method for the determination of diene hydrocarbons.** A. P. TERENTIEV, E. V. VINOGRADOVA, and G. D. GALPERN (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 267—272).—Diazotised  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$  (I) reacts quantitatively with  $\Delta^{1:3}$  dienes, but not at all with aromatic hydrocarbons or compounds with conjugated hetero-atoms (cf. lit.); one mol. of (I) reacts with one mol. of diene. Excess of (I) is used and the excess determined with  $\beta\text{-C}_{10}\text{H}_7\cdot\text{OH}$ . The method is suitable for the determination of dienes in mixtures of hydrocarbons of various types. H. G. M.

**Systematic detection of acetate.** L. J. CURTMAN and A. A. POLACHEK (Rec. trav. chim., 1936, 55, 153—156).—The green ppt. of  $\text{Cu}_4\text{O}_3\text{Cl}_2$  obtained when a solution containing  $\text{OAc}^+$  is boiled with  $\text{CuCl}_2$  (Reynoso, Compt. rend., 1855, 41, 278), when used as a qual. test (Field, J.C.S., 1873, 26, 575) will detect 1 mg.  $\text{NaOAc}$  (in a pure solution) and is thus more sensitive than the  $\text{FeCl}_3$  or odour tests. A solution of  $2M\text{-CuCl}_2\text{--}2M\text{-NaCl}$  is employed. If other acids are present, those with insol. Ag salts are first removed by adding  $0.5M\text{-AgNO}_3$ , and  $M\text{-CaCl}_2$  is added to ppt.  $\text{Ag}^+$  and  $\text{F}^-$ ; the solution is then made alkaline, evaporated, and neutralised.  $\text{ClO}_3^-$  if present is first reduced by  $\text{KNO}_2$ ;  $\text{NO}_2^-$  is oxidised by  $\text{HNO}_3$ . If

tartrate is present,  $\text{H}_2\text{SO}_4$  is added and  $\text{AcOH}$  distilled off and collected; if borate is present,  $\text{Na K tartrate}$  is added to give a non-volatile complex before distilling the  $\text{AcOH}$ . The solution is finally boiled with the  $\text{CuCl}_2$  solution. Procedure in each case is described in detail. E. W. W.

**Micro-determination of lactic and carbonic acids.**—See this vol., 768.

**Colour reactions of organic acids.** R. C. LOPEZ (Biochem. Z., 1936, 284, 365—366).—Application of the  $\text{C}_5\text{H}_5\text{N--Ac}_2\text{O}$  reaction (A., 1935, 1516) to various org. acids and their esters is described. F. O. H.

**Methods of determining organic acids.** E. V. SAPOSHNIKOVA and R. P. URINSON (Bull. Appl. Botany U.S.S.R., 1934, Ser. 3, No. 5, 255—272).—Modifications of the Hartmann and Hillig method of determining oxalic, citric, and tartaric acids are given. CH. ABS. (e)

**Precipitation of cystine by phosphotungstic acid.** M. DAMODARAN and T. G. SIVASWAMY (Biochem. J., 1936, 30, 750—752).—The extent of pptn. of cystine (I) by 24-phosphotungstic acid at any particular temp. is dependent on the concn. of (I). It is not complete at any concn., and below a certain min. val. no pptn. takes place. At the concn. of (I) usually present in protein hydrolysates only a small fraction is pptd. J. N. A.

**Colour reaction of histamine and complex salts of heavy metals with methylglyoxaline.** F. AXMACHER (Biochem. Z., 1936, 284, 339—342).—Aq. histamine and  $\text{CuSO}_4$  give a dark blue colour, modifications of which by treatment with oxidising and reducing agents, acids, and alkalis are described. Co salts give a brown colour (cf. Zimmermann, A., 1930, 648). Methylglyoxaline gives cryst. complex salts with Cu, Co, and Ni [e.g.,  $\text{Cu}(\text{C}_4\text{H}_6\text{N}_2)_6\text{SO}_4\cdot\text{Co}(\text{C}_4\text{H}_6\text{N}_2)_6(\text{NO}_3)_2$ ]. F. O. H.

**Test for thymine: keto-enolic type of diazo-test.** G. HUNTER (Biochem. J., 1936, 30, 745—749).—Thymine (I) coupled with diazotised sulph. anilic acid in  $\text{Na}_2\text{CO}_3$  solution gives an intense red colour when treated with  $\text{NaOH}$  and  $\text{NH}_4\text{OH}$ .  $<0.01$  mg. of (I) can be detected; the test is not given by uracil or cytosine. The conditions for the "keto-enolic type" of diazo-test given by glucose,  $\text{CH}_2\text{Ac}\cdot\text{CO}_2\text{H}$ ,  $\text{MeCHO}$ ,  $\text{COMe}_2$ , tyrosine, and (I) are (a) capacity for keto-enol tautomerism and (b) the presence of a reducing agent for the development of colour. J. N. A.

**Colour reaction of certain nitro-compounds.** P. K. BOSE and S. RAM (J. Indian Chem. Soc., 1936, 12, 687—689).—The colours (varying from cherry-red to indigo-blue) given by a no. of aromatic  $o\text{-NO}_2$  compounds in  $\text{EtOH}$  with uric acid- $\text{H}_2\text{O--KOH}$  at  $25^\circ$  and  $100^\circ$  are recorded. H. G. M.

**Detection of benzidine and tolidine present together.** L. KULBERG (J. Gen. Chem. Russ., 1935, 5, 1754—1756).—A drop of 10% aq.  $\text{CuSO}_4$  and a drop of 10% aq.  $\text{KNO}_3$  are placed on filter-paper, and a drop of the solution is added, when the spot turns blue in presence of  $o\text{-tolidine}$  (I), whilst benzidine (II) gives a brown ring with a blue centre. If the (II)

contains  $\pm 1\%$  of (I), the ring is green, and if the (I) contains  $\pm 1\%$  of (II) the spot has a colourless centre, and a blue ring with a rose-red margin. R. T.

**Determination of small quantities of benzoic acid.** E. B. JOHNSON (J.S.C.I., 1936, 55, 109—110T).—The BzOH is first nitrated, then reduced by Zn to  $m\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ , diazotised, and coupled with  $\beta\text{-C}_{10}\text{H}_7\cdot\text{OH}$  in alkaline solution. The bright red shade produced is matched with an aq. solution of Azogermanine B previously standardised for known amounts of  $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ , and the amount of BzOH obtained by reference to curves. Alternatively,  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{OH}$  may be used for coupling; in this case Neolan Pink B is employed. The method can be used in artificial light.

**Analytical uses of Nessler's reagent. Detection of aldehydes. Determination of glucose.** I. M. GOSWAMI, H. N. DAS-GUPTA, and K. L. RAY (J. Indian Chem. Soc., 1935, 12, 714—718).—Alkaline Nessler's solution is reduced by aldehydes (except OH-aldehydes in which OH is unprotected) but not, contrary to Bougault *et al.* (A., 1922, ii, 666, 709), by ketones (OH-ketones excepted). The extent of the reduction by glucose (I) and fructose depends on the strength and nature of the alkali (NaOH, KOH, or  $\text{Na}_2\text{CO}_3$ ) and on the temp. Details for the determination of (I) are given. H. G. M.

**Bromide-resorcinol reaction. Reactions characteristic of phenols, opium alkaloids, and oxalic acid.** M. PESEZ (Bull. Soc. chim., 1936, [v], 3, 676—681; cf. A., 1935, 961; B., 1935, 828).—The colour reactions of tartaric acid and  $\text{CCl}_3\cdot\text{CHO}$  in presence of KBr,  $\text{H}_2\text{SO}_4$ , and  $m\text{-C}_6\text{H}_4(\text{OH})_2$  are traced to the intermediate formation of  $\text{CHO}\cdot\text{CO}_2\text{H}$ . A reagent containing this substance is obtained by reducing 5%  $\text{H}_2\text{C}_2\text{O}_4$  solution with Al-Hg, filtering, and adding a few drops of conc.  $\text{H}_2\text{SO}_4$  to the filtrate. Its use in the characterisation of phenols and phenolic

acids is described. It can be employed in the differentiation of the chief opium alkaloids;  $\text{CCl}_3\cdot\text{CHO}$  in  $\text{H}_2\text{O}$  (2 : 10) can also be used but gives less intense colours.  $\text{H}_2\text{C}_2\text{O}_4$  is detected by reduction with Hg-Al and treatment of the reduced solution with conc.  $\text{H}_2\text{SO}_4$  and  $m\text{-C}_6\text{H}_4(\text{OH})_2$  whereby a blue colour is developed, whereas  $\text{HCO}_2\text{H}$ , AcOH, BzOH, lactic, citric, tartaric, salicylic, and uric acids,  $\text{COMe}_2$ , glycerol and the products of its oxidation give yellow-orange to red-brown colours. H. W.

**Colour reaction for rotenone.** R. S. CAHN and J. J. BOAM (Chem. and Ind., 1936, 384).—The  $\text{HCl}\text{-HNO}_3\text{-CHCl}_3$ -thymol test for rotenone (B., 1936, 467) is untrustworthy, since it depends more on the presence or production of  $\text{HNO}_2$  than on that of  $\text{HNO}_3$ . Pure  $\text{HNO}_3$  gives the colour only very slowly. R. S. C.

**New reaction of opium alkaloids and its application to the detection of certain oxidising agents.** M. PESEZ (Bull. Soc. chim., 1936, [v], 3, 675—676).—A small quantity of the alkaloid or its salt is dissolved in 0.5 c.c. of 90—95% EtOH and treated with 1.5 c.c. of conc.  $\text{H}_2\text{SO}_4$ . After agitation the mixture is heated for 2—3 min. on the water-bath, cooled, and cautiously diluted with 5 c.c. of  $\text{H}_2\text{O}$ . The solution gives an orange-red colour with NaOCl which is not discharged by  $\text{SnCl}_2$ ; Br- $\text{H}_2\text{O}$  and  $\text{NaNO}_2$  give red colours. The reaction is positive with morphine, apomorphine, codeine, and their derivatives, negative with narceine and papaverine. Brucine and adrenaline give brown colours. Conversely, a stable reagent is obtained with codeine which affords a very sensitive test for NaOCl, Br- $\text{H}_2\text{O}$ , and  $\text{NaNO}_2$  but gives negative results with  $\text{NO}_3^-$ ,  $\text{ClO}_3^-$ ,  $\text{SO}_4^{2-}$ ,  $\text{H}_2\text{O}_2$ , and metallic peroxides. H. W.

**Phthalic acid as reagent for optical identification of some metals and alkaloids.**—See this vol., 695.

## Biochemistry.

**Variations of the respiratory quotient of the frog and the turtle as a result of sharp changes of the temperature of the environment.** L. DONT-CHEFF and C. KAYSER (Compt. rend. Soc. Biol., 1936, 121, 1456—1458).—The R.Q. rises or falls with the temp.; the variations have no metabolic significance, but represent the variations of retention of  $\text{CO}_2$  with temp. R. N. C.

**Respiratory quotient of the fasting frog and turtle maintained at 20°, 10°, and 5°.** L. DONT-CHEFF and C. KAYSER (Compt. rend. Soc. Biol., 1936, 121, 1453—1455).—The R.Q. is unaffected by temp. within the above limits. R. N. C.

**Reticulocyte response in guinea-pigs following oral administration of certain antianæmic substances.** D. K. MILLER and C. P. RHOADS (New England J. Med., 1935, 213, 99—101).—Effects of a concentrate of rice polishings and autolysed yeast extract are examined. CH. ABS. (p)

**Action of sub-hæmolysing doses of mercuric chloride on the permeability of the erythrocyte.** M. ROCHA E SILVA (Compt. rend. Soc. Biol., 1936, 121, 1125—1128).—The permeability is unaffected. R. N. C.

**Forensic detection of blood.** O. SCHMIDT (Deut. Z. ges. gerichtl. Med., 1935, 24, 419—424; Chem. Zentr., 1935, ii, 1223).—Fusion of hæmin with resorcinol (cf. Schumm, A., 1928, 1263) and PhOH yields compounds with characteristic absorption spectra. H. N. R.

**Determination of bilirubin in blood.** A. VÁZQUEZ, V. G. ALVAREZ, and E. MATHET (Arch. med. cir. esp., 1933 [July 26]).—To 1 c.c. of serum is added a solution (1 : 1000) of methylene-blue (I) until the green colour first appearing turns blue. 0.01 c.c. of (I) is equiv. to  $5.6 \times 10^{-8}$  g. of bilirubin. CH. ABS. (p)

**Buffering power of hæmoglobin denatured by heat.** H. NAGAOKA (J. Biochem. Japan, 1936, 23,

101—123).—Hæmoglobin (I), when heated at its isoelectric point in isotonic aq. KCl, denatures first in a sol. condition before mol. aggregation occurs, a certain parallelism existing between increase in buffering power and denaturation. At higher temp., the buffering power and  $O_2$  capacity decrease, the latter being a more exact criterion of the extent of denaturation. The change in  $p_H$  of (I) on heating at  $52^\circ$  for several hr. is only  $+0.02$ . Diminution of buffering power, due to denaturation, occurs during the prep. of (I). F. O. H.

**Hæmatological studies in Indians. I. Hæmoglobin determination methods.** L. E. NAPIER and C. R. DAS GUPTA (Indian J. Med. Res., 1935, 22, 809—825).—Hellige's method can be adapted for clinical purposes if the colour standard, tubes, and pipettes are first checked by an abs. method of hæmoglobin determination. R. N. C.

**Solubility of hæmocyanins in saline solutions and specificity.** A. ROCHE and J. ROCHE (Compt. rend. Soc. Biol., 1936, 121, 1512—1514).—The solubilities are similar to those of globulins, but the limiting concns. of  $(NH_4)_2SO_4$  for pptn. vary with the species. R. N. C.

**Fractional ultrafiltration of the hæmocyanin of the snail.** P. GRABAR (Compt. rend. Soc. Biol., 1936, 121, 1472—1474).—The end-point of ultrafiltration occurs with membranes of mean pore diameter  $86\text{ m}\mu$ . R. N. C.

**Specificity of the characters of the serum-proteins in different animals.** L. SAMUEL (Compt. rend. Soc. Biol., 1936, 121, 1514—1516).—The specificity shows itself in the no. of different globulin fractions and their zones of pptn. Slight variations are often found even in members of the same species. The albumin-globulin ratio can be considered only as an "index." R. N. C.

**Function of serum-proteins.** R. BIERICH, A. LANG, and A. ROSENBOHM (Biochem. Z., 1936, 284, 329—338).—Serum-albumin-I and -II [separated by fractional pptn. with  $(NH_4)_2SO_4$ ] are respectively increased and decreased by addition to the serum of isamine-blue, pyronine, bile acids, or porphyrin; that of azelaic or sebatic acid and, in some cases, extracts of -II from pathological serum, has the reverse effect. The significance of the phenomenon in disease is discussed. F. O. H.

**Changes in serum-proteins in cancer.** R. BIERICH and A. LANG (Biochem. Z., 1936, 248, 443—447).—Neither the Cu-electrode potential method of Ettisch *et al.* (A., 1931, 503) nor the determination of acid groups indicates any differentiation between the globulin, albumin-I and -II (cf. preceding abstract) of normal and of cancerous blood. The tryptophan content of albumin-II, however, is diminished. F. O. H.

**Amino-groups of the proteins of human serum. Action of formaldehyde and ninhydrin.** W. L. DULIÈRE (Biochem. J., 1936, 30, 770—772).—Serum contains an average of  $0.635\text{ mg.}$  of  $NH_2\text{-N}$  (determined by  $CH_2O$  titration) per  $100\text{ mg.}$  of dry protein, the albumin containing  $>$  the globulins. The purification and properties of the reaction products of the

proteins with  $CH_2O$  and ninhydrin are described. The ninhydrin-protein products do not react with  $CH_2O$ . J. N. A.

**Presence of serum-vitellin in vertebrate blood.** M. LASKOWSKI (Biochem. Z., 1936, 284, 318—321).—Data are given for the lipin-, phosphoprotein-, and acid-sol. P in the blood of various species of birds, reptiles, amphibia, and fishes during resting and spawning periods. F. O. H.

**Zinc-ferrocyanide deproteinisation and the nitrogen compounds of the plasma.** M. PAGET and G. GUYADER (Compt. rend. Soc. Biol., 1936, 121, 1105—1106).—The reagent (I) does not adsorb urea or  $NH_2$ -acids, but retains a variable fraction of the uric acid (II). The difference between total N of the  $CCl_3\cdot CO_2H$  and (I) filtrates is slightly  $>$  the polypeptide-N (difference between N of  $CCl_3\cdot CO_2H$  and phosphotungstic ppts.), but if allowance is made for retention of (II), the N of the filtrate is of the order of that of the phosphotungstic acid filtrate. The (I) filtrate can be used for determination of the tyrosine index. R. N. C.

**Xanthoproteic reaction: its application to the determination of the tyrosine index of serum-polypeptides and of blood-phenols.** R. LEFAUX (J. Pharm. Chim., 1936, [viii], 23, 437—445; cf. A., 1936, 356).—The colour of the phosphotungstic acid filtrate  $\propto$  the phenol content and is expressed as the "phenol index." E. H. S.

**Methyl derivatives of guanidine in blood: solitary and renal hypertension.** M. ZAPPA-COSTA (Boll. Soc. ital. Biol. sperim., 1935, 10, 705—708).—Methylguanidines are determined in blood colorimetrically with  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{OH}$  after adsorption on C in alkaline solution. They are increased in hypertension, but the increase is not  $\propto$  the degree of hypertension or renal retention. R. N. C.

**Fatty acids of ox blood.** T. W. PARRY and J. A. B. SMITH (Biochem. J., 1936, 30, 592—598).—The fatty acids (70% yield) consisted of 26% of saturated acids (10% of  $C_{16}$ , 13% of  $C_{18}$ , and 3% of higher acids) and 69% of unsaturated acids (including 26% of  $C_{18}$ , of which approx. 20% was oleic and 6% linoleic, 33% of  $C_{20}$ , and 10% of  $C_{22}$ ). Neither linolenic nor any liquid saturated acid could be detected. W. O. K.

**Micro-determination of blood-fat.** L. POLLAK (Mikrochem., 1936, 19, 190—193).— $0.1\text{ c.c.}$  of blood is treated with  $\text{EtOH} + \text{Et}_2\text{O}$ , and the fat is saponified with  $\text{NaOH}$ . Fatty acids are liberated by acidifying with  $\text{H}_2\text{SO}_4$ , and are extracted with light petroleum. The latter is removed and the acids are oxidised at  $124^\circ$  by  $0.1N\text{-K}_2\text{Cr}_2\text{O}_7$  in 90%  $\text{H}_2\text{SO}_4$ , excess of  $\text{K}_2\text{Cr}_2\text{O}_7$  being determined iodometrically. J. S. A.

**Colour reaction of hexoses and their polymerides and its application to colorimetric determination of glucose in blood.**—See this vol., 709.

**Blood-sugar of anodonts.** M. FLORKIN and G. BOSSON (Compt. rend. Soc. Biol., 1936, 121, 1348—1350).—The "true" blood-sugar of anodonts is about  $0.20\text{--}0.80\text{ mg.}$  per c.c., vals. being the same

whether the blood is drawn from the heart or the palmar sac. Non-fermentable reducing substances are increased by fasting for a year. R. N. C.

**Determination of copper in plasma and blood-cells by Warburg's cysteine oxidation method.** J. BJERRUM and V. HENRIQUES (Skand. Arch. Physiol., 1935, 72, 271—282).—The method gives results comparable with those obtained by Macfarlane's colorimetric method. In a normal rabbit the blood-Cu was about equally divided between plasma and cells. After intravenous injection of Cu salts there was a marked rise in plasma-Cu followed by a slow fall during which the cell-Cu rose until both plasma- and cell-Cu reached the same level, after which both fell to normal. NUTR. ABS. (m)

**Helium solubility in blood at increased pressures.** J. A. HAWKINS and C. W. SHILLING (J. Biol. Chem., 1936, 113, 649—653).—Solubility coeffs. of He in dog's blood equilibrated at atm. pressure varied from 0.083 to 0.089, and in ox blood from 0.080 to 0.091. The amount of He dissolved by whole blood under pressures of He of 1—6 atm.  $\propto$  pressure.

J. N. A.

**Determination of traces of ferric iron, as in blood-serum.** J. DUBNOFF and P. L. KIRK (Mikrochem., 1936, 19, 194—207).— $\text{Fe}^{III}$  in the  $\text{CCl}_3\text{CO}_2\text{H}$  filtrate of serum is titrated by a differential potentiometric method with  $\text{TiCl}_3$  in presence of KCNS. The use of standardised additions of KCNS and conditions of working is essential owing to slow reduction of  $\text{Fe}^{III}$  by KCNS.

J. S. A.

**Iron. X. Acid-soluble iron of plasma.** G. BARKAN (Z. physiol. Chem., 1936, 239, 97—108; cf. this vol., 109).—In human and horse blood the spontaneous transfer of Fe from corpuscles to plasma is not a diffusion; it is independent of hæmolysis and is unaffected by quinine and KCN but is generally restricted by CO. Transferred Fe is not adsorbed by  $\text{Al}_2\text{O}_3$ , whilst its ionisation by acids is not inhibited by CO. Plasma-Fe is usually reduced in experimental anæmias.

W. MCC.

**Determination of sodium in serum.** E. G. BALL and J. F. SADUSK, jun. (J. Biol. Chem., 1936, 113, 661—674).—The method, based on the pptn. of Na as  $\text{U Zn Na}$  acetate, reduction of  $\text{U}^{VI}$  to  $\text{U}^{IV}$ , and subsequent oxidation to  $\text{U}^{VI}$  by  $\text{K}_2\text{Cr}_2\text{O}_7$ , is applicable to 0.2 c.c. of serum (error < 1%).

J. N. A.

**Determination of diastase in blood. I. Causes of error in Ottenstein's method.** F. BALTZER and J. BRINCK (Klin. Woch., 1935, 14, 929—930; Chem. Zentr., 1935, ii, 1223).

H. N. R.

**Reduction of methylene-blue by the blood of young infants.** C. H. SMITH (Amer. J. Dis. Children, 1935, 49, 1189—1203).—The rate of decolorisation of methylene-blue by blood varies with age, and in presence of 3% aq. Na citrate is highest at  $p_H$  7.4—8.1 and does not occur at  $p_H$  6.3. The action is associated with erythrocyte constituents.

CH. ABS. (p)

**Heart-lung preparation with coagulable blood.** L. BRULL (Compt. rend. Soc. Biol., 1936, 121, 1351—1353).

R. N. C.

**Hæmolytic action of photofluorescein.** J. F. MENKE (Biol. Bull., 1935, 68, 360—362).—Prep. of photofluorescein (I) by irradiation of Na fluorescein is described. (I) hæmolyses rats' blood in the dark, to the same extent as does fluorescein (II) in light. (II) has no action in the dark.

CH. ABS. (p)

**Existence of an optimum concentration of eosin for photodynamic hæmolysis.** M. ROCHA E SILVA (Compt. rend. Soc. Biol., 1936, 121, 1122—1125).—The optimum concn. is 0.02—0.03%.

R. N. C.

**Mechanism of anti-hæmolytic and-coagulatory action of blood-stabilising agents.** V. S. ILJIN (Biochem. Z., 1936, 284, 383—391).—Hæmolysis is inhibited by substances (e.g., Na citrate,  $\text{Ca}_2\text{C}_2\text{O}_4$ , NaF, hirudin) which inhibit coagulation; the action of those pptd. by  $\text{Ca}^{++}$  is suppressed by Ca, Mg, Sr, and Ba chlorides, which, however, enhance hirudin etc. The phenomenon is not related to combination with blood-Ca. Addition of fresh serum re-initiates hæmolysis, indicating the participation of complement, whilst the inhibition of coagulation by citrate etc. is due to reaction with prothrombin, which is therefore related to complement (cf. A., 1927, 787).

F. O. H.

**Anticoagulants. (A) Hypotensive action. (B) Effects of repeated injections. (C) Reciprocal action. (D) Effect of hypertensive and hypotensive substances on action of anticoagulants *in vivo*.** L. ROBUSCHI (Boll. Soc. ital. Biol. sperim., 1935, 10, 849—852, 852—856, 856—859, 860—864).

R. N. C.

**Anticoagulant action of arsenobenzenes.** H. GOLDIE (Compt. rend. Soc. Biol., 1936, 121, 1286—1290).—The anticoagulant power *in vitro* of sulph-arsenobenzene (I) is > that of novarsenobenzene (II) but the same *in vivo*. The min. anticoagulant dose of (I) *in vitro* is the same as the min. anti-alexie dose, suggesting that it inhibits a coagulant resembling alexin (possibly serozyme); the anticoagulant power of (II) is > its anti-alexie power, and its action is inhibited by excess of cytozyme. (I) and (II), like other anti-coagulants, change the isoelectric point and pptn. characters of serum and plasma, but only in a narrow range of  $p_H$ . Arsenobenzene 606 exhibits only a feeble anticoagulant action, and is insol. at neutrality and toxic.

R. N. C.

**Alexin and anti-alexin substances of horse serum.** H. GOLDIE (Compt. rend. Soc. Biol., 1936, 121, 1282—1286).—The activity of alexin (I) in a hæmolytic system is increased by adding pseudoglobulins (II) to the hæmolytic serum before adding (I); (II) probably fix anti-alexins in the serum.

R. N. C.

**Action of sucrose on alexin at high and low temperatures.** W. MUTSAARS and J. ROBERT (Compt. rend. Soc. Biol., 1936, 121, 1400—1402).—Sucrose protects alexin from inactivation at high but not at low temp.; this supports Madsen's view that the inactivation factors are different.

R. N. C.

**Effect of sucrose on the thermo-resistance of alexin.** W. MUTSAARS (Compt. rend. Soc. Biol., 1936, 121, 895—897).—The thermo-resistance is increased.

R. N. C.

**Minor hæmagglutinins.** Blood containing autoagglutinin, heteroagglutinins, hæmolysins, and a rouleau-forming substance. W. P. BELK (J. Lab. Clin. Med., 1935, 20, 1035—1042).—Data are obtained from the blood of a single patient recovering from mononucleosis. CH. ABS. (p)

**High agglutinin content of the serum of an injurious universal donor.** M. MULLER and E. BALGAIRIES (Compt. rend. Soc. Biol., 1936, 121, 1447—1449). R. N. C.

**Isohæmoagglutination and serum-albumins.** P. MICHON, M. VÉRAIN, and A. ZIEGLER (Compt. rend. Soc. Biol., 1936, 121, 1419—1420).—Isohæmoagglutinins are contained in the serum-globulins, serum being inactive. R. N. C.

**Isohæmoagglutination and viscosity.** P. MICHON, M. VÉRAIN, and A. ZIEGLER (Compt. rend. Soc. Biol., 1936, 121, 1417—1419).—Isohæmoagglutination is accompanied by a fall followed by a rise of  $\eta$ ; the variations are detectable at dilutions > those where agglutination is detected, and do not occur in non-agglutinating systems. R. N. C.

**Isolation of antibodies by fixation on an adsorbent-antigen system with subsequent regeneration.** K. MEYER and A. PIC (Ann. Inst. Pasteur, 1936, 56, 401—412).—After adsorption of an antigen, the adsorbent-antigen complex will adsorb the corresponding antibody, the latter being eluted with 0.9% aq. NaCl at 60°. H. G. R.

**Titration of therapeutic sera by neutralisation of antibody *in vitro*.** L. COTONI and J. POCHON (Compt. rend., 1936, 202, 1121—1123).—The method is rapid and trustworthy and reveals differences not observed in the *in-vivo* method. W. McC.

**Antigenic power of glycogen and starch.** A. GIOVANARDI (Boll. Soc. ital. Biol. sperim., 1935, 10, 777—780). R. N. C.

**Determination and calculation of the sensitisation of the complement-fixation reaction by titration with a fixed quantity of hæmolytic serum (anti-sheep hæmolytic system).** R. CROSNIER (Compt. rend. Soc. Biol., 1936, 121, 1306—1308). R. N. C.

**Viscosity of diphtheria toxin-antitoxin mixtures.** P. L. DU NOÛY and V. HAMON (Ann. Inst. Pasteur, 1936, 56, 359—375).—The increase in  $\eta$  of a toxin solution on adding a small quantity of antitoxin may be used to standardise the latter. H. G. R.

**Mechanism of the variations of the Nicloux coefficient *k* in normal, hydrated, and dehydrated *Gobio fluviatilis*.** G. FONTÈS, J. BRUNER, and A. LINDENBERG (Compt. rend. Soc. Biol., 1936, 121, 1458—1461).—Theoretical. R. N. C.

**Water impermeable to alcohol.** (A) G. FONTÈS. (B) M. NICLOUX (Compt. rend. Soc. Biol., 1936, 121, 1465—1470, 1470—1471).—Theoretical. R. N. C.

**Biochemistry of the vermiform appendix.** S. SUMIDA (J. Biochem. Japan, 1936, 23, 147—159).—Data are given for the physico-chemical properties, inorg. and org. constituents, and enzymes of the

appendix juice (rabbit, dog) and for the  $\text{NH}_2$ -acid distribution in the proteins of the mucosa and muscle layers. F. O. H.

**Behaviour of thyroid follicles in the Harvey-Loomis centrifuge microscope.** J. F. McCLENDON (Science, 1936, 83, 283—284).—At a centrifugal force of  $10^5$  to  $2 \times 10^5 g$  the colloid from the thyroid follicles is extruded, and pptn. of thyroglobulin then occurs. The mechanism of this extrusion is detailed. L. S. T.

**Chemistry of helminths. III. *Taenia solium*. IV. *Diphyllobothrium latum*. V. *Ascaris lumbricoides*.** I. A. SMORODINCEV and K. V. BEBESCHIS (J. Biochem. Japan, 1936, 23, 19—20, 21—22, 23—25).—Data are given for the dry wt., and contents of org. matter, ash, total N, and lipins of the worms, comparison being made between nematodes and cestodes. F. O. H.

**Chlorine content of feathers.** F. R. DODD (Analyst, 1936, 60, 252—253).—Untreated feathers (mixed) contained 0.609% of Cl. After treatment (washing with boiling  $\text{H}_2\text{O}$ ) the smaller grades (1—4) contained 0.051—0.085, and the larger (5 and 6) approx. 0.4%. The Cl, NaCl, and KCl contents of untreated feathers of several species are recorded. E. C. S.

**Iodine content of American fishery products.** E. J. COULSON (U.S. Bur. Fisheries, Invest. Rept., 1935, 1, No. 25, 7 pp.).—Of the fish tested (12 species fresh and canned) the highest vals. (parts per  $10^9$ ) were found in the haddock (average 26,100) and the mullet (average 20,490). The average for codfish was 5350, and for canned Chinook salmon 2010. Of 8 fish meals shrimp had 23,080, crab 19,440, whitefish 12,080, and menhaden 4500. All the other vals. were between 1000 and 2000. The average vals. for fish oils were cod-liver oil 7670, salmon oil 1980, and sardine oil from Maine 470 and from California 260. NUTR. ABS. (m)

**Presence of acetone in beef.** A. HOUDINIÈRE (Bull. Acad. vét. France, 1935, 8, 233—238).—Normal beef (muscle) contained 12 mg. of  $\text{COME}_2$  per 100 g. of tissue whilst in a heifer with milk fever 23 mg. were found. The  $\text{COME}_2$  was not removed by grilling but disappeared on prolonged boiling. NUTR. ABS. (m)

**Errors in the determination of ethyl alcohol in *Carassius auratus*.** G. FONTÈS, A. LINDENBERG, and R. GROSS (Compt. rend. Soc. Biol., 1936, 121, 1461—1465).—The presence of other substances volatile in steam makes the method of Nicloux untrustworthy. R. N. C.

**Highly unsaturated alcohols in sperm-blubber oil.**—See this vol., 703.

**Decenoic acid,  $\text{C}_{10}\text{H}_{18}\text{O}_2$ , in sperm-head oil.**—See this vol., 705.

**Evolution of natural fats: a general survey.** T. P. HILDITCH and J. A. LOVERN (Nature, 1936, 137, 478—481). L. S. T.

**Formation of adipocere.** MATZDORFF (Deut. Z. ges. gerichtl. Med., 1935, 24, 246—249; Chem. Zentr., 1935, ii, 1197).—Adipocere appears in the fat cells of the hypodermis of the body of a new-born

child kept for 7 days in flowing  $H_2O$  at  $11^\circ$  temp. and  $29^\circ$  of hardness. R. N. C.

**Physico-chemical studies on lecithin.** H. B. BULL and V. L. FRAMPTON (J. Amer. Chem. Soc., 1936, 58, 594—596).—Lecithin (I) prepared from egg-yolk by a modification of Sueyoshi's method (A., 1931, 975) contains a considerable amount of kephalin (II). Determinations of the isoelectric point ( $P$ ) of various specimens of (I) by the electrophoretic method (A., 1935, 933) and extrapolation to zero concn. of (II), gives a val. of  $p_H$  6.4 for (I) (cf. Chain and Kemp, *ibid.*, 194). The  $P$  of (I) is lowered considerably by admixed (II); divergent results (lit.) are thus explained. When an aq. suspension of (I)+(II) is kept the  $P$  falls. Titration curves for such suspensions are reported. H. B.

**Presence and distribution of some reducing substances in brain tissue.** M. MITOLO (Atti R. Accad. Lincei, 1935, [vi], 22, 359—365).—Vals. are given of the reducing power (with respect to 2:6-dichlorophenol-indophenol) of different parts of the brain tissue of toads, rats, pigeons, guinea-pigs, rabbits, cats, sheep, horses, and oxen. O. J. W.

**Carbohydrates of muscle extracts of normal and diabetic dogs.** T. CAHN and J. HOUGET (Compt. rend., 1936, 202, 985—986; cf. this vol., 630).—Both normal and diabetic muscle extracts can polymerise glucose to glycogen, although the reaction is 30—40% slower in the latter case. P. G. M.

**Isolation of *dl*-arginine from kidney autolysate.** H. A. HEINSEN (Z. physiol. Chem., 1936, 239, 162—164; cf. Ackermann, A., 1934, 874).—The lysine fraction (phosphotungstic acid ppt.) of the autolysate of ox-kidney yields *dl*-arginine (*disoziodolate*, m.p.  $201^\circ$ ). W. McC.

**Heat-denaturation of proteins as a chain reaction.** A. FISCHER (Nature, 1936, 137, 576—577).—The denaturation of highly-purified serum-globulin by heat ( $70^\circ$ ) is a chain reaction, and the denaturation process may be due to the appearance of  $\cdot NH_2$  or  $\cdot SH$  on the surface of the spherical protein mols. L. S. T.

**Storage of proteins in the liver.** H. LI (Chinese J. Physiol., 1936, 10, 7—26).—Loss of blood, hunger, muscular activity, or phloridzin poisoning produces disappearance of protein from rat-liver cells. Feeding with vegetable or animal protein leads to storage of protein in the liver. J. N. A.

**Chemistry of rigor mortis.** I. A. SMORODINCEV and N. V. NIKOLAEVA (J. Biochem. Japan, 1936, 23, 27—39).—Cow's flesh, cooled to approx.  $0^\circ$  immediately after slaughter, contains equal amounts of myosin (I), myogen (II), and stroma, 70% of the total N being extractable by 0.65*M*-saline solution at  $p_H$  9.1. The extractability of (I) and (II) decreases to varying extents over a period of 24—48 hr. at  $0^\circ$  and then remains approx. const. Data for changes at  $36^\circ$  are also given and the bearing of the results on muscle-enzyme action and rigor is discussed. F. O. H.

**Structure and properties of "byssus" or silk of oysters.**—See this vol., 670.

3 D

**Porphyrins in the incubated bird's egg.** A. A. H. VAN DEN BERGH and W. GROTEPASS (Compt. rend. Soc. Biol., 1936, 121, 1253—1258).—The shell of the hen's egg contains protoporphyrin (I), which is secreted simultaneously with Ca albuminate by the uterine mucosa. (I) is synthesised from the white of the germinating egg, simultaneously with hæmoglobin (II). (I) is not a degradation product of (II), but probably an intermediate product in its synthesis. R. N. C.

**Uroporphyrin-III.** J. WALDENSTRÖM (Z. physiol. Chem., 1936, 239, III—IV; cf. this vol., 503).—Isolation of uroporphyrin-III (from urine of acute porphyrinuria) prior to that by Mertens is claimed. The faces in some cases contained coproporphyrin-I which, together with uroporphyrin-I, occurred in the urine. W. McC.

**Lipochrome of pig's liver.** L. ZECHMEISTER and P. TUZSON (Z. physiol. Chem., 1936, 239, 147—148; cf. this vol., 499).—Fresh pig's liver contains about  $3 \times 10^{-5}\%$  of lipochrome of which  $\frac{2}{3} \times 10^{-6}\%$  is carotene. W. McC.

**Surface tension of cow's milk.** G. BELLE (Le Lait, 1936, 16, 13—30).—The  $\gamma$  of milk produced in the Casablanca district averaged 50.4 dynes per cm. During the 3 hr. after milking,  $\gamma$  decreased uniformly until it reached this const. val. The cooling of milk lowered  $\gamma$  considerably, an average val. of 47.7 dynes per cm. being reached at  $0^\circ$ . W. L. D.

**Surface tension of milk.** W. KOPACZEWSKI (Le Lait, 1936, 16, 356—359).—The  $\gamma$  of various milk samples was very uniform, averaging 53 dynes per cm. Dilution with  $H_2O$  does not change  $\gamma$  appreciably. The  $\gamma$  of separated milk differs only slightly from that of the corresponding whole milk; ageing of milk increases the val. by 2 dynes per cm. in 36 hr. Shaking milk for 5 min. increases  $\gamma$  by 2 dynes per cm. W. L. D.

**Ammonia content of cow's milk.** M. POLONOVSKI (Le Lait, 1936, 16, 232—234).—The average  $NH_3$ -N content of milk is 0.08%. The amount increases greatly on keeping or boiling. The increase on boiling is greater with old than with fresh milk. A low  $NH_3$  content in condensed milk is an indication of efficient preservation. W. L. D.

**Effect of certain ingested fatty oils on the composition of cow milk fat.** T. P. HILDITCH and H. M. THOMPSON (Biochem. J., 1936, 30, 677—691).—The milk fats from cows on winter diets supplemented with linseed or rape oils had higher oleic acid (I) contents; there was no evidence of the passage of the highly unsaturated linseed oil or the rape oil erucic ( $C_{22}$ ) acids into the fat. With rape oil a decrease in the palmitic acid content occurred. Supplementing the diet with cod-liver oil caused a large reduction in the content of lower saturated acids, a large increase in that of (I), and a smaller increase in the  $C_{20-22}$  unsaturated acids; palmitoleic acid was absent. By plotting the % of fully saturated glycerides against the % of saturated acids in the total acids in the control and test milk fats a straight line was obtained coincident with that obtained for animal depot fats (A., 1935, 645). The  $C_{20-22}$  unsaturated acids are probably

responsible for the sp. effect of cod-liver oil on lactating cows. H. D.

**Chemistry of cheese-ripening. III. Caseoglutin.** W. GRIMMER and W. LANGE (Milch. Forsch., 1936, 17, 352—375).—The mixture of two caseoglutins in Tilsiter cheese, ripened for 10 weeks, was separated and each fraction sub-divided into 3 fractions with  $\text{COMe}_2$ : (1) insol. in  $\text{COMe}_2$ ; (2) sol. in  $\text{COMe}_2$ , isoelectric point,  $p_H$  5.3; (3) sol. in  $\text{COMe}_2$ , isoelectric point,  $p_H$  7.0. The  $\text{NH}_2$ -acids of (1) showed a high content of leucine and proline. (3) contained only 0.05% of P, (1) and (2), 0.24—0.28%. W. L. D.

**Properties of milk-amylase and their modification by other milk constituents.** A. SCHLOEMER (Milch. Forsch., 1936, 17, 326—361).— $\text{Pb}(\text{OAc})_2$ ,  $\text{AcOH}$ , and citric acid sera of milk are suitable for studying milk-amylase but the enzyme is adsorbed on caseinogen pptd. from milk by  $\text{HCl}$ . Amylolytic activity of milk is inhibited by dialysis. The enzyme can be reactivated by  $\text{CaCl}_2$  and to a less degree by  $\text{NaCl}$ . The adsorption of amylase on the fat-caseinogen ppt. from milk and cream is greatest with high fat contents. A method of preparing the enzyme by dialysis of the  $\text{Pb}$  serum is described. W. L. D.

**Detection of narcotics, particularly barbituric acid derivatives, in various materials, especially cerebrospinal fluid and blood.** R. FISCHER and O. REISCH (Z. ges. exp. Med., 1935, 95, 739—753; Chem. Zentr., 1935, ii, 1223).—The drug (veronal, luminal, pernocton, medinal, dial, or evipan) is extracted with  $\text{Et}_2\text{O}$  and sublimed. H. N. R.

**Humoral distribution of sodium chloride in blood and exudates.** G. DELL'ACQUA (Boll. Soc. ital. Biol. speriment., 1935, 10, 765—768).— $[\text{NaCl}]$  in normal pleural and abdominal exudates and articular or cutaneous blister liquids is  $>$  that in serum, but  $<$  that in purulent liquids. In cirrhotics, serum- $\text{NaCl}$  is  $<$  abdominal exudate- $\text{NaCl}$  which is  $<$  cerebrospinal fluid- $\text{NaCl}$ . R. N. C.

**Lipase content of chyle. Absorption of digestive enzymes.** A. KÁLLÓ (Frankfurter Z. Path., 1935, 48, 305—309).—Chyle collected before passage through any lymph gland in dogs and chyle from a human cyst contained lipase (I) probably absorbed from the intestine and contributing in part to the (I) content of lymph and blood. NUTR. ABS. (m)

**Chemical and physical constants of the body-fluid of sacculine crabs.** A. DRILHON (Compt. rend., 1936, 202, 981—982).—In parasitised crabs the Ca, Mg, and protein contents of the lymph are  $>$  normal. There are two isoelectric points,  $p_H$  6 and 8; the lymph of normal crabs has only one at  $p_H$  6. P. G. M.

**Biliary sugar.** G. BALTACEANO and C. VASILIU (Compt. rend. Soc. Biol., 1938, 121, 1114—1116).—Biliary sugar is partly free and partly combined with proteins, and is related to blood-sugar. The content of sugar (especially that combined with protein) in bile from the gall-bladder is  $>$  that in bile from the duct. R. N. C.

**Ultra-violet spectrum of hæmoglobin derivatives and bile pigment.**—See this vol., 662.

**Relation between blood-sugar and exocrine pancreatic function.** C. O. HEBB (Arch. internat. Pharmacodyn., 1935, 52, 33—47).—In rabbits close parallelism exists between the lipase (I) content of the pancreatic juice and blood-glucose. Injection of glucose (II), but not of isotonic aq.  $\text{NaCl}$ ,  $\text{NaHCO}_3$ , or sucrose, caused an increase in (I) concn. This effect was not altered by adrenalectomy, but was abolished by atropine. During hyperglycæmia (II) was excreted in the juice, but atropine did not affect this excretion. NUTR. ABS. (m)

**Blood-sugar concentration and the external secretion of the pancreatic gland.** B. P. BABKIN (J. Amer. Med. Assoc., 1935, 105, 1659—1662).—A close relationship exists between blood-sugar and secretion by the pancreas. Hyperglycæmia always increased the output of enzymes from the acinous cells. Insulin hypoglycæmia lowered the concn. of enzymes in the pancreatic juice, this effect disappearing after vagotomy. NUTR. ABS. (m)

**Indoluria.** J. C. FORBES and R. C. NEALE (J. Lab. Clin. Med., 1935, 20, 1017—1024).—Indole is not found in normal urine, but occurs in various diseases. CH. ABS. (p)

**Simple, sensitive reaction for bilirubin in urine.** A. W. J. H. HOITINK (Nederl. Tijds. Geneesk., 1935, 79, 2928—2930; Chem. Zentr., 1935, ii, 1224).—A modification of Fouchet's method (A., 1918, ii, 415). H. N. R.

**Unsaponifiable fraction of rat's fæces.** E. AMMUNDSEN (Biochem. Z., 1936, 284, 313—317).—With fæces of rats on either dried milk or meat diets, the sterols are approx. 40% unsaturated (Br method), whilst the solubility of the digitonide in  $\text{MeOH}$  is the same and slightly  $>$  that of pure coprosterol (I). The unsaponifiable fraction on chromatographic analysis or distillation in a high vac. yields cetyl alcohol and a cryst. substance. The accuracy of determinations of (I) and dihydrocholesterol in their mixtures by the method of solubility of digitonides in  $\text{MeOH}$  is influenced by presence of  $\text{H}_2\text{O}$ , but not of  $\text{COMe}_2$ , or digitonin impurities. F. O. H.

**Effect of adrenalectomy on the colloidal state of [frog] muscle-proteins.** G. BENETATO and R. OPREAN (Compt. rend. Soc. Biol., 1936, 121, 1551—1552).—The "solubility" of the proteins is reduced. R. N. C.

**Effect of adrenalectomy on the  $p_H$  and buffering power of muscle.** G. BENETATO (Compt. rend. Soc. Biol., 1936, 121, 1547—1550).— $p_H$  and the buffering power in dogs are reduced. R. N. C.

**Anæmia of premature infants. II. Blood-iron and -hæmoglobin.** A. F. ABT (Amer. J. Dis. Children, 1935, 49, 1204—1218).—The blood-Fe of premature and full-term infants is similar at birth and tends to decrease at similar rates to a min. at the 12th week. The types of curves for Fe and hæmoglobin (I) are similar, but vals. for premature infants reach the lower levels at corresponding age periods. The ratio % (I)/% Fe is the same as for full-term infants. CH. ABS. (p)

**Iron content of teeth of normal and anæmic rats.** S. RATNER (J. Dent. Res., 1935, 15, 89—92).—

The Fe content of the upper incisors of anæmic rats was 0.0082–0.0251% (average 0.0144). After removal of hæmoglobin-Fe the average content was 0.0126%. The corresponding vals. for healthy rats were 0.0280–0.0308% (average 0.0298; after removal of hæmoglobin-Fe 0.0262). A rough correlation seemed to exist between colour depth of the teeth and Fe content. NUTR. ABS. (m)

**Agranulocytic angina.** Effects of toxic products of certain bacteria recovered from human stools and blood on the leucocytes of animals. W. M. HARRIS and H. J. SCHATTENBERG (J. Lab. Clin. Med., 1935, 20, 1053–1062).—Effects of toxic filtrates of cultures of *Clostridium welchii*, *Staphylococcus aureus*, *Salmonella enteritidis*, and *Streptococcus hemolyticus* from an affected patient are examined. CH. ABS. (p)

**Serum-calcium in arthritis.** E. F. HARTUNG and C. H. GREENE (J. Lab. Clin. Med., 1935, 20, 929–934).—Vals. were normal in rheumatoid arthritis but low in osteoarthritis. CH. ABS. (p)

**Calcium and phosphorus metabolism in generalised diseases of bones.** D. HUNTER (Proc. Roy. Soc. Med., 1935, 28, 1619–1638).—In hyperparathyroidism blood-Ca is high (12.6–23.6 mg. per 100 ml.), plasma-inorg. P is low (1.0–2.7 mg.), and urinary Ca is greatly increased. Results are somewhat similar in some cases of generalised osteoporosis with renal glycosuria, but here there is a much smaller increase in serum-Ca in relation to the increased urinary Ca. In focal osteitis fibrosa, exophthalmic goitre, and Paget's disease the blood-Ca and -P levels are normal. In exophthalmic goitre Ca excretion may be greatly increased. Urinary Ca is generally raised in Paget's disease and is normal in focal osteitis fibrosa. In multiple myelomatosis high serum-Ca vals. associated with increased Ca excretion are usually found. If renal insufficiency is also present the plasma-P is high. Secondary carcinomatous deposits in bones may result in a negative or positive Ca balance. In osteomalacia there is nearly always a decreased level of serum-Ca accompanied by a high faecal and low urinary output of Ca. NUTR. ABS. (m)

**Physico-chemical characteristics of body fluids in cancer patients.** G. J. GONZALEZ (Arch. med. cir. espec., 1933, No. 654).—Surface tension, sp. refraction,  $\eta$ , and cholesterol content of the blood are increased: electrical conductivity, glycaemia, and Ca content are lowered. Basal metabolism may increase initially but diminishes with the progress of the disease. Blood- $p_H$  decreases. CH. ABS. (p)

**Cancer. II. Determination of hydrogen-ion concentration of tissues in living animals by means of the capillary glass electrode.** C. VOEGTLIN, H. KAHLER, and R. H. FITCH (Nat. Inst. Health Bull., 1935, No. 164, 15–27).—Apparatus and technique are described. CH. ABS. (p)

**Gelation of serum-proteins in cancer.** W. KOPACZEWSKI (Compt. rend., 1936, 202, 990–992).—The acceleration of gelation of serum-proteins in cancer cannot be correlated with the indices of neoformation of the globulins and myxoproteins. P. G. M.

**Carcinogenic action and absorption and fluorescence spectra of 1:2-benzpyrene.**—See this vol., 664.

**Iron metabolism in cancer.** J. ROMHÁNYI and M. SCHMIDT (Frankfurter Z. Path., 1935, 48, 380–385).—In rats on which "Putnoky-Ehrlich" carcinoma has been grafted, growth of the tumour was accompanied by an initial fall of 33% in the Fe content of the liver, followed by an increase to 14% < normal. Tumour-Fe was const. throughout its growth. The Fe content of the spleen decreased about 14%, whilst there was a 31% increase in that of the kidneys. The excretion of Fe by kidney and bowel decreased 10% and 14%, respectively. NUTR. ABS. (m)

**Composition of normal and diseased organs. I. Normal, carcinomatous and sarcomatous lung.** B. LUSTIG (Biochem. Z., 1936, 284, 367–375).—Data for the contents of N, P, lipins, sterols, carbohydrate, and protein- and residual N are given. Increased contents of albumose and peptone in sarcomatous and of non-reducing and nucleal carbohydrate in carcinomatous lung occur. F. O. H.

**Effect of various goitre-producing diets on growth of carcinoma, sarcoma, and melanoma in animals.** K. SUGIURA and S. R. BENEDICT (Amer. J. Cancer, 1935, 23, 541–549).—Effects of goitrogenic diets with and without added I are compared. CH. ABS. (p)

**Complement fixation reactions in carcinoma.** H. W. LUNDY (J. Lab. Clin. Med., 1935, 20, 923–929).—Fractionation of the phosphatide of cancer tissue by various solvents is described. The antigen involved in fixation with cancer sera was stable at 125°, but was destroyed by treatment with  $C_5H_5N$  or  $(CH_2NH_2)_2$ . CH. ABS. (p)

**Effect of metabolic inhibitors on therapeutic irradiation of mouse tumours.** G. HARKER and W. MOPPETT (Austral. J. Exp. Biol., 1936, 14, 15–25).—Injection of KCN,  $KAg(CN)_2$ , and  $CH_3I \cdot CO_2Na$  increases the sensitivity of tumours to X-rays. The rate of destruction of  $KAg(CN)_2$  in the tissues is much < that of destruction of KCN. The capability of organs to destroy KCN varies greatly, brain being most destructive by far. W. McC.

**Chemistry of crystalline humour, normally and in cataract.** M. PAGET and G. LEVIN (J. Pharm. Chim., 1936, [viii], 23, 388–392).—In mammalian cataract the total ash, Ca, and cholesterol content of the cryst. humour are considerably, and that of S slightly, increased, whereas the K content is much decreased. J. S. A.

**Phosphorus compounds and bound sugars in the blood of diabetics.** M. MORIMUNE (Mitt. med. Akad. Kioto, 1935, 15, 853–860).—In diabetes without complications the bound sugar and the acid-insol. P were increased, the vals. appearing to run parallel. The vals. for P in other forms were normal. In diabetes with complications the bound sugar, total P, glycerophosphate, and acid-insol P were increased whilst the ester-P was decreased. NUTR. ABS. (m)

**Immunity in diabetes. II. Relative importance of nutritional state and of blood-sugar level**

in influencing development of the agglutinin after typhoid vaccine. R. RICHARDSON (J. Clin. Invest., 1935, 14, 389—392).—Rabbits with depleted liver-glycogen developed lower agglutinative titre after typhoid vaccine than did normal controls. No correlation was observed in diabetics between the fasting blood-sugar concn. and either the agglutinative titre developed after typhoid vaccine or the bactericidal power of the blood. CH. ABS. (p)

"Donaggio reaction" in diabetes. P. BIOCCHI (Boll. Soc. ital. Biol. sperim., 1935, 10, 737).

R. N. C.

Electrolyte balance in acute gout. J. H. TALBOT, B. M. JACOBSON, and S. A. OBERG (J. Clin. Invest., 1935, 14, 411—421).—Changes in  $H_2O$  and salt metabolism occur during acute gout attacks. Before clinical or subject evidence appeared, there was diuresis accompanied by negative Na and Cl balances, and increased excretion of K, Ca,  $NH_4$ , titratable acid,  $PO_4'''$ , and urate. Metabolism of acute gout is not defined by uric acid alone. CH. ABS. (p)

Leprosy: effect of vitamin- $B_1$ -deficient diet on the incubation period of rat leprosy. L. F. BADGER and W. H. SEBRELL (U.S. Publ. Health Repts., 1935, No. 50, 855—863).—The incubation period was shortened. CH. ABS. (p)

Composition of lipomas. E. STOLFI and G. STOLFI (Boll. Soc. ital. Biol. sperim., 1935, 10, 742—744).—The fat of lipomas and that of the subcutaneous connective tissue are chemically essentially the same. R. N. C.

Indole. IV. Indican-indole index of the blood in various experimental conditions. V. Indican-indole index of the blood in patients with normal liver and hepatic disease. VI. Microdetermination of free indole in blood. E. MACCHIA (Boll. Soc. ital. Biol. sperim., 1935, 10, 717—720, 720—722, 723—725).—IV. The index in the dog is scarcely changed by ligature of the renal peduncle, but is lowered by ligature of the hepatic peduncle and raised by removal of the intestine.

V. The index in normal patients is 10—16; it is reduced in hepatic disease, but increased in renal and intestinal affections.

VI. The serum is extracted with light petroleum + MeOH, and the extract washed with  $H_2O$  (and with conc. NaOH if icteric). The solution is treated with a modified Ehrlich reagent, and, after evaporation of solvent, indole is determined colorimetrically in AcOH solution. R. N. C.

Test for hippuric acid in diseases of the liver. A. J. QUICK (Arch. Int. Med., 1936, 57, 544—556).—Within 4 hr. of ingestion of 6 g. of NaOBz, approx. 3 g. of hippuric acid should be excreted. This val. is generally decreased in cases of hepatic disease.

H. G. R.

[Biological] synthesis of hippuric acid. P. F. VACCARO (Surg. Gynecol. Obstet., 1935, 61, 36—42).—Ingestion of NaOBz (5.9 g.) was followed by excretion of hippuric acid (3.5 g.) within 4 hr. Excretion was reduced in liver disease. CH. ABS. (p)

Liver-lipase in pathology and therapeutics. N. FIESSINGER and A. GAJDOS (Ann. Méd., 1935, 38,

405—426).—The lipase (I) of serum is believed to be similar to and derived from hepatic (I) and to differ from pancreatic (I). Serum-(I) was diminished in cirrhosis and tumour of the liver. Persistent elevation of the serum-(I) in dogs followed injection of hepatic (I); in liver perfusion experiments the (I) content of the perfusate was increased. NUTR. ABS. (m)

Thiocyanate treatment of mange in guinea-pigs. E. B. CARMICHAEL (Science, 1936, 83, 304).—A 2% solution of lauryl thiocyanate in cottonseed oil or a 5% aq. solution of "Loro" is effective.

L. S. T.

Virus aetiology of one form of lymphocytic meningitis. G. M. FINDLAY, N. S. ALCOCK, and R. O. STERN (Lancet, 1936, 230, 650—654).—The properties of a virus isolated from the cerebrospinal fluid of adults suffering from obscure symptoms associated with an increase of lymphocytes and its effect on various animals are described. L. S. T.

Glycine treatment of progressive myopathic muscular atrophy and creatine balance. L. PERRIA (Boll. Soc. ital. Biol. sperim., 1935, 10, 751—752).—The action of glycine on creatine (I) balance is variable, and the (I) elimination curve shows no tendency to revert to normal. R. N. C.

Creatine-creatinine excretion and the creatine content of muscle in nutritional muscular dystrophy. T. G. NI (Chinese J. Physiol., 1936, 10, 199—206; cf. Goettsch and Brown, A., 1932, 1057).—In muscular dystrophy caused by a special diet, the muscle-creatine (I) fell to a low level. In young guinea-pigs which had been fed the diet for some time, the urinary (I) increased, whilst creatinine (II) decreased. The early clinical symptoms of paralysis occurred some time after a significant rise in (I) and fall in (II). J. N. A.

Phosphatase of biopsy tissue in progressive myositis ossificans. W. E. WILKINS, E. M. REGEN and G. K. CARPENTER (Amer. J. Dis. Children, 1935, 49, 1219—1221).—Fibrous tissue and muscle from the region of lesions in the preossification stage showed high phosphatase activity. Heterotrophic bone and cartilage from an older lesion showed activity > that of a normal rib. Vals for normal tissue were low. CH. ABS. (p)

Indole and skatole content of the blood in kidney disease. M. ZAPPACOSTA (Boll. Soc. ital. Biol. sperim., 1935, 10, 708—710).—Blood-indole and -skatole are not increased in acute glomerular nephritis or nephrosis, but are moderately increased in renal sclerosis and uraemia, the increase being independent of the degree of injury. R. N. C.

Effect of renal denervation on patients suffering from nephritis. I. H. PAGE and G. J. HEUER (J. Clin. Invest., 1935, 14, 443—458).—Renal denervation in acute nephritis diminished protein excretion in most cases. Urea clearance was unaffected. CH. ABS. (p)

Neuritis in pregnancy successfully treated with vitamin- $B_1$ . G. W. THEOBALD (Lancet, 1936, 230, 834—837). L. S. T.

**Polypeptidæmia in pellagra.** I. ORNSTEIN and E. VASCAUTANU (Compt. rend. Soc. Biol., 1936, 121, 1440—1442).—Polypeptides generally show an increase which is not  $\propto$  the fall of blood-cholesterol or to blood-urea. R. N. C.

**Diet of sunflower seeds for the study of experimental polyneuritis.** A. ALLEGRI (Boll. Soc. ital. Biol. sperim., 1935, 10, 839—943). R. N. C.

**Follicular hormone and pregnancy diagnosis in women and in the mare.** S. L. SALA (Rev. sudamer. endocrinol., 1935, 18, 325—329).—Filtered urine (5 c.c.) is heated with 1 c.c. of HCl at 100° for 5 min., and after cooling is extracted with  $C_6H_6$ . After removal of  $C_6H_6$  the residue of the extract is dissolved in  $H_2SO_4$  (0.8 c.c.) and heated at 70—80° for a few min. Fluorescence, greenish by transmitted light, constitutes a positive test, which is trustworthy for mare's but not for human pregnancy. CH. ABS. (*p*)

**Determinations of prolactin and oestrin in pregnancy with special reference to late toxæmia and eclampsia.** G. VAN S. SMITH and O. W. SMITH (Surg. Gynecol. Obstet., 1935, 61, 27—35; cf. this vol., 229).—A peak level of prolactin (I) occurs in the 2nd—4th months of pregnancy. Oestrin (II) increases as pregnancy advances to term. In late toxæmia excess of (I) has probably been present for some time. Nausea in early pregnancy is associated with low (II). Neither (I) nor (II) is concerned in miscarriage. CH. ABS. (*p*)

**Unsalted diet and pregnancy. Chlorine contents of erythrocytes and plasma and their relationship to alkali reserve.** G. LAMBERT (Zentr. Gynäkol., 1935, 59, 2598—2601).—In pregnant women on ordinary diet there appeared to be no correlation between Cl index (cell-Cl: plasma-Cl) and alkali reserve. When the diet was poor in NaCl there was a slight decrease in cell- and plasma-Cl, but no change in the index or the alkali reserve. NUTR. ABS. (*m*)

**Mineral content of the silicotic lungs of an earthenware worker.** N. SUNDIUS, A. BYGÉN, and T. BRUCE (Trans. Ceram. Soc., 1936, 35, 167—181).—A method of extraction with  $H_2O_2$  by which lung dust (I) may be isolated almost unchanged is described. In the (I) of the worker, which was fairly uniformly distributed in the lung, all the components of the raw materials were found, although some increase in the kaolinite and mica, and decrease in the flint-quartz and feldspar contents, had resulted from separation by the air and the respiratory organs. The average diameter of most of the particles of the (I) was  $< 2-4 \times 10^{-3}$  mm. Chemical and X-ray examination showed that the mineralogical composition of the (I) was essentially the same as that of factory dust of similar grain-size, and that the dust had undergone little or no decomp. in the lung. A. L. R.

**X-Ray appearances of the lungs of electric arc welders.** A. T. DOIG and A. I. G. McLAUGHLIN (Lancet, 1936, 230, 771—775).—Alterations in the tissues due to inhalation of the fumes produced are described. The probable composition of the fumes is discussed. L. S. T.

**Blood chemistry of about five hundred patients with common skin diseases.** H. GOODWIN (J. Lab. Clin. Med., 1935, 20, 1048—1052).—Blood-sugar and -NaCl were generally within normal range, but relatively high -NaCl was associated with relatively low -sugar and *vice versa*. Urea-N and uric acid were not appreciably changed. CH. ABS. (*p*)

**Technique of the Bordet-Wassermann reaction in serum freed from the fraction precipitable by hydrochloric acid.** O. AUGUSTE (Compt. rend. Soc. Biol., 1936, 121, 1449—1450). R. N. C.

**Clinical value of prolactin determinations in tetroma testis.** M. CUTLER and S. E. OWEN (Amer. J. Cancer, 1935, 24, 318—325).—Affected patients excrete increased amounts of prolactin. CH. ABS. (*p*)

**Thyroid diseases and blood-chloride.** J. DECOURT and C. O. GUILLAUMIN (Compt. rend. Soc. Biol., 1936, 121, 1332—1335).—Corpuscular and plasma-Cl, both absolutely and relatively, are slightly reduced in myxœdema and increased in Basedow's disease and experimental hyperthyroidism in the rabbit. R. N. C.

**Mandelic acid and ammonium mandelate in the treatment of urinary infections.** H. E. HOLLING and R. PLATT (Lancet, 1936, 230, 769—771).—Treatment with Na mandelate +  $NH_4Cl$  or  $NH_4$  mandelate rendered the urine sterile in 2—21 days. L. S. T.

**Cholesterol in xanthomatosis.** L. NEKÁM, jun., and B. OTTENSTEIN (Klin. Woch., 1935, 14, 641—643).—Cholesteryl esters and lecithin are increased, and free cholesterol (I) is decreased, in xanthomatosis. Addition of liver- or pancreas-pulp to a (I) emulsion does not cause (I) decomp. under sterile conditions. Xanthomatosis is not associated with a functional disturbance of (I) breakdown. R. N. C.

**Old age and basal metabolism.** F. G. BENEDICT (New England J. Med., 1935, 212, 1111—1122).—Total metabolism per unit surface area and heat production per unit wt. have been determined in women of varying ages. CH. ABS. (*p*)

**Growth and basal metabolism. IV. Changes in the basal metabolism of children during the year.** I. NAKAGAWA (Amer. J. Dis. Children, 1935, 49, 1232—1239).—The total heat production of children aged 3—11 years increases by approx. 30 g.-cal. per day, and is expressed more satisfactorily by changes in wt. than by those in height or surface area. CH. ABS. (*p*)

**Basal metabolism of male Chinese in Manchuria.** F. G. BENEDICT and H. S. D. GARVEN (Chinese J. Physiol., 1936, 10, 141—146).—With 20 men, the average respiration rate was 15 and the  $O_2$  consumption 208 c.c. per min. The average metabolism was 3.5% below the Harris-Benedict standard. J. N. A.

**Variations in the processes of ossification in relation to normal and experimentally-modified rates of growth.** G. SCOZ and P. L. MARANGONI (Boll. Soc. ital. Biol. sperim., 1935, 10, 678—680).—Phosphatase (I) in the bones of the rat falls in winter,

whilst blood-(I) is unchanged; the ossification processes are retarded but not modified. Thyroxine (II) in low concns. lowers body-wt., bone-(I) and -Ca, and increases blood-(I), in dogs and guinea-pigs, whilst in rats it retards the rate of growth and reduces blood-(I) and bone-Ca. Following the effects of (II), the rate of growth and bone-Ca and -P increase whilst blood-(I) falls, the vals. returning to normal after 27 days. Repeated doses of (II) in the rat cause a rise in bone-(I) and a fall in -Ca and -P.

R. N. C.

**Adrenal capsules and gaseous metabolism. I. II. Effect of pilocarpine on gaseous exchange in decapsulated rats.** G. MICHELE (Boll. Soc. ital. Biol. sperim., 1935, 10, 628—631, 631—633).—I. Gaseous exchange falls for the first few hr. after decapsulation, but rises again in animals surviving the following day; this does not support the hypothesis that the adrenal capsules control gaseous exchange by discharge of adrenaline.

II. Pilocarpine does not increase  $O_2$  consumption, and hastens death.

R. N. C.

**Oxidative metabolism in sea-urchins' eggs.** P. E. LINDAHL and L. O. ÖHMAN (Naturwiss., 1936, 24, 157—158).—The action of KCN on the respiration of the fertilised eggs at various stages indicates that part of the respiration is not inhibited and is therefore not related to the Fe-containing respiratory enzyme. An increase in the velocity of  $O_2$  transport in substrate activation is due to changes in the enzyme system. Other aspects (e.g., the rôle of "carriers") of respiration are discussed.

F. O. H.

**Formation of hydrogen cyanide and form-aldehyde by oxidation of organic substances.**—See this vol., 707.

**Reduction intensity of living cells.** A. J. KLUYVER and J. C. HOOGHEIDE (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 298—305; cf. A., 1934, 1138).—The reduction intensity of the living cell is only in a restricted sense a sp. property of the cell, and is determined at any moment by the nature of the metabolic processes in the cell. The oxidation-reduction potentials under well-defined metabolic conditions are characteristic for the reduction intensity of the cells if the medium contains a partly reduced redox system, capable of penetrating the cells. Vals. for  $r_H$  of 8.4—9.0 are characteristic for the reduction intensity of all cells under the conditions of alcoholic fermentation, whilst for lactic acid formation the vals. are 5.0—6.0.

J. N. A.

**Bile secretion and a diet rich in liver.** G. BALTACEANO and C. VASILIU (Compt. rend. Soc. Biol., 1936, 121, 1535—1537).—The diet increases bile secretion in the dog, but lowers cholesterol, acids, pigments, and inorg. substances, and  $\eta$  and  $n$  of the bile.

R. N. C.

**Pancreas diet and the biliary function of the liver.** G. BALTACEANO and C. VASILIU (Compt. rend. Soc. Biol., 1936, 121, 1537—1541).—During administration of pancreas diet to dogs, bile secretion is increased; elimination of bile salts (I), org. and inorg. substances is increased, pigment (II) elimination

is reduced, cholesterol (III) shows slight variations that tend to increase, and  $\eta$  and  $n$  of the bile are unaffected. After cessation of the diet, bile secretion and the constituents oscillate for a period, after which (I), (III), and the dry residue of the bile fall, whilst (II) and  $H_2O$  rise.

R. N. C.

**Nitrogenous metabolism in Manchuria. C. WANG** (Chinese J. Physiol., 1936, 10, 135—139).—Data are given for total, urea-,  $NH_3$ -, uric acid-, and creatinine-N in the urine of 32 men.

J. N. A.

**Nitrogen metabolism in infants.** M. V. MILLER-SHABANOVA (Acta paediat., 1935, 18, 192—210).—The blood of fasting children aged 1 month to 2 years contained 1—5.3 g. of total N per 100 ml., increasing with age. The vals. in well-nourished were > in dyspeptic infants. The val. rose to a max. 3—4 hr. after a meal, the height of the max. depending on the amount of protein in the diet. The max. with breast milk was 1.4—4.7 g. per 100 ml., with mixed feeding 2.1—7.7, and with cow's milk 2.04—8.54. The fasting val. for non-protein-N was 6—16 mg. per 100 ml. After feeding, vals. of 17—20 mg. were obtained, the relationship to the protein of ingested food being insignificant.

NUTR. ABS. (m)

**Rate of absorption of iodine and glycine from the gastro-intestinal tract in health and disease.** C. W. HEATH and H. W. FULLERTON (J. Clin. Invest., 1935, 14, 475—481).

CH. ABS. (p)

**Perfusion of the stomach. XII. Perfusion with ornithine and citrulline.** K. KITSUGAWA (J. Biochem. Japan, 1936, 23, 131—138).—Citrulline (A, 1933, 172), perfused through the dog's stomach, produces both arginine and ornithine, the latter (as when directly perfused) being decomposed into arginine,  $NH_3$ , and urea.

F. O. H.

**Renal excretion of creatinine in man.** J. A. SHANNON (J. Clin. Invest., 1935, 14, 403—410).—Increase in creatinine (I) in the plasma is associated with depression of (I) clearance, both abs. and relative to inulin clearance. Secretion of (I) by renal tubules is probable. Phloridzin brings the two clearances together by depressing tubular secretion of (I).

CH. ABS. (p)

**Transformations of adenosinetriphosphoric acid in muscle. III. Isolated muscle.** D. FERDMANN, O. FEINSCHMIDT, and M. DMITRENKO (Biochem. Z., 1936, 284, 392—400; cf. A., 1935, 778).—Activity of isolated frog's muscle results in decomp. of adenosinetriphosphoric acid and concomitant formation of  $P_2O_7^{4-}$  in amounts  $\propto$  the work done and the adenylic acid produced. Inosinetriphosphoric acid is not formed.

F. O. H.

**Presence of strychnine-barbituric complex in the urine of animals that have received separate injections of strychnine and barbituric acid.** V. DE LAVERGNE, P. KISSEL, WEILLER, and H. CHAHIDI (Compt. rend. Soc. Biol., 1936, 121, 1412—1413).—Both strychnine and barbiturate are found in alkaline  $Et_2O$  extracts of the (guinea-pig's) urine after hydrolysis with  $H_2SO_4$ .

**Production of dihydroxydihydroanthracene-glycuronic acid from anthracene.**—See this vol., 721.

Flavins and metabolism. III. Action of lactoflavin and methyl alcohol extract of liver on blood-glycolysis. A. J. CHARIT, S. A. NEUFACH, and K. N. MOROZOVA. IV. Seasonal changes in the flavin content of the liver in cattle. V. Effect of alloxan and thymonucleic acid in the diet on the flavin content of rats' liver. A. J. CHARIT and N. V. CHAUSTOV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 127—131, 177—180, 235—236).—III. Aërobic glycolysis in dog's blood is unaffected by addition of lactoflavin, which, however, greatly increases anaërobic disappearance of glucose without increasing lactic acid production. MeOH extract of ox liver does not affect anaërobic but intensifies aërobic glycolysis.

IV. Seasonal changes in the diet of cattle produce corresponding (sometimes very great) changes in the flavin (I) content of their livers (max. in summer, min. in spring). In men on meat diets liability to pellagra increases with decrease in (I) content of dietary liver.

V. Addition of 1 mg. daily of thymonucleic acid [possibly containing traces of (I)] to the diet of rats slightly increases the (I) content of their livers but that of alloxan does not affect the content.

W. MCC.

Carbohydrate metabolism of the liver. V. Sugar intake in the normal intact cat during glucose absorption. VI. Sugar output and intake in the daily digestive cycle. C. TSAI and C. YI (Chinese J. Physiol., 1936, 10, 87—102, 105—117; cf. A., 1934, 1251).—V. The glucose (I) content of the inflowing and outflowing hepatic blood in cats with permanent angiotomy cannulae was studied before and at various intervals during (I) absorption. During the first 3 hr. of absorption, inflow (I) was always > outflow (I). The (I) intake by the liver reached a max. between 1.5 and 2.5 hr. and ceased at 4 hr. after administration of (I). The liver- and muscle-glycogen increased in animals fed with (I), probably due to glycogen formation during absorption of (I). The liver of the decapitated cat showed an output > the inflow.

VI. With alimentary hyperglycæmia, intake of (I) was often > output. A high portal (I) level was necessary for intake to be > output, but there was no relation between arterial (I) levels and the relative amount of intake. Ingestion of a pure meat diet had no effect on the relative concns. of (I) between inflowing and outflowing blood. With cessation of absorption the hepatic outflowing (I) was always > the portal and arterial (I). The liver appeared to discharge (I) into the circulation at a relatively const. rate during the entire interval between meals.

J. N. A.

Carbohydrate metabolism. III. Relation of salt and water to the oxidation of glucose. J. A. JOHNSTON and J. W. MARONEY (Amer. J. Dis. Children, 1935, 49, 1240—1255; cf. A., 1935, 888).—Oxidation of glucose is accelerated by oral administration of acid salts ( $\text{NH}_4\text{Cl}$ ,  $\text{CaCl}_2$ ) and retarded by alkaline salts ( $\text{NaHCO}_3$ ). It is depressed by  $\text{NaCl}$  and  $\text{H}_2\text{O}$  while these are retained in the body, but increases subsequently. Following thyroxine administration glycogen stores are depleted, and acid

salts then inhibit oxidation completely, whereas alkaline salts have the reverse effect. CH. ABS. (p)

Activators of carbohydrate fission as water-soluble constituents of food. H. VON EULER and M. MALMBERG (Biochem. Z., 1936, 284, 455—460).—Addition of cryst. cozymase will not induce growth in rats fed on a vitamin- $\text{B}_4$ -free diet; that of a yeast-juice prep. (inactive alone) together with nicotinamide induces significant growth. Fractions from extracts of nerve and brain-tissue have a similar action. The rôle of cozymase and other factors of carbohydrate metabolism in nutrition is discussed.

F. O. H.

Nature of sugars in a theoretically complete and balanced diet; can they have any effect on the development and maintenance of the rat? L. RANDOIN and S. QUEUILLE (Compt. rend. Soc. Biol., 1936, 121, 1318—1323).—Growth and maintenance are normal with dextrin (I), sucrose, or maltose. Galactose and lactose exhibit toxic action. Glucose and fructose (II) produce normal growth, but maintenance is poor, particularly with (II), where loss of wt. occurs at maturity unless (I) is added.

R. N. C.

Excretion of inulin, xylose, and urea by normal and phloridzinised man. J. A. SHANNON and H. W. SMITH (J. Clin. Invest., 1935, 14, 393—401).—Inulin (I) clearance in man after intravenous infusion is independent of plasma concn. (I) is not secreted by human renal tubules. Xylose and sucrose are normally reabsorbed by the tubules from glomerular filtrate. Evidence against reabsorption of (I) should be obtained before (I) clearance is accepted as a measure of glomerular filtration. CH. ABS. (p)

Metabolism of fructose. VI. Influence of the level of ovarian function. A. W. ROWE, M. A. McMANUS and A. J. PLUMMER (J. Amer. Med. Assoc., 1935, 104, 451—455).—Ovarian function has little influence (cf. A., 1934, 1393). CH. ABS. (p)

Medical problems in mineral metabolism. I. Legacies of evolution. II. Sodium deficiencies in clinical medicine. III. Experimental human salt deficiency. R. A. McCANCE (Lancet, 1936, 230, 643—650, 704—710, 765—768, 823—830).—Lectures. L. S. T.

Absorption of mineral substances by the embryo of *Sepia officinalis*. S. RANZI (Atti R. Accad. Lincei, 1935, [vi], 22, 605—608).—The embryo can absorb the following elements from sea- $\text{H}_2\text{O}$ : Na, K, Ca, Mg, P, Cu, Fe, Mn, V, B, Li, Sr.

O. J. W.

General application of Loeb's ionic quotient. D. L. RUBINSTEIN, H. BURLAKOVA, and W. LYOVA (Biochem. Z., 1936, 284, 437—442).—With changes in the nutrient media of *Drosophila*, the Na : Ca ratio of the organism can be varied between 300 and 1.6; the movements of the flies appear to be unchanged (cf. A., 1934, 1035; 1935, 1017).

F. O. H.

Ionic equilibrium between the aqueous humour and blood plasma of cats. H. DAVSON, W. S. DUKE-ELDER, and G. H. BENHAM (Biochem. J., 1936, 30, 773—775; cf. Walker, A., 1933, 849).—Determinations of Na, K, and Cl indicate the existence

of a Donnan equilibrium between aq. humour and blood-plasma as far as these ions are concerned. The bearing of these results on the problem of glaucoma is discussed.  
J. N. A.

**Mechanism of the action of sodium chloride and bicarbonate in the maintenance of acid-base equilibrium.** A. SLATINEANU, I. BALTEANU, M. SIBI, M. FRANÇHE, and L. CANTACUZÈNE (Compt. rend. Soc. Biol., 1936, 121, 1423—1427).— $\text{NaHCO}_3$  rectifies acidosis in patients with increased corpuscle-plasma-Cl ratio, which is reduced to normal. Chloropenia with normal alkaline reserve is due to NaCl deficiency, whilst with reduced alkaline reserve it is due to Na deficiency and can be treated with  $\text{NaHCO}_3$ .  
R. N. C.

**Numerical analysis of Lars Spildo's investigations into the calcium metabolism of growing swine. Faecal calcium elimination and calcium absorption.** A. WESTERLUND (Lantbruksögsk. Ann., 1935, 2, 71—105).—The analysis (A., 1935, 1274) leads to the following conclusions. Ca:P ratio, vitamin-D intake, or acid-base balance had no effect on Ca excretion in faeces or Ca absorption. Both excretion and absorption of Ca were determined by Ca intake. With intakes of 2—5 g. per head per day there was no correlation between intake and faecal excretion. Absorption increased with intake up to a max. at about 8 g. total intake, or about 0.5 g. per kg. body-wt. At this level % absorption was 60.  
NUTR. ABS. (m)

**Bromine metabolism in man.** P. CHATAGNON and C. CHATAGNON (Compt. rend., 1936, 202, 1119—1120).—In manic-depressive insanity and similar diseases variations in blood-Br appear to depend on the intake of Br and on the Br:Cl ratio. There is no characteristic decrease in blood-Br and the Br content of the pituitary is not abnormally high (cf. Zondek *et al.*, A., 1933, 739).  
W. McC.

**Effects of low-phosphorus rations on growing pigs.** C. E. AUBEL, J. S. HUGHES, and H. F. LIENHARDT (J. Agric. Res., 1936, 52, 149—159).—Low-P rations induce lessened appetite, poor utilisation of food and storage of energy, inability to develop bone and muscle normally, decrease in blood-inorg. P, increased thirst, and corresponding urination.  
A. G. P.

**Comparative studies in the sulphur metabolism of the dog and pig.** J. A. STEKOL (J. Biol. Chem., 1936, 113, 675—682).—With dogs (but not pigs) on a protein-free diet, ingested isobarbituric acid readily yields ethereal sulphates in the urine, and the yield is increased by feeding in addition *l*-cystine, *dl*-methionine, cysteine, or  $\text{Na}_2\text{SO}_4$ . Like the dog, rabbit, and rat, the pig synthesises *p*-bromophenyl- and 1- $\alpha$ -naphthyl-mercapturic acids from PhBr and  $\text{C}_{10}\text{H}_8$ , respectively.  
J. N. A.

**Light and reproduction in game birds.** L. B. CLARK, S. L. LEONARD, and G. BUMP (Science, 1936, 83, 268).—Irradiation by a Mazda lamp stimulates growth in the reproductive organs of grouse, quail, and pheasants.  
L. S. T.

**Measures of radioactivity in zones of endemic goitre.** G. PIGHINI and O. RÜLKE (Boll. Soc. ital.

Biol. sperim., 1935, 10, 663—666).—Vals. of the ionising power of the air and  $\text{H}_2\text{O}$  of a no. of Italian districts are given.  
R. N. C.

**Radioactivity, iodine, and the thyroid.** G. PIGHINI (Boll. Soc. ital. Biol. sperim., 1935, 10, 661—663).—I protects the thyroid of the rat against changes due to consumption of  $\text{H}_2\text{O}$  containing Rn.  
R. N. C.

**Physico-chemical properties and local anaesthetic action.** (A) Surface tension, adsorption, and prevention of adsorption. (B) Flocculation of colloids and relative lipin-solubility. C. ROHMANN and B. SCHEURLE (Arch. Pharm., 1936, 274, 225—235, 236—244).—(A) The anaesthetic efficiency of 12 compounds,  $p\text{-OR}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2[\text{CH}_2]_r\cdot\text{NEt}_2$  ( $\text{R}=\text{H}$  or alkyl), is approx. parallel to the lowering of  $\gamma$  of their 0.05M solutions at  $p_{\text{H}}$  5.9 (less so at that  $p_{\text{H}}$  which just prevents pptn. of free base) and to their efficiencies in preventing adsorption of glucose by C ("Verdrängungsadsorption"), but not to the amounts adsorbed on C. The parallelisms do not hold if  $\text{R}=\text{NEt}_2\cdot[\text{CH}_2]_2$  nor for four other local anaesthetics.

(B) Better parallelism than that described in (A) exists between efficiency, ability to ppt. colloidal albumose, and lipin-solubility (measured by partition between  $\text{H}_2\text{O}$  and  $\text{Et}_2\text{O}$  at  $p_{\text{H}}$  7.3). Exceptions exist amongst substances of different classes.  
R. S. C.

**Limits of action of hydrogen-ion concentration on vasal tonus: lung preparation of the dog.** G. RUSSO (Boll. Soc. ital. Biol. sperim., 1935, 10, 801—803).—The vessels dilate if  $p_{\text{H}}$  is lowered 0.2 unit from 7.2, and contract if  $p_{\text{H}}$  is raised by this val.  
R. N. C.

**Action of positive chemical stimuli on cultures in vitro.** I. Benzene. F. GUERCIO and R. ARNONE (Boll. Soc. ital. Biol. sperim., 1935, 10, 621—622).  
R. N. C.

**Embryonic "induction" by chemical substances.** M. W. WOERDEMAN (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 306—314).  
J. N. A.

**Cytological modifications of the hepatic cell through variation of the oxygen and carbon dioxide contents of the respired air.** M. MILLETTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 755—757).  
R. N. C.

**Effect of compressed air on animals.** XVII. Combustion of ethyl alcohol injected into rats. XVIII. Combustion of ethyl alcohol injected in increasing doses. A. AGGAZZOTTI. XV. Oxygen and carbon dioxide in the expired air of the rabbit subjected to the action of compressed air. G. BUCCIARDI, M. LEONARDI, and E. FERRARINI (Boll. Soc. ital. Biol. sperim., 1935, 10, 782—784, 784—786, 787—788).—XVII. EtOH oxidation is depressed by exposure to compressed air.

XVIII. EtOH oxidation increases progressively with the quantity injected until a limit is reached at which it tends to remain const.; it is always < that at atm. pressure.

XV.  $\text{CO}_2$  production and  $\text{O}_2$  consumption both increase with the pressure, the R.Q. remaining const.  
R. N. C.

**Action of calcium ions on the hypertension and hyperglycæmia due to potassium ions.** R. HAZARD (Compt. rend. Soc. Biol., 1936, 121, 1036—1039).—Ca<sup>++</sup> does not antagonise the action of K<sup>+</sup> in increasing the secretion of adrenaline (I), but reduces the hyperglycæmic action of (I). R. N. C.

**Influence on carbohydrate metabolism of experimentally induced hepatic changes.** IV. **Blocking of the reticulo-endothelial system with special reference to the Kupffer cell.** T. L. ALTHAUSEN, B. E. BLUMQUIST, and E. F. WHEDON (Amer. J. Digest. Dis. Nutrit., 1935, 2, 532—540).—Blocking of the reticulo-endothelial cells in rabbits by intravenous injection of C lowered the blood-sugar level, increased the tolerance to ingestion of glucose, decreased mobilisation of glycogen (I) from the liver when adrenaline was injected, and reduced the (I) content of liver and muscle. NUTR. ABS. (m)

**Convulsive action of glycerol.** A. LEVI (Boll. Soc. ital. Biol. sperim., 1935, 10, 780—781). R. N. C.

**Physiological properties of trichloroethylene.** H. TAYLOR (J. Ind. Hyg., 1936, 18, 175—193).—Continued inhalation of 0.05—0.2% C<sub>2</sub>HCl<sub>3</sub> by rats and dogs over a period of 6 months caused no pathological condition. H. D.

**Mechanism of the action of citrate ion on the heart and smooth muscle of amphibia.** G. RUSSO (Boll. Soc. ital. Biol. sperim., 1935, 10, 798—801).—The action is partly a sp. stimulation of the sympathetic nervous system, and partly a non-sp. fixation of Ca<sup>++</sup> ions. R. N. C.

**Behaviour of ascorbic acid and glutathione in the organs of guinea-pigs treated with various bacterial poisons.** I. Diphtheria toxin. II. Tetanus toxin. III. Koch's tuberculin. P. Nuzzi (Boll. Soc. ital. Biol. sperim., 1935, 10, 710—714, 714—715, 715—717).—I. Ascorbic acid (I) and glutathione (II) exhibit negligible changes in all the organs.

II. (I) shows no appreciable variation, but (II) is reduced to different extents.

III. (I) falls in the lungs and adrenals. (II) falls very slightly in the same organs and increases in the spleen. R. N. C.

**Action of 2:4-dinitrophenol on the isolated heart of the guinea-pig.** M. ALOISI (Boll. Soc. ital. Biol. sperim., 1935, 10, 746—748). R. N. C.

**Modifications of the physiological action of 3:4-dihydroxyphenyl-β-aminobutanol by substitution of methylamino- for the amino-group.** RAYMOND-HAMET (Compt. rend., 1936, 202, 690—692).—Replacement of the primary by a sec.-NH<sub>2</sub> increased the hypertensive action of the substance. This effect becomes less marked in lower homologues. A. G. P.

**Pathogenesis of tolylenediamine icterus.** T. OKA (Klin. Woch., 1935, 14, 861; Chem. Zentr., 1935, ii, 1211).—Effects following injection into dogs are described. H. N. R.

**Diabetogenic activity of substances related to phloridzin.** A. LAMBRECHTS (Compt. rend. Soc. Biol., 1936, 121, 1364—1366).—Dibromophloridzin

and arbutin, but not the azo-dyes azophloridzin, azophloretin, and azophloroglucinol, cause glycosuria when injected into the dog. R. N. C.

**Influence of certain lipins on the growth of a rabbit neoplasm.** A. R. HARNES (J. Lab. Clin. Med., 1935, 20, 1077—1079).—Subcutaneous injection of maize oil or EtOH-extract of ox brain retards the growth. CH. ABS. (p)

**Action of amino-acids on the contractions and the production of lactic acid by the isolated heart.** R. CRISMER (Compt. rend. Soc. Biol., 1936, 121, 1345—1347).—Lactic acid (I) production is increased by perfusion with neutral solutions containing glycine or phenylalanine; with a solution at  $p_H$  8.5 the increase balances the fall produced by the alkaline medium. The amplitude of contraction  $\propto$  (I) production. R. N. C.

**Action of acetylcholine on the formation of lactic acid and decomposition of phosphagen in the isolated muscle of the frog.** D. NACHMAN-SOHN and A. MARNAY (Compt. rend. Soc. Biol., 1936, 121, 1311—1314).—The processes are accelerated. The effect of acetylcholine on metabolism persists after the contraction it produces has disappeared, and it is not destroyed by contact for several hr. with the muscle in anaërobiosis. R. N. C.

**Sympathetic regulation of normal blood-sugar and metabolism of tissue-chlorides.** W. LIP-SCHITZ (Compt. rend. Soc. Biol., 1936, 121, 1295—1298).—The increase of blood-sugar and -Cl provoked by adrenaline (I) in rabbits is abolished by ergotamine (II), which causes a fall. Cl is also increased by ligation of an artery, this increase also being abolished by (II). Injection of CaCl<sub>2</sub> increases blood-Cl; the increase disappears with that of Ca, but while it persists tissue-NaCl migrates to the blood, probably through sympathetic excitation by Ca in a manner analogous to that of (I) and arterial ligation. R. N. C.

**Action of injectable liver extracts.** H. E. BÜTTNER (Fortschr. Ther., 1935, 11, 257—264; Chem. Zentr., 1935, ii, 1208). H. N. R.

**Effect of tissue extracts on esterification of cholesterol in serum.** W. M. SPERRY (J. Biol. Chem., 1936, 113, 599—606; cf. A., 1935, 1536).—When saline extracts of various tissues from different species of animals were incubated with ox, sheep, and human serum, esterification of the free cholesterol occurred, just as when the serum was incubated alone, but in most cases the extracts appeared to inhibit the reaction slightly. The results are not in agreement with those of Shope (A., 1929, 88) and a probable explanation is discussed. Thymol inhibits the esterification in ox serum. J. N. A.

**Reflex and direct respiratory action of some sympathomimetic substances.** E. BECCARI and A. BORIANI (Boll. Soc. ital. Biol. sperim., 1935, 10, 774—777). R. N. C.

**Pantocaine L.** A. A. NABI (Lancet, 1936, 230, 779—780).—*p*-Butylaminobenzoyldimethylaminoethanol hydrochloride is a satisfactory spinal anæsthetic which produces no marked retention of urine or fall in blood pressure. L. S. T.

**Percaïne.** I. Action on the isolated frog's heart. II. Action on the isolated rabbit's heart. Comparison with the action of cocaine: antagonism with adrenaline. R. SANTI and B. ZWEIFEL (Boll. Soc. ital. Biol. sperim., 1935, 10, 648—652, 652—566). R. N. C.

**Anæsthetic action of dialkylbarbituric acids.**—See this vol., 736.

**Action of emetine on the activity of the adrenal and thyroid glands.** R. N. CHOPRA, J. C. GUPTA, and A. C. ROY (Indian J. Med. Res., 1935, 22, 771—776).—Parallel decreases in thyroid-I and adrenal adrenaline in the rabbit are recorded. R. N. C.

**Amphotropic action of ergotamine (ginergen) on the isolated toad's heart.** G. RUSSO (Boll. Soc. ital. Biol. sperim., 1935, 10, 803—805). R. N. C.

**Neutralising action *in vitro* of some chemical substances on the toxicity of curare.** H. VINCENT and F. MOREL (Compt. rend., 1936, 202, 803—805).—Very small amounts of the Na salts of oleic, linoleic, ricinoleic, salicylic, di-iodosalicylic,  $\alpha$ - and  $\beta$ -hydroxynaphthoic, and methylenebis- $\beta$ -hydroxynaphthoic acids when added to solutions of curare entirely neutralised the toxicity of the latter as determined by injection in a guinea-pig. J. N. A.

**Invasion of the body by animal poisons.** F. DURAN-REYNALS (Science, 1936, 83, 286—287). I. S. T.

**Toxicity and potential dangers of crude "Duprene."** W. F. VON OETTINGEN and W. DEICHMANN-GRUEBLER (J. Ind. Hyg., 1936, 18, 271—272).—The vapour from heated Duprene has no permanent toxic effect. H. D.

**$\beta$ -Chlorobutadiene (Chloroprene): its toxicity and pathology and the mechanism of its action.** W. F. VON OETTINGEN, W. C. HUEPER, W. DEICHMANN-GRUEBLER, and F. H. WILEY (J. Ind. Hyg., 1936, 18, 240—270).— $\beta$ -Chlorobutadiene is toxic, however administered. H. D.

**Selective adsorption of enzymes by cellulose.** H. TAUBER (J. Biol. Chem., 1936, 113, 753—757).—Cotton adsorbs pepsin (I) and catalase (rabbit's liver) strongly and peroxidase (horseradish) weakly; (I) is eluted by 0.9% aq. NaCl. H. D.

**Formation of respiration enzymes during germination of barley.** H. FINK, H. HAEHN, and E. ZENGER (Woch. Brau., 1936, 53, 65—69, 73—77, 83—87, 93—95, 101—103).—The mechanism of respiration is discussed. In a study of the anaerobic phase, the decolorisation of methylene-blue (I) by barley meal (source of dehydrase) is followed (modified Thunberg-Ahlgren technique) in presence of hexose diphosphate (II) ( $H_2$  donator), hot aq. extract of yeast (source of co-enzyme), and  $PO_4^{3-}$  buffer ( $p_H$  9.0). The dehydrase activity of resting barley is small, but increases markedly during malting (pale); with dark malt, a max. is attained after approx. one half the germination period. The enzyme resists heat-treatment and is not destroyed on kilning, but it is very sensitive to antiseptics and is destroyed by hot EtOH. For given amounts of (I) and (II) there is an optimal concn. of meal; increase in amount

of yeast extract causes an acceleration of dehydrogenation up to a definite max. val. A certain min. concn. of (II) is necessary; increases above this cause increased dehydrogenation, but there is no direct proportionality. The time of decolorisation  $\propto$  the concn. of (I) so long as this remains relatively small. Dehydrogenation is optimal at a faintly alkaline  $p_H$ ; with increasing acidity it is inhibited, but the acceleration of decolorisation in strongly alkaline media is due to chemical, and not to enzymic, action. Of numerous substances investigated as donator, (II) gave the greatest acceleration; other hexose phosphates have a smaller effect. Dehydrogenase may be extracted from malt readily by aq.  $K_2HPO_4$ , but with difficulty by  $H_2O$ . Malt contains some substance capable of acting as  $H_2$  donator, but no co-enzyme. The malt embryo contains the bulk of the dehydrogenase; the endosperm contains relatively little, whilst the rootlets and husk are almost inactive. It has not been possible to identify the products of decomp. of (II) produced by dehydrogenase activity. I. A. P.

**Peroxidase.** M. TAMAI (J. Biochem. Japan, 1936, 23, 1—17).—Purified peroxidase is free from ionic Fe. Addition of  $Cu^{++}$  (but not of  $Fe^{+++}$  or  $Mn^{++}$ ) activates, whilst that of KCN inhibits to an extent dependent on the purity of the prep. The activity of potato-peroxidase is greatly accelerated by storage of the potato tissue in  $H_2O$  and  $O_2$ . The nature of accompanying impurities, which partly inhibit the enzyme but also protect it from the action of KCN, is discussed. F. O. H.

**Cadmium and oxidation enzymes.** A. ZLATAROV (Biochem. Z., 1936, 284, 448—454).—Cd salts have a pronounced peroxidase- and catalase-like action on  $H_2O_2$ . Low concns. of  $CdCl_2$  or  $Cd(OAc)_2$  inhibit and high concns. enhance the activity of blood- and liver-catalase whilst all concns. of  $Cd(NO_3)_2$  inhibit the former; other Cd salts have a similar action. F. O. H.

**Spectroscopy of purified enzymes. II. Amylase and peroxidase.** R. ITOH (J. Biochem. Japan, 1936, 23, 125—130).—Spectroscopic and chemical examination of pancreatic amylase at various stages of purification confirms that it is not protein but carbohydrate in nature. Peroxidase appears to be a compound of protein and porphyrin-Fe complex, the activity being due to the latter (cf. A., 1935, 1535). F. O. H.

**Sisto- and eleuto-amylase.** R. DEPLANQUE (Woch. Brau., 1936, 53, 137—141).—A lecture.

**Action of  $\alpha$ -glucosidase on  $\alpha$ -methylglucoside and certain di- and tri-saccharides.** K. MYRBÄCK and S. MYRBÄCK (Svensk Kem. Tidskr., 1936, 48, 64—68).—Differences of action of maltases and invertases from different sources on  $\alpha$ -glucosidically-linked sugars show that Weidenhagen's theory of carbohydrase specificity is not generally valid. M. H. M. A.

**Liver-asparaginase.** Y. SUZUKI (J. Biochem. Japan, 1936, 23, 57—69).—Enzyme preps. from calf's and rabbit's liver hydrolyse (determined by  $NH_3$  liberation) asparagine, glycyl- and anhydroglycyl-

asparagine, pyrrolidonecarboxylamide (cf. Ishiyama, A., 1933, 723), and glucosamine. The data indicate two types of asparaginase with  $p_H$  optima of approx. 8.1. F. O. H.

**Cell membrane as a hindrance to the digestion of plant foods.** E. MANGOLD and H. JÄNSCH (Sitzungsber. Ges. naturf. Fr. Berl., 1935, Feb., 40—44).—Heupke's claim that enzymes can penetrate cells and digest their contents is questioned.

NUTR. ABS. (m)

**New type of enzyme in the intestinal tract.** M. BERGMANN and J. S. FRUTON (Science, 1936, 83, 306).—The action of erepsin on substances like glycyl-L-proline is due to a special enzyme which, unlike dipeptidase and aminopeptidase, is not appreciably inhibited by  $CN'$ . As  $>$  one quarter of the peptide linkings in proteins such as collagen and gelatin require the action of the new enzyme, its presence in the intestinal mucosa is significant.

L. S. T.

**Enzymic histochemistry. XVI. Digestion of keratin by larvæ of the clothes moth (*Tineola biselliella*, Humm.).** K. LINDERSTRÖM-LANG and F. DUSPIVA (Compt. rend. Trav. Lab. Carlsberg, 1936, 21, No. 4, 53—83).—Both the intestinal fluid and a glycerol extract of the intestines of *Tineola* have high proteolytic activity; with casein as substrate the optimum  $p_H$  is 9.3. This proteinase has no action on keratin (I) at this  $p_H$ , nor at the  $p_H$  of the intestinal fluid (9.6—10.2). Dissolution of wool, with cleavage of peptide linkings, takes place if a reducing agent (thioglycollic acid) is present to reduce the autoxidised cystine (II). There exists, in the middle intestine, a reducing system, possibly enzymic, able to reduce (II) to cysteine. (I) can thus be digested by the simultaneous action of this reducing system and the proteinase.

E. A. H. R.

**Proteolytic action of pancreatic juice, and of trypsin followed by erepsin.** C. LAURESCO (Arch. internat. Physiol., 1935, 42, 169—182).—Successive action of pancreatic juice and erepsin (I) produced a degradation of protein only slightly  $<$  that produced by pepsin, trypsin, and (I). This explains why N absorption remains very near to normal even in the absence of the stomach. The resistance offered by gelatin and gliadin may be due to the fact that peptides containing proline or glutamic acid tend to resist splitting by pancreatic juice.

NUTR. ABS. (m)

**Liberation of ammonia during enzymic proteolysis.** E. F. TERROINE and C. LAURESCO (Arch. internat. Physiol., 1935, 42, 205—222).—Proteolysis by pancreatic juice, activated by enterokinase or Ca, is always accompanied by production of  $NH_3$ . This is least in the first 24 hr. and cannot be explained by processes other than bacterial, although it appears to be modified somewhat by the nature of the proteolytic enzyme used.

NUTR. ABS. (m)

**Hydrolysis of crystalline pepsin by trypsin.** P. S. YANG (Chinese J. Physiol., 1936, 10, 1—5).—Trypsin hydrolysed pepsin (I) at  $p_H$  5.6 and 37—39°. The decrease of activity of (I) is accompanied by an increase of  $NH_2-N$ .

J. N. A.

**Proteases and ontogenesis. I. Cathepsin in the chick embryo.** E. MYSTKOWSKI (Biochem. J., 1936, 30, 765—769).—With gelatin, ovalbumin, and lecithovitellin (I) as substrates, the activity of cathepsin in connexion with the embryonic synthesis of protein is very small, with or without cysteine as activator. The optimum  $p_H$  is 4.7, whilst with (I) as substrate it is 5.8. The activity is not significantly changed during the whole developmental period of the embryo. The yolk-sac is 15—20 times more active than the embryo. No positive results on synthesis *in vitro* were obtained. J. N. A.

**Phosphatase of the prostate gland. II.** W. KUTSCHER and A. WÖRNER (Z. physiol. Chem., 1936, 239, 109—126; cf. this vol., 111).—The phosphatase is stable at  $p_H$  3.7—6.0, the inactivation at other reactions being independent of the concn. of substrate. Hydrolysis of  $\beta$ -glycerophosphate (I) is optimal at  $p_H$  5.2—6.2 and of phenylphosphoric acid at 4.0—5.4, the optimal concn. of (I) being about 0.153M. When the amount of P liberated is about 9%; the extent of hydrolysis  $\propto$  enzyme concn. The rate of reaction decreases with time. The enzyme is not activated by  $Mg^{++}$  and is inactivated by NaF (0.002—0.01M), org. solvents, and Et urethane but not by cysteine. Purification by electro-dialysis affords a product (N 7%) liberating 75% of its wt. of  $H_3PO_4$  per sec. W. McC.

**Variations in phosphatase activity of bone, kidney, and blood in experimental rickets.** G. SCOZ (Boll. Soc. ital. Biol. speriment., 1935, 10, 823—826).—The bone-Ca and rate of growth of the bones in rachitic rats are  $<$  those in normal animals; during curative treatment the rate of growth begins to increase before Ca. Phosphatase (I) in the blood of rachitic animals is increased, whilst kidney- and bone-(I) are increased in winter but diminished in summer. During curative treatment blood-(I) falls whilst kidney- and bone-(I) rise; when the cure is almost complete, bone-(I) is still slightly high whilst blood-(I) is low, as occurs when the ossification process is increased by thyroxine.

R. N. C.

**Influence of certain dyes on fermentation and respiration of yeast extract.** L. MICHAELIS and C. V. SMYTHE (J. Biol. Chem., 1936, 113, 717—734).—The effect of a no. of reversibly oxidisable and reducible dyes on the alcoholic fermentation by yeast extract is studied. The dyes fall into 3 groups, viz., (a) those that increase the  $O_2$  consumption but do not inhibit fermentation, (b) those that inhibit aerobic fermentation [the inhibition being suppressed by addition of hexose diphosphate (I)] and are sp. poisons for the enzymes responsible for the synthesis of (I), and (c) those that produce an irreversible inhibition of aerobic fermentation due to enzyme (e.g., carboxylase) destruction. No correlation between inhibition and oxidation-reduction potential was obtained. H. D.

**Trehalose in pressed yeast.** K. MYRBACK (Svensk Kem. Tidskr., 1936, 48, 55—61).—Pressed yeast contains as fermentable carbohydrate 13.3% of glycogen, the remainder being trehalose (I), which is absent from ordinary live yeast and brewer's

bottom yeast. It is isolated by extraction of the yeast with aq. EtOH, pptn. of protein, and evaporation (90% yield). The (I) content of pressed yeast falls slowly at 5°, rapidly in air at room temp., but may be preserved by vac. drying. (I) is fermented directly without preliminary conversion into glucose.

M. H. M. A.

**Application of micro-Kjeldahl-Pregl method to determination of total nitrogen in yeast.** M. SOBOTKA (Mikrochem., 1936, 19, 81—88).—N is completely converted into  $\text{NH}_3$  by a short heating with  $\text{H}_2\text{SO}_4$ , the oxidation being completed with 30%  $\text{H}_2\text{O}_2$ .  $\text{Hg}(\text{OAc})_2$  is the most suitable catalyst.

J. S. A.

**Occurrence of growth-promoting factor B in animal organs.** V. HARTELUS and S. HJORTH-HANSEN (Compt. rend. Trav. Lab. Carlsberg, 1936, 21, No. 11, 221—229).—Calf liver contains large amounts of the growth-promoting factor B (I) which acts on *Aspergillus niger* and yeast. The (I) content of calf liver is about 5 times that of cod liver, veal, or salted herring; that of cod meat is still lower. Calf- and cod-bile have a weak effect on the growth of yeast and none on that of *A. niger*. The high (I) content of calf liver may be due to the glycogen it contains.

E. A. H. R.

**Effect of acetate on the consumption of succinic acid by moulds.** V. S. BUTKEVITSCH and L. K. OSNICKAJA (Compt. rend. Acad. Sci., U.R.S.S., 1935, 4, 345—348).—The consumption of Na succinate (I) by *Aspergillus niger* is greatly restricted by addition of NaOAc, which is itself consumed. Added sugar does not affect the process. Citric acid is produced only if sugar is added.  $\text{H}_2\text{C}_2\text{O}_4$  is produced in amounts equiv. to the base liberated by consumption of (I) and NaOAc. The source of succinic acid which sometimes accumulates in moulds may be substances other than sugar and AcOH.

W. McC.

**Palitantin, a metabolic product of *Penicillium palitans*.**—See this vol., 729.

**Staining technique for protozoa.** D. L. SARGENT (Stain Tech., 1936, 11, 49—52).—A modification of Donaldson's I-eosin stain for intestinal protozoa contains colloidal I and aniline-red in dil. solution.

W. O. K.

**Chemistry and physiology of the sulphur bacteria.** H. J. BUNKER (Dept. Sci. Ind. Res., Chem. Res., Spec. Rept. No. 3, 1936, 48 pp.).—A review.

**Production of free sulphur from L-cystine by a soil bacterium.** H. H. BARBER and R. B. BURROWS (Biochem. J., 1936, 30, 599—603).—*Achromobacter cystinovorum*, a new Gram-negative bacillus isolated from soil, decomposes cystine in a medium containing no other source of C, N, or S with formation of  $\text{NH}_3$ , free S, and  $\text{CO}_2$  in equiv. proportions.

W. O. K.

**Bacterial reduction of sulphates.** J. W. YOUNG (Canad. J. Res., 1936, 14, B, 49—54).—Anaerobic sulphate-reducing strains of Gram-negative vibrios are isolated from deep well  $\text{H}_2\text{O}$ , from soil,

and from sewage. They grow best at  $p_{\text{H}}$  5—9 and utilise lactates but not formates as a source of C.

J. L. D.

**Microchemistry of sulphur bacteria.** A. MONTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 690—691).—The endocellular S droplets in colonies of S bacteria are converted into  $\text{Ag}_2\text{S}$  by  $\text{AgNO}_3$ .  $\text{Pb}(\text{OAc})_2$  removes the droplets in neutral solution, but in conc. KOH the S is partly converted into PbS.  $\text{HgCl}_2$  and  $\text{H}_2\text{PtCl}_6$  have relatively little action, whilst  $\text{OsO}_4$  fixes the protoplasm and droplets but does not penetrate the colony.

R. N. C.

**Activity of non-pathogenic bacteria in the thermal waters of Aix-les-Bains and Aix-Burtscheid.**—See this vol., 698.

**Biochemical activities of the acetic acid bacteria.** K. R. BUTLIN (Dept. Sci. Ind. Res., Chem. Res., Spec. Rept. No. 2, 47 pp.).—A survey.

**Fermentation of mannitol provoked by *B. coli* and *B. lactis aerogenes*.** V. CIANCHI (Boll. Soc. ital. Biol. sperim., 1935, 10, 730—732).—R. N. C.

**Action of photo-catalysts on the fermentation of lactose determined by *B. coli*.** G. GUERRINI (Boll. Soc. ital. Biol. sperim., 1935, 10, 847—849).—The action of photo-catalysts is stimulant or inhibitory according to the quantity and quality of the catalyst.

R. N. C.

**Catalase activity of lactic acid bacteria.** D. TALCE-NIEDIA (Le Lait, 1936, 16, 225—232).—Certain strains of *Streptococcus lactis* produce catalase (I), but on culturing they show a low (I) activity (index by the volumetric method of 0.5—1.0). This activity, however, cannot be used as a basis for assessing the qualities of cultures of lactic acid bacteria.

W. L. D.

**Biochemistry of micro-organisms. VII. *Bacterium linens*.** W. GRIMMER and J. SCHMID (Milch. Forsch., 1936, 17, 286—302).—*B. linens* liberates leucine, isoleucine, and tyrosine from casein and deaminates other  $\text{NH}_2$ -acids. No indole or skatole is formed. The organism is closely related to *B. mesentericus*.

W. L. D.

**Effect of sulphur compounds on fermentation by propionic bacteria.** P. CHAIX and C. FROMAGEOT (Compt. rend., 1936, 202, 983—984).—0.1 mg. of cystine per 5 c.c. is sufficient to stimulate the max. activity of the bacteria. Methionine, glutathione (oxidised or reduced), thiolactic and thioglycolic acid have a similar action.

P. G. M.

**Fixation of nitrogen in leguminous root nodules.** A. I. VIRTANEN and T. LAINE (Suomen Kem., 1936, 9, B, 12; cf. A., 1935, 1551).—Nitrites detected in aq. extracts of sand cultures of peas arise from oximes originally present in the cultures. Aspartic acid, formed from  $\text{CO}_2\text{H}\cdot\text{CH}_2\cdot\text{C}(\text{N}\cdot\text{OH})\cdot\text{CO}_2\text{H}$ , may be the primary product of N fixation.

R. S.

**DL-Tolylalanine and its bacterial decomposition.**—See this vol., 721.

**Biological oxidations. VI. Oxidation of pyruvic acid by gonococci.** E. S. G. BARRON (J. Biol. Chem., 1936, 113, 695—715; cf. A., 1935, 121).—The oxidation of  $\text{AcCO}_2\text{H}$  by the ketonoxidase from

gonococci has a temp. coeff. of 2.87 and is inhibited by  $\text{Na}_4\text{P}_2\text{O}_7$ , KCN, NaF, and a no. of org. compounds, but not by  $\text{H}_2\text{S}$  and CO. The existence of an activating enzyme for  $\text{AcCO}_2\text{H}$  oxidation is demonstrated.

H. D.

**Antigenic structure of *Vibrio cholerae*.** VIII. Specific carbohydrate content and serology of the acid-soluble fractions. R. W. LINTON, B. N. MITRA, and S. C. SEAL. IX. Dissociation and changes in chemical structure. R. W. LINTON, D. L. SRIVASTAVA, and B. N. MITRA (Indian J. Med. Res., 1935, 22, 617—632, 633—657).—VIII. Reducing substances (I) are high in the A and B acid-sol. fractions of *V. cholerae* but low in the residue. The two fractions probably represent the outer part of the organism. A contains most of the serological activity. The distribution of (I) between A and B shows a parallelism with the smoothness of the organisms, (I) in A being > in B in smooth organisms. The same parallelism is not shown with agglutinability. (I) are probably derived from the sp. polysaccharide (II) by hydrolysis.

IX. Dissociation in the vibrios is caused by change of (II) content, the appearance of new types of protein and carbohydrates in the organism, or by the presence of two types of (II) in unstable equilibrium in the strain. A third type of (II), containing glucose without aldobionic acid, is present in dissociants of the "medusa-head" type; dissociation to this stage is accompanied by transformation of (II) into a different type without loss. The El Tor vibrios form a chemically distinct group, which is related to the cholera vibrios through (II) and to the  $\text{H}_2\text{O}$  vibrios through (I).

R. N. C.

**Vibrio filtrates.** R. W. LINTON, H. SINGH, and S. C. SEAL (Indian J. Med. Res., 1935, 22, 659—674).—The factors producing the Schwartzmann phenomenon in filtrates from 20-hr. cultures of the four vibrios concerned are not sp., and are conc. by pptn. with EtOH or saturation with  $(\text{NH}_4)_2\text{SO}_4$ . Inorg. substances are removed from broth filtrates by fractional pptn. with EtOH, the active material appearing in the second fraction, but the differentiation does not occur with peptone- $\text{H}_2\text{O}$  filtrates.

R. N. C.

**Action of the sulphonamide radical on experimental streptococcal infection in the mouse.** P. GOISSEDET, R. DESPOIS, P. GAILLOT, and R. MAYER (Compt. rend. Soc. Biol., 1936, 121, 1082—1084).—Aromatic sulphonamides exhibit antistreptococcal activity.

R. N. C.

**Immunological specificity of staphylococci.** I. Occurrence of serological types. L. A. JULIANELLE and C. W. WIEGHARD. II. Chemical nature of the soluble specific substances. C. W. WIEGHARD and L. A. JULIANELLE. III. Interrelationships of cell constituents. L. A. JULIANELLE and C. W. WIEGHARD (J. Exp. Med., 1935, 62, 11—21).—I. At least two types of sol. sp. substances are derived from staphylococci.

II. Characteristics of two carbohydrates are given. Type A is unidentified. Type B yields glucose on hydrolysis. Immunological specificity of both types is lost on hydrolysis.

III. The two carbohydrates are type-sp. The protein of staphylococcus is species-sp.

CH. ABS. (p)

**Bactericidal action of some euflavine preparations on *Staphylococcus aureus* and *Bacillus pyocyaneus*.** K. A. KJÆR (Dansk Tidsskr. Farm., 1936, 10, 102—104).—Potency of the preps. is only slightly affected by variations in diaminoacridine hydrochloride content of 0.6—85.6%.

M. H. M. A.

**Lipins of tubercle bacilli.** XLIII. Composition of leprosin. R. J. ANDERSON, J. A. CROWDER, M. S. NEWMAN, and F. H. STODOLA (J. Biol. Chem., 1936, 113, 637—647).—The neutral wax-like substance [now termed leprosin (I)] previously isolated (A., 1932, 307) from *B. lepra* is purified by repeated pptn. from  $\text{Et}_2\text{O}$  with  $\text{COMe}_2$ ; it has m.p. 50—51°,  $[\alpha]_D + 4^\circ$  in  $\text{CHCl}_3$ , 1 val. (Hanus) 5, and is sterol-free. Hydrolysis ( $\text{EtOH-KOH}$ ) gives glycerol, *d*- $\beta$ -eicosanol (cf. this vol., 311), (probably) *d*- $\beta$ -octadecanol, myristic, palmitic, stearic, tetracosanoic, and a OH-acid (leprosinic acid) [20% of (I)], m.p. 62—63°,  $[\alpha]_D + 4^\circ$  in  $\text{CHCl}_3$  (Me ester, m.p. 51—52°; Ac, m.p. 42—43°, and Br-, m.p. 54—55°, derivatives).

H. B.

**"Acid wax" of human tubercle bacilli.** F. ULZER and H. GRUBER (Wiss. Mitt. österreich. Heilmittelstelle, 1935, 13, 1—3; Chem. Zentr., 1935, ii, 1196).—The unsaponifiability of the "acid wax" (I) and the non-existence of mycol are confirmed. (I) is the only constituent of the  $\text{Et}_2\text{O}$ -sol. fraction of the unsaponifiable lipins of tubercle bacilli.

R. N. C.

**Effect of fatty acids on tubercle and other acid-fast bacilli.** S. IJIMA (Tôhoku J. Exp. Med., 1935, 25, 424—436).—The inhibitory effect of acids decreases in the order  $\text{HCO}_2\text{H}$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{AcOH}$ ,  $\text{PrCO}_2\text{H}$ , and progressively to decanoic acid, which completely inhibits growth at concn. of 1 in 10,000. Myristic, palmitic, and stearic acids have no action. Na salts are 0.1—0.02 as active as the free acids.

CH. ABS. (p)

**X-Ray studies of crystallite orientation in cellulose fibres.** II.—See this vol., 670.

**Physico-chemical properties of hog cholera virus.** I. Filterability as affected by hydrogen-ion concentration. II. Migration when subjected to electrophoresis. III. Attenuation of virus and production of immunity to hog cholera. L. H. SCHWARTZ (Iowa State Coll. J. Sci., 1934, 9, 187—193).—I. The virus over a  $p_H$  range of 5.0—9.0 passed all filters.

II. The virus migrated to the positive electrode.

III. Attenuation by ageing or by treatment with  $\text{CH}_2\text{O}$  or  $\text{PhOH}$ , or prep. in dil. blood and saturation with  $\text{N}_2$ ,  $\text{Cl}_2$ ,  $\text{SO}_2$ , or  $\text{CO}_2$  did not confer immunity. The latter was attained by saturating dil. blood with  $\text{H}_2$  or  $\text{O}_2$ .

CH. ABS. (p)

**Isoelectric precipitation of the tobacco mosaic virus complex.** R. J. BEST (Austral. J. Exp. Biol., 1936, 14, 1—13).—The virus is reversibly pptd. from the juice at  $p_H$  3—4 (max. > 99% at 3.4). The ppt., which contains 14% of N, consists entirely of virus or of virus united to material from which it cannot be

separated by elution, although relatively stable colloidal solutions are obtained by washing with buffer solutions at  $p_H$  2.8—2.3 and 4.5—7.5. W. McC.

**Hormonal properties of the pineal gland.** P. ENGEL (Wien. klin. Woch., 1935, 48, 481—486).—A review. R. N. C.

**Effect of adrenal preparations and vitamin-C on the sex cycle in castrated mice.** I. KAWAKAMI (J. Pharm. Soc. Japan, 1935, 55, 599—612).—Neither material produced any effect. CH. ABS. (p)

**Action of various hormones *in vitro* on the normal bone-marrow and in presence of germs.** I. Adrenal hormones. S. FIORENTINI (Boll. Soc. ital. Biol. sperim., 1935, 10, 740—742). R. N. C.

**Effects of stimulation of the adrenal gland on its content of ascorbic acid, adrenaline, and glutathione.** C. C. KUCHEL and M. L. MITCHELL (Austral. J. Exp. Biol., 1936, 14, 51—55).—Stimulation results in decrease in the ascorbic acid (I) content, the decrease having no const. relation to the accompanying decrease in adrenaline content. The ratio glutathione : (I) in the whole gland is only slightly affected by stimulation. W. McC.

**Adrenal gland extract causing luteinisation of the ovaries and endometrial hyperplasia.** R. ALLEN and G. BOURNE (Austral. J. Exp. Biol., 1936, 14, 45—50).—The extract is made with 8% aq.  $CCl_3 \cdot CO_2H$ . The active principle, which is very stable and insol. in  $Et_2O$ , is not identical with cortin. W. McC.

**Effect of the adrenal glands on calcium metabolism.** I. SCHOUR and J. M. ROGOFF (Science, 1936, 83, 267—268).—Characteristic disturbances in calcification of dentine occurring in the incisors of bilaterally adrenalectomised rats are described. A functional interrelationship between the adrenal and parathyroid glands is again (cf. A., 1934, 1409) indicated. L. S. T.

**Different reactions of the bulbar centre to adrenaline and pituitrin.** U. SACCHI (Boll. Soc. ital. Biol. sperim., 1935, 10, 671—675). R. N. C.

**Interrelationships among urinary, pituitary, and placental gonadotropic factors.** J. B. COLLIP (J. Amer. Med. Assoc., 1935, 104, 556—558).—A review. CH. ABS. (p)

**Pituitary gonadotropic hormones.** P. E. SMITH (J. Amer. Med. Assoc., 1935, 104, 553—556).—A review. CH. ABS. (p)

**General physiology of the anterior pituitary.** P. E. SMITH (J. Amer. Med. Assoc., 1935, 104, 548—553).—A review. CH. ABS. (p)

**Purified growth-hormone from ox anterior pituitary.** E. DINGEMANSE and J. FREUD (Acta Brev. neerl. Physiol., 1935, 5, 39—40).—The pituitary is dried with excess of  $COMe_2$  at low temp. and extracted with alkali. The hormone is purified by repeated adsorption on norite, elution with  $PhOH$ , and pptn. with  $EtOH-Et_2O$  (1 : 2). It is free from thyrotropic and lactogenic hormones, and is stable for 3 weeks over  $P_2O_5$ . R. N. C.

**Effect of anterior pituitary hormones on the male eel.** B. SCHREIBER (Boll. Soc. ital. Biol. sperim., 1935, 10, 818—821). R. N. C.

**Malignant tumours of the female genital organs as sources of hormones.** H. SIEBKE (Z. ges. Naturwiss., 1935, 1, 70—71; Chem. Zentr., 1935, ii, 1197).—Anterior pituitary hormones are found in the urine of women at the climacteric and menopause, or after irradiation of the genital organs or castration. Sex hormones appear in the urine of women with carcinoma of the genital organs or columnar cell carcinoma but disappear with the appearance of cachexia. R. N. C.

**Tumour of the pituitary induced with follicular hormone.** B. ZONDEK (Lancet, 1936, 230, 776—778; cf. this vol., 389). L. S. T.

**Physiology of oestrogenic principles.** E. ALLEN (J. Amer. Med. Assoc., 1935, 104, 1498—1502).—A review. CH. ABS. (p)

**Effects of prolonged administration of oestrin in rats.** C. S. MCEUEN, H. SELYE, and J. B. COLLIP (Lancet, 1936, 230, 775—776). L. S. T.

**Isolation of oestrone and equilin from pregnant mare's urine.** D. BEALL [with M. EDSON] (Biochem. J., 1936, 30, 577—581).—The acid-hydrolysed urine is extracted with  $PhMe$ , the "weak phenols" are separated by extraction with solvents, and after vac. distillation divided into  $C_6H_6$ -sol. and -insol. fractions. The ketonic compounds in the former are pptd. by  $Hg(OH)_2-NH_3$ , the equilin (I) and oestrone (II) in this ppt. being separated by  $EtOH$ . Acid hydrolysis of the equilin complex dissolved in the  $EtOH$ , followed by removal of the  $EtOH$  and vac. distillation, yielded a crude distillate from which pure (I) was recrystallised from 80%  $EtOH$ . Similarly, the  $Hg$ -ketone complex yielded a residue from which crude (II) is obtained by sublimation, purification by the quinoline reaction, and crystallisation from  $EtOH$ . (II) is directly isolated from the  $C_6H_6$ -insol. fraction by the quinoline reaction and recrystallisation. W. O. K.

**17-Ethyltestosterone.**  $\Delta^5$ -Pregnene-3 : 20-dione.—See this vol., 727.

**Culture *in vitro* of the female genital apparatus with folliculin.** F. GUERCIO and R. ARNONE (Boll. Soc. ital. Biol. sperim., 1935, 10, 622—624). R. N. C.

**Isolated amoeboid cells observed in cultures *in vitro* of uterine tissue (mucosa and muscular fibres) of the adult rabbit treated with gonadotropic hormone and folliculin.** F. GUERCIO (Boll. Soc. ital. Biol. sperim., 1935, 10, 624—626). R. N. C.

**Action of folliculin and testicular extract on the residual chromic index.** M. POLONOVSKI, H. WAREMBOURG, and J. DRIESSENS (Compt. rend. Soc. Biol., 1936, 121, 1451—1452).—Folliculin raises the index whilst testicular extract depresses it; the rise or fall in cancerous blood is > in normal blood. R. N. C.

**Oestrogenic action of androsterone.** E. WOLFF and A. GINGLINGER (Compt. rend. Soc. Biol., 1936, 121, 1476—1478). R. N. C.

Double (masculinising and feminising) action of androsterone on the genital tract of the chick embryo. E. WOLFF (Compt. rend. Soc. Biol., 1936, 121, 1474—1476). R. N. C.

Male hormones and accessory substances. R. DEANESLY and A. S. PARKES (Lancet, 1936, 230, 837—839).—In rats, the activity of androsterone or testosterone is markedly increased by an increase in the amount of various media, *e.g.*, olive, arachis, or castor oil, and  $\text{OH}\cdot\text{CHMe}\cdot\text{CH}_2\cdot\text{OH}$ , and by the addition of palmitic acid to the oil solution of testosterone. L. S. T.

Biological properties of testosterone. V. KORENCHESKY (Nature, 1936, 137, 494).—The effects of testosterone (I) on castrated male rats and on ovariectomised rats are described. Like androsterone and androsteronediol, (I) has some of the important properties of female hormones. L. S. T.

Preparation of vagotonin free from insulin. D. SANTENOISE, T. BRIEU, and E. STANKOFF (Compt. rend. Soc. Biol., 1936, 121, 1420—1422).—Depressor-free pancreatic extract is dissolved in  $\text{H}_2\text{O}$  and the vagotonin (I) is repeatedly pptd. with  $\text{LiCl}$  at  $p_{\text{H}}$  2.75 to remove impurities, dissolved in  $\text{EtOH}$ , and pptd. with  $\text{Et}_2\text{O}$  at  $-10^\circ$ . Insulin is removed by pptn. with 0.2%  $\text{K}_4\text{Fe}(\text{CN})_6$  at  $p_{\text{H}}$  3.2, and (I) is then repeatedly pptd. at  $p_{\text{H}}$  2.5 with  $\text{LiCl}$  and dissolved in  $\text{H}_2\text{O}$ , the  $p_{\text{H}}$  is adjusted to 6.0 with  $\text{LiOH}$ , and  $\text{LiCl}$  and  $\text{K}_4\text{Fe}(\text{CN})_6$  are removed by dialysis; (I) is then repeatedly pptd. with  $\text{EtOH}$  and  $\text{Et}_2\text{O}$ , washed, and dried over  $\text{P}_2\text{O}_5$ . R. N. C.

Effect of previous diet and insulin administration on adrenaline hyperglycaemia. R. BOLLER and K. MAKRYCOSTAS (Klin. Woch., 1935, 14, 646—647).—Hyperglycaemia due to adrenaline (I) is not affected by regulated diet for 6 days before injection. Administration of daily increasing doses of insulin up to the tolerance limit increases the response to (I); (I) secretion is also increased. R. N. C.

Action of insulin on the ovarian cycle. A. CRAINCEANU and L. COPELMAN (Compt. rend. Soc. Biol., 1936, 121, 1303—1304). R. N. C.

Blood-sugar, -chlorine, and -protein curves after injection of insulin. G. DELL'ACQUA (Boll. Soc. ital. Biol. sperim., 1935, 10, 761—765).—Following injection of insulin into normal and diabetic subjects, the hyperchloraemia  $\propto$  the hypoglycaemia, both levels showing small fluctuations; blood-proteins vary irregularly. R. N. C.

Insulin and body-weight. I. Variations in body-weight, glycogen content, and iodine value of adipose tissue. E. BOERI, G. SCOZ, and P. BAER. II. Variations of the composition of adipose tissue in insulinised animals. P. BAER, G. SCOZ, and E. BOERI (Boll. Soc. ital. Biol. sperim., 1935, 10, 680—682, 682—685).—I. Glycogen and the I val. of the adipose tissue of rats and dogs are increased if > 6 daily injections of insulin (I) are given.

II. The  $\text{H}_2\text{O}$  content of the adipose tissue increases during the first 5—10 days of treatment, whilst fat decreases. Later,  $\text{H}_2\text{O}$  falls, and fat, glycogen, the I val., and body-wt. increase for 10 days, the body-wt. subsequently remaining const. whilst the other vals.

tend to return to normal. With carbohydrate (II) nutrition, (I) tends to induce synthesis of fats from (II).

R. N. C.

Effect of thyroxine on the protein-sulphur of the liver in the guinea-pig. G. SCOZ, P. L. MICHELI, and T. GUALTIEROTTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 829—830).—S falls sharply in the first few days, afterwards rising steadily. R. N. C.

Effect of thyroxine on the extractable sulphur and vitamin-C content of the liver of the guinea-pig. G. SCOZ and T. GUALTIEROTTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 830—832).—Extractable S of liver varies inversely and vitamin-C directly with body-wt. R. N. C.

Effect of thyroxine on the phosphatase power of the liver in the guinea-pig. G. SCOZ and G. CANTONI (Boll. Soc. ital. Biol. sperim., 1935, 10, 833—834).—The phosphatase power falls and rises again with the wt. of the liver. R. N. C.

Effect of thyroxine on the catheptic and amylolytic activities of the liver in the guinea-pig. G. SCOZ and L. DE CARO (Boll. Soc. ital. Biol. sperim., 1935, 10, 826—828).—The activities are increased proportionately during the first few days when body-wt. falls; in the succeeding period the amylase activity falls below normal. R. N. C.

Action of thyroxine on body-weight and the weight and nitrogen content of some internal organs of the rat. G. SCOZ and P. L. MICHELI (Boll. Soc. ital. Biol. sperim., 1935, 10, 687—689).—Thyroxine increases the wt. of the liver and kidney of the rat, but the N contents of the dry organs are unaffected. R. N. C.

Thyrotropic hormone in non-pituitary tissues. L. BALLIF and I. GHERSOVICI (Compt. rend. Soc. Biol., 1936, 121, 1437—1438).—The hormone is not present in the ovary. R. N. C.

Induction of mammary ducts. A. DEAKIN (Nature, 1936, 137, 619—620).—Evidence for the presence of an inducing substance, sp. for a particular group of animals, which is responsible for the development of mammary ducts, is discussed. L. S. T.

Lactation and pregnancy. P. DE FREMERY and P. J. DENEKAMP (Acta Brev. neerl. Physiol., 1935, 5, 44—46).—Prolactin causes lactation and abortion in pregnant animals. R. N. C.

Incidence of rickets. "Gallosterol" as a source of vitamin-A with normal dietary phosphorus and calcium. S. MURAO (J. Biochem. Japan, 1936, 23, 71—90).—Deoxycholic acid (I) has a growth-inhibitory action on normal rats and, to a greater extent, on rats on vitamin-A- and -D-free diet; the effect does not occur in rats with excessive feeding of irradiated ergosterol (II). Administration of (II) irradiated for varying periods to rats on -A- and -D-free diets produces corresponding differences in the period necessary for onset of A-avitaminosis. The effect of (I)-vitamin-A ("gallosterol") on the incidence and degree of avitaminosis is described. F. O. H.

Effect of solvents on the spectral curve of vitamin-A and on its photochemical degradation. A. CHEVALIER, P. DUBOULOZ, and S. MANUEL

(Compt. rend. Soc. Biol., 1936, 121, 1495—1498).—The absorption curve shows slight modifications in different solvents, the max. in  $C_6H_{14}$  being shifted somewhat to the right of that in EtOH. Vitamin-A in  $C_6H_{14}$  solution is degraded photochemically to a series of products, the absorption max. of which lie progressively further to the right of that of -A.

R. N. C.

**Values of the motor chronaxia of the normal guinea-pig and the hepatic vitamin-A content.** A. CHEVALLIER and L. ESPY (Compt. rend. Soc. Biol., 1936, 121, 820—822).—Chronaxia and hepatic vitamin-A are related.

R. N. C.

**Localisation of vitamin-A in red blood corpuscles during their evolution in vertebrates.** P. JOYET-LAVERGNE (Compt. rend., 1936, 202, 1101—1102; cf. this vol., 257).—The content and localisation of the vitamin (I) in the corpuscles depends on their stage of evolution. The (I) content of young corpuscles is > that of old. When the corpuscles have a nucleolus (I) is localised there. In young corpuscles (I) is sometimes diffused throughout the nucleus.

W. McC.

**Content of vitamin-A in the liver of foetus and new-born.** W. NEUWEILER (Z. Vitaminforsch., 1936, 5, 104—110).—The % content of vitamin-A in the liver of foetal and new-born man is approx. equal to that in the liver of adults.

F. O. H.

**Vitamin-A value of halibut-liver oil.** B. AHMAD (Indian Med. Gaz., 1935, 70, 70—71).—Samples of oil failing to produce improvement in general health of children contained 25 times as much vitamin-A as did standard cod-liver oil, and cured xerophthalmia in -A-deficient rats.

CH. ABS. (p)

**Standardisation and determination of vitamin-A.** E. M. HUME and H. CHICK (Med. Res. Coun. Spec. Rep. Ser. No. 202, 1935, 61 pp.).—The specimen of carotene first used as a provisional international standard in 1931 was only 60% pure. It is recommended that 0.0006 mg. of pure  $\beta$ -carotene (I) should now be adopted as the international unit. The maintenance of the yellow colour of (I) is a trustworthy indication of the preservation of biological activity. Coconut oil with addition of quinol as a stabiliser is recommended as solvent. The potency of oil X, of the U.S.P., now adopted as a subsidiary international standard is 3000 international units per g. For the spectrophotometric determination of vitamin-A the factor 1600 is provisionally recommended for converting the extinction coeff. ( $E_{1\%}^{1\text{cm}}$  at 328  $m\mu$ ) into international units of -A per g.

NUTR. ABS. (m)

**Content of (a) vitamin-A, (b) vitamin-C in Hunan lachiao, *Capsicum annuum*, L., var. *longum*.** H. C. HO (Chinese J. Physiol., 1936, 10, 171—178, 179—185; cf. Szent-Györgyi, A., 1933, 433).—(a) Dried lachiao pods are fairly rich in vitamin-A, 0.3 g. of the powder giving a growth response in rats similar to that obtained with 0.006 mg. of carotene. Approx. one half is extracted by boiling EtOH.

(b) The fresh pods contain -C, 0.5—1.0 g. per day protecting guinea-pigs from scurvy. The -C content is entirely lost on drying.

J. N. A.

**Vitamin-A and -D content of the liver of new-born infants.** K. U. TOVERUD and F. ENDER (Acta paediat., 1935, 18, 174—191). **Vitamin-A and -D- in the liver of the newborn.** K. U. TOVERUD and F. ENDER (Norsk. Mag. Laegevidenskapen, 1935, 96, 947—960).—In 97 cases the vitamin-A val. was 0.2—517 blue units per g. of liver (mean 47.6 for premature, 28.8 for full term infants). These variations corresponded with variations in the -A content of the maternal diet in pregnancy. As regards -D content of livers from 44 of the above cases, 24 showed completely negative results, 15 slight healing of rickets in the test rats, and 5 fair healing, the -D content depending on the richness of the maternal diet.

NUTR. ABS. (m)

**Vitamin-A and -B requirements of young rats at a particular period of growth and when given a high-carbohydrate diet.** L. RANDOIN and R. NETTER (Compt. rend., 1936, 202, 1105—1107).—Newly weaned rats, on a diet rich in carbohydrate, but deprived of vitamin-A, continue to grow normally for about 6 weeks without symptoms of avitaminosis-A if they receive sufficient -B. Deprivation of -B with or without that of -A prevents growth and results in early death.

W. McC.

**Vitamin-B groups.** A. G. VAN VEEN (Geneesk. Tijds. Nederl.-Indië, 1934, 74, 1495—1603; Chem. Zentr., 1935, ii, 1203).

R. N. C.

**Vitamins and cultures *in vitro*. I. Action of vitamin-B on embryonal tissue cultures.** F. ROSSI (Boll. Soc. ital. Biol. sperim., 1935, 10, 843—847).—The vitamin exerts a toxic action, but in small concns. produces an initially increased rate of growth.

R. N. C.

**Pharmacological action of vitamin-B preparations and their constituents, particularly adenylothiomethylpentose.** C. HASEGAWA (Fukuoka Acta med., 1935, 28, 122—123).—A yeast extract containing B-vitamins caused stoppage of the frog's heart and of intestinal movements, with lowering of the blood-pressure, in rabbits. These effects were not produced by cryst. oryzanin, possessing a known -B<sub>1</sub> activity, but were produced by autoclaved yeast extract or by a mixture of adenylothiomethylpentose (I), adenine, nicotinic acid, hypoxanthine, and choline in the proportions in which they were present in the extract. The effects were similar to those produced by (I) and were considered to be due to (I).

NUTR. ABS. (m)

**Dynamics of the symptoms of polyavitaminosis in dogs.** M. S. LEVINSON (Z. Vitaminforsch., 1936, 5, 81—104).—Dogs fed on autoclaved diets develop polyavitaminosis within 2½—3 months. During the latent period (2 months), there are no outward symptoms but abnormalities in H<sub>2</sub>O-NaCl balance, diuresis, excretion of NH<sub>3</sub> and urea, and blood elements occur. The onset of ataxia, polyneuritis, skin lesions, etc. during the following period is mainly characteristic of B-avitaminosis.

F. O. H.

**Control and revision of the international standard for vitamin-B.** A. ALLEGRI (Boll. Soc. ital. Biol. sperim., 1935, 10, 836—839).

R. N. C.

**Isoelectric point of vitamin- $B_1$ .** G. NARASIMHAMURTHY (Current Sci., 1936, 4, 586—587).—The isoelectric point of pure vitamin- $B_1$  determined by electrophoresis and micro-cataphoresis methods is  $p_{\text{H}}$  9.2. F. N. W.

**Isoelectric point of vitamin- $B_1$ .** B. C. GUHA (Current Sci., 1936, 4, 653).—Comments (cf. preceding abstract). F. A. A.

**Potentiometric titrations of vitamin- $B_1$  and thiochrome.** A. G. OGSTON and R. A. PETERS (Biochem. J., 1936, 30, 736—741).—The titration curve of vitamin- $B_1$  on the acid side is completely described by one basic group of  $p_K$  4.8. Thiochrome shows a basic  $p_K$  of 5.6 and, like  $-B_1$ , a tendency for a drifting val. to the alkaline side. It has no  $-B_1$  activity by catatorulin test. P. W. C.

**Value of increased supply of vitamin- $B_1$  and iron in the diet of children. II.** J. R. ROSS and P. SUMMERFELDT (Amer. J. Dis. Children, 1935, 49, 1185—1188).—Increases in wt. resulting from substitution of special mixed cereals for ordinary cereals in the diet were  $>$  those attributable to their vitamin- $B$  content. CH. ABS. (p)

**Lactoflavin, a possible contaminant of vitamin-free diets.** G. C. SUPPLEE, G. E. FLANIGAN, Z. M. HANFORD, and S. ANSBACHER (J. Biol. Chem., 1936, 113, 787—792).—Lactoflavin (I), determined by the fluorescence method, is present in crude and certain "vitamin-free" caseinogen (II) preps. Repeated extraction of crude (II) with dil. aq. NaCl at the isoelectric point gives a prep. free from (I). H. D.

**Nature and partial isolation of the substance curative of the pellagra-like condition [in rats and chicks] due to dietary egg-white.** J. G. LEASE (Z. Vitaminforsch., 1936, 5, 110—118).—The principle (I) (not identical with vitamin- $B_2$ ) is not extracted from liver or kidney (in which it occurs) by org. solvents or  $H_2O$ . Acid- or protease-hydrolysates, however, yield aq. extracts containing (I), which is pptd. (from MeOH) by  $Et_2O$  and  $EtOAc$  but not by  $COMe_2$  or (from  $H_2O$ ) by protein-precipitants (excepting phosphotungstic acid). (I) is dialysable, gives a positive biuret reaction, and is stable to heat, acids, and alkalis but not to oxidation, autoclaving, or ultra-violet irradiation. (I) is active when administered orally or parenterally. F. O. H.

**Further evidence for the existence of vitamin- $B_1$ .** O. L. KLINE, C. A. ELVEHJEM, and E. B. HART (Biochem. J., 1936, 30, 780—784; cf. this vol., 390).—The existence of vitamin- $B_1$  and its necessity for the normal nutrition of rats are confirmed (cf. Reader, A., 1930, 380). J. N. A.

**Treatment of infantile scurvy with ascorbic acid.** E. GOETTSCH (Amer. J. Dis. Children, 1935, 49, 1441—1448).—Intravenous injection of 400 mg. of ascorbic acid caused rapid healing. Calcification was more rapid than when orange juice was given. CH. ABS. (p)

**Effect of administration of vitamin- $C$  on the reticulocytes in certain infectious diseases.** J. M. FAULKNER (New England J. Med., 1935, 213, 19—20). CH. ABS. (p)

**Effect of ascorbic acid on coagulation of blood in normal and pathological conditions.** L. COTTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 697—700).—Ascorbic acid injected intravenously frequently reduces the time of coagulation, particularly in hæmophilia. R. N. C.

**Action of ascorbic acid on blood coagulation *in vitro* and *in vivo* in the rabbit.** C. J. HANUT (Compt. rend. Soc. Biol., 1936, 121, 1338—1340).—Ascorbic acid accelerates coagulation of recalcified oxalated blood *in vitro* at a concn. of 0.005—0.02% and retards it at higher concns. through its effect on the reaction of the mixture; when neutralised it does not affect coagulation. It accelerates coagulation of recalcified oxalated or citrated plasma from rabbits when injected intravenously. R. N. C.

**Action of ascorbic acid on blood coagulation in normal or vitamin- $C$ -deficient guinea-pigs.** C. J. HANUT (Compt. rend. Soc. Biol., 1936, 121, 1341—1342).—Ascorbic acid accelerates coagulation in normal animals, but does not affect it in the deficient animal that is showing signs of scurvy. R. N. C.

**Anticoagulant action *in vitro* of complex salts derived from vitamin- $C$  and copper, titanium, or zinc, associated with other metals.** F. ARLOING, A. MOREL, and A. JOSSEAND (Compt. rend. Soc. Biol., 1936, 121, 1479—1480).—The anticoagulant actions of Cu and Ti complexes are  $<$  those of Fe complexes. Zn in an Fe complex increases its anticoagulant action, unless Pb is also present, whilst complexes containing Zn without any other multivalent metal show the greatest anticoagulant action. R. N. C.

**Modifications of the antirachitic activity of orthophosphoric acid by fixation of alcoholic, phenolic, and glucosidic chains.** R. LECOQ and M. L. BARBAN (Bull. Soc. sci. Hyg. aliment., 1935, 23, 121—132; cf. A., 1935, 109, 238, 657).—The activity of  $H_3PO_4$  is not seriously affected by esterification with alcohols; it is slightly retarded in Na alkyl phosphates and accelerated in the Ca salts. Phenolic esterification inhibits the activity. The activity is scarcely affected by esterification with open-chain sugars, whether or not basic groups are present, but is largely inhibited by esterification with inositol. R. N. C.

**Ascorbic acid as a precursor of serum complement.** F. MARSH (Nature, 1936, 137, 618—619).—The complement complex diminishes or even disappears when ascorbic acid (I) is withdrawn from the food of the guinea-pig, and is restored to normal level by a diet rich in (I). L. S. T.

**Action of vitamin- $C$  on diphtheria toxin and the sensitivity of the whooping-cough bacillus to quinol and vitamin- $C$ .** O. GROOTTEN and N. BEZSSONOFF (Ann. Inst. Pasteur, 1936, 56, 413—426; cf. A., 1935, 1542).—Massive doses of neutralised ascorbic acid increase the resistance of guinea-pigs to diphtheria toxin. The activity is distinctly  $<$  that reported by Harde (A., 1934, 1271). H. G. R.

**Capacity of synthesis of ascorbic acid in the fetus.** A. GIROUD, A. S. RUIZ, R. RATSIMAMANGA, M. RABINOWICZ, and E. HARTMANN (Compt. rend. Soc.

Biol., 1936, 121, 1062—1063).—Fœtal ascorbic acid (I) is > maternal (I) in the organs of the rabbit, rat, and guinea-pig, but less in cattle and sheep; synthesis is probable in the first three species. R. N. C.

**Diminution of the iodine value of the liver- and adrenal fats of the guinea-pig in avitaminosis-C.** L. DE CARO and M. GIANI (Boll. Soc. ital. Biol. sperim., 1935, 10, 835). R. N. C.

**Variations of the ascorbic acid content in the puerperal state.** I. F. GUERCIO, G. PICINELLI, and H. HAMBURGER (Boll. Soc. ital. Biol. sperim., 1935, 10, 640—643).—Introductory. R. N. C.

**Vitamin-C content of the aqueous humour and its antiscorbutic action.** C. CELLA and I. D. GEORGESCU (Compt. rend. Soc. Biol., 1936, 121, 1116—1119). R. N. C.

**Vitamin-C content of different parts of the nervous system.** F. PLAUT and M. BÜLOW (Z. ges. Neurol. Psychiat., 1935, 153, 182—192).—The ascorbic acid content of all parts of the human brain declined with advancing age but at relatively different rates; the cerebral content was greatest in the fœtus, the cerebellar content in infancy, and that of the spinal cord in old age. The content of the cerebral and cerebellar cortex was > that of the medulla at all ages except in senility. Observations on the rabbit, dog, cat, and calf gave comparable results.

NUTR. ABS. (*m*)

**Distribution of vitamin-C in different parts of common Indian foodstuffs.** M. N. RUDRA (Biochem. J., 1936, 30, 701—703).—The vitamin-C (I) distribution in the skin, flesh, leaves, and seeds of 21 different fruits and vegetables was studied. (I) is more conc. in the skin than in the flesh; with root vegetables the greatest concn. is in the leaves. With animal foods the concns. were in the order: liver > kidney > bone-marrow > milk > heart > muscle.

H. D.

**Determination of ascorbic acid.** K. WACHHOLDER and H. H. PODESTÀ (Z. physiol. Chem., 1936, 239, 149—161).—The methods of Bezssonoff *et al.* (A., 1934, 1146), Fujita *et al.* (A., 1935, 793), and Tillmans are not sp. and should be rejected. Those of Folin (A., 1930, 630) and Martini *et al.* (A., 1934, 1271) are trustworthy but for each animal, organ, and fluid tests must be made to show which of the two methods gives the lower and hence more sp. val.

W. McC.

**Chemical and biological assay of vitamin-C.** H. C. HOU (Chinese J. Physiol., 1936, 10, 191—196).—In guinea-pigs the curve of response to different amounts of ascorbic acid (I) was a straight line. Satien pumelo juice gave nearly the same chemical and biological assay vals. for (I). Green amaranth grown with exclusion of short ultra-violet rays showed a difference between the two vals., but this was < that for amaranth grown in the open. Mixtures containing (I) and small amounts of lucerne were more active than when larger amounts of the latter were used.

J. N. A.

**Antirachitic factor in human milk.** I. A. SABRI and M. M. FIKRI (Arch. Dis. Childhood, 1935, 10, 377—380).—Irradiated (ultra-violet) fat from

the milk of healthy mothers with normal children afforded nearly complete protection from rickets when incorporated in the rachitogenic ration of rats to the extent of 4%, whilst that from mothers whose children were rachitic gave similar protection only when it constituted 8% of the diet.

NUTR. ABS. (*m*)

**Comparison of the vitamin-D contents of Guernsey and Shorthorn butter (milk).** S. K. KON and K. M. HENRY (Biochem. J., 1936, 30, 776—779).—Under similar conditions of feeding and management, butter fat from Guernsey and Shorthorn cows contained 0.35 and 0.28 international units of vitamin-D per g., respectively; the difference is not statistically significant. If the relationship is generally valid, the relative contents of the two milks could be expressed by the ratio of the % fat.

J. N. A.

**Dietary requirements for lactation.** V. Presence of a second lactation factor in yeast. W. NAKAHARA, F. INUKAI, S. KATO, and S. UGAMI (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 47—52; cf. this vol., 227).—Yeast contains a second dietary factor,  $L_2$ , necessary for lactation. It is different from  $L_1$  (originally called  $L$  and obtained from liver and yeast) and is non-adsorbable on acid earth.

J. N. A.

**Nutritional deficiency causing gizzard erosions in chicks.** H. J. ALMQUIST and E. L. R. STOKSTAD (Nature, 1936, 137, 581—582).—Gizzard erosion is a separate deficiency disease which can be corr. by a new fat-sol. factor, probably vitamin in nature, present in kale and lucerne. The new factor, which is localised in the saponifiable fraction of the extracts, is distinct from the anti-hæmorrhagic vitamin.

L. S. T.

**Biological effectiveness of  $\alpha$ -particles as a function of ion concentration produced in their paths.** R. E. ZIRKLE (Amer. J. Cancer, 1935, 23, 558—567).—The effectiveness of irradiation ( $B$ ) of fern spores depends on the no. of ions produced in the nucleus and on the ionisation per unit path ( $I$ ) which varies in a characteristic manner along the path. The relationship,  $B = kI^{2.5}$ , is established ( $k$  is a proportionality const.).

CH. ABS. (*p*)

**Inheritance of sugar content in cucurbits.** V. V. ARASIMOVITSCH (Bull. Appl. Bot. U.S.S.R., 1934, [iii], No. 5, 5—30).—Inheritable characteristics in respect of total sugars, sucrose (I), fructose (II), and glucose (III) are frequently observed in hybrids. (I), (II), and (III) are polymer characters, are dominant for some hybrids and absent from others. Dominance of (III) is more frequent than that of (II). (I) is often polymer-recessive.

CH. ABS. (*p*)

**Distribution and translocation of sugars in sugar-beet.** I. Sugars in the tissue elements of sugar-beet in relation to its sugar content. II. Connection between vascular bundles of separate rings in the root and vascular bundles of separate leaves. E. F. VOTCHAL (Nauch. Zap. Sach. Prom., 1934, 11, Book 40, No. 2, 34—36, 36—38).

CH. ABS. (*p*)

**Breeding of coumarin-free clover.** R. B. GELTSCHINSKAJA and M. A. BORDUNOVA (Bull.

Appl. Bot. U.S.S.R., 1934, [iii], No. 5, 315—323).—The coumarin content of clover varies with individual plants and increases up to the flowering period. Vals. for red clover were 1.0—0.056 and for yellow clover 0.86—0.062%.

CH. ABS. (p)

**Chemotropic irritation of roots.** B. NIKLEWSKI, M. KAHLÓWNA, and M. DYDÓWNA (Polish Agric. Forest. Ann., 1935, 34, 457—489).— $K_2HPO_4$ ,  $KH_2PO_4$ ,  $K_2SO_4$ , and  $KNO_3$ , even in 0.0001M solutions, caused irritation of *Sinapis* roots.  $NH_4Cl$ ,  $KCl$ ,  $NaCl$ , and  $CaCl_2$  had little or no action. Non-electrolytes from stall manure, humus, etc. were irritant at dilutions of 1 in  $10^8$ . The action is associated with substances of certain mol. size.

CH. ABS. (p)

**Ionic antagonism in the phenomenon of imbibition.** D. KOHLER (Compt. rend. Soc. Biol., 1936, 121, 1308—1311).— $Na^+$ ,  $K^+$ ,  $Mg^{++}$ , and  $Ca^{++}$  act antagonistically to one another in their effects on imbibition by *Laminaria*, the coeff. of imbibition of mixtures of two of the ions being always < the calc. val. assuming that the effects are additive.  $Ca^{++}$  exhibits the greatest antagonism to the other ions.

R. N. C.

**Kinetics of penetration. XIII. Effect of  $p_H$  on the entrance of potassium into *Nitella* at low concentrations.** A. G. JACQUES (Proc. Nat. Acad. Sci., 1936, 22, 191—193).—Between  $p_H$  6 and 8, the tendency of K to enter the sap of *Nitella* cells from external solutions in which  $[K^+]=10^{-5}M$  decreases with rise of  $p_H$ , the  $[Cl^-]$  remaining const. F. A. A.

**Moisture relations of pecan leaves.** A. H. FINCH and C. W. VAN HORN (Science, 1936, 83, 260).—The % of  $H_2O$  in mature leaves is practically const. and independent of differences in soil- $H_2O$  when conditions for max. transpiration obtain. A considerable degree of drought may occur before transpiration ceases or before  $CO_2$  entrance into the leaf and the interruption of photosynthesis takes place. With a reduced N content and practically unimpaired photosynthesis conditions favouring carbohydrate storage are produced by moderate drying of the soil. Soil-moisture control may be an important means of regulating the formation and utilisation of carbohydrate reserves in the tree.

L. S. T.

**Cell sap of Characeae.** R. COLLANDER (Protoplasma, 1936, 25, 201—210).—Comparison of plants grown in fresh and in brackish  $H_2O$  shows differences in sap concn. which are  $\ll$  those in the two media. The difference between the total salt concn. in the sap and that of the corresponding medium is approx. the same in both cases. The case of absorption of cations is in the order  $K > Na > Ca, Mg$ . The ratio  $K/Na$  in the sap varies with the species. A. G. P.

**Relationship of the phosphate concentration of solution cultures to the type and size of root systems and the time of maturity of certain plants.** A. L. SOMMER (J. Agric. Res., 1936, 52, 133—148).—Increasing  $[PO_4^{---}]$  in the nutrient is associated with a decreasing root/top ratio and later maturation.

A. G. P.

**Rôle of potassium in the sugar synthesis of *Sorghum saccharatum* (sugar sorghum).**

I. N. G. CHOKKANNA (Z. Pflanz. Düng., 1936, 43, 43—69).—In flowing-nutrient cultures K protects the plant to some extent against the ill-effects of low temp. The height of the plants and the stem/leaf (wt.) ratio decrease with increasing K content. With conc. (stationary) media the major portion of the K intake occurs in the early growth stages. Evidence of "luxury" consumption is obtained. With increasing K dosage the ratio N/K and the amounts of Ca and P taken up by the plant decline. The ratio protein-/total N in leaves is > in stems and is unaffected by the K supply. The total sugar and the % sucrose (I) in the total increase with the K given. Within the plant K tends to maintain a neutral sap and suppress the inversion of (I) by acids or enzymes.

A. G. P.

**Effect of glycerol and mannose on metabolism of the nucleus in [embryonic cells of] the lupin.** G. DELOFFRE (Compt. rend. Soc. Biol., 1936, 121, 1100—1103).—Glycerol (I) and mannose (II) are both assimilable, producing regeneration and preventing diminution of the nucleus. (I) is more assimilable than (II), but < glucose. (II) acts partly as an assimilable substance, and partly as a toxic substance, causing withering and decay of the embryo.

R. N. C.

**Metabolism of the phosphorus compounds of the acorn during germination in light.** E. MICHEL-DURAND (Compt. rend., 1936, 202, 866—867).—Analysis of various parts of oak plants about 80 days old showed that P compounds were present mainly in the roots and leaves. The physiological activity of the organs is roots > leaves > cotyledons.

J. N. A.

**Effect of insulin on plant respiration.** N. L. PAL and U. N. CHATTERJI (Nature, 1936, 137, 535—536).—The leaves of *Hiptage madablota* and *Allium tuberosum* respire at a higher rate when injected with insulin (40 units per 100 c.c.) than when injected with  $H_2O$ . Phylloclades of *Opuntia Dillenii* show a lower rate of  $CO_2$  evolution.

L. S. T.

**Chlorophyll fluorescence and carbonic acid assimilation. V. Relation between leaf fluorescence and oxygen assimilation.** H. KAUTSKY and W. FLESCH (Biochem. Z., 1936, 284, 412—436).—The fluorescence of leaves of *Parietaria officinalis* on ultra-violet irradiation varies with the proportion of  $O_2$  in the surrounding atm. With < 0.5% of  $O_2$ , fluorescence does not increase with increased time of irradiation.  $CO_2$  apparently plays no part in the phenomenon. The effect with leaves differs from that of chlorophyll (I) adsorbed on  $Al(OH)_3$ , the curves indicating dissociation of  $O_2$  in the leaf. The rôle of (I),  $O_2$ , and  $CO_2$  in plant respiration is discussed.

F. O. H.

**Explanation of the relatively large concentration of  $O^{18}$  in the atmosphere.**—See this vol., 698.

**Plant growth in relation to partial pressures of oxygen.** B. N. SINGH and G. P. KAPOOR (Proc. Indian Acad. Sci., 1936, 3, B, 238—245).—With increasing  $[O_2]$  dry-matter production by wheat plants increases, at first roughly proportionally, subsequently reaching a stationary and finally a

declining phase. The initial increase is attributed to a stimulation of assimilation and respiratory processes. The age of the plants is an influential factor.

A. G. P.

**Different action of auxin-*a* and of heteroauxin.** J. VAN OVERBEEK (Proc. Nat. Acad. Sci., 1936, 22, 187—190).—The growth-substance curvatures of twice-decapitated *Avena* coleoptiles exposed to visible radiation are < those of non-irradiated controls, when pure auxin-*a* (I) or an extract containing auxin-*a* and -*b* is used; no difference is found when pure heteroauxin (II) (cf. Kögl *et al.*, A., 1934, 1418) is used. Sections of coleoptiles applied to agar blocks containing (I) or (II) cause destruction of these substances, (I) more rapidly than (II).

F. A. A.

**Cell sap acidity and the incidence of white-fly (*Bemesia gossypiperda*) on cottons.** M. A. HUSAIN, A. N. PURI, and K. N. TREHAN (Current Sci., 1936, 4, 486—487).—The gradient in  $p_H$  of cell sap from top to bottom of cotton plants varies with type and age of the plant. Incidence of white-fly attack is greater at higher  $p_H$  (after a time lag); immunity of some varieties to attack may be due to  $p_H$  of sap, and might thus be artificially induced.

E. W. W.

**Effect of lead on plant growth.** K. SCHARER and W. SCHROPP (Z. Pflanz. Düng., 1936, 43, 34—43).—In sand cultures barley, oats, and, notably, wheat were very sensitive to injury by Pb. Rye and maize were more resistant. Maize was affected by [Pb] > 10 mg. per litre of nutrient. Small concns. had a stimulatory action in some cases.

A. G. P.

**Action of sugars on *Saprolegnia*.** F. MOREAU (Compt. rend., 1936, 202, 1086—1087).—Dil. solutions of sugars are toxic to *Achlya colorata* (glucose and fructose > maltose and sucrose). Starch is non-toxic.

W. McC.

**Hydrocyanic acid production by leaves of *Photinia*, Lindl.** R. SALGUES (Compt. rend., 1936, 202, 971—973).—The loss of HCN during the period of rapid development attains a max. in September, following which the content rises until midwinter, and again declines until the leaves fall. The life cycle is 20 months.

P. G. M.

**Occurrence of cyanogenetic glucosides in *S. African species of Acacia*.** I. D. G. STEYN and C. RIMINGTON (Onderstepoort J. Vet. Sci., 1935, 4, 51—63).—The glucosides occurred in *A. giraffe*, *A. litakunensis*, *A. stolonifera*, *A. robusta* (without an enzyme effecting its decomp.), and *A. lasiopetala*. That from the last named (*acacipetalin*),  $C_{11}H_{17}O_6N$ , had m.p. 176—177,  $[\alpha]_D^{25}$  -35.96° and was rapidly decomposed by emulsin. *A. karroo* contained no glucoside. Means of feeding cyanogenetic pods to cattle with safety are described.

CH. ABS. (p)

**Composition of pure-bred and hybrid peas.** C. SOSA-BOURDOUIL (Compt. rend., 1936, 202, 1091—1093).—The C and H contents of *Pisum sativum*, L., *P. arvense*, L., and *P. Jomardii*, Schrank., of a cross between two varieties of the first, and of crosses between the first and each of the other two exhibit no appreciable differences but the N contents

of the crosses (1st—4th generation) are < those of the parent plants. In the crosses there is no direct relation between N content and colour or shape.

W. McC.

**Constituents of *Epimedium macranthum*.**—See this vol., 710.

**Heterosides of the fruits of *Sophora japonica*.** L. J. RABATÉ and J. DUSSY (Compt. rend., 1936, 202, 1117—1119; cf. Charaux *et al.*, A., 1935, 985, 1041).—In addition to sophoricoside, the pods of *S. japonica* contain rutoside and *sophoraflavanololide* (I) (yield 0.5%, m.p. 207—208°,  $[\alpha]_D$  -61° in EtOH. (I) is readily attacked by emulsin and, on hydrolysis with acid, yields a disaccharide (further hydrolysed to 2 mols. of glucose) and 3:5:7:4'-tetrahydroxy-flavone.

W. McC.

**Chemistry and pharmacological action of *Toddalea aculeata*.**—See this vol., 743.

**Saponin of the seeds of *Esculus turbinata*, Blume.**—See this vol., 732.

**Sapogenin of the roots of *Momordica cochinchinensis*.**—See this vol., 731.

**Chemical examination of the bark of *Moringa pterygosperma*.** S. GHOSH, R. N. CHOPRA, and A. DUTT (Indian J. Med. Res., 1935, 22, 785—788).—The bark contains a liquid base,  $C_7H_9N$  (*hydrochloride*, m.p. 254.4°,  $[\alpha]_D^{30}$  +1.8° in  $H_2O$ ), probably a  $C_5H_5N$  derivative or an ephedrine base, and an alkaloid, *moringinine*; it also contains org. acids, resins, a phytosterol, fixed and essential oils, and a waxy substance.

R. N. C.

**Deltaline, a new alkaloid from *Delphinium occidentale*.**—See this vol., 743.

**Monolupine, a new alkaloid from *Lupinus caudatus*.**—See this vol., 741.

**Isolation of a fourth crystallisable jack bean globulin by digestion of canavalin with trypsin.** J. B. SUMNER and S. F. HOWELL (J. Biol. Chem., 1936, 113, 607—610).—The *globulin*, obtained by tryptic digestion of canavalin (I), is sol. in  $H_2O$  and in 5% NaCl, but insol. in 0.2—1.0% NaCl at  $p_H$  6.5. The isoelectric point, determined by cataphoresis in 0.1N-OAc' buffer, is  $p_H$  4.8. It contains unoxidised S and tyrosine, but not tryptophan. A method for the prep. of (I) from jack bean meal is described.

J. N. A.

**Micro-determination of lactic and carbonic acids.** K. HINSBERG and R. AMMON (Biochem. Z., 1936, 284, 343—346).—Lactic acid is determined in blood (5 c.c.), pre-treated with  $CuSO_4$ - $Ca(OH)_2$ , by heating in a vac. in presence of  $MnSO_4$ - $KMnO_4$ , the  $MeCHO$  formed being absorbed in  $NaHSO_3$  and titrated iodometrically. Similar apparatus is used for  $CO_2$  (liberated by tartaric acid), which is absorbed in 0.2N-NaOH, excess of which is titrated by 0.1N-HCl in presence of phenolphthalein.

F. O. H.

**Spectrographic determination of certain elements by the arc process.**—See this vol., 695.

**Nephelometric micro-determination of chlorine in ash of organic materials.**—See this vol., 693.

# BRITISH CHEMICAL ABSTRACTS

## A.—PURE CHEMISTRY

JULY, 1936.

### General, Physical, and Inorganic Chemistry.

Intensity anomalies in the Lyman series of hydrogen. T. TAKAMINE and T. SUGA (Nature, 1936, 137, 827—828). L. S. T.

Oxygen in solar prominences. A. L. NARAYAN and T. ROYDS (Current Sci., 1936, 4, 734).—The  $O_2$  triplet at  $\lambda$  7770 Å. has been observed in a prominence at a height of 9000 miles above the chromosphere. L. J. J.

Zeeman and Paschen-Back effects in the case of extreme  $j$ - $j$  coupling.  $2p^5ns$  configurations of neon. P. JACQUINOT (Compt. rend., 1936, 202, 1578—1580). H. J. E.

Induced predissociation in the absorption spectrum of sulphur. V. KONDRATEEV and E. OLSSON (Z. Physik, 1936, 99, 671—676).—The energy of dissociation of the normal state of  $S_2$  is  $> 4.1$  volts. A. B. D. C.

Intensity distribution in the diffuse series of potassium. P. A. COENEN and H. A. KRAMERS (Physica, 1936, 3, 341—345).—Quantum-mechanical calculation of the intensities of the diffuse series of K is in accord with experiment (this vol., 261) and explains the anomaly of the exceptional weakness of the second line. J. W. S.

Colour phenomenon in "colloidal" potassium vapour. J. KUNZ (Physikal. Z., 1936, 37, 415).— $H_2$  is passed over molten K in an evacuated tube. On placing the tube in connexion with another exhausted tube an intense but short-lived colour appears in the second tube. The colour varies along the tube. The pptd. K is strongly photo-electric. A. J. M.

Lines in the arc spectrum of cobalt not emitted by Co I. M. T. ANTUNES and M. A. CATALAN (Anal. Fis. Quím., 1935, 33, 391—432).—A crit. examination is made of the lines between 2449 and 19,778 Å. attributed to Co, and a list of the respective levels, but omitting lines emitted by Co I, is given. F. R. G.

Structure of the spectrum of unexcited cobalt. M. A. CATALAN and M. T. ANTUNES (Anal. Fis. Quím., 1936, 34, 207—297).—For Co I,  $\lambda$  and  $\nu$  with emission and absorption intensities and levels are tabulated for the range 2012—18,273 Å. A supplement to the list of lines not emitted by Co I (see above) is also given. F. R. G.

Electrical quadrupole moment and magnetic moment of  $^{63}\text{Cu}$  and  $^{65}\text{Cu}$ . H. SCHÜLER and T. SCHMIDT (Z. Physik, 1936, 100, 113—116).—The quadrupole moment of the two isotopes is  $\sim 0.1 \times$

$10^{-24}$ , and the magnetic moments are 2.5 and 2.6 for 63 and 65, respectively. A. B. D. C.

Absorption spectrum of rubidium. N. T. ZÉ and W. W. PO (Compt. rend., 1936, 202, 1428—1430).—A no. of new lines, observed at 350—550°, are recorded. L. J. J.

Transmission and reflexion of thin silver layers in the infra-red and ultra-violet. F. GOOS (Z. Physik, 1936, 100, 95—112).—Transmission and reflexion data are given for Ag layers 0.8—142 m $\mu$  thick on quartz from 1050 to 265 m $\mu$ . A. B. D. C.

Spectra of xenon in the extreme ultra-violet. J. C. BOYCE (Physical Rev., 1936, [ii], 49, 730—732).—Using increased dispersion and resolving power, revised and extended data and classifications are tabulated for Xe I, II, III in the range  $\lambda\lambda$  2000—600. N. M. B.

Absorption spectrum of hydrogen. III. Auto-ionisation in the term  $3p-^1\Pi_u$  of  $H_2$  and its selection rules. Ionisation energy of  $H_2$ . H. BEUTLER and H. O. JÜNGER (Z. Physik, 1936, 100, 80—94; cf. this vol., 261).—The ionisation energy of  $H_2$  is  $124,429 + 13 \text{ cm.}^{-1}$ . A. B. D. C.

Reversal temperature and population of excited states in the caesium discharge. F. L. MOHLER (J. Res. Nat. Bur. Stand., 1936, 16, 227—231).—Data are recorded for the lines  $6S-nP$  ( $n=6-11$ ) at a no. of pressure and current vals. L. J. J.

Analytical and quantitative lines of hafnium in the arc spectrum. S. PINA DE RUBIES and J. G. AGUADO (Anal. Fis. Quím., 1935, 33, 549—565).—The method previously described (A., 1934, 48) is applied to Hf. A list of Hf lines and of those lines of other elements which might be mistaken for the principal Hf lines, is given. F. R. G.

Quartz mercury arc. A. J. ALLEN (Science, 1936, 83, 336). L. S. T.

Fluorescent emission of the mercury line 2537 Å. at pressures between  $10^3$  and  $10^1$  mm. P. PRINGSHEIM and O. D. SALTMARSH (Proc. Roy. Soc., 1936, A, 154, 90—95).—The degree of polarisation of the fluorescence radiation of Hg has been measured. The phenomena are analogous to those observed with Na vapour. It is considered that the observed fluorescence is due, not to Hg atoms, but to van der Waals mols. L. L. B.

Electrical quadrupole moment of the  $^{209}\text{Bi}$  nucleus. H. SCHÜLER and T. SCHMIDT (Z. Physik, 1936, 99, 717—728).—This quadrupole moment is  $-0.4 \times 10^{-24}$ . A. B. D. C.

Scale of wave-lengths in the infra-red solar spectrum. H. D. BABCOCK, C. E. MOORE, and W. P. HOGE (*Astrophys. J.*, 1936, **83**, 103—120).

L. S. T.

Ultra-violet spectrum of the night sky. A. ARNULF (*Compt. rend.*, 1936, **202**, 1412—1414).—Data are recorded for  $\lambda\lambda$  3556—2979 Å. L. J. J.

Enhancement of red lines and bands in the auroral spectrum from a sunlit atmosphere. L. VEGARD and E. TØNSBERG (*Nature*, 1936, **137**, 778—779).—Sunlight produces a pronounced enhancement of certain bands of the first positive group of  $N_2$ , and of the red line 6300 Å., which is due probably to production of  $O_3$  by the sun's radiation.

L. S. T.

Colour temperatures and continuous absorption of hydrogen for stars of the first spectral types. A. ARNULF, D. BARBIER, D. CHALONGE, and (ILLE.) R. CANAVAGGIA (*Compt. rend.*, 1936, **202**, 1571—1573).

H. J. E.

Search for the bands of boron compounds in stellar spectra. P. SWINGS (*Astrophys. J.*, 1936, **83**, 177—178).—BH bands in late-type stars could not be detected.

L. S. T.

Spectrum of Arcturus. S. G. HACKER (*Astrophys. J.*, 1936, **83**, 140—161).—At. and mol. spectra identified in the region 4119—6743 Å. are summarised.

L. S. T.

Resonance phenomena in ionised gases. W. SIGRIST (*Helv. phys. Acta*, 1935, **8**, 317—320; *Chem. Zentr.*, 1935, ii, 1316—1317).

H. J. E.

Sparks between flame electrodes. M. PIERUCCI (*Nuovo Cim.*, 1935, [ii], **12**, 240—242; *Chem. Zentr.*, 1935, ii, 1317).—A spark discharge between two Bunsen coal-gas flames, inclined towards one another so as to serve as electrodes, has been investigated, using plain gas flames and flames charged with salt solutions from an atomiser. In general at. but not ionic spectra are emitted.

J. S. A.

Investigation of electrical discharges in gases with the cloud chamber. E. FLEGLER and H. RÄTHER (*Z. Physik*, 1936, **99**, 635—642).—Study of initiation of self-maintained discharges shows that photo-ionisation, rather than space charge, gives the necessary initial conditions.

A. B. D. C.

Increase of sparking potential by irradiation with ultra-violet light. W. SEITZ and W. FÜCKS (*Naturwiss.*, 1936, **24**, 346).—Contrary to expectation, for certain cathodes (e.g., Ag) and gases (e.g., A) at moderate pressures, an increase in the sparking potential was observed when the cathode was irradiated with ultra-violet light. For a Zn cathode and A, however, the potential decreased.

A. J. M.

Spectral investigation of the thread ray discharge. W. HANLE and W. NOLLER (*Physikal. Z.*, 1936, **37**, 412—414).—The spectrum of the thread ray and its surrounding radiation has been investigated, and the electron velocity distribution in both radiations is obtained from a study of intensities in the line spectra. The methods of excitation are discussed, and the effect of an electric field on the radiation is examined.

A. J. M.

Fine structure of the  $L_{23}$  absorption edge of magnesium metal. H. W. B. SKINNER and J. E. JOHNSTON (*Nature*, 1936, **137**, 826—827).

L. S. T.

Absorption of soft X-rays in aluminium. G. B. BANDOPADHYAYA and A. T. MAITRA (*Phil. Mag.*, 1936, [vii], **21**, 869—880).—The mass absorption coeff. of Al was measured for  $\lambda\lambda$  7—24 Å.

H. J. E.

Atomic scattering factor of cadmium for Cu  $K\alpha$  radiation. G. W. BRINDLEY (*Proc. Leeds Phil. Soc.*, 1936, **3**, 200—207).—The intensities of reflexion of Cu  $K\alpha$  radiation from finely divided Cd have been measured and compared with those of Al, the at. scattering factor of the Cd atom at room temp. being deduced. The irregularities when plotted against  $\sin \theta/\lambda$ , similar to those found with Zn, indicate that in Cd the atoms have a greater mean amplitude of vibration parallel to the  $c$  axis than in the basal plane.

J. W. S.

Atomic scattering factor of zinc. C. M. KOTIN and J. LOSADA (*Anal. Fis. Quim.*, 1935, **33**, 597—601).—The scattering curve for Zn has been obtained by the Debye-Scherrer method, and is comparable with the theoretical curve of James *et al.* (cf. A., 1931, 889).

F. R. G.

Screening doublets of X-ray spectra. A. E. SANDSTROM (*Z. Physik*, 1936, **99**, 622—625).

A. B. D. C.

Constant  $A$  in Richardson's equation. E. WIGNER (*Physical Rev.*, 1936, [ii], **49**, 696—700).—The chemical const. of the electron gas in the high-temp. region, where all measurements are made, is different from its val. at very low temp. (cf. Herzfeld, A., 1930, 391). The high-temp. val. of the Richardson const.  $A$ , which thus differs from the low-temp. val., is calc. in terms of thermodynamic quantities.

N. M. B.

Theory of the work function. II. Surface double layer. J. BARDEEN (*Physical Rev.*, 1936, [ii], **49**, 653—663; cf. A., 1935, 1050).—In order to determine the moment of the electrostatic surface double layer, the electronic surface charge density is calc. For Na, the vals. for the work function and moment of the double layer are 2.35 and 0.4 e.v. (including the effect of polarisation forces), and 2.0 and 1.0 e.v. (omitting these forces), respectively.

N. M. B.

Photo-electric properties of sodium films on aluminium. J. J. BRADY and V. P. JACOBSMEYER (*Physical Rev.*, 1936, [ii], **49**, 670—675; cf. A., 1932, 1184).—The max. sensitivity of Na films on Al was not attained for a film thickness of < 80 mol. layers; it then remained const. for greater thicknesses. No detectable photo-current was observed for < 5 mol. layers. Spectral distribution curves, analysed according to Fowler's theory, indicate a const. val. of 5150 Å. for the threshold of the Na film for all film thicknesses. Current-voltage curves for different thicknesses, analysed according to Du Bridge's theory, indicate that the work function of the various films is the same, the val. for the freshly distilled Al on which the deposits were made being 4.08 volts, which gives the val. 3020 Å. for the threshold of Al. The photo-electric current showed a decrease, probably due to

surface migration of the Na atoms in forming aggregates, immediately after forming a film, but the decrease was much less for films  $> 50$  mol. layers.

N. M. B.

**Temperature of electrons ( $T_e$ ) in the positive column of a discharge in a mixture (Ne-Na).** W. UYTERHOEVEN and C. VERBURG (Compt. rend., 1936, 202, 1498—1500; cf. A., 1935, 1438).—The positive ionic current collected near the walls is a max. when the wall temp. is  $260^\circ$ .  $T_e$  ( $1T_e = 13,200^\circ$  abs.) is a max. at  $240^\circ$ , i.e., when there is 0.01 Na ion for 100 Ne, but decreases towards the centre of the tube. The increase in potential gradient is attributed to the presence of easily ionisable Na.

R. S.

**Influence of metastable atoms on the electron temperature in the positive column.** G. SPIWAK and E. REICHRUDEL (Physica, 1936, 3, 301—306).—At high c.d. and with large concns. of impurity, ionisation of the gases and impurities by collision with electrons plays the principal part in controlling electron temp., but with low c.d. and with small concns. of impurity metastable atoms have a considerable influence.

J. W. S.

**Cesium-oxygen films on tungsten.** J. H. LEES (Phil. Mag., 1936, [vii], 21, 1131—1139; cf. A., 1925, ii, 254).—Max. emission from Cs-coated W filaments at  $780^\circ$  abs. is observed after treatment with  $O_2$  at relatively high pressure, followed by momentary heating to  $1800^\circ$  abs. The emission is decreased by activation above  $2000^\circ$  abs., owing to evaporation of the activated O. The adsorption of  $O_2$  reaches equilibrium rapidly. Some evidence is obtained that  $O_2$  penetrates the W lattice.

J. W. S.

**Method of measuring secondary-electron emission from filaments.** L. R. G. TRELOAR (Proc. Physical Soc., 1936, 48, 488—497).—An indirect method is described, and gives results for W and Ta filaments in agreement with available data.

N. M. B.

**Electron energies and excitation in the helium positive column.** F. L. JONES (Proc. Physical Soc., 1936, 48, 513—526).—A distribution function is suggested to account for available data on the intensities of lines emitted from He discharges, the variation of the intensities with gas pressure is calc., and curves are drawn for the relative intensities of the various lines at different pressures, and compared with experimental curves. From the general agreement an expression for the distribution is given. Results indicate that the energy distribution of the majority of the electrons is determined by diffusion, but a small fraction form a group with Maxwell energy distribution, and of predominating influence in the He discharge at high pressure as regards excitation and ionisation.

N. M. B.

**Energy losses of electrons striking the nitrogen nucleus.** J. E. ROBERTS, R. WHIDDINGTON, and E. G. WOODROOFE (Proc. Leeds Phil. Soc., 1936, 3, 189—190).—When electrons of medium energy are passed through N, at low pressure, the scattered electrons, on analysis, show not only a strong line corresponding to elastic collisions without energy loss, but also bands corresponding to mol. excitations.

Singlet transition bands are observed at higher impact energy (120 e.v.) and triplet bands at 16—25 e.v. The max. of these bands correspond approx. in some cases with known spectroscopic vals.

J. W. S.

**Concentration of electron beams by gases.** I. SOKOLSKAJA (Tech. Phys. U.S.S.R., 1936, 3, 28—38).—The relations between the focal length and gas pressure, beam current, velocity, and wall potential in A were investigated.

H. J. E.

**Determination of electron velocity by means of probe measurements.** W. DENECKE and E. LUBCKE (Physikal. Z., 1936, 37, 347—350).—It is shown that by the use of several test wires arranged in a certain part of the positive column of a glow discharge it is possible to obtain the velocity distribution of electrons, the space potential, the electron c.d., and electron concn.

A. J. M.

**Change in secondary-electron emission of insulators and semi-conductors on irradiation with electrons.** M. KNOLL (Naturwiss., 1936, 24, 345).—If an insulator is irradiated with electrons (500—5000 volts) there is a considerable change in the secondary-electron emission when tested with another electron beam. The secondary emission factor was lowered for  $Al_2O_3$ , glass,  $Cu_2O$ , and certain phosphors.

A. J. M.

**Scattering of positrons by electrons with exchange on Dirac's theory of the positron.** H. J. BHABHA (Proc. Roy. Soc., 1936, A, 154, 195—206).—Exchange may take place between the electron initially observed and one of the virtual electrons in states of negative energy. The process may be considered as one in which the initial electron and positron have been annihilated, giving rise simultaneously to a new pair.

L. L. B.

**Theory of the positron.** A. PROCA (Compt. rend., 1936, 202, 1366—1368).

R. S.

**Production of electron pairs.** J. C. JAEGER (Nature, 1936, 137, 781—782).—The absorption cross-sections per atom for the production of positive-negative electron pairs by  $\gamma$ -rays have been determined for Sn, Tb, and Pb. The Born approximation gives vals. which are too low, but the error decreases rapidly with decreasing at. no. and increasing energy of the  $\gamma$ -rays.

L. S. T.

**Law of impulse maintenance with the annihilation of positrons.** A. I. ALICHANIAN, A. I. ALICHANOV, and L. A. ARZIMOVITSCH (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 287—288, and Nature, 1936, 137, 703—704).—A system of counter tubes was used to measure quanta set free on annihilation of positrons from radio-P (obtained by bombardment of Al with  $\alpha$ -particles from Ra-C'). It was shown that two quanta are emitted in opposite directions as required by the impulse maintenance law.

A. J. M.

**At. wts. by calculation.** A. C. WOODMANSEY (Phil. Mag., 1936, [vii], 21, 1079—1081).—The at. wts. of simple elements are represented satisfactorily by the expression at. wt. =  $0.9935x + 0.0140y$ , where  $x$  = mass no.,  $y$  = at. no.

J. W. S.

**At. wt. of cadmium.** O. HÖNIGSCHMID and R. SCHLEE (Z. anorg. Chem., 1936, 227, 184—192).—The mean of eight argentometric titrations of  $\text{CdCl}_2$  gives Cd 112.41+0.002 (Ag 107.880, Cl 35.457), and of five titrations of  $\text{CdBr}_2$ , 112.41+0.004. This val. is identical with the international at. wt., and differs from Aston's by 0.2 unit. F. L. U.

**Revision of at. wt. of chromium. II. Study of the relations  $\text{CrO}_2\text{Cl}_2 : 2\text{Ag}$  and  $\text{CrO}_2\text{Cl}_2 : 2\text{AgCl}$ .** F. GONZALEZ NÚÑEZ (Anal. Fís. Quím., 1935, 33, 533—548; cf. A, 1930, 1337).—The at. wt. of Cr has been redetermined as 52.013+0.001.

F. R. G.

**Enrichment of nitrogen in the isotope  $^{15}\text{N}$ .** D. E. WOOLDRIDGE and F. A. JENKINS (Physical Rev., 1936, [ii], 49, 704).—Further enrichment of  $^{13}\text{C}$  by diffusion of  $\text{CH}_4$  in a Hertz apparatus has been obtained (cf. this vol., 574). This method has been extended to  $\text{N}_2$ . Isotope band heads due to  $^{14}\text{N}^{15}\text{N}$  had an intensity corresponding with an abundance of 3 at.-%  $^{15}\text{N}$ , an enrichment factor of approx. 10. N. M. B.

**Isotopic constitution of strontium, barium, and indium.** J. P. BLEWETT and M. B. SAMPSON (Physical Rev., 1936, [ii], 49, 778).—Mass spectrograph analyses of the ions of Sr, Ba, and In emitted when oxides of these elements are heated on W filaments give evidence of isotopes  $^{84}\text{Sr}$  and  $^{134}\text{Ba}$ , with abundance 0.5 and 1.8%, respectively. Other isotopes of Sr of masses 82, 83, 85, 89, and 90 were present to <1 in 2000, 1000, 2000, 500, and 2000, respectively, Ba isotopes of masses 132, 133, 139, and 140 to <1 in 2000, 1000, 400, and 1000, respectively, and In isotopes of masses 110, 111, 112, 114, 116, 117, 118, and 119 to <1 in 5000, 10,000, 5000, 200, 5000, 10,000, 8000, and 30,000, respectively (cf. Szilard, A., 1935, 276). N. M. B.

**Proof of the existence of the odd cadmium isotopes by band spectroscopy.** A. HEIMER and E. HULTHEN (Naturwiss., 1936, 24, 377).—Examination of the  $\text{CdH}/\text{CdD}$  spectrum over the range 3300—3400 Å. shows the presence (in order of intensity) of the following isotopes of Cd: 114, 112, 110, 111, 113, 116. A. J. M.

**Isotope displacement in the arc spectrum of platinum.** S. TOLANSKY and E. LEE (Nature, 1936, 137, 908).—Even isotope displacements in the Pt I spectrum (tabulated) are in good agreement with the results of Jaeckel and Kopfermann (this vol., 654).  $^{195}\text{Pt}$  has a nuclear spin of  $\frac{1}{2}$ , and approx. abundances of the isotopes 198, 196, 195, and 194 are 1 : 4 : 4 : 5. L. S. T.

**Spontaneous and artificial transmutations of atom nuclei.** K. C. KAR (Phil. Mag., 1936, [vii], 21, 1067—1078; cf. A., 1934, 5).—Mathematical. The wave-statistical theory developed previously is extended to explain the emission of long range  $\alpha$ -particles by radioactive elements and to explain artificial disintegration. J. W. S.

**Collision forces between light nuclei.** C. B. O. MOHR and G. E. PRINGLE (Nature, 1936, 137, 865—866).—Calculations made from measurements of the angular distribution of scattering of the slower  $\alpha$ -particles

in  $\text{H}_2$ ,  $\text{D}_2$ , and He indicate that the forces which come into play act at distances  $>10^{-12}$  cm. If the current method of explanation is to be retained forces of range  $>e^2/mc^2$  must be included. L. S. T.

**Structure of neutrons and  $\beta$ -disintegration.** D. MEKSYN (Nature, 1936, 137, 906).—It is assumed that when a neutron is formed from a proton and an electron the excess of energy of the particles is transformed into rest mass, energy and momentum being conserved. L. S. T.

**Possible effect of screening in the theory of  $\beta$ -disintegration.** M. E. ROSE (Physical Rev., 1936, [ii], 49, 727—729; cf. Konopinski, A., 1935, 1048).—Various considerations and calculations individually lead to the conclusion that the effect of screening is negligible. N. M. B.

**End-points of the  $\beta$ -ray spectra of radium-E and thorium-C''.** F. C. CHAMPION and N. S. ALEXANDER (Nature, 1936, 137, 744).—The end-points occur at  $1.35 \times 10^6$  and  $2.25 \times 10^6$  e.v., respectively. L. S. T.

**Excitation of  $\gamma$ -rays in boron.** S. KIKUCHI, H. AOKI, and K. HUSIMI (Nature, 1936, 137, 745).—The emission of  $\gamma$ -rays from B in presence of slow neutrons is confirmed. L. S. T.

**Scattering of neutrons by protons.** M. GOLDBABER (Nature, 1936, 137, 824—825).—The mean free path of the neutrons obtained from  $\text{D}_2\text{O}$  bombarded by radio-Th is  $4.5 \pm 1.5$  cm. of paraffin. Disagreement with the theoretical val. of 1.3 shows that there is no evidence of the existence of an excited state of the deuteron and that another model of the proton-neutron interaction is required. L. S. T.

**Experiments with neutrons produced by the bombardment of deuterons with deuterons.** S. KIKUCHI, S. NAKAGAWA, H. AOKI, and K. FUSHIMI (Proc. Phys.-Math. Soc. Japan, 1935, 17, 189—193).—The Fermi photon effect has been studied with deuteron-deuteron neutrons. The production of slow neutrons and their absorption by various elements and salts have been studied. Fermi's results are confirmed. CH. ABS. (e)

**Properties of slow neutrons.** B. PONTECORVO (Nuovo Cim., 1935, [ii], 12, 211—222; Chem. Zentr., 1935, ii, 1312).—The activity effect of neutrons slowed down by passage through material containing H is much  $>$  that of neutrons slowed down by other materials (Pb,  $\text{SiO}_2$ , C). J. S. A.

**Cross-section measurements with slow neutrons of different velocities.** H. VON HALBAN, jun., and P. PREISWERK (Nature, 1936, 137, 905—906).—The cross-section for neutron capture by B decreases with increasing energy of the neutrons (cf. this vol., 402). Results for neutrons captured by Li, Dy, Ag, and Rh are also given. In general, cross-sections for resonance neutron capture and for capture of thermal neutrons are greatest for nuclei the resonance levels of which have the lowest energy. L. S. T.

**Disintegration of boron by neutrons.** R. J. WALEN (Compt. rend., 1936, 202, 1500—1502).—The results are in agreement with the equation  $^{10}\text{B} + \frac{1}{2}\text{n} \rightarrow \frac{3}{2}\text{Li} + \text{He} + \text{Q}$ . R. S.

**Transformation of boron by slow neutrons.** M. J. DEISENROTH-MISSOVSKI, G. D. LATISCHEV, L. I. RUSSINOV, and R. A. EICHELBERGER (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 351—353).—The effect on the no. of transmuted particles in the nuclear reaction  ${}^7\text{Li} + {}^4\text{He}$ , of layers of  $\text{H}_2\text{O}$  of various thicknesses interposed between the source of neutrons and the B compound ( $\text{Me}_3\text{BO}_3$ ) was investigated. The curve between no. of transmuted particles and thickness of  $\text{H}_2\text{O}$  layer may be explained by supposing either that the neutrons are absorbed in the  $\text{H}_2\text{O}$ , or that the absorption of slow neutrons by B shows a resonance effect. A. J. M.

**Absorption of slow neutrons in boron.** F. RASETTI, D. P. MITCHELL, G. A. FINK, and G. B. PEGRAM (Physical Rev., 1936, [ii], 49, 777).—Using a method similar to that employed for Ag and Cd (cf. this vol., 264), the dependence of the capture cross-section on neutron velocity was determined. Results indicate that the absorption of thermal energy neutrons follows the  $1/v$  law. N. M. B.

**Disintegration of nitrogen by slow neutrons.** T. W. BONNER and W. M. BRUBAKER (Physical Rev., 1936, [ii], 49, 778).—The reaction is found to be giving the val.  $0.58 \pm 0.03$  m.e.v. for the energy of disintegration  $Q_\alpha$ , calc. from range measurements, and eliminating a previous discrepancy (cf. this vol., 403; Chadwick, *ibid.*, 5). N. M. B.

**Artificial radioactivity.** K. DIEBNER and E. GRASSMANN (Physikal. Z., 1936, 37, 359—383).—A review.

**Induced radioactivity of short period.** T. BJERGE (Nature, 1936, 137, 865).—An arrangement for detecting induced radioactivity  $> 0.3$  sec. is described. When bombarded by a neutron source ( $\text{Be} + \text{Rn}$ ) of 350 millicuries, Be gives a strong activity of  $0.9 \pm 0.2$  sec. half-val. period and max. energy of  $6$  to  $8 \times 10^6$  e.v. The effect is not increased by surrounding the source with paraffin wax. The process leading to the active nucleus is discussed. No new activities were detected with Li, B, C, N, O, F, Na, Al, Cl, Fe, Ni, Cu, Zn, Se, Ag, Cd, Sn, or Pb. L. S. T.

**Disintegration of boron into three  $\alpha$ -particles.** P. I. DEE and C. W. GILBERT (Proc. Roy. Soc., 1936, A, 154, 279—296).—The disintegration of B by artificially accelerated protons takes place as follows:  ${}^{10}\text{B} + {}^1\text{H} \rightarrow {}^4\text{He} + {}^4\text{He} + {}^4\text{He}$ . The total energy released in the reaction is  $8.7 \pm 0.2 \times 10^5$  e.v. A theoretical picture of the process, involving the existence of an unstable  ${}^8\text{Be}$  nucleus, is given. L. L. B.

**High-velocity positive ions.** V. Disintegration of boron. VI. Disintegration of carbon, nitrogen, and oxygen by deuterons. J. D. COCKCROFT and W. B. LEWIS (Proc. Roy. Soc., 1936, A, 154, 246—261, 261—279; cf. A., 1934, 826).—V. Experiments on the disintegration of B by deuterons of energy 300—600 kv. have established the existence of two homogeneous  $\alpha$ -particle groups of range 4.5 and 14.7 cm. for deuteron energies of 560 kv. These groups are assumed to result from transmmutations in which  ${}^8\text{Be}$  and  ${}^9\text{Be}$  are produced. Two continuous distributions of doubly charged

ionising particles are also observed, probably due to the break up of the  ${}^{10}\text{B}$ -deuteron system into 3  $\alpha$ -particles.

VI. The disintegration of C, N, and O<sub>2</sub> by deuterons has been reinvestigated by an improved method. Several new groups of particles have been discovered, and all the reaction energies determined to within about 0.1 mv. The new results are used to correct Bethe's mass scale, and to check the energy balance in the process of positron emission from radio-N<sub>2</sub>.

L. L. B.

**Separation of radioactive atoms from the stable isotopic atoms.** O. ERBACHER and K. PHILIPP (Z. physikal. Chem., 1936, 176, 169—181).—The radioactive species of halogens produced by the action of neutrons on a liquid non-ionised org. halogen compound (I) are formed as ions and can be removed by shaking with  $\text{H}_2\text{O}$ . The (I) which dissolves in the  $\text{H}_2\text{O}$  at the same time is subsequently removed by extraction with  $\text{C}_6\text{H}_6$ , giving a practically pure aq. solution of the radioactive ions. In this way  $10^{-16}$  g. of radioactive Br has been separated from 21 g. of inactive Br atoms. R. C.

**Preparation of artificially radioactive halogens in unweighable amount from the stable isotopes.** O. ERBACHER and K. PHILIPP (Ber., 1936, 69, [B], 893—898).— $\text{EtI}$ ,  $\text{EtBr}$ , or  $\text{C}_2\text{H}_5\text{Cl}_2$  is bombarded (method to be described) and shaken with blood charcoal which is then introduced into  $\text{H}_2\text{O}$  through which  $\text{H}_2$  bubbles in presence of Pt powder. When the mixture is boiled and filtered, the bulk of the radioactive halogen is contained in the  $\text{H}_2\text{O}$ , which remains clear after addition of  $\text{AgNO}_3$  and dil.  $\text{HNO}_3$ . H. W.

**Radioactive isotope of sulphur.** E. B. ANDERSEN (Z. physikal. Chem., 1936, B, 32, 237—242).—A radioactive isotope of half-life period  $\sim 80$  days and probably  ${}^{33}\text{S}$  is formed by the action of neutrons on the Cl in  $\text{CCl}_4$ . It has been used to study the reactions of thiosulphates. R. C.

**New transformation processes in the bombardment of uranium with neutrons. Elements beyond uranium.** O. HAHN, L. MEITNER, and F. STRASSMANN (Ber., 1936, 69, [B], 905—919; cf. A., 1935, 1050).—The production of the following at. types is observed by the bombardment of U with neutrons; the half-life periods and type of bombardment are given in parentheses:  ${}^{235}\text{Th}$  (4 min., slow);  ${}^{235}\text{Pa}$  (very short, slow);  ${}^{235}\text{U}$  ( $24 \pm 2$  min., slow);  ${}^{237}\text{U}$  (40 sec., rapid);  ${}^{239}\text{U}$  (10 sec., preferably slow);  ${}^{237}\text{eka-Re}$  ( $16 \pm 1$  min., rapid);  ${}^{239}\text{eka-Re}$  ( $2.2 \pm 0.2$  min., preferably slow);  ${}^{237}\text{eka-Os}$  (12 hr., rapid);  ${}^{239}\text{eka-Os}$  ( $59 \pm 2$  min., preferably slow);  ${}^{239}\text{eka-Ir}$  (3 days, preferably slow); (?)  $\text{eka-Pt}$  ( $\sim 3$  hr., preferably slow). H. W.

**Decrease of the primary cosmic radiation in different materials.** J. CLAY (Physica, 1936, 3, 332—340).—Measurement of the decrease of ionisation by cosmic radiation under thick layers of Fe and Pb proves that equilibrium between primary radiation and secondary effects is reached under layers  $> 400$  g. per sq. cm. Under such layers the decrease in Pb, Fe, and  $\text{H}_2\text{O} \propto$  density, in accord with a corpuscular

nature of the radiation. The coeff., however, is 0.00044 per g. per sq. cm., about one tenth of that in air. It is suggested that there are two independent types of primary radiation, both shower-producing, and to account for the decrease in intensity in H<sub>2</sub>O layers at different magnetic latitudes it is assumed that the hard and soft components consist of protons and electrons, respectively, the energy required to penetrate the atm. being  $4 \times 10^9$  e.v. for protons and about  $10^{10}$  e.v. for electrons. J. W. S.

**Range of a single shower particle produced by cosmic rays in lead, iron, and aluminium.** J. CLAY (Physica, 1936, 3, 352—358).—By arranging three counters under a shower-producing sheet, one being enclosed within an absorbing layer of variable thickness, and measuring the threefold coincidences of the counters, it has been shown that the particles have a definite range, which for Pb showers is 4.4 cm. in Pb, 5.6 cm. in Fe, and about 10 cm. in Al. Shower particles from Fe have a range of 5.2 cm. in Pb, whilst those from Al have still longer ranges. The calc. energies are 87, 104, and 168 ( $\times 10^6$ ) e.v. for Pb, Fe, and Al showers, respectively. J. W. S.

**Absorption of cosmic-ray showers in lead.** C. G. MONTGOMERY and D. D. MONTGOMERY. **Coincidence counter studies of cosmic-ray showers.** R. H. WOODWARD. **Geomagnetic analysis of cosmic radiation.** G. LEMAITRE and M. S. VALLARTA (Physical Rev., 1936, [ii], 49, 705—711, 711—718, 719—726; cf. A., 1935, 560). N. M. B.

**Interpretation of Shankland's experiment.** R. PEIERLS (Nature, 1936, 137, 904). L. S. T.

**Wave theory of the neutrino.** G. RUMER (Compt. rend., 1936, 202, 1484—1486; cf. A., 1935, 143). R. S.

**Neutrino theory of light.** M. BORN and N. S. N. NATH (Proc. Indian Acad. Sci., 1936, 3, A, 318—337).—Mathematical. A general survey. N. M. B.

**Constitution of atomic nuclei and their magnetic moments.** S. SHIMASAKI (Proc. Phys.-Math. Soc. Japan, 1935, 17, 177—188).—It is assumed that protons or neutrons do not exist free in the nucleus, but only in the form of deuterons or <sup>3</sup>H nuclei. Two deuterons, two <sup>3</sup>H nuclei, or one deuteron and one <sup>3</sup>H nucleus have a tendency to unite. The nuclei of elements with  $Z < 28$  are built principally by the addition of successive  $\alpha$ -particles. In heavier elements additions of two <sup>3</sup>H nuclei play the chief role. Vals. for nuclear magnetic moments are calc. which are in agreement with experimental vals. CH. ABS. (e)

**Scattering and absorption of particles by nuclei.** I. T. SEXL (Z. Physik, 1936, 99, 751—775).—Theoretical. A. B. D. C.

**Statistical distribution of absorbed light quanta in the nuclei of a photographic layer.** G. UNGAR (Z. Physik, 1936, 99, 688—694).—Theoretical. A. B. D. C.

**Fundamental equations of elementary particles.** A. PROCA (Compt. rend., 1936, 202, 1490—1492). R. S.

**Interaction of two particles.** H. R. HULME (Proc. Roy. Soc., 1936, A, 154, 487—500).—The interaction of a nuclear particle in an excited state with an electron in the *K*-shell is considered according to the methods of quantum electrodynamics.

L. L. B.

**Inertia of electrons in metals.** C. G. DARWIN (Proc. Roy. Soc., 1936, A, 154, 61—66).—According to the theory of metals, the effective mass of the free electrons is increased owing to the displacement of their energy levels by the cryst. field. This effect is, however, not shown in experiments on electron inertia. L. L. B.

**Wave functions for 1s2s<sup>1</sup>S helium.** A. S. COOLIDGE and H. M. JAMES (Physical Rev., 1936, [ii], 49, 676—687).—Mathematical. N. M. B.

**Ground state of lithium.** H. M. JAMES and A. S. COOLIDGE (Physical Rev., 1936, [ii], 49, 688—695).—Mathematical. Wave functions are examined. The calc. ionisation energy is  $5.363 \pm 0.007$  against  $5.364$  e.v. observed. N. M. B.

**Rational nomenclature for elementary corpuscles.** P. GRUNER (Physikal. Z., 1936, 37, 350—351).—The following names are proposed for corpuscles of mass approx.  $10^{-27}$  g. (present names in parentheses): nulliton (neutrino), positon (positron), negaton (electron); and for particles of mass about  $10^{-24}$  g. (general name, materion), proton (proton), neproton (negatively charged particle with the mass of the proton), neutron (neutron). A. J. M.

**Validity of the Franck-Condon principle for evaluation of intensity distribution in molecular spectra.** W. FINKELNBURG (Z. Physik, 1936, 99, 798—800).—This principle cannot be applied to transitions involving loosely linked bonds or states of repulsion. A. B. D. C.

**Intensity and form of the absorption bands of liquid oxygen.** R. GUILLIEN (Compt. rend., 1936, 202, 1373—1375; cf. A., 1934, 581).—The liquid O<sub>2</sub> bands 7635, 6290, 5769, 5325, 4773, and 4472 Å. have been studied and compared with data for compressed O<sub>2</sub>. R. S.

**The A band of liquid oxygen.** R. GUILLIEN (Compt. rend., 1936, 202, 1423—1425).—The band extends from <7595 to 7735 Å. Extinction coeffs. ( $\kappa$ ) have been measured in liquid N<sub>2</sub>-O<sub>2</sub> mixtures. The  $\kappa/\kappa_{\max} - 1/\lambda$  curve becomes narrower with increasing dilution. Data are recorded and discussed. L. J. J.

**Influence of temperature on the absorption spectrum of ozone.** E. VASSY (Compt. rend., 1936, 202, 1426—1428).—The spectrum is independent of pressure. The ratio of the extinction coeffs. at 20° and -80° for  $\lambda$  3372—3151 Å. are recorded. There is no temp. effect at the absorption max. 85% of the atm. O<sub>3</sub> is at <11 km. altitude. L. J. J.

**Band spectrum of the sulphur molecule.** E. OLSSON (Nature, 1936, 137, 745).—The internuclear distance of the S mol. obtained from the rotational analysis of six main absorption bands is 1.88 Å.; this should replace the accepted val. of 1.60 Å. L. S. T.

**Absorption spectrum of water, aqueous solutions, and alcohols between 0.70 and 0.95  $\mu$ .** E. GANZ (Ann. Physik, 1936, [v], 26, 331—348).—The effect of temp. on the absorption bands of  $H_2O$  at 0.77 and 0.845  $\mu$  has been investigated. The displacement of the absorption max. at 0.77  $\mu$  with temp. shows a discontinuity at 40—45°, in common with many other properties of  $H_2O$ . The absorption const. at the max.  $\propto$  thickness of  $H_2O$ . The absorption is considerably affected by ions (cf. following abstract). The quasicryst. structure of  $H_2O$  is established by small ions, but distorted by large ones. The absorption spectra of MeOH, EtOH,  $Pr^oOH$ , and  $Bu^oOH$  have also been investigated. A. J. M.

**Effect of temperature on the absorption bands of water in salt solutions.** E. GANZ and W. GERLACH (Physikal. Z., 1936, 37, 358—359).—The displacement and sharpening of the  $H_2O$  absorption band at 0.762  $\mu$  by raising the temp. from 10° to 90° have been investigated both for pure  $H_2O$  and for aq. solutions. The band is strengthened but not displaced in chloride solutions, whilst it is sharpened and displaced towards shorter  $\lambda$  in nitrate, chlorate, and particularly perchlorate solutions. The effect of temp. on the position of the absorption max. is directly connected with the displacement of the max. caused by addition of salt at lower temp. There is equivalence between the effect of temp. and of ions on the structure of  $H_2O$ . A. J. M.

**Collision potentials of  $C^+$  and  $C^{++}$  ions in  $CO$ , deduced from  $D(CO)=6.9$  volts.** R. SCHMID (Z. Physik, 1936, 99, 626—632).—A dissociation energy of 6.9 volts for  $CO$  gives the potential of  $C^+$  and  $C^{++}$  over the  $CO_2$  ground level as 29 and 54 volts, respectively.  $CO_2$  dissociates thus:  $CO_2+5.47$  volts  $\rightarrow CO(X^1\Sigma)+O(^3P)$ ,  $CO(X^1\Sigma)+6$  volts  $CO(a^3\Pi)$ , and  $CO(a^3\Pi)+5.22$  volts  $C(^5S)+O(^3P)$ . A. B. D. C.

**'Stark effect on absorption bands of nitric oxide.** G. BLET (Rev. Opt. theor. inst., 1935, 14, 62—67; Chem. Zentr., 1935, ii, 1315).—No broadening of the rotational lines in the band of  $NO$  at 2260  $\mu$  was observed. J. S. A.

**Band spectra of the hydrides of lithium. III. Potential curves and isotope relations.** F. H. CRAWFORD and T. JORGENSEN, jun. (Physical Rev., 1936, [ii], 49, 745—752; cf. A., 1935, 1051).—Theoretical. N. M. B.

**Band spectra of alkaline-earth hydrides.** B. GRUNDSTROM (Z. Physik, 1936, 99, 595—606).—Rotation analysis and heats of dissociation are given for  $CaH$ ,  $SrH$ ,  $BaH$ , and  $MgH$ ; the latter are 15,000, 14,000, 13,000, and 23,000  $cm^{-1}$ , respectively. A. B. D. C.

**Absorption spectrum of aqueous chlorine and hydrogen peroxide vapour.** W. C. FERGUSON, L. SLOTIN, and D. W. G. STYLE (Trans. Faraday Soc., 1936, 32, 956—962).—Data are recorded for the extinction coeffs. of aq.  $Cl_2$  and  $HOCl$  solutions, and of  $HOCl$  and  $H_2O_2$  vapours, for a no. of  $\lambda > 210$   $\mu$ . L. J. J.

**Continuous absorption spectrum of hydrogen iodide.** C. F. GOODEVE and A. W. C. TAYLOR (Proc. Roy. Soc., 1936, A, 154, 181—187).—The ex-

tinction coeffs. of  $HI$  have been measured, and the approx. course of the upper potential energy curve is calc. from the eigenfunction of the ground state and the observed extinction. The results favour the dissociation into normal atoms. L. L. B.

**Band spectrum of boron fluoride.** H. M. STRONG and H. P. KNAUSS (Physical Rev., 1936, [ii], 49, 740—744; cf. Dull, A., 1935, 562).—The spectrum of  $BF$  excited by the electrodeless discharge in  $BF_3$  has been photographed at high and low dispersion. 16 bands, degraded to the violet, were observed in the range  $\lambda$  3712—2580, resembling the  $CO$  bands corresponding with similar electronic configurations. Data and a vibrational analysis are given. N. M. B.

**Band systems and structure of  $SiF$ .** R. K. ASUNDI and R. SAMUEL (Proc. Indian Acad. Sci., 1936, 3, A, 346—359).—A detailed analysis, using the experimental data of Johnson (cf. A., 1927, 1005), is given. N. M. B.

**Absorption spectra of halides and oxyhalides of sulphur, selenium, and tellurium.** S. L. HUSSAIN and R. SAMUEL (Current Sci., 1936, 4, 734—736).—Data are recorded for absorption max. and long- $\lambda$  limits, agreeing with linking energies calc. from thermochemical data. Different absorption regions in the di- and tetra-halides correspond with splitting off of one and two halogen atoms, whilst in the oxychlorides two halogen atoms are split off simultaneously. The linking energies are approx. additive. L. J. J.

**Absorption spectra of sodium and potassium in melts of their halogen salts.** E. MOLIWO (Nachr. Ges. Wiss. Gottingen, 1935, [ii], 1, 203—207; Chem. Zentr., 1935, ii, 1510—1511).—The melts show broad absorption bands the position of which depends on the metal alone, being at 790  $m\mu$  for Na halides and 980  $m\mu$  for K halides. No simple relation exists between these bands and the absorption spectrum of the colour centres in the solid crystals. J. S. A.

**Absorption spectra and linkage of inorganic salts in the vapour state.** M. I. HAQ and R. SAMUEL (Nature, 1936, 137, 907—908; cf. this vol., 661).—The absorption spectra of  $H_2SO_4$ ,  $K_2SO_4$ ,  $Ag_2SO_4$ , and  $ZnSO_4$  in the vapour state indicate covalent linking in this state. The suggested structural formula for  $NH_4NO_3$  is  $(O:)_2N^+O^-N(H)_4$  with 5 covalent linkings in the vapour state. L. S. T.

**Spectral study of phenylhydrazine and derivatives.** (MLLE.) D. BIQUARD (Bull. Soc. chim., 1936, [v], 3, 909—916).—Ultra-violet absorption spectra of derivatives of  $NHPh \cdot NH_2$  and some aromatic diamines have been determined. Complex chromophores are indicated. E. S. H.

**Effect of X-rays on methylene-blue and on trimethylthionine.** W. STENSTROM and H. R. STREET (Proc. Soc. Exp. Biol. Med., 1935, 32, 1498—1500).—Absorption by both dyes is reduced, reduction in methylene-blue being  $>$  in trimethylthionine. R. N. C.

**Ultra-violet absorption spectra of certain proteins and amino-acids.** C. B. COULTER, F. M.

STONE, and E. A. KABAT (J. Gen. Physiol., 1936, 19, 739—752).—The absorption spectra (2500—3000 Å.) of a no. of proteins consist of 6—9 bands similar to those of tryptophan, tryosine, and phenylalanine shifted 10 to 35 Å. towards longer  $\lambda$ . That of pneumococcus type I antibody is similar to that of  $\psi$ -globulin.

H. G. R.

Effect of solvents on the spectral curve of vitamin-A.—See this vol., 763.

Absorption spectra of oestrone and related compounds in alkaline solution. R. K. CALLOW (Biochem. J., 1936, 30, 906—908).—Addition of NaOH to solutions of oestrone (I), oestradiol, and oestriol causes a shift of the ultra-violet absorption band towards the visible region but on the Me ether of (I) has no effect. The change is due to salt formation of the phenolic group in the 3 position and with (I) is not due to enolisation of the 17-keto-group.

P. W. C.

Absorption spectra of diphenyls.—See this vol., 723.

Christiansen filter effect in the infra-red. R. B. BARNES and L. G. BONNER (Physical Rev., 1936, [ii], 49, 732—740).—Prep., characteristics, and factors affecting data from the use of the filters are discussed. Results and curves are given for MgO, quartz, calcite, marble, CaSO<sub>4</sub>, the halides of Na, K, and Rb, LiF, CsCl, CsBr, TiCl, TiBr, and TlI dispersed in air, and for quartz, MgO, and NaCl dispersed in org. liquids. Transmission between 3  $\mu$  and 90  $\mu$  was measured.

N. M. B.

Infra-red spectra of H<sub>2</sub>S, HDS, and D<sub>2</sub>S. C. R. BAILEY, J. W. THOMPSON, and J. B. HALE (Physical Rev., 1936, [ii], 49, 777).—Data are contrasted and compared with those found by Nielsen (cf. this vol., 545).

N. M. B.

Spectra [of substituted methanes] in the near infra-red. C. CORIN (J. Chim. phys., 1936, 33, 427—428).—Data are recorded for CH<sub>4</sub>, MeCl, CH<sub>3</sub>Cl, CHCl<sub>3</sub>, and C<sub>6</sub>H<sub>14</sub> from 0.88 to 2.7  $\mu$ . The bands can be derived as harmonics or combinations of the four fundamental frequencies of the Raman spectra.

R. C. M.

Extreme infra-red dispersion of polar and non-polar liquids. C. H. CARTWRIGHT and J. ERRERA (Proc. Roy. Soc., 1936, A, 154, 138—157).—The absorption and reflexion of several polar and non-polar liquids have been measured between  $\lambda\lambda$  of 50 and 150  $\mu$ . Vals. calc. for the at. polarisation were in good agreement with those determined for mols. in the gaseous state. The relaxation times and apparent radii of the polar mols. were calc. from measurements on the abs. intensity of absorption. On diluting the liquids in non-polar solvents, a characteristic absorption band in H<sub>2</sub>O disappeared; this is therefore attributed to a quasi-cryst. structure. In all the other substances, however, the characteristic absorption bands remained in dil. solution, and are therefore due to intramol. vibrations.

L. L. B.

Raman spectra of "heavy" arsine, silicochloroform, and silicobromoform. J. M. DELROSSE (Nature, 1936, 137, 868).—Frequencies are recorded.

L. S. T.

Raman spectra of carbon and silicon tetrafluorides. D. M. YOST, E. N. LASSETTRE, and S. T. GROSS (J. Chem. Physics, 1936, 4, 325).—Data are recorded for liquid and gaseous states.

L. J. J.

Influence of temperature on Raman bands of water at  $\Delta\nu=510$ —780 cm.<sup>-1</sup> G. BOLLA (Nuovo Cim., 1935, [ii], 12, 243—246; Chem. Zentr., 1935, ii, 1316).—The bands do not disappear with rise of temp. (cf. Magat, A., 1934, 1056).

J. S. A.

Raman spectrum and electrolytic dissociation of selenic acid. C. S. VENKATESWARAN (Proc. Indian Acad. Sci., 1936, 3, A, 307—317; cf. this vol., 547; Ganesan, A., 1935, 11).—Raman data are given for the state of solid, liquid, and aq. solution of concn. range 92.5—7.5 wt.-%. Marked changes in the position, intensity, and character of the lines are attributed to dissociation steps H<sub>2</sub>SeO<sub>4</sub>  $\rightarrow$  HSeO<sub>4</sub>' + H' and HSeO<sub>4</sub>'  $\rightarrow$  SeO<sub>4</sub>'' + H', the first stage starting from the solid and the second stage from about 50% concn. Results are compared with those for H<sub>2</sub>SO<sub>4</sub> (cf. Bell, A., 1935, 807) and conclusions on structure and apparent band shifts are drawn. Changes in the lines during solid-liquid transition are characteristic of heteropolar linkings in the acid mols.

N. M. B.

Raman effect in liquid ammonia and solutions of nitrates in liquid ammonia. G. COSTEANU (Compt. rend., 1936, 202, 1432—1434).—A new line, 3460 cm.<sup>-1</sup>, in liquid NH<sub>3</sub> is recorded. Dissolution of NH<sub>3</sub> in H<sub>2</sub>O produces a shift of +10—15 cm.<sup>-1</sup> for the lines 3210, 3300, 3380 cm.<sup>-1</sup>. The line 1048 cm.<sup>-1</sup> of NO<sub>3</sub>' in H<sub>2</sub>O solution is displaced towards shorter  $\lambda$  in NH<sub>3</sub> solution.

L. J. J.

Raman effect and its applications in organic chemistry. II. A. DADIEU (Angew. Chem., 1936, 49, 344—349).—A review.

H. J. E.

Raman spectrum of deuterobromoform. O. REDLICH and W. STRICKS (Monatsh., 1936, 67, 328—331; cf. A., 1935, 685).—The Raman spectrum of CDBr<sub>3</sub> has been measured and compared with that of CHBr<sub>3</sub>, the relationship being in accord with the authors' theory. Comparison of data for PH<sub>3</sub> and PD<sub>3</sub> indicates that there are missing frequencies for PH<sub>3</sub> between 550 and 780 cm.<sup>-1</sup> and for PD<sub>3</sub> between 790 and 1115 cm.<sup>-1</sup>

J. W. S.

Raman effect and dipole moment in relation to free rotation. III. Raman spectra of solid ethylene halides. S. MIZUSHIMA, Y. MORINO, and S. NOZIRI (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 63—70; cf. A., 1935, 428).—The Raman spectra and dipole moments of solid and liquid C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> and C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub> have been determined. It is concluded that the *trans*-configuration is adopted in the solid state, whilst in solutions the deviation from the *trans*-position varies with the solvent.

R. S.

Raman spectra of metallic formates and constitution of formic acid. C. S. VENKATESWARAN (Current Sci., 1936, 4, 736—737; cf. this vol., 268).—A reply to Halasyam (*ibid.*, 663). Raman spectral evidence for the presence of the -CHO group in HCO<sub>2</sub>H is summarised.

L. J. J.

Deuterium compounds. II. Raman spectra of deuterioacetic acid and deuterioacetone. W.

ENGLER (Z. physikal. Chem., 1936, B, 32, 471—474).—The spectra of  $\text{AcOD}$ ,  $\text{CD}_3\cdot\text{CO}_2\text{D}$ , and  $\text{CO}(\text{CD}_3)_2$  have been determined. R. C.

Raman spectrum of oxalic acid. J. H. HIBBEN (J. Chem. Physics, 1936, 4, 323—324).—Polemical against Angus and Leckie (this vol., 269). L. J. J.

[Raman spectrum of oxalic acid.] W. R. ANGUS and A. H. LECKIE (J. Chem. Physics, 1936, 4, 324).—A reply to the above. L. J. J.

Raman spectra of  $\beta$ -methyl- $\Delta^a$ - and  $\Delta^b$ -butene. —See this vol., 819.

Raman effect. LV. *cyclo*Pentyl derivatives. K. W. F. KOHLRAUSCH, A. W. REITZ, and W. STOCKMAIR (Z. physikal. Chem., 1936, B, 32, 229—236).—The Raman spectra of *cyclopentanone* and  $\text{C}_5\text{H}_n\text{X}$  ( $\text{X}=\text{OH}$ ,  $\text{NH}_2$ , Me, SH, Cl, Br, I) have been determined. The effect of substitution differs characteristically from that in *cyclohexyl* derivatives (this vol., 547), which is ascribed to the two C-H linkings of each  $\text{CH}_2$  group being equiv. in direction in a flat C- ring, but not in a non-planar  $\text{C}_6$  ring. The no. of lines suggests that the *cyclohexyl* halogen derivatives exist in two forms different in configuration. R. C.

Raman spectra of compounds belonging to the anethole, safrole, and eugenol groups. B. STSZ, E. PERROTTET, and E. BRINER (Helv. Chim. Acta, 1936, 19, 548—558).—Raman spectra are given for estragol, natural anethole (I) (=isomerised estragol), safrole, isosafrole, heliotropin, eugenol and its Me and Et ethers, isoeugenol (II) and its Me ether, vanillin and its Me ether (cf. A., 1935, 1446). They show the frequencies characteristic of the Ph nucleus, aliphatic and aromatic C-H, C=O, and C=C (in  $\text{CH}_2\text{R}\cdot\text{CH}:\text{CH}_2$  1638, in  $\text{CHR}:\text{CHMe}$  1654  $\text{cm}^{-1}$ ) linkings. (I) probably contains 100% *trans*-, (II) 80% *trans*- and 20% *cis*-compounds. R. S. C.

Raman effect. LVI. Raman effect and free rotation. IV. K. W. F. KOHLRAUSCH and (GROSS PRINZ) YPSILANTI (Z. physikal. Chem., 1936, B, 32, 407—416).—The Raman spectra of various straight-chain compounds, principally of the type  $\text{X}\cdot[\text{CH}_2]_3\cdot\text{Y}$ , have been determined. The results show that if the mol. of a dihalogenated paraffin with a four- or five-membered chain is of such character that by free rotation various spatial forms may be realised the no. of lines in the vibrational spectrum is increased. ( $\text{CHBrMe}$ )<sub>n</sub> apparently exists only in a *trans* form; the Me groups appear to give this form the preponderating stability. R. C.

*cyclo*Propane. Raman spectrum and polymerisation by ultra-violet light. L. HARRIS, A. A. ASHDOWN, and R. T. ARMSTRONG (J. Amer. Chem. Soc., 1936, 58, 852—853).—The Raman spectrum of *cyclopropane* (I) consists of 14 frequencies (cf. Lespiau *et al.*, A., 1932, 675; Kohlrausch and Koppl, A., 1934, 942); the strongest is at 1191  $\text{cm}^{-1}$ . A Hg-sensitised polymerisation of (I) to a viscous oil, b.p. about 300°/760 mm., occurs with Hg-radiation of  $\lambda$  2536 Å. H. B.

Raman spectrum of some substituted *cyclohexenes*. E. CANALS, M. MOUSSERON, L. SOUCHE, and P. PEYROT (Compt. rend., 1936, 202, 1519—

1521).—The Raman spectra of 1-methyl-, -ethyl-, -propyl-, -isopropyl-, -butyl-, -phenyl-, -benzyl-, and -*cyclohexyl*- $\Delta^1$ -*cyclohexene* (I) are similar to those of other *cyclohexenes* (cf. A., 1934, 10). The line 825  $\text{cm}^{-1}$  of *cyclohexene* is replaced by two in the regions 747—772 and 825—850, and in the Me, Et, and Pr derivatives the frequency of the line 758 varies inversely as the no. of C. The line 1440, characteristic of  $\text{CH}_2$ , is accompanied by a satellite 1453 in all cases except (I) which gives one line at 1443. R. S.

Raman effect and problems of constitution. X. Strain theory. K. W. F. KOHLRAUSCH and R. SEKA (Ber., 1936, 69, [B], 729—743).—Measurements are recorded for *cyclohexene*, *cyclopentane* (I), *cyclopentene*, *cyclopentadiene*,  $\alpha$ -*dicyclopentadiene* (II) and its  $\text{H}_2$ - and  $\text{H}_4$ -derivatives,  $\text{Me}_2$   $\alpha$ -*cis*-3 : 6-*endomethylene*- $\Delta^4$ -tetra- and -hexa-hydrophthalate,  $\text{Me}$  2 : 5-*endomethylene*- $\Delta^3$ -tetra- and -hexa-hydrobenzoate. The transition of (I) to *cyclopropane*, which according to model is accompanied by an increase in strain and according to thermochemistry by an increase in energy, involves a decrease in strength of the C-C linking when the spectra are evaluated by an approx. theoretical treatment of the vibration forms; the corresponding increment of the energy content is of the same order of magnitude as that determined thermochemically. In the unsaturated plane, five-membered ring for which the approx. strain in the ring according to model and, in particular, the deformation of the angle at the double linking cannot account for the increased energy content, the C:C frequency suffers a depression, probably mainly due to a diminution in the strength of the double linking. Different frequencies are shown by the two double linkings in (II) one of which is situated (Alder-Stein) in the slightly strained *cyclopentene* ring, whereas the other belongs to the greatly strained *dicycloheptene* ring. In this case the deformation of the angle at the double linking in the strained ring is not calculable, but the increase of its energy content is thermochemically established. The lower C:C frequency is due to the more slightly strained ring. The calc. increase of the energy content from the depression of the frequency agrees in order of magnitude with the results obtained thermochemically. H. W.

Nature of intermolecular oscillations in some organic crystals. S. C. SIRKAR (Indian J. Physics, 1936, 10, 109—116).—The Raman spectra of  $\text{C}_7\text{H}_8$  and  $\text{Ph}_2\text{O}$  have been investigated in the solids and in solution in MeOH and  $\text{C}_6\text{H}_{12}$ , at different temp. Certain of the Raman lines of these substances seem to be due to intermol. vibrations in groups of mols. which persist in the case of  $\text{Ph}_2\text{O}$ , but disappear almost completely in the case of  $\text{C}_{10}\text{H}_8$  when the substance is melted or dissolved. The directions of the displacements of the  $\text{C}_{10}\text{H}_8$  lines with temp. are in agreement with the lattice oscillation theory of Gross and Vuks (A., 1935, 564, 914), but the extent of the displacement is different for different lines, and is too great to be explained by this theory. The absorption spectra of  $\text{Ph}_2\text{O}$  and  $\text{C}_{10}\text{H}_8$  in the solids and in solution in MeOH and  $\text{C}_6\text{H}_{12}$  have also been investigated.

The positions of the bands for solid  $C_{10}H_8$  are different from those for solutions or vapour, but in the case of  $Ph_2O$  there is no appreciable difference in the absorption spectra of the solid, liquid, or solution. This may be due to the polar character of  $Ph_2O$ , which would allow the formation of stable polymerised groups, not completely broken down even in solution.

A. J. M.

Raman spectra and decomposition reactions of ozonides.—See this vol., 839.

Variation of intensity of scattered light with temperature. C. V. JOGARAO (Proc. Indian Acad. Sci., 1936, 3, A, 377—383).—The intensity of scattering increases in  $C_6H_6$  and  $AcOH$ , and decreases in  $PhNO_2$  and  $HCO_2H$ , with rise of temp. The differences are due to the aggregate effect of density scattering and orientation scattering; on separation, the former always increases with temp., and the latter sometimes increases ( $C_6H_6$ ) and sometimes decreases ( $PhNO_2$ ,  $AcOH$ , and  $HCO_2H$ ).

N. M. B.

Mechanism of the emission of light by chemical reactions. R. AUDUBERT (Compt. rend., 1936, 202, 406—407; cf. this vol., 407).—It is suggested that mols., after reaction, may retain both their energy of activation and the energy of reaction, and that their subsequent collisions of the fourth kind may give rise to the emission of quanta of high energy. Calculations for certain reactions are in accord with experiment.

J. W. S.

Emission of ultra-violet light during the anodic oxidation of aluminium. R. AUDUBERT and O. VIKTORIN (Compt. rend., 1936, 202, 1504—1507; cf. A., 1935, 1055).—The intensity of the ultra-violet light emitted decreases with time. There is no emission from an Al cathode.

R. S.

Thermoluminescence and chemiluminescence. H. STEINMETZ and M. ALT (Z. Krist., 1936, 92, 363—371).—These effects are discussed for several cases, especially the influence of impurities and the separation of chemical from thermal effects.

B. W. R.

Fluorescence of terbium salts in solutions. A. FILIPPOV, J. LARIONOV, and A. SEIDEL (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 253—256).—The fluorescence spectrum of aq. solutions of salts of the Y series of earths is ascribed entirely to  $Tb^{+++}$ . The intensity of the fluorescence depends largely on the method of prep. of the solution, being increased by heating the salt before dissolution, and destroyed by the presence of traces of  $HNO_3$ . The method may be used in the detection of traces of Tb.

A. J. M.

Inhibition of the fluorescence of methylene-blue by ferrous salts. K. WEBER (Naturwiss., 1936, 24, 318).—The observation of Hellstrom (this vol., 270) that the fluorescence of methylene-blue is inhibited by  $Fe^{++}$  ions is related to the fading of vat dyes when illuminated in presence of  $Fe^{++}$  ions (cf. this vol., 300), both being dependent on the more positive redox potential of the activated dye mol. (or ion) and its consequent reaction with  $Fe^{++}$ . The variation of the effect with  $p_H$  is attributed to the influence of the latter on the redox potential of the dye and of the ferro-ferrous system.

W. O. K.

Phosphorescence and long-period fluorescence of organic dyes. P. PRINGSHEIM and H. VOGELS (J. Chim. phys., 1936, 33, 345—355).—Measurements of the decrease of intensity of light emitted by tryptaflavine adsorbed on  $SiO_2$  gel, when activation ceases, in high vac. at  $39^\circ$ ,  $18.5^\circ$ ,  $-37^\circ$ , and  $-190^\circ$  show that at  $-190^\circ$  the emission is a long-period fluorescence, whilst at the higher temp. it is a true phosphorescence in agreement with Jablonski (A., 1935, 682).

R. C. M.

Fluorescence of porphyrins. II. A. STERN and H. MOLVIG (Z. physikal. Chem., 1936, 176, 209—225; cf. this vol., 270).—Fluorescence spectra in dioxan have been determined. The displacement of the fluorescence band max. caused by partial alkyl substitution of the porphin system (I) is not always in the same direction as the displacement of the absorption max. The effect on the fluorescence of hydrogenation of the vinyl groups of (I) and the dihydro-porphin system has been examined. Me chlorophyllide *a* has a fluorescence spectrum of four bands, showing that Mg has a considerable effect on the fluorescence. The considerable similarity in the fluorescence spectra of  $\beta\delta$ -di-iminocoproporphyrin II Me<sub>4</sub> ester (II) (this vol., 86) and coproporphyrin II Me<sub>4</sub> ester shows that (II) must have a porphyrin structure and therefore contain *tert.* N. In aq. HCl solution (II) does not fluoresce, presumably due to salt formation at the  $\beta\delta$ -N atoms. Pyrromethenes do not fluoresce in HCl. It appears that fluorescence in the visible is caused by the presence of the pyrromethene structure in (I). When fluorescence is absent in HCl solution it may be inferred that N is present instead of the methene groups of (I). In porphyrins substituted only with alkyl there is present the same (I) as in all other normal porphyrins, and not a special form of (I). The fluorescence of the porphyrins is caused by the conjugated pyrrole nuclei, and the fluorescence spectrum is affected by the smallest changes in this structure.

R. C.

Fluorescence and duration of emission of fluorocyclene. M. MAKOWIECKA (Acta. phys. polon., 1934, 2, 357—359; Chem. Zentr., 1935, ii, 1336).—The fluorescence of fluorocyclene (I) in various solvents varies little with the solvent, and the spectral distribution of intensity is independent of the exciting  $\lambda$ . All four fluorescence bands exhibit the same degree of polarisation; at low temp. they become narrower and displaced towards longer  $\lambda$ . The mean duration of emission is  $2.9 \times 10^{-7}$  sec.

J. S. A.

Methods of determining the Volta effect. H. GERICKE (Physikal. Z., 1936, 37, 327—338).—A critical examination of the ionisation, condenser, photo-electric, and thermionic methods is given.

A. J. M.

Determination of the Volta effect for pure metals. F. KRÜGER and G. SCHULZ (Ann. Physik, 1936, [v], 26, 308—330).—The Volta effect was measured for a series of metals by a photo-electric method. For W, Ta, Fe, Ni, Ag, Cu, and Mo the

effect disappeared when the metals were completely outgassed by long heating in vac., and reappeared when the treated metals were allowed to remain in damp air. This supports the chemical theory of the effect. The photo-electric effect was also determined for these metals. The effect of heating in vac. was similar to that on the Volta effect, except at the beginning of the heating, where the photo-effect increases on removal of  $H_2O$  and gases from the metal whilst the Volta effect at once diminishes, being dependent only on the  $H_2O$  film. A. J. M.

**Photo-electric investigations of semi-conductors.** G. BERGMANN and J. HANSLER (Z. Physik, 1936, 100, 50—79).—Electrons in many semi-conductors move under the influence of light alone. Spectral sensitivities of these substances show max. that move to increased  $\lambda$  with increased mol. wt., provided the ions in question come from one column of the periodic table. A. B. D. C.

**Photo-effect for thin layers of aluminium and tantalum oxide.** G. ROSENTHAL (Z. Physik, 1936, 99, 607—621).—Ta oxide cells give greater photo-effects than the Al cells. A. B. D. C.

**Photo-electric sensitivity of palladium-silver alloys saturated with hydrogen.** F. KRUGER and W. KALLENBACH (Z. Physik, 1936, 99, 743—750).—Max. sensitivity occurs at 20% Ag with a subsidiary max. at 60 to 65% Ag, and these coincide with alloys of max.  $H_2$  absorption (cf. Schniedermann, A., 1932, 789). A. B. D. C.

**Internal photo-effect in potassium chloride under illumination with ultra-violet light.** N. KALABUCHOV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 251—252).—On the basis of an energy scheme due to Tartakovski (A., 1935, 1306) it is to be expected that the internal photo-effect will occur with the allochromatic crystals NaCl and KCl without preliminary treatment, when they are irradiated by  $\lambda$  1602 and 1841 Å., respectively. This effect has been observed with KCl crystals using a  $H_2$  discharge tube with  $CaF_2$  window as light source. A. J. M.

**Crystal photo-effect for coloured Rochelle salt.** F. SEIDL (Z. Physik, 1936, 99, 633—634).—Rochelle salt coloured by radioactive radiation shows a secondary photo-effect. A. B. D. C.

**Nature of the surface conduction of cuprous oxide.** L. DUBAR (Compt. rend., 1936, 202, 1330—1332; cf. A., 1935, 1055).—The surface conduction is negligible after removing gas or forming a fresh surface in vac. H. J. E.

**Normal conductivity and reversion effects of solid paraffin subject to  $\gamma$ -rays.** F. SEIDL (Z. Physik, 1936, 99, 695—709).— $\gamma$ -Radiation increases normal conductivity and influences reversion phenomena. The greatest resistance of paraffin of m.p. 52—53° is  $3.3 \times 10^{18}$  ohm cm. A. B. D. C.

**Electrical conductivity of oxides of cobalt and iron. Recrystallisation of zinc oxide.** C. WAGNER and E. KOCH (Z. physikal. Chem., 1936, B, 32, 439—446).—The sp. conductivity,  $\kappa$ , of CoO and FeO at 800—1000° increases with the  $O_2$  pressure,  $p$ ; conduction is of the electron deficiency type

(cf. A., 1933, 888). For  $Co_3O_4$ ,  $Fe_3O_4$ , and  $Fe_2O_3$  at 900—1000°  $\kappa$  is practically independent of  $p$ . For  $Co_3O_4$  at room temp.  $\kappa$  varies with the previous treatment, i.e., depends on the presence of an excess of O, which varies with the temp. at which equilibration with the gas phase was last effected previously. The conductivity at high temp. is ascribed to the distribution of  $Co^{++}$  and  $Co^{+++}$  ions being partly irregular. When heated in  $H_2$  at 450° ZnO undergoes recrystallisation to a greater extent than if heated in  $O_2$  owing to both its elements being transportable through the gas phase as at. Zn and  $H_2O$ . R. C.

**Liquid ammonia as a solvent. VI. Dielectric constant of liquid ammonia.** H. M. GRUBB, J. F. CHITTRUM, and H. HUNT (J. Amer. Chem. Soc., 1936, 58, 776).—Vals. at 5°, 15°, 25°, and 35° are 18.94, 17.82, 16.90, and 16.26, respectively.

E. S. H.

**Determination of the dielectric constants of organic liquids at radio frequencies. II. Chlorobenzene and ethylene dichloride.** R. M. DAVIES (Phil. Mag., 1936, [vii], 21, 1008—1029; cf. this vol., 271).—The dielectric consts. of PhCl and  $C_2H_4Cl_2$  at 20°, 25° were 5.713<sub>5</sub>, 5.626<sub>3</sub> and 10.64<sub>7</sub>, 10.35<sub>8</sub>, respectively. H. J. E.

**Dispersion and absorption by viscous liquids at high frequencies.** W. DAHMS (Ann. Physik, 1936, [v], 26, 177—192).—Dielectric consts. and conductivities of fructose (I) and sucrose (II) solutions and  $PhNO_2$  for  $\lambda$  1.47—8.30 m. have been measured by Wenk's method (A., 1933, 925). The results with  $PhNO_2$  agree with Debye's theory. With the sugars, the dipole conductivity increases more slowly than  $\propto 1/\lambda^2$ , whilst at short  $\lambda$ ,  $\epsilon$  is < the statistical val. in the case of (I), but not of (II). L. J. J.

**Apparent dipole moments of benzene, *p*-dichlorobenzene, diphenyl, 4 : 4'-dichlorodiphenyl, and carbon disulphide in polar solvents.** C. G. LE FEVRE and R. J. W. LE FEVRE (J.C.S., 1936, 487—491; cf. this vol., 140).—The dielectric consts. and  $d$  of solutions of the above substances in  $C_6H_6$ ,  $CHCl_3$ ,  $CCl_4$ ,  $PhCl$ ,  $PhNO_2$ ,  $NPhMe_2$ ,  $EtOBz$ , and  $PhCN$  have been determined. Assuming that the usual evaluation of dipole moments is valid for these cases, the data indicate that the induced moments of the solute  $\propto$  the dipole moment of the solvent, approx. The results suggest that the dipolar solvent units cluster around the solute with their dipoles in parallel rather than antiparallel alignment. The model leads to polarisabilities of the solute mols. in general accord with other vals. Alternative interpretations are discussed. J. G. A. G.

**Solvent effect in dipole-moment measurements. Polarisations of chloro- and nitrobenzene, chloroform, and bromoform in polar solvents.** R. J. W. LE FEVRE and P. RUSSELL (J.C.S., 1936, 491—495; cf. this vol., 140).—Dielectric consts. and  $d$  of binary mixtures of the above substances and of binary mixtures with  $C_6H_6$  and  $PhMe$  have been determined, and polarisations,  $P$ , and apparent dipole moments,  $\mu$ , calc. The tendency towards organised structure in liquids leads to models whereby the effects on  $P$  and  $\mu$  of the mutual

interaction of the mols. may be inferred. In conformity with the theory, the  $\mu$  of  $\text{PhNO}_2$  and  $\text{PhCl}$ , separate and mixed, in the liquid state are  $<$  in the gas state. The  $\mu$  of  $\text{PhNO}_2$  and  $\text{PhCl}$  are slightly depressed by dissolution in  $\text{CHCl}_3$ , but the  $\mu$  of  $\text{CHCl}_3$  and  $\text{CHBr}_3$  are raised by dissolution in  $\text{PhNO}_2$  and  $\text{PhCl}$ . J. G. A. G.

**Apparent dipole moment of paraldehyde in various solvents.** R. J. W. LE FEVRE and P. RUSSELL (J.C.S., 1936, 496—497).—The dielectric consts. and  $d$  of paraldehyde (I) and solutions of (I) in nine polar and non-polar solvents have been determined. Polarisation have been calc. The apparent dipole moment in the solvents is 1.68—2.26 D, that of (I) alone being 1.89 D. J. G. A. G.

**Refraction and dispersion of gases and vapours. VIII. Variation with temperature of molecular refraction of carbon dioxide and acetic acid vapour.** H. GOLDSCHMIDT and P. HOLEMANN (Z. physikal. Chem., 1936, B, 32, 341—352; cf. A., 1934, 348).—The refractivity,  $R_L$ , for 546.1 m $\mu$  of  $\text{CO}_2$  is const. to within 0.1% at 15—400°, but between 400° and 800° there is a rise of  $\sim 0.6\%$ , which is ascribed to the thermal excitation of higher vibrational states in the mol. With  $\text{AcOH}$  at 120—300°  $R_L$  falls with rising temp., and the effect on it of  $d$  and temp. indicates that the fall is due to dissociation of the double mols. Association to double mols. increases  $R_L$  by  $\sim 1.5\%$ . This increase may be due to increase in the probabilities of electron transition owing to mutual perturbation of the mols. in the complexes, and to the electron frequency determining  $R_L$  depending on the ionisation energy of the mol., which has been shown to fall on association. R. C.

**Change in refractivity and dispersion on transition from the vapour to the liquid state.** P. HOLEMANN (Z. physikal. Chem., 1936, B, 32, 353—368).—The mol. refractivity,  $R_L$ , of liquid  $\text{SiCl}_4$ ,  $\text{SnCl}_4$ , and  $\text{SnBr}_4$  at  $\lambda$  486.1, 587.6, and 656.3 m $\mu$  are represented by the dispersion formula  $R_L - R_\infty \lambda^2 / (\lambda^2 - \lambda_0^2)$ .  $R_L$  is smaller for the liquid than for the vapour state by an amount  $\Delta R$  which shows no clear parallelism with the dipole moment but increases in the order  $\text{CCl}_4 < \text{SiCl}_4 < \text{SnCl}_4 < \text{SnBr}_4$ . A similar effect for other compounds is shown by existing data. This change in  $R_L$  is best explained by supposing it to result from the superimposition of two effects: association in the liquid state, causing a rise in  $R_L$  and deviation of the internal field in the liquid from the Lorentz-Lorenz internal field, causing a fall in  $R_L$ . With  $\text{H}_2\text{O}$  a third at most of  $\Delta R$  can be explained by increase on condensation of the effect of the infra-red absorption bands on the refraction in the visible. On condensation  $R_\infty$  and  $\lambda_0$  also fall. R. C.

**Decrease in refraction of electrolyte solutions.** T. NEUGEBAUER (Z. Physik, 1936, 99, 677—687).—Theoretical. Changes in refraction of an electrolyte solution are not due to Debye effects, but to true association. A. B. D. C.

**Anisotropy of the optical polarisation field in liquids. III.** B. S. R. RAO (Proc. Indian Acad. Sci., 1936, 3, A, 369—376).—The mol. refractivity of  $\text{PhNO}_2$  increases with temp., and for  $\text{H}_2\text{O}$  diminishes

slightly; for  $\text{AcOH}$  and  $\text{HCO}_2\text{H}$  it increases to a certain temp. and then diminishes. The coeffs. of anisotropy of the optical polarisation field are calc. for  $\text{AcOH}$  and  $\text{PhNO}_2$ . In the former, the polarisation field becomes more anisotropic, and in the latter, more isotropic, with rising temp. N. M. B.

**Variation of double refraction in celluloid with the amount of permanent stretch at constant temperature and at different temperatures.** F. C. HARRIS and B. R. SETH (Proc. Physical Soc., 1936, 48, 477—487).—Residual double refraction was measured at const. temp. at a no. of  $\lambda\lambda$  in the visible spectrum for specimens of celluloid subject to different amounts of permanent stretch by stretching beyond the elastic limit. Dispersion followed the law  $n/\lambda^2 = A - B\lambda$ , where  $n$  is the permanent double refraction at  $\lambda$  and  $A$  and  $B$  are consts.  $n$  had a max. for some val.  $\lambda_m$ , the vals. of  $\lambda_m$  increasing with permanent stretch. Temp. effects on dispersion and on  $\lambda_m$  were investigated. N. M. B.

**Dispersion of magnetic rotation of liquid mixtures.** H. POLTZ (Z. physikal. Chem., 1936, B, 32, 243—273; cf. A., 1932, 678).—It is deduced theoretically that  $\varphi = M[\omega]n\lambda^2/(n^2 + 2)^2$ , where  $M[\omega]$  is the mol. magnetic rotation, should have properties similar to those of the mol. refractive power,  $R_L$ , e.g., should obey the mixture rule.  $[\omega]$  in the visible and ultra-violet,  $n$  in the visible, and  $d$  have been measured for eight binary mixture over the whole concn. range.  $M[\omega]$  is additive primarily in mixtures with large association complexes or without sp. intermol. effects, whilst  $\varphi$  approximates to additivity most closely in non-associated mixtures. In general,  $R_L$  runs parallel with  $\varphi$ , and  $R_G$  with in mixtures. R. C.

**Kerr effect in polar molecules.** O. SPECCHIA and N. DALLAPORTA (Nuovo Cim., 1935, [ii], 12, 15—25; Chem. Zentr., 1935, ii, 1316).—The Kerr const. for castor oil has been determined at 21°, and an expression derived for its variation with temp. J. S. A.

**Maxwell effect in liquids.** G. G. PALDHIAKAR (Phil. Mag., 1936, [vii], 21, 1125—1130).—An expression is derived for the Maxwell const. which is in accord with experimental data on the birefringence in state of viscous flow for 4 paraffins and 9 aromatic compounds. J. W. S.

**Uses of the polar molecule concept in elementary chemistry.** S. J. FRENCH (J. Chem. Educ., 1936, 13, 122—130). L. S. T.

**Structure of the formate ion.** P. A. SMALL and J. H. WOLFENDEN (Nature, 1936, 137, 781).—A criticism (cf. this vol., 663). The slowness of the exchange process between the formate ion and  $\text{D}_2\text{O}$  does not support the views of Ray and Sarkar (*loc. cit.*). With  $\text{HCO}_2\text{K}$  in neutral solution 8% exchange occurs in 8 days at 100°; the exchange is accelerated in presence of alkali. L. S. T.

**Electronic theory of organic chemistry. V. Relations between the structure, reaction capacity, and polymerisation of organic compounds.** V. RASUMOVSKI (Bull. Soc. chim., 1936, [v], 3, 798—817).—A discussion. E. S. H.

**Orbital valency and directed properties in the theory of the chemical linking.** I, II. G. NORDHEIM-POSCHL (Ann. Physik, 1936, [v], 26, 258—280, 281—307).—An extension of the Heitler-London theory. Ground states of diat. mols., models of polyat. mols., theory of energy of combination, and double linkings are considered. A. J. M.

**Metallic binding.** I. P. GOMBAS (Z. Physik, 1936, 99, 729—742).—Statistical methods, applied to a lattice of positive ions surrounded by an electron gas, explain absence of conductivity from solid  $H_2$ , and give good vals. for the lattice const., lattice energy, heat of sublimation, and compressibility of K.

A. B. D. C.

**Metallic binding according to the combined approximation procedure.** H. HELLMANN and W. KASSATOTSCHKIN (J. Chem. Physics, 1936, 4, 324—325; cf. A., 1935, 278, 1058).—Calc. vals. for heats of sublimation and  $d_0$  are in satisfactory agreement with experimental data for Na, K, Rb, and Cs.

L. J. J.

**Wave-mechanical treatment of the LiH molecule.** J. K. KNIPP (J. Chem. Physics, 1936, 4, 300—307). Theoretical.

L. J. J.

**Rotation-vibration wave equation for a polyatomic molecule.** M. ELIASHEVITSCH (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 295—298).—Mathematical.

A. J. M.

**Mechanism of addition to double linkings.** III. **Molecular forces between benzoquinone and cyclopentadiene.** A. WASSERMANN (J.C.S., 1936, 432—436).—London's approximation formula,  $= 3/2 \times P_k P_l / R^6 \times \Delta E_k \times \Delta E_l / (\Delta E_k + \Delta E_l)$  ( $R$  = distance between mols.  $k$  and  $l$ ) for the attraction energy for simple mols. due to the "dispersion effect" (A., 1930, 1239; 1931, 149) is extended to calculate energies between large org. mols. From  $\mu$  of C:O and C:C linkings, vals. of polarisability  $P$  are calc., and  $\Delta E$  for the conjugated double linking from an absorption band at 2400 Å. in benzoquinone (I) vapour. The lattice energy between mols. of the (I) lattice is 14.6 kg.-cal. per mol. Neglecting kinetic energy of the crystal and repulsive forces between mols., this should approximate to heat of sublimation (published val., 15 kg.-cal. per mol.). Lattice energy calc. on dipole and dipole-induction energy alone is only 7 kg.-cal. per mol. Similarly, attraction energies (due to dispersion effect) between (I) and cyclopentadiene in configurations suitable for (a) 1:2-, (b) *exo*-1:4-, and (c) *endo*-1:4-addition are calc. The val. is 9—10 kg.-cal. greater for (c) than for (a). Vals. are compared with the dipole-induction energies (cf. *loc. cit.*). E. W. W.

**Binding energies of molecular compounds of mono- and di-phenyl-polyene- and-polyinehydrocarbons with *s*-trinitrobenzene, and physical nature of secondary valency forces.** G. BRIEGLER and J. KAMBEITZ (Z. physikal. Chem., 1936, B, 32, 305—333; cf. this vol., 410).—In dil. solutions in indifferent solvents compound formation occurs in the ratio 1:1. The binding energies,  $E$ , have been determined by an optical method. The results are in harmony with Hückel's theory of the polar structure

of unsaturated aromatic systems (A., 1932, 901). The  $NO_2$ -compound (I) adds itself to one Ph nucleus of the hydrocarbon so that the nuclear plane of the latter is parallel to the plane of the ring of (I) and polarises the localised single  $\sigma$ -linkings and the  $p$ -electron cloud of the Ph nucleus. If in a monophenyl hydrocarbon the Ph nucleus or in a  $Ph_2$  hydrocarbon both Ph nuclei are conjugated with a continuously conjugated chain of double or triple linkings the perturbation caused by addition of the polar component in the  $p$ -electron cloud of one Ph nucleus and at first localised is transmitted over the whole mol., and  $E$  is comparatively high. Such transmission is prevented by interrupting the conjugation of the Ph nucleus with the conjugated aliphatic chain by interposition of a  $CH_2$  group; an abrupt fall in  $E$  results. There is a parallelism between the effects of constitution on the optical properties of certain mono- and di-phenyl hydrocarbons and on the  $E$  of their compounds with (I). R. C.

**Direct transmission of vibrational energy from one gas molecule to another on collision.** F. PATAT and E. BARTHOLOME (Z. physikal. Chem., 1936, B, 32, 396—406).—Comparison of existing data derived from measurements of sound dispersion and absorption for the frequency with which a mol. loses a vibrational quantum on collision with data for the stabilising action of gases on  $Br+Br$   $Br_2$  suggests that the direct transmission of vibrational energy from one mol. to another on collision plays an important part in reaction kinetics. In unimol. decomp. this appears to be the decisive type of energy exchange and occurs at practically every collision. R. C.

**Polarisation of hydrogen halides.** C. H. D. CLARK (Proc. Leeds Phil. Soc., 1936, 3, 208—217; cf. A., 1935, 569).—Polarisation data for H halides confirm that polarisability ( $\alpha$ )  $\propto$  (internuclear distance).<sup>3</sup> The depression of  $\alpha$  by a proton entering a halogen ion varies linearly with the Debye "apparent polarisability" of the halide. The vals. of the dielectric consts.,  $n_\infty$ , dipole moments, dipole distances,  $\alpha$ , deviation from additivity of inter-nuclear distance and mol. refraction, and the total, electron, and orientation polarisations of  $HF$ ,  $HCl$ ,  $HBr$ , and  $HI$  are calc. and related to the structures of the mols. The nature of the polarisation of element no. 85 is predicted.

J. W. S.

**Relation between polarisability and inter-nuclear distance for simple di-atoms.** F. R. GOSS (Proc. Leeds Phil. Soc., 1936, 3, 231—234).—The polarisability of simple di-atoms is  $kr^2/2$  for  $H_2$ ,  $(k-n/4)r^2$  for the  $KK$  period, and  $(k+0.20-n/4)r^2$  for higher periods, where  $k=3.85$  and  $n$  is the mol. group no. (cf. Clark, A., 1934, 476). J. W. S.

**Molecular constants and potential energy curves for diatomic molecules.** II. M. L. HUGGINS (J. Chem. Physics, 1936, 4, 308—312; cf. A., 1935, 1193).—Theoretical. The potential energy expression already employed is applied to diat. mols. containing heavier atoms. Calc. vals. of the equilibrium distance ( $r_e$ ) generally agree with experimental vals.

L. J. J.

**Spectroscopy and valency.** IV. **Periodic groups of hydride di-atoms.** C. H. D. CLARK.

**V. Periodic functions of hydride di-atoms.** C. H. D. CLARK and J. L. STOVES (Proc. Leeds Phil. Soc., 1936, 3, 218—220, 221—230; cf. A., 1935, 432).—IV. Hydride di-atoms are classified into periodic groups according to electron configurations. It is improbable that the normal ground state spin of a diat. hydride is  $> 1$  quantum unit.

V. The spectroscopic and bond consts. of hydride di-atoms plotted against the periodic group no. of the elements show no max. as found with non-hydride di-atoms. Hydrides of elements with 18 electrons within the valency group give characteristic curves distinct from those of inert gas structure in that min. are found at group III. J. W. S.

**Vibration-rotation energy levels of polyatomic molecules. II. Perturbations due to neighbouring vibrational states.** E. B. WILSON, jun. (J. Chem. Physics, 1936, 4, 313—316; cf. this vol., 667).—Mathematical. L. J. J.

**Rotation of polyatomic molecules.** E. BARTHOLOMÉ (Z. Elektrochem., 1936, 42, 341—359).—A review.

**Characteristic vibrations of mechanical molecular models. III. Plane six-membered ring and its derivatives.** F. TRENKLER (Physikal. Z., 1936, 37, 338—345; cf. A., 1935, 432, 918).—The characteristic frequencies and vibrational forms of mechanical models representing unsaturated six-membered rings (*cyclohexene*, 1:3- and 1:4-*cyclohexadiene*, 1:3:5-*cyclohexatriene*, and  $C_6H_6$ ) and mono- and di-derivatives of  $C_6H_6$  agree with those expected from theory. The type of vibration is almost independent of the no. and position of the double linkings. It was not possible to observe all the theoretical vibrations of tri-derivatives of  $C_6H_6$  and some of these deviate from theory. A. J. M.

**Parachor and chemical constitution. V. Structure of liquid crystals.** S. K. RAY (J. Indian Chem. Soc., 1936, 13, 194—197).—The parachors of liquid crystals of *p*-azoxy-anisole and -phenetole and *p*-methoxybenzylideneazine at first diminish with rise of temp., then rise suddenly by 12—14 units to the val. corresponding with the true m.p., after which the increases are gradual. This irregularity is explained on the assumption that 7 or 8 mols. are associated to form a complex mol., and rise of temp. breaks down the lateral cohesion between them. C. R. H.

**Parachors of methyl and ethyl nitrites and of nitromethane and nitroethane.** W. A. NOYES and B. SINGH (J. Amer. Chem. Soc., 1936, 58, 802—803).—The parachors of  $MeONO$  and  $EtONO$  agree closely with those of  $MeNO_2$  and  $EtNO_2$ . A hypothesis to explain the increase in parachor caused by a double covalency is advanced. E. S. H.

**Production of clear crystal diagrams in Quenstedt linear projection by means of  $\gamma$ -ray interference.** H. SEEMAN (Physikal. Z., 1936, 37, 345—347).—The production of  $\gamma$ -ray interference diagrams from rock-salt is described. The result is a Quenstedt projection of the lattice. A. J. M.

**Theory of the reflexion of X-rays by crystals.** C. MAUGUIN (Compt. rend., 1936, 202, 1375—1377).—Mathematical. R. S.

**Numerical method for two-dimensional Fourier synthesis.** C. A. BEEVERS and H. LIPSON (Nature, 1936, 137, 825—826). L. S. T.

**Lattice constants for 1936.** M. C. NEUBURGER (Z. Krist., 1936, 93, 1—36).—Tables give the best accepted figures for the lattice consts. of the elements, with their lattice types,  $d$ , at. wt., vol. occupied by the atom, distance of nearest neighbours, etc. References to the literature are given, and data as to the purity of the specimens measured. B. W. R.

**Complete fibre diagrams.** E. SAUTER (Z. Krist., 1936, 93, 93—106).—For obtaining the fullest information about fibre structure from X-rays there are advantages in using a conical film with axis parallel to the fibre axis. A camera suitable for such photographs is described, and examples of its use are given. The interpretation of the photographs is as simple as for the usual type. B. W. R.

**Relation between faults and growth-cessations in crystals.** E. HERLINGER (Z. Krist., 1936, 92, 372—379).—The occurrence of a fault in a crystal growth causes a disturbance of the lattice field which may eventually introduce further faults. The process is traced in detail; alterations of habit and of growth rate may be due to this cause. B. W. R.

**Structure of the real macro-crystal.** E. HERLINGER (Z. Krist., 1936, 92, 380—386).—Further consequences of the effects of faults, resulting in diminished energy of the surface of an irregular crystal as compared with that of the ideal crystal (cf. preceding abstract), are considered. B. W. R.

**Technique for the construction of models illustrating the arrangement and packing of atoms in crystals.** M. J. BUEGER and R. D. BUTLER (Amer. Min., 1936, 21, 150—172). L. S. T.

**Statistical theory of superlattices with unequal concentrations of the components.** R. PEIERLS (Proc. Roy. Soc., 1936, A, 154, 207—222).—Bethe's method (A., 1935, 1193) is generalised to include a cubic face-centred lattice of composition  $AB_3$  (e.g.,  $AuCu_3$ ). L. L. B.

**Influence of the symmetry of the medium on the symmetry of corrosion figures in crystals.** L. ROYER (Compt. rend., 1936, 202, 1346—1348; A., 1930, 21).—Definite corrosion figures were obtained from cryst. apatite and wulfenite with org. acids. Active and inactive acids (e.g., the tartaric acids) gave different and characteristic figures. The effect depends on the symmetry of the crystal and on that of the solution. H. J. E.

**Photometric measurement of the number of oriented crystallites in metallic wires.** J. G. DE LA CUEVA (Anal. Fis. Quim., 1935, 33, 433—437).—The Debye-Scherrer method can be adapted to the determination of the proportion of oriented crystallites in drawn Al wire. There is an increase from 51.72% for 1.78 mm. to 80% for 0.58 mm. diameter wire. The permanent residue of unoriented crystal-

lites is considered to occur in the surface layer and to be produced by friction during the drawing of the wire.

F. R. G.

**X-Ray study of the electrolytic deposition of cadmium.** A. RUBIO and J. G. DE LA CUEVA (Anal. Fis. Quím., 1935, 33, 521—532).—Cd deposited from a solution (1 litre) of CdO 39.4 g., KCN 128.2 g., Na<sub>2</sub>SO<sub>4</sub> 50.0 g., and NiSO<sub>4</sub> 1.0 g. with or without addition of colloid has a grain  $>10^{-6}$  cm. The lattice consts. are identical with those of ordinary Cd and the plane (1122) is oriented parallel to the plane of the sample. The influence of c.d., the nature of the cathode, and the presence of colloid on the orientation of the crystals is discussed.

F. R. G.

**To what class of symmetry does ordinary ice belong?** N. SELJAKOV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 293—294).—X-Ray analysis of ice by the Laue method shows the existence of  $\alpha$ - and  $\beta$ -ice. The former belongs to one of the classes  $D_{6h}$ ,  $D_6$ ,  $C_{6v}$ , and  $D_{3h}$  (hexagonal ice), and the latter to one of the classes  $C_{3v}$  and  $C_3$  (rhombohedral ice). Both modifications are stable.  $\alpha$ -Ice is formed when the temp. of the surrounding air is a little  $<0^\circ$ , and  $\beta$ -ice at lower temp.

A. J. M.

**Morphological and structural relations in cuprite.** W. KLEBER and R. SCHROEDER (Neues Jahrb. Min., 1935, A, 69, 364—387; Chem. Zentr., 1935, ii, 1326).—From a review of the relevant crystallographic, optical, and X-ray data, cuprite is allocated to the space-group  $O^2$  of the trioctahedral crystal class.

J. S. A.

**Structure of  $\alpha$ -quartz.** P. H. WEI (Z. Krist., 1936, 92, 355—362).—Parameters for the already known structure are determined from intensity measurements. Primary extinction in the crystal is measured by abs. methods, and is considerable.

B. W. R.

**Structure of strontium and barium peroxides, SrO<sub>2</sub> and BaO<sub>2</sub>.** J. D. BERNAL, E. DJATLOVA, I. KARSANOVSKI, S. REICHSTEIN, and A. G. WARD (Z. Krist., 1936, 92, 344—354).—The structures are of the CaC<sub>2</sub> type,  $a_0$  5.02  $c_0$  6.55 and  $a_0$  5.34  $c_0$  6.77 Å., respectively. Space-group  $F4/mmm$ . The parameters are determined. The distance O—O is found to be 1.31 Å.

B. W. R.

**Lattice constant of galena with new Röntgen spectrometer.** E. VON ZEIPPEL (Ark. Mat. Astron. Fysik, 1935, 25, A, No. 8; Chem. Zentr., 1935, ii, 1326).—From precision measurements by a substitution method on a new type of instrument (described), using Ag  $K\alpha_1$  radiation in the first 4 orders,  $2d=5923.34$  Å. The half-val. width of the Ag  $K\alpha_1$  line = 5.6".

J. S. A.

**Rotation of anionic polyhedra in cubic crystal lattices. II. Borofluorides.** C. FINBAK and O. HASSEL (Z. physikal. Chem., 1936, B, 32, 433—438).—The X-ray diagrams of the cubic high-temp. forms of NH<sub>4</sub>BF<sub>4</sub> and KBF<sub>4</sub> point to a rotation of the anion as in perchlorates (cf. this vol., 669). In the transformation of KClO<sub>4</sub> and NH<sub>4</sub>BF<sub>4</sub> from the rhombic into the cubic form the occurrence of the displacement of anions and cations postulated by Herrmann and Ilge (A., 1931, 414) has been demonstrated.

In the rotation of anions there will be resonance between this rotation and the directed oscillation of the cations. In cubic KPF<sub>6</sub>, NH<sub>4</sub>PF<sub>6</sub>, and TlPF<sub>6</sub> there is rotation of the PF<sub>6</sub><sup>-</sup> ions.

R. C.

**Crystal structure of radium fluoride.** G. E. R. SCHULZE (Z. physikal. Chem., 1936, B, 32, 430—432).—RaF<sub>2</sub> crystallises in the fluorspar lattice with  $a$  6.368 Å. and  $d$  6.75. The radius of Ra<sup>++</sup> for co-ordination no. 6 is 1.52 Å.

R. C.

**Configuration of the azide ion.** L. K. FREVEL (J. Amer. Chem. Soc., 1936, 58, 779—782).—The N—N distances in crystals of NaN<sub>3</sub> and KN<sub>3</sub> have been determined by the X-ray method as  $1.150 \pm 0.016$  and  $1.145 \pm 0.017$  Å., respectively. In NH<sub>4</sub>N<sub>3</sub> it is  $1.165 \pm 0.021$  Å.

E. S. H.

**Space-group of calcium sulphate dihydrate.** J. PALACIOS and L. RIVOIR (Anal. Fis. Quím., 1935, 33, 518—520).—A re-examination of the crystal structure of gypsum (cf. A., 1930, 139) shows that, contrary to Onorato (A., 1930, 672), the space-group is  $C_{2h}$ .

F. R. G.

**Structure of some hydrates of sodium borate.** W. MINDER (Z. Krist., 1936, 92, 301—309).—Cell consts. and space-groups of the following compounds are determined: kernite Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·4H<sub>2</sub>O, tinkalconite Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·5H<sub>2</sub>O, borax Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O. The results are discussed in relation to the effective vol. occupied by the additional H<sub>2</sub>O.

B. W. R.

**Crystal structure of silver phosphate.** L. HELMHOLZ (J. Chem. Physics, 1936, 4, 316—322).—Laue and oscillation diagrams of Ag<sub>3</sub>PO<sub>4</sub> give 5.995 Å. for the edge of the cubic unit containing two mols. The space-group is  $T^4$ . A new val. for the O parameter has been obtained, giving P—O in :PO<sub>3</sub>  $1.61 \pm 0.03$  Å. The discrepancy with KH<sub>2</sub>PO<sub>4</sub> is due to covalent bond formation of O with Ag atoms, which must be treated as oscillators with tetragonal symmetry. The ratio of the amplitudes of vibration along and perpendicular to the tetragonal axis is calc.

L. J. J.

**Crystal structure of barium antimonate.** J. BEINTEMA (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 652—661).—Ba(SbO<sub>3</sub>)<sub>2</sub>·8H<sub>2</sub>O forms monoclinic prismatic (pseudo-orthorhombic) crystals ( $a_0$  9.961,  $b_0$  12.506,  $c_0$  10.129 Å.;  $\beta$  87° 17'; 1 mol. in unit cell; space-group  $C_{2h}^2$ ). The Sb atoms are arranged in layers perpendicular to the  $b$  axis. The distance between such layers is 6.253 Å. The distance between Sb atoms in a layer is approx. 5 Å. Each Sb is surrounded by 6 O atoms, forming {Sb(OH)<sub>6</sub>}'. The composition is Ba{Sb(OH)<sub>6</sub>}<sub>2</sub>·2H<sub>2</sub>O.

H. J. E.

**Crystallography of lithium molybdatellurate.** J. D. H. DONNAY and J. MÉLON (Amer. Min., 1936, 21, 125—127).—3Li<sub>2</sub>O·TeO<sub>3</sub>·6MoO<sub>3</sub>·13H<sub>2</sub>O,  $d$   $2.2 \pm 0.1$ , hardness  $2\frac{1}{2}$ , rhombohedral-hexagonal, uniaxial negative,  $n_e$  1.612,  $n_w$  1.703 (both  $\pm 0.001$ ) for Na light.

L. S. T.

**Crystal structure of hexaethylbenzene.** H. K. PAL and A. C. GUHA (Z. Krist., 1936, 92, 392—394).—Goniometric measurements are given; the cell is triclinic with  $a_0$  9.90,  $b_0$  9.84,  $c_0$  6.10 Å.,  $\alpha$  58° 5',  $\beta$  103° 54',  $\gamma$  123° 43'.

B. W. R.

**Magnetic isotropy and crystal structure of hexaethylbenzene.** N. GANGULI (Z. Krist., 1936, 93, 42—46).—Magnetic measurements on single crystals are used to locate an approx. plane of magnetic symmetry, parallel to which the  $C_6$  rings of the mols. should lie. B. W. R.

**Molecular structure of quinhydrone.** J. PALACIOS and O. R. FOZ (Anal. Fis. Quím., 1935, 33, 627—642).—Contrary to the authors' earlier work (A., 1932, 904) quinhydrone (I) crystals are triclinic, pseudomonoclinic, pseudorhombic, and pseudohexagonal; space-group  $C_2$ ;  $a$  21.8,  $b$  6.04,  $c$  7.70 Å.; they exhibit a subperiodicity due to alternation of mols. of benzoquinone (II) and quinol (III). Vals. of  $\chi_m \times 10^6$  are (I) —84.2, (II) —33.3, (III) —64.5. (I) does not exist as a free radical. F. R. G.

**X-Ray analysis of the dibenzyl series. III. Structure of stilbene, tolane, and azobenzene.** J. M. ROBERTSON, M. PRASAD, and (MISS) I. WOODWARD (Proc. Roy. Soc., 1936, A, 154, 187—195; cf. A., 1933, 1107).—Detailed measurements have been made on stilbene, and sufficient preliminary data obtained for tolane and azobenzene to show that the three structures are closely similar. The space-group is  $C_{2h}^2$  ( $P2_1/a$ ), with 4 mols. per unit cell. In stilbene, the 4 mols. have centres of symmetry which coincide with 4 crystal centres; 2 of the mols. have orientations similar to that of dibenzyl, whilst the other 2 can be derived from them by a rotation of  $180^\circ$  about the  $a$  axis and a translation of  $\frac{1}{2}c$ . The proposed structure is compatible with the other physical properties of the crystal, including the magnetic data. L. L. B.

**Crystal structure of condensed ring compounds. I. 1:2-cycloPentenophenanthrene. II. 7-Methoxy-3':3'-dimethyl-1:2-cyclopentenophenanthrene and 7-methoxy-1:2-cyclopentenophenanthrene.** J. IBALL (Z. Krist., 1936, 92, 293—300; 93, 47—56).—I. The cell is monoclinic,  $a_0$  18.38,  $b_0$  5.83,  $c_0$  23.61 Å.,  $\beta$   $114.3^\circ$ ;  $d$  1.23; 8 mols. in cell; space-group  $B$   $2_{1/c}$ . The reflexion intensities show marked similarities with the analogous ones from chrysene, which enables the orientation of the mols. to be determined approx.

II. Both compounds are monoclinic, space-group  $C_{2h}^2$ ; cell data and optical data are given, and the probable position of the mols. in the cell is located on the basis of these data and the reflexion intensities.

B. W. R.

**Crystal studies on certain *p*-toluenesulphonamides. I. Nitrogen-substituted sulphonanilides. II. Nitrogen-substituted sulphon-*o*-toluidides. III. Nitrogen-substituted sulphon-*p*-toluidides.** G. H. YOUNG, W. J. KETH, and A. P. HONESS (Z. Krist., 1936, 92, 216—220, 395—401; 93, 107—112).—I. Crystallographic data are given for *p*-toluenesulphon-*N*-isopropylanilide, and for the corresponding *N*-*n*- and *N*-*sec*-Bu compounds.

II. A goniometric description of *p*-toluenesulphon-*N*-methyl-*o*-toluidide and the corresponding *N*-Et, -Pr $^\beta$ , -Pr $^\alpha$ , -Bu $^\alpha$ , -Bu $^\beta$ , and -isoamyl compounds.

III. Crystallographic descriptions of *p*-toluenesulphon-*N*-methyl-*p*-toluidide and the corresponding Et, Pr $^\beta$ , Bu $^\beta$ , *n*- and iso-amyl compounds are given.

**X-Ray studies on choleic acids.** Y. GO and O. KRATKY (Z. Krist., 1936, 92, 310—312).—Compounds of deoxycholic acid with the saturated fatty acids give sensibly the same X-ray photographs with from 3 to 22 C atoms. A typical set of photographs is analysed; the rhombic cell has  $a_0$  25.8,  $b_0$  13.5,  $c_0$  7.22 Å.; space-group probably  $V^3$ . B. W. R.

**X-Ray study of myosin.** W. T. ASTBURY and (MRS.) S. DICKINSON (Nature, 1936, 137, 909—910; cf. this vol., 623). L. S. T.

**Experiments with models on the theory of the Kikuchi lines.** A. LICHTENFELD and K. SCHWARZ (Naturwiss., 1936, 24, 377).—A reply to von Laue (cf. this vol., 554). A. J. M.

**Electron analysis: influence of the prolonged passage of a beam of electrons through thin films.** J. J. TRILLAT and S. OKETANI (Compt. rend., 1936, 202, 1332—1334).—The diffraction pattern from a thin crystal. Au film disappears gradually on exposing a single spot on the film continuously to the electron beam for  $1\frac{1}{2}$  hr. The effect is attributed to local heating (cf. Andrade and Martindale, A., 1935, 1449). H. J. E.

**Structure of thin metallic films deposited on rock-salt by vaporisation.** L. BRÜCK (Ann. Physik, 1936, [v], 26, 233—257).—The structure of films of Ag, Au, Al, Cu, Ni, Pd, Co, Fe, and Cr deposited on NaCl by vaporisation in vac. was investigated by electron diffraction. Above a temp. characteristic of each metal, films of Au, Ag, Al, Ni, Cu, and Pd possessed a mosaic structure, the crystallites being oriented in the same direction. Fe and Cr showed three directions of orientation. The previously discovered orientation rule for substances deposited on a crystal base holds only for deposition from solution.

A. J. M.

**Electron diffraction by single crystals.** O. SPECCHIA and N. DALLAPORTA (Nuovo Cim., 1935, [ii], 12, 4—14; Chem. Zentr., 1935, ii, 1311).—The formation of supplementary lines and bands in the diffraction pattern is discussed. J. S. A.

**Electron-diffraction study of the structure of electro-deposited metals.** G. I. FINCH and C. H. SUN (Trans. Faraday Soc., 1936, 32, 852—863).—The structure of electro- and chemically deposited metal films on metallic substrates has been studied. Orientation of the substrate crystals nearly always determines that of the electro-deposit, whilst films deposited on amorphous surfaces show normal orientation. Adhesion increases with orienting effect. An anomalous double diffraction observed with composite films is discussed. Chemical displacement leads to alloy formation. L. J. J.

**Diffraction of electrons by amalgam films.** A. E. AYLMEYER, G. I. FINCH, and S. FORDHAM (Trans. Faraday Soc., 1936, 32, 864—871).—Extra rings due to amalgam formation on Au, Ag, Cu, and Pd leaf have been investigated. Au and Ag form simple cubic amalgams with  $a$  17.81 and 17.94 Å., respectively, and Ag also forms two face-centred tetragonal amalgams. Pd is partly attacked. L. J. J.

**Structure of the paraffin chain studied by means of electron rays.** R. RIGAMONTI (Gazzetta,

1936, 66, 174—182).—Electron diffraction measurements with long-chain paraffin hydrocarbons confirm the results of X-ray investigations. The angle between the plane of symmetry of the paraffin chain and the (010) crystal plane is calc. to be  $35-50^\circ$  and the C-H distance 1.25 Å. These vals. are confirmed by steric considerations. O. J. W.

**δ-Quartz.** L. BALAMUTH, F. ROSE, and S. L. QUIMBY (Physical Rev., 1936, [ii], 49, 703).—Quartz can be piezoelectrically excited at a temp. as low as  $78^\circ$  abs., contrary to Osterberg's result (cf. this vol., 672). N. M. B.

**Changes in magnetisation of nickel and permalloy and of nickel-iron crystals in high fields.** G. GERLOFF (Z. Physik, 1936, 99, 585—594).—The susceptibility of Ni and permalloy attains a const. end val. at 4000 gauss, changing by  $< 6\%$  up to 5500 gauss. A. B. D. C.

**Conditions of demagnetisation of rhombohedral iron sesquioxide.** A. MICHEL (Compt. rend., 1936, 202, 1769—1771; cf. A., 1935, 1063).—Pptd.  $\text{Fe}_2\text{O}_3$ , annealed at  $700^\circ$ , shows a rapid increase in magnetisation above  $600^\circ$  (anomaly  $A$ ). On cooling again the magnetisation rises normally with decrease of temp. to below the Curie point, then attains a max., decreases slightly (anomaly  $a$ ) and thereafter remains approx. const. to room temp. On annealing at  $800-900^\circ$ ,  $A$  occurs at  $560^\circ$ , whilst  $a$  disappears, but after annealing above  $1000^\circ$ ,  $A$  is still lower. After annealing for several hr. at  $1300^\circ$ , normal reversible magnetisation curves are obtained. The min. temp. of demagnetisation of annealed  $\text{Fe}_2\text{O}_3$  can occur below the Curie point, but it is always above the temp. of anomaly  $a$ . J. W. S.

**Temperature variation of electron spin paramagnetism.** E. C. STONER (Proc. Leeds Phil. Soc., 1936, 3, 191—199).—Expressions are derived for the temp. variation of paramagnetic susceptibility due to electron spin. The bearing of the results on the magnetic properties of metals is discussed. J. W. S.

**Total reflecting power as a function of temperature in the neighbourhood of the Curie point.** L. S. ORNSTEIN and J. H. VAN DER VEEN (Physica, 1936, 3, 289—300).—The total reflecting power of Fe for  $\lambda$  6500 Å. and angle of incidence about  $15^\circ$  rises rapidly and continuously from about 62% to 66% when the temp. rises from  $1000^\circ$  to  $1100^\circ$  abs. It is concluded that the internal magnetic field does not disappear abruptly at the Curie point, but some remains up to  $1100^\circ$ . It is suggested that the Curie point for some regions of spontaneous magnetisation is a function of the orientation of the internal field towards the crystal lattice of this region. No large change in reflecting power occurs at the  $\beta$ - $\gamma$  transition point ( $1180^\circ$  abs.). J.

**Variation of Young's modulus with magnetisation and temperature in nickel.** S. SIEGEL and S. L. QUIMBY (Physical Rev., 1936, [ii], 49, 663—670).—For annealed polycryst. Ni, 99.7% pure, the % increase in Young's modulus,  $E$ ,  $\propto J^2$  ( $J$ —intensity of magnetisation) over 0—0.4 saturation at all temp. below  $311^\circ$ . The total increase in  $E$  from

the demagnetised to the saturated state is 6.7% at  $23^\circ$ , reaching a max. of 18.7% at  $185^\circ$ , and decreasing to zero at the Curie point. Results are in general agreement with Akulov's theory (cf. A., 1933, 1237). N. M. B.

**Plasticity of bismuth crystals.** H. J. GOUGH and H. L. COX (Nature, 1936, 137, 701).—Photomicrographs of Bi crystals showing deformation by "slip" following compression are reproduced. Deformation by twinning is more common. L. S. T.

**Dependence of plasticity on temperature.** H. EKSTEIN (Z. Krist., 1936, 92, 253—274).—The elastic properties of W single crystals at  $-185^\circ$  and  $16^\circ$ , of rock-salt over the range  $300^\circ$  to  $-250^\circ$ , and of bakelite over the range  $16^\circ$  to  $60^\circ$  have been measured. Agreeing with previous results on cryst. substances, the temp. variation is not sufficient to suggest that plasticity is thermal in origin; for the amorphous bakelite the very large variation of elastic consts. agrees with the temp. theory of plasticity. B. W. R.

**Photo-electric method for determining the elastic limit of an X-rayed rock-salt crystal.** M. N. PODASCHEVSKI (Physikal. Z. Sovietunion, 1935, 7, 399—409). CH. ABS. (e)

**Statistical molecular configuration and elastic properties of substances of high mol. wt.** W. KUHN (Naturwiss., 1936, 24, 346—347).—Theoretical. A. J. M.

**Elastic constants, electrical resistance, and thermal expansion of magnesium crystals.** E. GOENS and E. SCHMID (Physikal. Z., 1936, 37, 385—391).—The principal elastic consts., sp. resistance at room temp., relative electrical resistance over the temp. range  $-269^\circ$  to  $100^\circ$ , and the principal vals. of the thermal expansion over the range  $-253^\circ$  to  $200^\circ$  have been determined for single hexagonal Mg crystals for different crystallographic orientations. The anisotropy of these physical properties, though  $<$  that for Zn and Cd, is  $>$  would be expected considering the close resemblance of the Mg lattice to the hexagonal close-packed lattice. A. J. M.

**Principal elastic constants of single crystals of copper, gold, and lead.** E. GOENS (Physikal. Z., 1936, 37, 321—326).—The vals. of the principal elastic consts.,  $S_{11}$ ,  $S_{12}$ ,  $S_{44}$ , of single crystals of Cu, Au, and Pb, obtained by a dynamic method, were Cu, 14.91, —6.25, 13.28, respectively, Au, 23.30, —10.65, 23.80, respectively, and Pb, 93.0, —42.6, 69.4, respectively (all  $\times 10^{-13}$  sq. cm. per dyne). The corresponding principal elastic moduli,  $C_{11}$ ,  $C_{12}$ , and  $C_{44}$  were also calc. The Cauchy relation ( $C_{12} = C_{44}$ ) is not satisfied. The results for Cu do not agree with those of Kimura (A., 1933, 1237). A. J. M.

**State of electrolytically separated metals.** G. TAMMANN and H. JAACKS (Z. anorg. Chem., 1936, 227, 249—260).—Electrolytically separated metals, e.g., Cu, Fe, Zn, and Ni, have a hardness similar to that of cold-worked metal, and, in both cases, the structure is fibrous. The fibres are formed perpendicular to the cathode. The reflected Co  $K_\alpha$  line shows an increased sharpness of the interference lines on heating in all cases except Cu. The metals may contain considerable quantities of  $\text{H}_2$ , which is

removed by heat, but this appears to bear no relation to the hardness. The  $H_2$  content varies in the different layers of the electrolytic metal, causing scaling. The rate of dissolution of electrolytic Fe in acids varies with the treatment, the untreated Fe being less readily attacked than the fused or milled metal. The rate for electrolytic Zn is not much affected by treatment. The temp. of separation of a metal greatly affects polarisation. M. S. B.

**Orientation of oxide films on iron.** R. F. MEHL and E. L. McCANDLESS (Nature, 1936, 137, 702; A., 1935, 161).—X-Ray photographs of FeO films on single crystals of Fe show reflexions from  $Fe_3O_4$  resulting from partial decomp. of the wüstite phase. The  $Fe_3O_4$  is identically oriented with the FeO with all planes of the same indices in the two cubic lattices parallel. The same orientation relationship holds when an FeO film is grown by reduction on a natural crystal of magnetite. The Fe atoms determine the orientation relationship in the case of FeO on Fe and the oxygen atoms that of  $Fe_3O_4$  on  $Fe_3O_4$ . L. S. T.

**Isomorphism of organic compounds.** H. LETTRÉ, H. BARNBECK, and W. LEGER (Ber., 1936, 69, [B], 1151—1154).—Investigation of the systems from the hydroxy-, chloro-, and methyl-benzoic acids taken in corresponding pairs, of  $r\text{-OH}\cdot\text{CHPh}\cdot\text{CO}_2\text{H}$  and  $r\text{-CHClPh}\cdot\text{CO}_2\text{H}$ , and of cholesterol and cholesteryl chloride combined with the results of Grimm (A., 1931, 1363) shows isomorphous replaceability between OH and Me in one of five cases, of OH and Cl in four of 12 cases, and of Cl and Me in six of nine instances examined. Formation of mixed crystals is not observed in the systems: stilbene-phenanthrene (I),  $(\text{CH}_2\text{Ph})_2$ -(I),  $\text{CHPh}\cdot\text{CPh}_2$ -benzylidene-fluorene,  $\text{C}_6\text{Ph}_3$ -9:10-diphenylphenanthrene. H. W.

**Application of the theory of thermal oscillations to the field of mesophases (liquid crystals).** H. ZOCHER (Kolloid-Z., 1936, 75, 161—163).—Theoretical. E. S. H.

**Mol.-wt. changes of sulphur monochloride.** W. A. PATRICK and N. HACKERMAN (J. Physical Chem., 1936, 40, 679—688).—Determinations in a modified Cottrell b.-p. apparatus, using  $\text{C}_6\text{H}_6$ ,  $\text{CCl}_4$ ,  $\text{CHCl}_3$ , cyclohexane, and PhMe as solvents, show that the mol. wt. of  $\text{S}_2\text{Cl}_2$  is affected by its age, temp., solvent, and concn. The abnormal vals. are assumed to be due to the presence of a polymeride  $(\text{S}_2\text{Cl}_2)_2$ , which breaks up into  $\text{S}_8$  and  $\text{S}_2\text{Cl}_4$ . The change with concn. is also due to equilibrium between large and small mols. of S. E. S. H.

**Mol. wt. of fused yellow phosphorus.** N. D. LITVINOV (J. Appl. Chem. Russ., 1936, 9, 589—590).—The mol. wt. corresponds with  $\text{P}_4$  at 50—95°. R. T.

**Phenomenological theory of superconductivity.** E. SCHRÖDINGER (Nature, 1936, 137, 824).—London's theory (A., 1935, 689) is simplified. L. S. T.

**Conductance of salt crystals.** W. JOST (J. Chem. Physics, 1936, 4, 323).—A reply to Rodebush and Cooke (this vol., 138). L. J. J.

**Magnetic anisotropy of resorcinol.** K. LONSDALE (Nature, 1936, 137, 826).—Measurements of the diamagnetic anisotropy of a single crystal of resorcinol are recorded. The derived orientation of the mol. plane relative to the crystal axes agrees with the results of a Fourier analysis. L. S. T.

**Appearance of ferromagnetism in some paramagnetic salts at very low temperatures.** M. KURTI, P. LAINE, B. V. ROLLIN, and F. SIMON (Compt. rend., 1936, 202, 1576—1578).— $\text{NH}_4$  Fe alum behaves as a ferromagnetic substance at approx.  $0.01^\circ$  abs. H. J. E.

**Diamagnetic susceptibility of heavy water.** V. C. G. TREW and J. F. SPENCER (Nature, 1936, 137, 706).—Using a modified Gouy balance, the mass susceptibility obtained for 99.2%  $\text{D}_2\text{O}$ ,  $d$  1.1049, is  $0.637 \pm 0.001 \times 10^{-6}$  unit at  $20^\circ$  (cf. this vol., 672),  $\text{H}_2\text{O}$  being  $0.720 \times 10^{-6}$ . L. S. T.

**Magnetic susceptibility of chlorine hexoxide.** J. FARQUHARSON, C. F. GOODEVE, and F. D. RICHARDSON (Trans. Faraday Soc., 1936, 32, 790—795).—The magnetic susceptibility of solid and liquid  $\text{Cl}_2\text{O}_6$  has been measured between  $-40^\circ$  and  $10^\circ$ . The % of  $\text{ClO}_3$  present at various temp., and the corresponding equilibrium consts., have been calc. by using theoretical vals. for  $\text{Cl}_2\text{O}_6$  and  $\text{ClO}_3$ . The heat of dissociation is calc. to be  $1730 \pm 500$  g.-cal. per mol.  $\beta^{3.5} = 2.023 \pm 0.003$ ; coeff. of cubical expansion =  $12 \pm 3 \times 10^{-4}$ . F. L. U.

**Magnetochemical studies. XXI. Molybdenum and tungsten halides. Magnetic behaviour of compounds of the higher transitional elements.** W. KLEMM and H. STEINBERG (Z. anorg. Chem., 1936, 227, 193—213; cf. this vol., 556).—Susceptibilities of  $\text{MoCl}_3$ ,  $\text{MoCl}_5$ ,  $\text{MoBr}_3$ ,  $\text{MoBr}_4$ ,  $\text{WCl}_3$ ,  $\text{WCl}_5$ ,  $\text{WCl}_6$ , and  $\text{WBr}_5$  have been determined at  $20^\circ$ ,  $-78^\circ$ , and  $-183^\circ$ . F. L. U.

**Magnetic study of mixed crystals of bivalent copper and silver.** L. CAPATOS and N. PERAKIS (Compt. rend., 1936, 202, 1773—1775).— $[\text{Ag}^{11}, 4\text{C}_5\text{H}_5\text{N}]\text{S}_2\text{O}_8$  and  $[\text{Cu}^{11}, 4\text{C}_5\text{H}_5\text{N}]\text{S}_2\text{O}_8$  have magnetic moments of 9.11 and 9.78 Weiss magnetons, respectively. Study of mixed crystals of these compounds shows that addition of small amounts of either compound to the other lowers the Curie const., but that a max. is attained at about equimol. concns. The Curie points change in parallel manner. J. W. S.

**Magnetochemical investigations. XXII. Magnetic behaviour of chromium-phenyl compounds.** W. KLEMM and (FRL.) A. NEUBER (Z. anorg. Chem., 1936, 227, 261—271).—The magnetic moment of Hein's Cr-Ph compounds (A., 1931, 1435) is approx. 1.73 Bohr magnetons, whether the compound contains 5, 4, or 3 Ph per Cr. It is concluded that  $\text{Cr}^{\text{V}}$  is present in all cases. Formulæ are discussed. M. S. B.

[Magnetic behaviour of chromium-phenyl compounds.] F. HEIN (Z. anorg. Chem., 1936, 227, 272; cf. preceding abstract).—A reference to the formulæ for Cr-Ph compounds. M. S. B.

**Polymerisation and diamagnetic susceptibility.** S. S. BHATNAGAR, M. B. NEVGI, and R. N.

MATHUR (Z. Physik, 1936, **100**, 141—144).—Polymerisation of anthracene,  $\text{COMe}_2$ ,  $\text{PhCHO}$ , furfuraldehyde, and  $\text{AcCN}$  leads to a decrease in sp. diamagnetic susceptibility. A. B. D. C.

Magnetic susceptibilities of organic substances in different physical states. A. BOSE (Phil. Mag., 1936, [vii], **21**, 1119—1125).—Within limits of experimental error the diamagnetic susceptibilities of 27 org. compounds investigated are independent of their physical state (single crystal, molten liquid, or solution). J. W. S.

Magnetic properties of superconductors. T. C. KEELEY and K. MENDELSSOHN (Proc. Roy. Soc., 1936, **A**, 154, 378—385; cf. A., 1935, 1309).—Previous experiments have been extended to a greater no. of superconducting substances, the specimens used being in the form of long rods in a longitudinal field. The change from superconductivity to the normal state takes place in a small temp. interval, which increases as the temp. falls. The steepness of the transition in Sn single crystals is much  $>$  in polycryst. Sn, and the transition region can be reduced further by using highly purified substances. L. L. B.

Ultrasonic velocities in liquid mixtures. S. PARTHASARATHY (Proc. Indian Acad. Sci., 1936, **3**, A, 297—303; cf. this vol., 277).—Data and graphs of ultrasonic velocities and adiabatic compressibilities are given for binary liquid mixtures of  $\text{CCl}_4$  with  $\text{C}_6\text{H}_6$ ,  $\text{CS}_2$ ,  $\text{EtOAc}$ , and tetralin. The types of curve found for adiabatic compressibility-concn. are similar to those previously found for intensity of scattered light-concn. (cf. A., 1934, 1056). N. M. B.

Absorption of ultrasonic waves in liquids. J. CLAEYS, J. ERRERA, and H. SACK (Compt. rend., 1936, **202**, 1493—1494).—The absorption coeffs. of ultrasonic waves in  $\text{H}_2\text{O}$ ,  $\text{CCl}_4$ ,  $\text{C}_6\text{H}_6$ ,  $\text{CS}_2$ , and  $\text{MeOAc}$  are  $>$  the theoretical. Addition of a small amount of  $\text{CCl}_4$  greatly diminishes the absorption in  $\text{CS}_2$ . The deviation from the classical theory is attributed to hysteresis of the adiabatic compressibility of liquids. R. S.

Measurements of absorption, velocity, and out-gassing [of liquids] in the ultrasonic region. C. SORENSEN (Ann. Physik, 1936, [v], **26**, 121—137).—Data are recorded for a no. of liquids at frequencies of 194—950 kHz. Except with  $\text{H}_2\text{O}$ , the absorption increases with frequency, and with  $\text{EtOH}$ ,  $\text{C}_6\text{H}_6$ , and  $\text{PhMe}$  depends on the intensity of the radiation. The energy required to expel 1 c.c. of gas from  $\text{H}_2\text{O}$  and oil at a no. of frequencies has been measured. The velocity in  $\text{C}_6\text{H}_6$  decreases with increasing frequency. L. J. J.

Specific heats of the mineral oxides: vitreous silica, lime, alumina, as a function of temperature. A. THURET (Compt. rend., 1936, **202**, 1368—1370).—Equations in good agreement with experimental data have been deduced for the mean and the true sp. heats. R.

Hydrogen sulphide. Heat capacity and vapour pressure of solid and liquid. Heat of vaporisation. Comparison of thermodynamic and spectroscopic values of the entropy. W. F.

GIAUQUE and R. W. BLUE (J. Amer. Chem. Soc., 1936, **58**, 831—837).—Heat capacities have been determined from  $16^\circ$  abs. to the b.p. A transition was observed at  $103.52^\circ$  abs. and a large energy absorption, possibly ending in a transition, near  $126^\circ$  abs.  $\text{H}_2\text{S}$  has m.p.  $187.61^\circ$  abs., b.p.  $212.77^\circ$  abs., heat of fusion 568.1 and heat of vaporisation at the b.p. 4463 g.-cal. per mol. The v.p. has been determined over the range  $164.90$ — $213.17^\circ$  abs. The calc. mol. entropy of the gas at the b.p. is  $46.38 \pm 0.1$  e.u., neglecting the nuclear spin entropy. E. S. H.

Simplified method of calculating entropy of organic compounds. I. I. STRELKOV (Ukrain. Chem. J., 1936, **11**, 32—40).—The entropy of org. compounds at  $25^\circ$  is given by  $kC$ , where  $C$  is the mol. sp. heat, and  $k=1.1$  for solids, and 1.4 for liquids. R. T.

Changes in thermal and calorimetric values along the two fusion curves of helium. J. J. VAN LAAR (Proc. K. Akad. Wetensch. Amsterdam, 1936, **39**, 612—622).—The triple point is at  $1.774^\circ$  abs./28.91 atm. Data for the v.p. and latent heat are recorded. H. J. E.

Latent heat of tin in passing from the superconductive to the non-superconductive state. W. H. KEESOM and P. H. VAN LAER (Proc. K. Akad. Wetensch. Amsterdam, 1936, **39**, 573—574, and Physica, 1936, **3**, 371—384).—The val. obtained with fields of 50—140 gauss agrees with that calc. thermodynamically. The magnetic field within the Sn was zero so long as the whole body was superconductive. In the transition range it increased gradually. H. J. E.

F.p. and b.p. of propane. M. M. HICKS-BRUUN and J. H. BRUUN (J. Amer. Chem. Soc., 1936, **58**, 810—811).—After treatment with  $\text{ClSO}_3\text{H}$  and subsequent fractional distillation, propane has f.p.  $-187 \pm 0.1^\circ$  and b.p.  $-42.17 \pm 0.05^\circ$ . E. S. H.

Boiling under constant pressure. G. DUCH (J. Chim. phys., 1936, **33**, 414—426).—Approx. formulae are derived connecting the reduced mol. attraction force  $\varphi\gamma$ , the surface tension  $A$ , and the mol. radius  $r$  of a liquid. For a related group of org. liquids,  $\Delta\varphi\gamma/\Delta(1/r)$  and  $\Delta A/\Delta(1/r)$  should be const.; this is in general supported by published or experimental vals. of the physical quantities involved. R. C. M.

Thermal properties of halides. X. Vapour pressures and vapour densities of gallium trihalides. W. FISCHER and O. JUBERMANN (Z. anorg. Chem., 1936, **227**, 227—236).—M.p. determinations in quartz tubes in vac. give  $\text{GaCl}_3$   $77.9 \pm 0.2^\circ$ ,  $\text{GaBr}_3$   $121.5 \pm 0.6^\circ$ , and  $\text{GaI}_3$   $212 \pm 1^\circ$ . The v.p. of the unsaturated and saturated vapours has been determined with a quartz spiral manometer and the following vals. for the b.p. have been deduced:  $\text{GaCl}_3$   $201.3^\circ$ ,  $\text{GaBr}_3$   $279^\circ$  (at 750 mm.),  $\text{GaI}_3$   $346^\circ$ . The degree of dissociation of  $\text{Ga}_2\text{X}_6$  into  $2\text{GaX}_3$  has been calc. at m.p. and b.p. This increases from chloride to iodide whilst the heat of dissociation diminishes and the heat of volatilisation increases. M. S. B.

**Hydrocarbon vapour pressures.** E. R. COX (Ind. Eng. Chem., 1936, 28, 613—616).—V.-p. data for all hydrocarbons having mol. wt.  $> 30$  can be correlated by three equations, if b.p., crit. temp. and pressure are known, and the latter can be calc. for the normal paraffin series. H. C. M.

**Phase equilibria in hydrocarbon systems.**  
**XIII. Joule-Thomson coefficients of propane.** B. H. SAGE, E. R. KENNEDY, and W. N. LACEY (Ind. Eng. Chem., 1936, 28, 601—604).—Joule-Thomson coeffs. of pure  $C_3H_8$  gas were determined at six temp. between  $21^\circ$  and  $105^\circ$  and at pressures up to 550 lb. per sq. in. using a small automatically maintained const.-pressure drop across a radial-flow porous plug at a given temp. and pressure, the fall in temp. of the gas in passing through the plug being measured. H. C. M.

**Isotherms of ethylene between  $0^\circ$  and  $150^\circ$  and at pressures from 20 to 270 atmospheres.** A. MICHELS, J. DE GRUYTER, and F. NIESEN (Physica, 1936, 3, 346—351).—The isotherms have been measured at  $0^\circ$ ,  $25^\circ$ ,  $50^\circ$ ,  $75^\circ$ ,  $100^\circ$ ,  $125^\circ$ , and  $150^\circ$ , and empirical equations for  $pv$ , correct to 0.01%, are calc. for the respective temp. From the  $(pv_{t+12.5} - pv_{t-12.5})/25 - t$  curves for different densities it is concluded that  $c_v$  increases with increasing density to pass through a max. at the crit. density. J. W. S.

**Vapour pressure of mercury dimethyl.** F. RATMAN (J. Appl. Chem. Russ., 1936, 9, 591—593).—The v.p. is given by  $\log P = 6.53 - 1050/T - 11,000/T^2$ , at  $-60^\circ$  to  $100^\circ$ . R. T.

**Internal changes in the system  $SO_3$ .** I. A. SMITS and N. F. MOERMAN (Z. physikal. Chem., 1936, B, 32, 369—382).—The v.p.,  $p$ , of a specimen of  $\alpha$ - $SO_3$  prepared by partial evaporation of equilibrated  $\alpha$ - $SO_3$  and not in internal equilibrium increases with time according to a hyperbolic curve. Such  $SO_3$  begins to melt only at a temp. considerably above the triple point, showing that the mass is disequilibrated throughout. On irradiation with Cu K $\alpha$  radiation  $p$  rises at a const. rate to a val. corresponding with the v.p. of the  $\alpha$ -form in internal equilibrium, then remains const. It follows that X-rays accelerate equilibration. From measurements of the heat of mixing of molten  $SO_3$  with 83%  $H_2SO_4$  and the heats of dissolution in this solvent of disequilibrated and equilibrated  $\alpha$ - $SO_3$  the mol. heat of fusion of a disequilibrated specimen was found to  $-1.8$  kg.-cal., changing to  $-5.0$  kg.-cal. after irradiation with X-rays. This latter val. agrees with that calc. from v.-p. data for  $\alpha$ - $SO_3$  in internal equilibrium, showing that X-rays effect internal equilibration throughout the solid. R. C.

**Thermal conductivity of deuterium.** G. W. KANNULUIK (Nature, 1936, 137, 741).—The val. obtained at  $1.6^\circ$  for  $D_2$  is  $32.94 \pm 0.04 \times 10^{-5}$  g.-cal. per cm. per sec. per degree. L. S. T.

**Heat conductivity of liquid helium.** W. H. KEESOM and (MISS) A. P. KEESOM (Physica, 1936, 3, 359—360).—The thermal conductivity of liquid He II at  $1.4^\circ$  and  $1.75^\circ$  abs. is about 190 g.-cal. per degree cm. sec., or 200 times that of Cu at room temp.

and  $3 \times 10^6$  that of liquid He I. The term "supra-heat conductivity" is suggested for this phenomenon. J. W. S.

**Theory of viscosity of liquids.** D. B. MACLEOD (Trans. Faraday Soc., 1936, 32, 872—876).—An equation of the type of Andrade (A., 1934, 356) can be deduced from the author's equation for  $\eta$  (A., 1925, ii, 498) by taking into account associative van der Waals forces. L. J. J.

**Significance of viscosity.** H. R. SCHULZ (Z. Physik, 1936, 99, 666—668).—Greases are colloidal solutions, and may be used to determine the dependence of the coeff. of viscosity on time, temp., and shearing forces. A. B. D. C.

**Viscosities of some liquid refrigerants.** J. H. AWBERRY and E. GRIFFITHS (Proc. Physical Soc., 1936, 48, 372—380).—Using the method of timing the rate of fall of a closely fitting plug in a vertical tube filled with the liquid, and a special arrangement to prevent evaporation and bubble formation, data were obtained for  $\eta$  for  $SO_2$ ,  $MeCl$ ,  $EtCl$ ,  $CCl_2F_2$ , *cis*- and *trans*- $C_2H_2Cl_2$ , and  $CHCl_3$ , over the range  $-15^\circ$  to  $30^\circ$ . Results follow the law  $\eta = Ae^{a/T}$ , where  $T$  is the abs. temp. and  $A$  and  $a$  are consts. N. M. B.

**Structure viscosity.** W. PHILIPPOFF (Z. Spiritusind., 1936, 59, 157—158).—A survey of apparatus and technique, and discussion of published data for starch. E. S. H.

**Theory of structure viscosity. II. Streaming of structure-viscous substances.** W. PHILIPPOFF (Kolloid-Z., 1936, 75, 142—154; cf. A., 1935, 692).—Published work is discussed. E. S. H.

**Heterogeneous recombination and diffusion coefficients of halogen atoms.** E. RABINOWITCH and W. C. WOOD (Trans. Faraday Soc., 1936, 32, 917—922).—The mechanism of heterogeneous recombination is discussed. Diffusion coeffs. of Br and I atoms through a no. of gases are calc. from measurements of the stationary dissociation of illuminated halogen vapours. L. J. J.

**Origin of the term "solute."** (STR) W. J. POPE (Nature, 1936, 137, 782). L. S. T.

**Thermal diffusion in deuterium mixtures.** K. E. GREW and B. E. ATKINS (Proc. Physical Soc., 1936, 48, 415—420).—Measurements of thermal diffusion effects in  $H_2$ - $N_2$  and  $D_2$ - $N_2$  mixtures over the temp. range  $-190^\circ$  to  $100^\circ$  indicate that  $H_2$  and  $D_2$  have the same type of mol. field. He- $N_2$  mixtures were also examined. N. M. B.

**Compressibility of aqueous solutions.** E. BRANDER (Soc. Scient. Fenn. Comm. Phys.-Math., 1936, 9, 1—8).—A theoretical expression for the compressibility of aq. solutions is developed which gives vals. in close agreement with recorded experimental data and with those calc. from Tammann's formula (A., 1896, ii, 13). R. C. M.

**Apparent volumes and apparent compressibilities of solutes in solution. III. Unsaturated and supersaturated solutions of calcium nitrate.** A. F. SCOTT and G. L. BRIDGER (J. Physical Chem., 1936, 40, 461—470).— $d$  and compressibility coeffs. have been determined for both unsaturated and super-

saturated solutions of  $\text{Ca}(\text{NO}_3)_2$  at  $35^\circ$ . There is no definite evidence of the existence of separate hydrates in solution. The influence of concn. on the apparent mol. vol. and compressibility is discussed.  $d^{25}$  for cryst.  $\text{Ca}(\text{NO}_3)_2$  is 1.896, in good agreement with previous vals. M. S. B.

**Viscosity and density of carbamide solutions.** N. D. LITVINOV and A. I. MELNIKOVA (J. Appl. Chem. Russ., 1936, 9, 583—588).—The  $\eta$  of 15–75% solutions at 15–90° is given by  $1/\eta = (2.4 - 0.2c)t + 0.067c - 0.01209c^2 + 50.463$ ; over the same range  $d = 1.0074 - 0.00048t + 0.0028c$ . R. T.

**Optical properties of liquid mixtures of ketones and alcohols.** T. TOMONARI (Z. physikal. Chem., 1936, B, 32, 202—221; cf. A., 1933, 669, 1114).—The sp. refractivity,  $r_L$ , of ketone-alcohol mixtures falls below the mixture rule val. by an amount which diminishes with increasing chain length of either component. The changes in  $n$ ,  $d$ , and  $r_L$  of the mixtures caused by small amounts of acid decrease in the same order, owing to increasing shielding of the OH and CO groups by alkyl groups; the changes increase with fall of temp. Acid has no effect on the state of  $\text{COMe}_2\text{-H}_2\text{O}$  mixtures, for here there is extensive complex formation in absence of acid. R. C.

**Specific heats and related properties of the binary system methyl alcohol-toluene.** L. S. MASON and E. R. WASHBURN (J. Physical Chem., 1936, 40, 481—491).—Sp. heats, heats of mixing, vol. contraction on mixing, and  $n$  have been determined for  $\text{MeOH-PhMe}$  mixtures at  $25^\circ$  and  $35^\circ$ . Heat capacities are  $>$  and  $n <$  required by the additivity rule. Mixing is always accompanied by heat absorption. The thermal effects are most pronounced in mixtures containing only a small proportion of  $\text{MeOH}$ , and it is suggested that they are due to dissociation of associated  $\text{MeOH}$  into simpler mol. aggregates. Changes of vol. and of  $n$  are attributed to combination of  $\text{MeOH}$  with  $\text{PhMe}$ . M. S. B.

**Thermal conductivity of water-glycerol mixtures.** S. ERK and A. KELLER (Physikal. Z., 1936, 37, 353—358).—Results for 18 to 88% glycerol at 6–72° are recorded and expressed in terms of an empirical equation. A. J. M.

**Properties of illuminated iodine solutions. II. Negative absorption effect in benzene and other solvents.** E. RABINOWITCH and W. C. WOOD (Trans. Faraday Soc., 1936, 32, 816—823).—I solutions in  $\text{C}_6\text{H}_6$ ,  $\text{MeOH}$ , and  $\text{H}_2\text{O}$  show during strong illumination a reversible increase in their extinction coeff. which is  $\propto \sqrt{\text{light intensity}}$  and independent of  $[\text{I}]$  (cf. this vol., 437). For solutions in  $\text{CCl}_4\text{-C}_6\text{H}_6$  mixtures the effect is  $\propto [\text{C}_6\text{H}_6]$ . Explanations are suggested. F. L. U.

**Mutually surface-active liquids. Mixtures of sulphuric acid with nitrobenzene and with ether.**

C. BAILEY (J.C.S., 1936, 684—686).—Surface  $n$  n-composition curves for  $\text{H}_2\text{SO}_4\text{-PhNO}_2$  and  $\text{H}_2\text{SO}_4\text{-Et}_2\text{O}$  mixtures both show a min. at a small % of  $\text{H}_2\text{SO}_4$ . F. L. U.

**B.p. and composition of the vapour phase in the ternary system sulphuric acid-nitric acid-**

**water.** V. A. KIREEV, I. J. KLINOV, and A. N. GRIGOROVITSCH (J. Chem. Ind. Russ., 1936, 13, 346—348). R. T.

**Physical properties of the system ethyl alcohol-glycerol-water.** R. C. ERNST, C. H. WATKINS, and H. H. RUWE (J. Physical. Chem., 1936, 40, 627—635).—Surface tensions, viscosities,  $d$ ,  $n$ , and sp. heats have been determined at  $25^\circ$ . E. S. H.

**Commercially important systems of organic solvents. Vapour-liquid equilibrium data for the ternary system *n*-butanol-*n*-butyl acetate-water.** A. S. BRUNJES and C. C. FURNAS (Ind. Eng. Chem., 1936, 28, 573—580).—Equilibrium data at  $25^\circ$  are presented together with the  $d$  of ternary mixtures both saturated and unsaturated. It is shown that the composition of an unknown mixture of the alcohol and ester may be derived from a measurement of the amount of  $\text{H}_2\text{O}$  dissolved by the mixture. A saturated three-phase system when distilled leaves residues with a smaller  $\text{H}_2\text{O}$  content than the distillate, i.e., there is no true ternary azeotropic mixture. The azeotrope of  $\text{Bu}^n\text{OAc-H}_2\text{O}$  has b.p.  $95.5^\circ/760$  mm. and contains 29.44 mol.-% of  $\text{Bu}^n\text{OAc}$ . J. L. D.

**Vapour pressure of hydrogen fluoride, silicon fluoride, and water over solutions of the system  $\text{HF-H}_2\text{SiF}_6\text{-H}_2\text{SO}_4\text{-H}_2\text{O}$ .** N. CHAJDUKOV, Z. LINETZKAJA, and A. BOGNOVAROV (J. Appl. Chem. Russ., 1936, 9, 439—445).—V.-p. data are recorded for the systems  $\text{HF-H}_2\text{O}$  and  $\text{HF-H}_2\text{SiF}_6\text{-H}_2\text{SO}_4\text{-H}_2\text{O}$  at  $25\text{--}75^\circ$ . R. T.

**Application of the quantum theory of metals to the phase equilibrium in alloys.** S. T. KONOBEJEVSKI (Ann. Physik, 1936, [v], 26, 97—115).—Theoretical. The Hume-Rothery phase types (A., 1928, 111) represent energy minima corresponding with definite electron-gas concns. The thermodynamics of equilibria involving solid solutions are discussed from this viewpoint. L. J. J.

**Intermetallic compounds and mixed crystals.** U. DEHLINGER (Naturwiss., 1936, 24, 391—395).—A summary.

**X-Ray investigation of the equilibrium diagrams of aluminium-lithium alloys and the structure of  $\text{AlLi}$ .** G. KOMOVSKI and A. MAXIMOV (Z. Krist., 1936, 92, 275—283).—The equilibrium diagram up to 20.5% Li confirms the existence of two phases,  $\alpha$  and  $\beta$ . The  $\beta$ -phase is a compound  $\text{AlLi}$  which is cubic,  $a_0$  6.37 Å., with 16 atoms in the unit cell. The character of the  $\alpha$ -phase is not determined. B. W. R.

**Thermal and electrical conductivities of metals and alloys. II. Heat-resistant alloys from  $0^\circ$  to  $800^\circ$ .** R. W. POWELL (Proc. Physical Soc., 1936, 48, 381—392; cf. A., 1934, 1282).—Thermal conductivities, obtained by a comparative longitudinal-flow method, and electrical resistivities and Lorenz functions have been determined for various special steels, monel metal, and a Ni (80%)-Cr (20%) alloy, for temp. up to  $800^\circ$ . The Lorenz functions are abnormally high at room temp., but decrease with rise of temp. to a common val. at  $800^\circ$  of about  $0.62 \times 10^{-8}$ — $0.68 \times 10^{-8}$ . Results indicate that the thermal

conductivity of a metal can be approx. predicted from the electrical resistivity with an accuracy which increases with rise of temp. N. M. B.

**Electrical conductivity and phase diagram of binary alloys. The system sodium-lead.** H. KLAIBER (Z. Elektrochem., 1936, 42, 258—264).—Conductivities have been obtained for alloys containing up to 40 at.-% Na at temp. from 50° to 300°. The decrease in  $\kappa$  with increase in [Na] is discontinuous. There is no evidence for the formation of  $\text{Na}_2\text{Pb}_5$  as is suggested by the existence of a max. in the m.-p. curve. A phase diagram has been constructed. C. R. H.

**Cobalt-molybdenum system.** W. P. SYKES and H. F. GRAFF (Trans. Amer. Soc. Met., 1935, 23, 249—283).—The solid solubility of Mo in Co decreases from 26% at the eutectic temp. (1300°) to < 2% at 700°. The eutectic contains the hexagonal Co-rich solid solution ( $\gamma$ ), and  $\epsilon$ , a phase of formula  $\text{CoMo}$ .  $\epsilon$  is formed from the melt, on cooling, by a peritectic reaction at 1550° between the Co-rich liquid and the  $\eta$ -phase ( $\text{Co}_2\text{Mo}_3$ ). The  $\eta$ -phase forms at 1020° on cooling from the melt by a second peritectic reaction between the Co-rich liquid and the Mo-rich  $\delta$ -phase.  $\eta$  decomposes at 1250° on cooling into  $\epsilon$  and  $\delta$ . The  $\delta$ -phase is the Mo-rich solid solution (3% Co at 1600°). The face-centered cubic form of Co extends to 25% of Mo at 1310°, at which temp. it forms as the  $\beta$ -phase on cooling the hexagonal solid solution ( $\gamma + \epsilon \rightleftharpoons \beta$ ). At 1200° a hexagonal phase ( $\theta$ ) forms by the reaction  $\theta$  is stable at 1200—1050°. The transformation point of Co at 1020° is raised to approx. 1310° by 25% of Mo. The lower point (420°) is depressed to 240° by 1—2% of Mo. The Co-rich solid solution,  $\beta$ , undergoes age-hardening at > 450°. Max. hardness is observed in an alloy of Co with 15% Mo when aged for 100 hr. at 550°. CH. ABS. (e)

**Properties of Heusler's alloy, and the true specific heat of manganese and its discontinuity.** J. R. ASHWORTH (Proc. Physical Soc., 1936, 48, 456—468).—Measurements of density, intensity of magnetisation, crit. temp., Curie const., electrical resistivity and its temp. coeff., thermoelectric power, and sp. heat are recorded. The true sp. heat of Mn shows a very marked discontinuity at about 350°, near the crit. temp. of Heusler's alloy. The heat capacity of the alloy is additive, both above and below the crit. temp.; this is also true for magnetite. N. M. B.

**Problem of mixed crystals; Na-AgCl and Tl-CsCl mixed crystals with Al and Cr X-rays.** H. O'DANIEL (Z. Krist., 1936, 92, 221—252; cf. this vol., 676).—The energy relations of superlattices in mixed crystals are discussed, and an attempt is made to locate these lattices in Na-AgCl and Tl-CsCl mixed crystals, using X-radiation both of normal and of rather long  $\lambda$ . B. W. R.

**Permeability of palladium to hydrogen. Loss of diffusion power of pure palladium when heated. Regeneration of poisoned palladium.** V. LOMBARD, C. EICHNER, and M. ALBERT (Compt. rend., 1936, 202, 1777—1779).—A disc of pure Pd suffers a progressive and irreversible loss of diffusive

power on prolonged heating above 500—520° in presence of  $\text{H}_2$ , this loss being the more rapid the higher is the temp. This poisoning is arrested by lowering the temp. to < 450—500°. It thus appears that the state of max. permeability only is characteristic of the metal. The diffusive power can be restored considerably by heating to 500° in a current of air, cooling in air, and reducing the oxide film produced in  $\text{H}_2$  at < 140°. The loss of diffusive power is probably due to agglomeration of the fine surface granules. J. W. S.

**Temperature coefficient of solubility of hydrogen in organic solvents.** E. B. MAXTED and C. H. MOON (Trans. Faraday Soc., 1936, 32, 769—775).—The solubility of  $\text{H}_2$  in  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ ,  $\text{EtOH}$ ,  $\text{AcOH}$ , and  $\text{EtOAc}$  has been determined over a wide range of temp. between 0° and 75°. In each case the temp. coeff. is positive. F. L. U.

**Solubility of carbon dioxide in aqueous solutions containing alcohol and sugars [at 15°].** H. A. SHOWALTER and J. B. FERGUSON (Canad. J. Res., 1936, 14, 120—126).—The absorption coeff.,  $\alpha$ , decreases approx. linearly with increasing concn. of sucrose, glucose, and fructose. J. G. A. G.

**Desorption of gases from aqueous solutions into air.** I. G. NAGATKIN (J. Appl. Chem. Russ., 1936, 9, 434—438).—The rate of desaturation of aq. solutions of  $\text{CO}_2$ ,  $\text{H}_2\text{S}$ ,  $\text{Cl}_2$ , and  $\text{O}_2$  when air is passed at const. velocity over the surface of the solution is  $\propto$  the depth of the column of solution, to the mol. wt. and dipole moment of the solute, and to its degree of association. The experimental data are in agreement with Guyer's equation (A., 1934, 483). R. T.

**Active oxides. XCIX. Solubilities of a mixture of magnesium and ferric oxides during the course of ageing.** G. F. HÜTTIG and E. ZEIDLER (Kolloid-Z., 1936, 75, 170—184; cf. this vol., 441).—The solubility in dil.  $\text{HCl}$  of ignited  $\text{MgO}$  or  $\text{Fe}_2\text{O}_3$  is a more const. quantity the higher is the temp. of ignition. With equimol. mixtures the solubility and variation with age pass through max. and min. as the temp. of ignition is raised. E. S. H.

**Solubility and activity coefficient of silver acetate in mixed solvents.** F. H. MACDOUGALL and C. E. BARTSCH (J. Physical Chem., 1936, 40, 649—659).—Solubilities of  $\text{AgOAc}$  at 25° in 10, 20, and 30%  $\text{EtOH-H}_2\text{O}$  in presence of K, Na, Li, Ca, Sr, and Ba nitrates have been determined. The solubility of  $\text{AgOAc}$  in  $\text{H}_2\text{O}$  at 25° is 0.06634 g.-mol. per litre. The Debye-Hückel equation is valid for the solutions investigated. Vals. of the mean ionic diameter are calc. for solutions containing  $\text{KNO}_3$  or  $\text{NaNO}_3$ . The activity coeff. of  $\text{AgOAc}$  in saturated solutions in  $\text{EtOH-H}_2\text{O}$  mixtures without added nitrates has been calc. E. S. H.

**Solubility of  $\alpha$ -valine in water.** J. B. DALTON and C. L. A. SCHMIDT (J. Gen. Physiol., 1936, 19, 767—771).—The solubility between 0° and 60° varies with the cryst. form. H. G. R.

**Solubilities of the dihalogenated  $l$ -tyrosines in ethyl alcohol-water mixtures.** P. S. WINNEK and

C. L. A. SCHMIDT (J. Gen. Physiol., 1935, **19**, 773—780).—The solubilities of dihalogenated *l*-tyrosines are first increased by the addition of EtOH and then decreased, whereas that of *l*-tyrosine is decreased. The apparent heat of dissolution of di-iodotyrosine in EtOH-H<sub>2</sub>O and the solubility of *dl*-thyroxine at 30° in org. solvents have been determined.

H. G. R.

**Distribution of picric acid between benzene and mixtures of light and heavy water.** P. GROSS and A. WISCHIN (Trans. Faraday Soc., 1936, **32**, 879—883).—The distribution const. with pure D<sub>2</sub>O at 18° is 4 times that with pure H<sub>2</sub>O; it is not a linear function of the D<sub>2</sub>O content. The effect is due to the different zero-point energies in the D and H linkings.

L. J. J.

**Structural changes taking place during the ageing of precipitates. X. Distribution coefficient of lead between the surface of barium sulphate and solution. Determination of specific surface of barium sulphate.** I. M. KOLTHOFF and W. M. MACNEVIN (J. Amer. Chem. Soc., 1936, **58**, 725—728; cf. this vol., 561).—The distribution coeff., *K*, of PbSO<sub>4</sub> between BaSO<sub>4</sub> and H<sub>2</sub>O is 0.12, and 0.067 between BaSO<sub>4</sub> and 50% EtOH at 25°. *K* decreases with increasing mol.-% of PbSO<sub>4</sub> in the surface of BaSO<sub>4</sub>. The determination of the sp. surface of aged BaSO<sub>4</sub> ppts. by the radioactive method is described.

E. S. H.

**Anomalous distribution of thorium-C'' between uni- and ter-valent thallium ions.** J. ZIRKLER (Z. Physik, 1936, **99**, 669—670).—Further evidence is given for the distribution previously recorded (cf. this vol., 282).

A. B. D. C.

**Sorption of sulphur dioxide by active charcoal. VII. Sorption equilibrium at low temperatures.** K. ARII (Bull. Inst. Phys. Chem. Res. Japan, 1936, **15**, 254—265; cf. this vol., 153).—Sorption of SO<sub>2</sub> between -40° and -10° on charcoal activated at 800° may be represented by the isotherms of Patrick or Gregg.

R. S.

**Reversibility of adsorption of dissolved substances on ash-free charcoal.** L. LEPIN and G. STRACHOVA (Z. physikal. Chem., 1936, **176**, 303—312).—For AcOH, the adsorption of which is essentially of the van der Waals type, the adsorption and desorption isotherms practically coincide. For HCO<sub>2</sub>H, the adsorption of which is partly mol. and partly due to surface reaction of the CO<sub>2</sub>H groups, the curves deviate somewhat, whilst with HCl and H<sub>2</sub>SO<sub>4</sub>, which are adsorbed mainly by surface reaction, the curves deviate widely. On readsorption after desorption the system moves back to the adsorption isotherm and vice versa. These observations are satisfactorily explained on the basis of Schilov's theory of surface compounds.

R. C.

**Mechanism of desorption of solvent vapours from active charcoal. I.** A. P. OKATOV and Z. I. LEVINA (J. Appl. Chem. Russ., 1936, **9**, 287—297).—Adsorbed EtOH is removed more easily than Et<sub>2</sub>O from C by a current of steam. In general, the energy required for desorption  $\propto$  the activity of the C, and the use of highly active C for solvent recovery is not therefore always advantageous.

R. T.

**Adsorption of the heavier rare gases by mercury.** H. M. CASSEL and K. NEUGEBAUER (J. Physical Chem., 1936, **40**, 523—530).—The surface tension of Hg in contact with Kr at 235° and 253° abs. and with Xe at temp. between 237° and 293° abs. has been measured at various pressures. The adsorbed quantities have been calc. by Gibbs' equation. The heats of adsorption are also derived and compared with the theoretical vals. on the basis of the dispersion theory of the van der Waals forces.

M. S. B.

**Adsorption of gases by glass walls. XIV. Kinetics of the adsorption of carbon dioxide by Jena glass.** V. ALEXANDRE (Anal. Fis. Quím., 1936, **34**, 315—319).—Using the technique employed previously (A., 1926, 1002), the adsorption of CO<sub>2</sub> by Jena glass between 760 and 190 mm. at 16° is found to be 0.25 of the adsorption by ordinary glass. The velocity of adsorption cannot be determined owing to the small quantities involved.

F. R. G.

**Sorption of gases by titania gel. II. Relation between the pressure and the sorbed amount of sulphur dioxide. I.** HIGUTI (Bull. Inst. Phys. Chem. Res. Japan, 1936, **15**, 266—285; cf. A., 1935, 1315).—Sorption and desorption between -40° and 40° have been studied and the results are considered in relation to current theories. The hysteresis phenomena can be explained by the capillary adsorption theory.

R. S.

**Chemisorption of carbon dioxide by reduced iron. Influence of the chemisorption on van der Waals adsorption of carbon dioxide at 0°.** K. KAWAKITA (Proc. Imp. Acad. Tokyo, 1936, **12**, 61—63).—The van der Waals adsorption (*a*) of CO<sub>2</sub>, which occurs rapidly at 0°, has been studied with Fe on which CO<sub>2</sub> has been chemisorbed at 300—400° [when Fe+CO<sub>2</sub> (ads.)=Fe<sub>3</sub>O<sub>4</sub>+CO (ads.) and 2CO (ads.)=C+CO<sub>2</sub> (ads.), the first reaction occurring only on active Fe centres and the second even on weak centres]. *a* is independent of the amount of chemisorption and time of evacuation after chemisorption, but is less if the desorption is performed at 0° than at 300—400°. With no evacuation after chemisorption *a* is small. The no. of adsorption centres for *a* on a fresh surface at 0° is approx. half that for a surface on which CO<sub>2</sub> has been chemisorbed at 300—400° and evacuated at the same temp., but the fraction of surface covered is approx. the same.

R. S. B.

**Activated adsorption of hydrogen on chromic oxide gel. Effect of gas pressure.** R. L. BURWELL, jun., and H. S. TAYLOR (J. Amer. Chem. Soc., 1936, **58**, 697—705).—Rates of adsorption have been measured at 195—491° abs. and 0.125—1 atm. The data show that the surface of Cr<sub>2</sub>O<sub>3</sub> gel is composite, with areas of characteristic activation energies ranging from low vals. to 21.7 kg.-cal. per mol. for a large and relatively uniform area. The influence of temp., pressure, and occupied surface on the velocity of adsorption on such an area has been examined. The slow process of adsorption appears to be an interaction between mols. adsorbed by van der Waals forces and surface atoms which receive the necessary surface energy.

E. S. H.

**Sorption of water vapour from air by means of silica gel.** E. L. KOPELOVITSCH and N. I. TROITZKAJA (*J. Appl. Chem. Russ.*, 1936, 9, 673—680).—Max. sorption is shown by acid-treated  $\text{SiO}_2$  gel which is characterised by its high percentage of small pores, and by the high apparent  $d$  (0.65) of the dry powder. Sorption of  $\text{H}_2\text{O}$  is favoured by low temp. and high partial  $\text{H}_2\text{O}$  pressure.  $\text{H}_2\text{O}$  is removed from saturated gel at  $200^\circ$  (75—90 min.). R. T.

**Ionic exchange and sorption of gases by chabasite.** E. RABINOWITCH and W. C. WOOD (*Trans. Faraday Soc.*, 1936, 32, 947—956; cf. *A.*, 1932, 458).—The sorption of  $\text{H}_2$  (at  $-190^\circ$ ),  $\text{N}_2$  ( $-190^\circ$  and  $-80^\circ$ ),  $\text{CO}_2$  ( $20^\circ$ ), and  $\text{C}_3\text{H}_8$  ( $20^\circ$ ) by a no. of chabasites (I) in which the Ca was replaced by a series of different cations, have been measured. Ca-, Sr-, and Ba-(I) have approx. identical sorption properties. With Cd-(I), sorption is less at low pressure, but the saturation val. is the same. The sorption capacity is abnormally low for  $\text{N}_2$  and  $\text{C}_3\text{H}_8$  on Na-(I), and for  $\text{N}_2$ ,  $\text{H}_2$ , and  $\text{C}_3\text{H}_8$  on K-(I). The results are discussed. L. J. J.

**Adsorption of electrolytes on crystal surfaces.** I. M. KOLTHOFF (*Chem. Weekblad*, 1936, 33, 321—324).—Polemical against de Brouckere (*this vol.*, 422). D. R. D.

**Effect of irradiation on adsorptive power of solids.** I. J. A. HEDVALL [with E. FRIDEN, T. LINDSTRAND, and E. SVENANDER] (*Z. physikal. Chem.*, 1936, B, 32, 383—395).—The previously reported increase in adsorptive power,  $A$ , of phosphors during illumination (*A.*, 1935, 1055) has been confirmed by further experiments. Ultra-violet light causes a greater increase than does white light. When irradiation ceases,  $A$  declines progressively, but tends to constancy at a val. is observed when there has been no irradiation. Substances other than phosphors exhibit similar effects on appropriate irradiation. Attempts to detect differences in the rate of dissolution of fluorophors in the light and in the dark have yielded negative results. R. C.

**Determination of heats of sorption from solutions at crystal surfaces.** N. A. HELD and I. A. KHAINSKY (*Kolloid-Z.*, 1936, 75, 287—288).—Preliminary results for the adsorption of Na oleate in aq. solution by  $\text{BaSO}_4$  are reported. E. S. H.

**Adsorption of proteins. Influence of salts on the adsorption of hæmoglobin by kaolin.** M. PAIĆ and (Mlle.) V. DEUTSCH (*Compt. rend.*, 1936, 202, 1514—1516; cf. *this vol.*, 676).—The adsorption is diminished by 0.1—1N-Na<sup>+</sup>, -K<sup>+</sup>, and -Ba<sup>++</sup> and by  $\text{N-SO}_4^{--}$ . The diminution produced by NaCNS and  $\text{Na}_3\text{PO}_4$  is mainly due to the increase in  $p_H$ . R. S.

**Adsorption of nitrogenous substances from aqueous solutions.**—See *this vol.*, 914.

**Binding of glacial phosphoric acid by the proteins of wheat flour.** L. W. SAMUEL and R. K. SCHOFIELD (*Trans. Faraday Soc.*, 1936, 32, 760—769; cf. *A.*, 1935, 300).—The capacity of 37 wheat flours to bind glacial phosphoric acid has been found by electrometric titration to vary from 6.7 to 10.1 milliequiv. per 100 g. of flour. Flours of higher N

content tend to bind more acid per g. of flour but less per g. of protein. The uptake per g. of gluten varies only slightly with acid concn. between 0.02 and 1.0N. Flour proteins do not bind the various  $(\text{HPO}_3)$  units in the proportion in which they exist in the original acid solution. F. L. U.

**Reduction of some adsorbed oxidation-reduction indicators.** H. A. ABRAMSON and I. R. TAYLOR (*J. Physiol. Chem.*, 1936, 40, 519—521).—Experiments on the reduction and re-oxidation of methylene-blue, litmus, and phenosafranine adsorbed on filter-paper indicate that the bonds responsible for adsorption do not affect appreciably those groups which are involved in the oxidation-reduction process. The ionisation of adsorbed protein is a similar example of this type of behaviour. A surface which adsorbs selectively one of the constituents of a reversible oxidation-reduction system may thus alter the oxidation-reduction potential. Data for  $p_H$  indicators are discussed in this connexion.

M. S. B.  
**Polarisation of the luminescence of dyes adsorbed on colloidal gels.** P. PRINGSHEIM and H. VOGELS (*J. Chim. phys.*, 1936, 33, 261—271).—The rate and character of the fixation of dyes on  $\text{SiO}_2$  gel have been studied by measuring the degree of polarisation ( $p$ ) of the fluorescence. The  $p$ -time curves have the general form of adsorption curves. The amount of adsorption varies considerably with the solvent. The fluorescence appears to be due to adsorbed ions and not to mols. M. S. B.

**Absorption and accumulation of solutes by living plant cells.**—See *this vol.*, 907.

**Simple kinetic theory of ionic exchange. I. Ions of equal valency.** H. JENNY (*J. Physical Chem.*, 1936, 40, 501—517).—A model for the mechanism of ionic exchange is described and an exchange adsorption isotherm derived which is verified by ionic exchange data for Putnam clay. The structure of the colloidal particles is apparently important. The equation is satisfactory for soil colloids and bentonite clays, all of which have plate-like structures and seem to exchange on the outer surface only; it is less satisfactory for permutites and certain zeolites which have ultra-microscopic pores and channels. If there are large differences in the nature of the exchanging ions discrepancies may also occur. There is a relationship between the base-exchange const. and the ratio of the electric potentials of the double layers, which suggests that ionic exchange is connected with the question of colloid stability. M. S. B.

**Theory of formation of surface films on metals. II.** C. WAGNER (*Z. physikal. Chem.*, 1936, B, 32, 447—462).—The theory previously advanced (*A.*, 1933, 564) has been combined with the results of the misplacement theory of electrical conductivity (*ibid.*, 588) to obtain relations between the rate of formation of surface films,  $k$ , and the pressure of the reacting gas,  $p$ . The diffusion coeffs. for the equalisation of concns. in ionic lattices deviating in composition from the integral stoicheiometric ratio have been calc. for various types of misplacement. For film formation on Ag by  $\text{Cl}_2$  and  $\text{Br}_2$  the parabolic

law (A., 1922, ii, 831) is valid and, as the above theory requires,  $k \propto \sqrt{p}$ . From the observed vals. of  $k$  it is calc. that for AgBr at 200° and  $p=0.23$  atm. the electrons are responsible for 17% of the conductivity; the observed val. is 12%. It is inferred that diffusion during film formation consists in the migration of equiv. amounts of Ag<sup>+</sup> ions and electrons from the metal through the film to the outer surface, where the real chemical reaction occurs. The conductivity is thus of the electron deficiency type.

R. C.

**Composition and structure of surface films on iron.** E. A. NIKIFOROV and N. A. GODINA (J. Appl. Chem. Russ., 1936, 9, 225—228).

R. T.

**Mobility of potassium on tungsten.** R. C. L. BOSWORTH (Proc. Roy. Soc., 1936, A, 154, 112—123).—The diffusion coeff. for the surface migration of films of K on W rises with increasing concn., whilst the associated activation energy falls. The activation energy of diffusion for an infinitely dil. film = 0.72 volt, and for a unimol. film = 0.29 volt. This fall in the val. is due to the existence of a spreading force caused by the mutual repulsion of the adions. The effective dipole moment of the adions has been calc. from vals. of the spreading force at different surface concns.

L. L. B.

**Diffusion of gases from capillary tubes.** G. COSTEANU and P. RENAUD (Compt. rend., 1936, 202, 1511—1514).—When a stream of H<sub>2</sub>O vapour at low pressure from a capillary tube impinges on Na, or a current of air containing H<sub>2</sub>S strikes a gelatin surface containing Pb(OAc)<sub>2</sub>, concentric annular stains are produced.

R. S.

**Mechanism of the rise of hydrosols and coloured solutions through porous materials.** A. BOUTARIC and (Mlle.) P. BERTHER (Compt. rend., 1936, 202, 1781—1783; cf. A., 1934, 840).—The fact that rise of sol particles or coloured ions through porous material (e.g., filter-paper) does not cease when the solute reaches the top of the porous material is explained by solute continuing to rise, owing to evaporation and to progressive swelling of the porous material.

J. W. S.

**Determination of Zsigmondy's gold number, foam number, and surface tension of sodium and potassium salts of saturated and unsaturated fatty acids.** N. N. GODBOLE and M. SAGGAPAL (Kolloid-Z., 1936, 75, 193—201).—Data for K and Na salts of saturated fatty acids (C<sub>4</sub>—C<sub>18</sub>) and for unsaturated and hydroxy-C<sub>18</sub> acids are recorded and discussed from the viewpoint of detergent requirements.

E. S. H.

**Energy transformations at interfaces.** H. KAUSKY (Kolloid-Z., 1936, 75, 164—169).—The adsorption of the three tautomeric aminophthalic acid hydrazides by basic and acid gels has been studied. The absorbates show different colours of fluorescence, corresponding with the several tautomerides which are obtained under different conditions of prep.

E. S. H.

**Creeping of saturated salt solutions.** T. H. HAZLEHURST, jun., H. C. MARTIN, and L. BREWER (J. Physical Chem., 1936, 40, 439—452; cf. Wash-

burn, A., 1927, 931).—Creeping of a solution over a surface is attributed to the preferential wetting of the surface by the solid solute. Previous views of the mechanism are considered and the influence of the nature of the supporting surface, the crystal habit of the solute, and the free surface energies involved are discussed.

M. S. B.

**Osmotic complexes in which the pressure can differ on the two sides of the membrane.** F. A. H. SCHREINEMAKERS and J. P. WERRE (Rec. trav. chim., 1936, 55, 301—314).—Pressure and vol. changes which take place during osmosis in complex systems characterised by various combinations of liquids are considered.

C. R. H.

**Action of allylamine and Novalgin on prepared animal membranes (goldbeater's skins).** R. RAFF and E. ABRAHAMCZIK (Z. ges. exp. Med., 1935, 95, 691—702; Chem. Zentr., 1935, ii, 1562).—Allylamine (I) and allyl formate increase the permeability to H<sub>2</sub>O; treatment with Novalgin checks the deterioration caused by (I).

H. N. R.

**Preparation of isotonic solutions.** H. BOHME (Arch. Pharm., 1936, 274, 255—267).

R. S. C.

**F.p. of aqueous solutions. X. Dioxan and its mixtures with lithium, sodium, and potassium chlorides.** G. SCATCHARD and M. A. BENEDICT (J. Amer. Chem. Soc., 1936, 58, 837—842; cf. A., 1935, 30).—The f.p. of aq. dioxan containing KCl, NaCl, or LiCl up to a total concn. of dioxan + ions of 2M have been determined. At low concns. the osmotic coeffs. of the mixtures are < the Debye-McAulay theory requires, but agree well with the second theory of Debye. The salting-out effects of M-salt solutions calc. from these results have nearly the same relative vals. as those measured directly for Et<sub>2</sub>O.

E. S. H.

**Dielectric constants of solutions of organic acids in ethyl alcohol and benzene.** R. C. GORE and H. T. BRISCOE (J. Physical Chem., 1936, 40, 619—625).—Solutions of 24 org. acids at concns. up to 100 mg.-mol. per litre have been examined. The curves are compared with those relating  $n$  and resistance functions of the same solutions with concn. The results show that the electrical saturation theory holds qualitatively in some cases, but not quantitatively. EtOH has dielectric const. 24.33 at 25° and  $n_D$  1.35921.

E. S. H.

**Mechanism of quenching of fluorescence in solutions.** J. WEISS and H. FISCHGOLD (Z. physikal. Chem., 1936, B, 32, 135—138).—The quenching may be regarded as a simple electron transfer from the quenching ion to the excited mol.,  $Fl^*$ , e.g.,  $Fl^* + Fe^{++} \rightarrow Fl + Fe^{+++}$ , or, in a heterogeneous system on a metal surface,  $Fl^* + Pt \rightarrow Fl + Pt^*$ . The energy of excitation of Fl has the effect of increased electro-affinity. In the homogeneous reaction with Fe at higher light intensities in absence of O<sub>2</sub> practically irreversible reduction may occur or a reversible photostationary state be set up, depending on the conditions.

R. C.

**Significance of van der Waals forces for properties of salt solutions.** G. KORTUM (Z. Elektrochem., 1936, 42, 287—292; cf. this vol., 425).—The

importance of van der Waals forces between ions and solvent mols. is discussed. F. L. U.

**Velocity of fall of "super-Stokes" particles.** N. FUCHS (Tech. Phys. U.S.S.R., 1936, 3, 254—257).—Theoretical. The validity of Stokes' law for small spheres has been studied. Calculations for solid particles of  $d$  4—12 falling in air show that Stokes' law ceases to apply at radius  $10\ \mu$ . Fluid particles, which flatten on falling, will have a smaller velocity than the calc. val. R. S. B.

**Preparation of gold sol.** A. C. HONIG (Pharm. Weekblad, 1936, 73, 614—617).—Au sols made from  $H_2O$  twice distilled in glass are not transparent. Transparency depends on the presence of traces of Sn in the solution and consistently good sols are obtained by using such  $H_2O$  collected in glass vessels containing a Sn rod. In the method recommended, 2.5 c.c. of 1%  $AuCl_3$ , 2.63 c.c. of 0.2N- $K_2CO_3$ , and 0.125 c.c. of 1%  $H_2C_2O_4$  solutions are added to 250 c.c. of the boiling  $H_2O$ ; the flask is removed from the flame, and 3 c.c. of 1%  $CH_2O$  solution are added with shaking. S. C.

**Negative ferric hydroxide sol. Preparation.** A. DAS and R. DE (J. Indian Chem. Soc., 1936, 13, 197—203).—Neutral  $Fe(OH)_3$  sol can be prepared by mixing equimol. quantities of  $FeCl_3$  and  $NaOH$  solutions in the presence of a stabiliser, e.g., alkaline citrate, tartrate, phosphate, silicate, sulphide, or carbonate, the stabilising effect decreasing in this order. C. R. H.

**Organosol of sulphur.** K. INABA (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 298—300).—Amorphous S is pptd. from  $Na_2S_2O_3$  by  $HCl$ , dissolved in  $C_6H_6$  or  $EtOH$ , and the organosol obtained by irradiation with ultra-violet light. A no. of sols have been prepared for clinical use by distillation of  $C_6H_6$  from a mixture of "benzosol" and fat or oil. R. S.

**Synthesis of hydrosols of sparingly-soluble salts by electrolysis. II. Ferric phosphate hydrosols.** B. G. SAPROMETOV and E. I. SMOLIGINA (Kolloid-Z., 1936, 75, 291—297; cf. A., 1934, 1305).—The optimal conditions (c.d., temp., and concn. of  $Na_2HPO_4$ ) for the prep. of  $FePO_4$  sols have been determined. For the more stable sols the dispersity,  $\zeta$  potential, and resistance to flocculation by  $KCl$  have been determined. E. S. H.

**Liquid ammonia as a solvent. V. Metallic solutions.** J. F. CHITTUM and H. HUNT (J. Physical Chem., 1936, 40, 581—589).—Solutions of  $NH_4$  in liquid  $NH_3$  have been prepared by electrolysis of  $NH_4Cl$  at  $-60^\circ$  to  $-80^\circ$ . Solutions of alkali metals in liquid  $NH_3$  show the Tyndall effect; on electro-dialysis the alkali metal does not pass through the membrane. Such systems are discussed as colloid solutions. E. S. H.

**Physical chemistry of the autoclave process of sulphur melts. Formation and destruction of the three-phase sulphur emulsion.** K. N. SAMOCHVALOV and O. S. KOSHUCHOVA (Kolloid-Z., 1936, 75, 217—222).—The degree of emulsification in the system molten S—conc. aq.  $MgCl_2$  and the type of emulsion

(S as the inner or outer phase) have been studied under different conditions, using  $CaSO_4$  or  $SiO_2$  as emulsifiers. E. S. H.

**Brownian movement of a linear lattice. I.** BESSENOV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 323—327).—Mathematical. A. J. M.

**Photographic observation of aerosol particles as an objective method of measurement.** A. WINKEL and W. WITT (Z. Elektrochem., 1936, 42, 281—285).—An optically defined vol. of aerosol, illuminated from opposite directions by two high-power lamp systems on the same optical axis, is photomicrographed with an exposure of 0.1 sec. Very fine particles can be thus recorded, and photophoresis is prevented. In studying coagulation the photographic method is preferred to visual counting, owing to the elimination of personal errors, and to the possibility of photographing an aerosol within a few sec. of its formation, and thus obtaining points at an early stage in the coagulation process. Examples are given of the photographic study of Brownian movement, sedimentation under gravity, and electric mobility. F. L. U.

**Behaviour of aerosols in the acoustic field. I.** O. BRANDT and E. HIEDEMANN (Kolloid-Z., 1936, 75, 129—135).—Kinemato-micrographic investigation has shown that aerosols (smoke,  $NH_4Cl$ , etc.) are coagulated when subjected to sound or ultrasonic waves. The increase in particle size has been determined by measurements of light absorption and rate of fall. E. S. H.

**Determination of size of micelles from the swelling of films.** S. PAFKOV (J. Appl. Chem. Russ., 1936, 9, 518—519).—Polemical, against Voskresenski (B., 1935, 719). R. T.

**Colour and opacity of emulsions.** J. F. MORSE (Trans. Faraday Soc., 1936, 32, 941—947).—A photo-electric photo-colorimeter is described. In a coloured emulsion the tone increases with degree of dispersion. Data are recorded for opacities of paraffin-aq. gum solution emulsions at different concns. and degrees of dispersion. For emulsions of grain size  $1\ \mu$ , the opacity is independent of concn. for concns.  $> 5\%$ . L. J. J.

**Dielectric constant of colloidal systems.** J. T. G. OVERBEEK (Natuurwetensch. Tijds., 1936, 18, 55—72).—The  $\epsilon$  of colloidal systems with  $H_2O$  as the disperse medium is affected by (1) differences in  $\epsilon$  of the disperse phase and disperse medium, which may increase or decrease  $\epsilon$ ; (2) the electric double layer effect, as yet unconfirmed experimentally, which will increase  $\epsilon$ ; (3) the permanent dipole moment of the particles increasing  $\epsilon$  at low  $\nu$ , confirmed with lyophilic colloids; (4) hydration decreasing  $\epsilon$  at high  $\nu$  but increasing  $\epsilon$  at low  $\nu$ . This last has been confirmed experimentally but an adequate explanation of the phenomenon is wanting. S. C.

**Diffusion potentials in colloidal systems.** H. B. STEINBACH (J. Cell. Comp. Physiol., 1935, 7, 291—300).—The potential between alkaline gelatin gels and applied electrolytes is considerable, and may be considered to be a diffusion potential between two electrolyte phases, the gel functioning as a slow-moving anion. R. N. C.

**Double layer in colloids.** H. R. KRUYT (*Natuurwetensch. Tijds.*, 1936, 18, 29—37).—A lecture on the theory of the electric double layer in colloids. S. C.

**Character of hydrophilic colloids. Hydration.** H. R. KRUYT (*Natuurwetensch. Tijds.*, 1936, 18, 38—43).—A lecture, discussing mainly dipole orientation in the hydration of colloids. S. C.

**Colloid behaviour of polymeric carbohydrates: starch, cellulose, and glycogen.** P. KOETS (*Natuurwetensch. Tijds.*, 1936, 18, 44—54).—A lecture dealing principally with the internal hydration and the electrical states of these systems. S. C.

**Mixtures of colloidal electrolytes with uni-univalent salts.** J. W. MCBAIN and (Miss) J. SEARLES (*J. Physical Chem.*, 1936, 40, 463—499).—The electrical conductivity and f.p. lowering of mixtures of ordinary electrolytes with alkali or H soaps are in good agreement with the additive mixture rule. The charges on the micelle are so widely spaced as to be practically independent. Thus the ionic strength of colloidal electrolytes is similar to that of uni-univalent electrolytes. M. S. B.

**Validity of the Lambert-Beer law in hydrophobic colloids.** F. B. GRIBNAU, H. R. KRUYT, and L. S. ORNSTEIN (*Kolloid-Z.*, 1936, 75, 262—268).—Experiments with Au and Se hydrosols confirm the validity of the law. E. S. H.

**Osmotic pressure of glycogen solutions.**—See this vol., 878.

**Viscosity and adsorption of starch sols.** J. H. C. MERCKEL (*Kolloid-Z.*, 1936, 75, 318—322).—The influence of Na salts of monobasic acids on the  $\eta$  of starch sols and the adsorption of the same salts by starch are in accordance with the lyotropic series. E. S. H.

**Structure mechanics of viscous-elastic continua. I. Hydrodynamic theory of anomalous turbulence.** H. UMSTATTER (*Kolloid-Z.*, 1936, 75, 135—142).—Mathematical. E. S. H.

**Coagulation of colloids. XI. Variation of optical refractivity during the coagulation of colloidal manganese dioxide and new evidence for the discontinuity of the change.** S. S. JOSHI and S. J. RAO (*J. Indian Chem. Soc.*, 1936, 13, 141—149).—Coagulation of colloidal  $MnO_2$  by conc. solutions of inorg. salts has been followed by the measurement of  $n$ . Further evidence is obtained that coagulation proceeds through discontinuous stages termed "zones of coagulation." (Cf. this vol., 426.) C. R. H.

**Flocculation of stannic oxide sols.** H. S. VAN KLOOSTER and A. PETROVICH (*J. Physical Chem.*, 1936, 40, 591—597).—The ease of peptisation of  $SnO_2$  sols by alkalis is in the order  $KOH > NaOH > NH_4OH > LiOH$ . When the sols are treated with alkali-metal salts, the flocculation vals. of the cations are in the order  $K > Na > NH_4 > Li$ , which indicates that colloidal  $SnO_2$  has hydrophilic properties. Addition of alcohol lowers the amount of electrolyte required for coagulation. The significance of hydration of the flocculating ions is discussed. E. S. H.

**Electrolyte coagulation of weakly solvated sols and electrolyte activity. III. Flocculation by reversing electrolytes.** W. OSTWALD (*Kolloid-Z.*, 1936, 75, 297—317; cf. this vol., 157).—A crit. discussion of published work. E. S. H.

**Liesegang rings of manganese sulphide. II.** O. F. TOWER (*J. Physical Chem.*, 1936, 40, 599—602; cf. A., 1931, 924).—Periodic structures of  $MnS$  in  $SiO_2$  gel were found to be spaced in geometrical progression. The influence of diffusion, supersaturation, and adsorption is discussed. E. S. H.

**Quantitative analyses of Liesegang rings.** A. T. LINCOLN and J. C. HILLYER (*J. Physical Chem.*, 1936, 40, 645—647).—Quant. analyses of periodic structures of  $CuCrO_4$  in  $SiO_2$  gel have been made. Comparison with the conditions of pptn. in absence of the gel shows that the  $SiO_2$  gel inhibits the pptn. of  $CuCrO_4$  until higher concns. are reached. E. S. H.

**Mixed crystal formation of zinc sulphide post-precipitated with mercuric sulphide. Ageing of mercuric sulphide and of zinc sulphide.** R. MOLTZAU and I. M. KOLTHOFF (*J. Physical Chem.*, 1936, 40, 637—643).—X-Ray evidence shows that the ppts. form mixed crystals containing  $\approx 12$  mol.-% of  $ZnS$ . Ageing of the ppts. in the supernatant liquid at room temp. tends to perfect the cryst. state. Some of the variables affecting the transformation of black  $HgS$  to the red form have been noted. E. S. H.

**Effect of surface tension and electrical potential on the stability of mercury emulsions.** V. SIVERTZ, W. H. NAYLOR, and H. V. TARTAR (*J. Amer. Chem. Soc.*, 1936, 58, 782—786).—The  $Hg-H_2O$  interfacial tension is raised by adding K citrate, tartrate, or chloride. There is no relation between change of interfacial tension or  $p_H$  of solution and ease of emulsification in this system. Electrocapillary curves show that emulsifying and non-emulsifying agents give similar results. E. S. H.

**Dynamical principle of thixotropic solidification and its application.** W. HELLER (*Compt. rend.*, 1936, 202, 1507—1509).—Thixotropy is defined and the conditions for its appearance in hydrophilic colloids are indicated. R. S.

**Alumina gel, its preparation and properties.** H. BRÜCKNER and L. HIRTH (*Angew. Chem.*, 1936, 49, 360—362).—When Al salt solutions, containing about 2% of  $Al^{+++}$ , are pptd. by adding 25% excess of aq.  $NH_3$  and the product is washed repeatedly by decantation, an amorphous  $Al_2O_3$  gel is obtained, which resembles  $SiO_2$  gel. The relative rates of adsorption of  $H_2O$  vapour by amorphous and cryst.  $Al_2O_3$  gel and  $SiO_2$  gel have been compared. The amorphous  $Al_2O_3$  gel takes up a max. of 40%  $H_2O$  and can be regenerated by heating in air at 400—500°. E. S. H.

**Hydroxide and oxyhydrate gels, and their amphoteric properties.** A. KRAUSE (*Kolloid-Z.*, 1936, 75, 288—291).—Polemical (cf. this vol., 158). E. S. H.

**Gel system: cellulose nitrate-copper bronze.** W. E. GLOOR and H. M. SPURLIN (*J. Amer. Chem. Soc.*,

1936, 58, 854—855).—Gelation in this system appears to be caused by a reaction between Cu in some form and  $\text{NO}_3^-$  in the cellulose ester. The greater is the length of the chain mols. or the greater their concn., the less is the amount of bronzing powder required to form a stiff gel. E. S. H.

**Determination of temperature of maximum density of gels.** H. E. VON GRONOW (Z. anorg. Chem., 1936, 227, 221—224).—The temp. of max.  $d$  of gelatin gels, calc. from the contraction occurring when gelatin is dissolved in  $\text{H}_2\text{O}$ , and from the respective coeffs. of expansion, agree with those observed by Taffel (J.C.S., 1922, 121, 1971). The gels behave, on thermal expansion, precisely as if the gelatin were present in the form of anhyd. solid. F. L. U.

**Bound water in gelatin gel.** E. HATSCHKE (Trans. Faraday Soc., 1936, 32, 787—789).—A direct demonstration of "bound"  $\text{H}_2\text{O}$  in gelatin gel is based on the colour change accompanying the dehydration of  $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$  contained in the gel. The change is complete when the  $\text{H}_2\text{O}$  content of the gel falls to 30.4—34.0%. F. L. U.

**Gelation of different kinds of gelatin.** R. REIGER and S. BACH (Kolloid-Z., 1936, 75, 322—325).—Investigation of the change of optical rotation of gelatin during the initial stages of gelation shows that for 4 different kinds of gelatin the abs. change is different, but the relative change is the same. E. S. H.

**Influence of ultrasonic waves on gels.** H. FREUNDLICH and K. SOLLNER (Trans. Faraday Soc., 1936, 32, 966—970).—The liquefaction of thixotropic gels by ultrasonic waves is due to cavitation, and does not occur if this is prevented. L. J. J.

**Physico-chemical properties of electrodialysed gels of silica, alumina, ferric hydroxide, and their mixture. I. Ion exchange.** P. B. BHATTACHARYA and K. GANGULI (J. Indian Chem. Soc., 1936, 13, 204—213).—Dried electrodialysed gels of  $\text{SiO}_2$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$ , and mixtures of  $\text{SiO}_2$  and  $\text{Fe}_2\text{O}_3$  or  $\text{Al}_2\text{O}_3$  were treated with aq. solutions of  $\text{NaCl}$ ,  $\text{KCl}$ ,  $\text{CaCl}_2$ , and  $\text{MgCl}_2$  and the amount of ion adsorption was measured.  $\text{SiO}_2$  did not adsorb  $\text{Cl}^-$  ions. Cation adsorption in the case of the mixed gels was always  $>$  that calc. from the adsorption of the components. C. R. H.

**Viscosity of thorium phosphate gel-forming mixtures during gelation.** S. M. MEHTA, M. U. PARMAR, and M. PRASAD (J. Indian Chem. Soc., 1936, 13, 128—135).—The  $\eta$  of  $\text{Th}_3(\text{PO}_4)_4$  during gelation, alone and in presence of  $\text{Th}(\text{NO}_3)_3$  and  $\text{H}_3\text{PO}_4$ , has been investigated. The  $\eta$  increases with time, at first slowly and then more rapidly, but there is no evidence of discontinuity in the  $\eta$ -time curves during gelation. Additions of  $\text{H}_3\text{PO}_4$  and  $\text{Th}(\text{NO}_3)_3$  respectively increase and decrease the rate of increase of  $\eta$  with time, the former being due to an increase in the no. of micelles in unit vol., and the latter to  $\text{Th}$  ions peptising  $\text{Th}_3(\text{PO}_4)_4$ , and so increasing the degree of dispersion of the micelles. Non-electrolytes decrease and electrolytes increase the rate of increase of  $\eta$  with time. C. R. H.

**Viscosity of fibrinogen.**—See this vol., 874.

**Isoelectric point of glycinin.** R. J. HARTMAN and L. T. CHENG (J. Physical Chem., 1936, 40, 453—459).—The electrophoresis of glycinin indicates that the isoelectric point is at 5.02. Min.  $\eta$ , min. solubility, and min. variation of electrical conductivity with change of  $p_H$  are at the same point within the limits of experimental error. This result confirms Loeb's view that the physical properties of a protein are related to the isoelectric point. M. S. B.

**Influence of mono- and poly-hydric alcohols and mono- and poly-saccharides on the absorption of fluid by gels.** L. I. WEBER and F. LEDERER (Biochem. Z., 1936, 285, 115—122).—A layer of  $\text{H}_2\text{O}$  or aq. solution of various non-electrolytes is placed above a gelatin gel and the effect on swelling noted. The power to remove  $\text{H}_2\text{O}$  from the gel increases with increasing no. of OH groups and with increasing mol. wt. Thus the effect increases in the series  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{PrOH}$ ,  $(\text{CH}_2\text{OH})_2$ , trimethylene glycol,  $\beta$ -butylene glycol and similarly in the series glycol, glycerol, erythritol, mannitol, glucose, maltose, sucrose, and lactose. Dextrin and starch have about the same action. The solubility of the solute has some effect but does not solely determine the degree of swelling. P. W. C.

**Cataphoretic migration velocity of inorganic colloids.** J. N. MUKHERJEE, S. G. CHAUDHURY, and B. N. GHOSH (Kolloid-Beih., 1936, 43, 417—466).—A summary of published work. The influence of dilution, electrolytes, non-electrolytes, and their mixtures, and the relation of electrophoresis to dielectric const. and crit. coagulation potential are discussed. E. S. H.

**Experimental test of the identity of electrokinetic potentials.** Electrosmosis and streaming potential measurements with a glass slit. R. DuBOIS and A. H. ROBERTS (J. Physical Chem., 1936, 40, 543—560).— $\zeta$ -potentials for very dil. aq. electrolytes ( $10^{-3}$ — $10^{-6}N$ ) obtained from electrosmosis experiments are nearly identical with those afforded by streaming potential measurements over most of the concn. range. Large discrepancies, however, occur at very low ionic concn. With  $10^{-5}N$ - $\text{AlCl}_3$  results of opposite sign are obtained by the two methods. M. S. B.

**Exchange reactions between heavy water and hydrogen compounds.**—See this vol., 819.

**Effect of isotopy on the position of chemical equilibrium.** J. M. BLIVOET (Chem. Weekblad, 1936, 33, 287—288).—Isotopy has no effect on chemical equilibrium as far as statistical wt. is concerned. The explanation given by Giauque and Overstreet (A., 1932, 695) is criticised and a more rational one offered. S. C.

**Equilibrium between ethyl alcohol, water, and ethyl ether in the gaseous phase.** G. SEMERANO (Gazzetta, 1936, 66, 162—169).—The equilibrium has been studied at  $249^\circ$  and  $266^\circ$  and 10—70 atm., using a mixture of Al oxide and phosphate as catalyst. From the linear relation between  $\log K$  and  $p$ , the

calc. vals. of  $K$  at 1 atm. are 7.25 and 7.69 at 249° and 266°, respectively. O. J. W.

**Equilibrium between *n*-propyl alcohol, water, and *n*-propyl ether in the gaseous phase.** G. SEMERANO (Gazzetta, 1936, 66, 170—172; cf. preceding abstract).—From measurements up to 32 atm. between 235° and 260° the val. of  $K$  at 1 atm. and 250° is calc. to be 11.0. O. J. W.

**Equilibrium between *n*-butyl alcohol, water, and *n*-butyl ether in the vapour state.** G. SEMERANO (Gazzetta, 1936, 66, 172—174; cf. preceding abstracts).—From measurements up to 20 atm. between 250° and 260° the calc. val. of  $K$  at 1 atm. and 250° is 14.0. O. J. W.

**Cryoscopic determination of the total hydration of potassium iodide ions.** (Mlle.) O. HUN (Compt. rend., 1936, 202, 1779—1781).—The apparent cryoscopic const. ( $A$ ), 1933, 460) for 0.5*N*-KI is 19.99, suggesting hydration represented by  $KI \cdot 8.6H_2O$  (cf. *ibid.*, 566;  $A$ , 1934, 728). J. W. S.

**Dissociation constant of hydrochloric acid.** R. A. ROBINSON (Trans. Faraday Soc., 1936, 32, 743—744).—The const.  $K = a_{H^+}a_{Cl^-}/[mol. fraction HCl]$  ( $a$ =activity) has been derived for 0.56—15.4*N*-HCl from v.-p. data, assuming the validity of Raoult's law.  $K$  varies from  $20 \times 10^{-6}$  at 0° to  $0.12 \times 10^{-6}$  at 50°. Log  $K$  gives a linear plot with  $1/T$ , from which the heat of dissociation is calc. to be 17.9 kg.-cal. F. L. U.

**Thermodynamics of hydrochloric acid in methyl alcohol-water mixtures from electromotive force measurements.** H. S. HARNED and H. C. THOMAS (J. Amer. Chem. Soc., 1936, 58, 761—766).—E.m.f. of the cells  $H_2|HCl(m)|$  in  $x\%$  MeOH,  $y\%$   $H_2O|AgCl-Ag$  have been determined at 5° intervals from 0° to 40° in 10—20 wt.-% MeOH, with acid concns. of 0.003—2*M*. The activity coeff. of the acid in MeOH- $H_2O$  mixtures of high dielectric const. can be calc. on the basis of the extended Debye-Hückel theory from the data for aq. solution. Methods of extrapolation of the e.m.f. data for the above cell have been studied and the standard potential of the cell in MeOH has been recalcd. The e.m.f. of transfer of the acid at unit activity from one solvent to another is discussed in relation to the Born theory, and vals. for the sum of the reciprocals of the ionic radii have been obtained. Equations and parameters for calculating the relative partial mol. heat content and sp. heat of the acid in 10 and 20% MeOH solutions are given. E. S. H.

**Second dissociation constant of carbonic acid.** Y. KAUKO and V. MANTERE (Z. physikal. Chem., 1936, 176, 187—201; cf. this vol., 29).—From the e.m.f. of the cell  $H_2|Na_2CO_3|saturated KCl|0.01*N*-HCl|0.09*N*-KCl|H_2$ , the  $H$  ion activity of  $10^{-4}$ — $10^{-3}$ *M*- $Na_2CO_3$  has been determined, leading to vals. of the above dissociation const. at 0—37°, having a possible error of  $\pm 7\%$ . The heat effect for the second dissociation is -2700 and -7500 kg.-cal. at 12.5—37 and 0—12.5°, respectively. R. C.

**Chemical constitution and dissociation constants of monocarboxylic acids. V. Further substituted benzoic and phenylacetic acids.**

J. F. J. DIPPEY and R. H. LEWIS (J.C.S., 1936, 644—649; cf.  $A$ , 1935, 581).—Vals. of  $K \times 10^5$ , both classical and thermodynamic, have been obtained by the conductivity method for *m*- and *p*-methyl-, *m*-methoxy-, *o*- and *m*-fluoro-, *m*-bromo-, *o*- and *m*-iodo-, *m*- and *p*-nitro-benzoic acids, and *o*- and *m*-iodophenylacetic acids. The results are discussed. F. L. U.

**Dissociation constants of polybasic acids. II.** W. R. MAXWELL and J. R. PARTINGTON (Trans. Faraday Soc., 1936, 32, 775—782; cf.  $A$ , 1935, 934).—The dissociation consts. of trimellitic, trimesic, mellophanic, prehnitic, and pyromellitic acids have been determined. The results support the hypothesis that the negative charge or charges on a dissociating ion produce an inhibiting effect which is a simple function of their no. and distance from the dissociating  $\cdot CO_2H$ . F. L. U.

**Proton affinities of sparingly soluble bases: benzdine.** E. B. R. PRIDEAUX and J. R. PARKINSON (Trans. Faraday Soc., 1936, 32, 963—966).—The dissociation const.  $k_b$ ,  $p_{k_1}$ , and  $p_{k_2}$  have been determined by colorimetric methods, by the electro-metric method in aq. alcoholic solution and extrapolation to zero  $[EtOH]$ , and colorimetrically in presence of solid base, giving, respectively,  $k_b \times 10^9$  1.25, —, 1.74;  $p_{k_1}$  5.097, 5.09, 5.23;  $p_{k_2}$  3.61, 3.79, —. L. J. J.

**Calorimetric study of the action of ammonia on cobalt chloride in water in presence of ammonium chloride.** M. CHATELET (J. Chim. phys., 1936, 33, 313—324).—Equilibria have been determined at 18° for the ions  $Co(NH_3)^{2+}$  and  $Co(NH_3)_3^{2+}$  previously detected (cf. this vol., 290).  $Co^{2+} + NH_3 \rightleftharpoons Co(NH_3)^{2+}$  gives  $K_1 = [Co^{2+}][NH_3]/[Co(NH_3)^{2+}] = 0.3$  and  $Co(NH_3)^{2+} + 2NH_3 \rightleftharpoons Co(NH_3)_3^{2+}$  gives  $K_2 = [Co(NH_3)^{2+}][NH_3]^2/[Co(NH_3)_3^{2+}] = 95$ . Thus the equilibrium const.  $K_3$ , corresponding with the formation of  $Co(NH_3)_3^{2+}$  from  $Co^{2+}$ , is  $K_1K_2 = 28$ . Heats of reaction have also been calc. M. S. B.

**Ferric sulphate in aqueous solutions of other sulphates.** F. K. CAMERON (J. Physical Chem., 1936, 40, 689—696).—In general, addition of  $Fe_2(SO_4)_3$  lowers the solubility of other sulphates. With  $FeSO_4$  no double salt is formed between 25° and 50°. With  $(NH_4)_2SO_4$  an alum is formed below 36°; the range of concn. in which it exists at 25° has been determined. With  $K_2SO_4$  an alum is formed below 16° over a wide concn. range; above 16°  $2K_2SO_4 \cdot Fe_2(SO_4)_3 \cdot 14H_2O$  is stable at all but very high or very low concns. of  $Fe_2(SO_4)_3$ . E. S. H.

**Lower cobalt sulphides. Equilibrium diagram of system Co-CoS.** H. HULSMANN and F. WEIBKE [with K. MEISEL] (Z. anorg. Chem., 1936, 227, 113—123; cf.  $A$ , 1935, 1335).—Thermal, microscopic, and X-ray analysis of the system Co-CoS confirms the results obtained by Friedrich ( $A$ , 1908, ii, 500). CoS melts at  $1135 \pm 10^\circ$ , and forms a homogeneous phase only in presence of a slight excess of S. The face-centred cubic lattice with  $a$  9.924 Å. characterises the  $\gamma$ -phase ( $Co_5S_5$ ). L. U.

**M.-p. diagram of boron trioxide-sodium metaborate melts.** E. JENCKEL (Z. anorg. Chem., 1936,

227, 214—220; cf. A., 1935, 704).—The m.-p. diagram of the system  $B_2O_3$ - $NaBO_2$  affords evidence of the compounds  $Na_2O, 4B_2O_3$ ,  $Na_2O, 3B_2O_3$ , and  $Na_2O, 2B_2O_3$ . The two former exist in stable and unstable modifications. F. L. U.

**System  $SO_3$ - $H_2O$  and absolute sulphuric acid.** E. MOLES and C. R. DE ROBLES (Anal. Fis. Quím., 1936, 34, 331—362).—The anomalous cryoscopic const. of  $H_2SO_4$  (cf. Oddo *et al.* A., 1918, ii, 352) is supposed to be connected with the equilibrium  $3H_2SO_4 \rightleftharpoons H_2SO_4 \cdot H_2O + H_2S_2O_7$ . F. R. G.

**Thermal dissociation of calcium carbonate.** J. C. SOUTHARD and P. H. ROYSTER (J. Physical Chem., 1936, 40, 435—438).—Measurements made with the use of a furnace in which a temp. of  $900^\circ$  could be maintained const. within  $0.04^\circ$  for over 30 hr. lead to pressures given by  $\log_{10} p_{\text{cm.}} = -9140/T + 0.382 \log_{10} T - 0.668 \times 10^{-3}T + 9.3171$ . The temp. corresponding with 1 atm. is  $894.4^\circ$ . M. S. B.

**Saturation pressure of ammonia in the thermal decomposition of zinc chloride diammine.** E. STAROKADOMSKAJA (J. Appl. Chem. Russ., 1936, 9, 599—602).—The pressure of  $NH_3$  over  $ZnCl_2 \cdot 2NH_3$  at  $220$ — $540^\circ$  ( $1$ — $40$  atm.) agrees with that calc. from Krasnov's formula (Bull. All-Soviet Union Thermotech. Inst., 1935, No. 11). R. T.

**Vapour pressure of nitric acid and ammonia over aqueous ammonium nitrate.** V. A. KLEVKE and J. D. CHASKINA (J. Chem. Ind. Russ., 1936, 13, 408—411).—The  $[HNO_3]$  of the vapour from boiling aq.  $NH_4NO_3$  is negligible for concns.  $< 65\%$ . The loss of  $NH_3$  involved in concentrating a  $60\%$  solution (containing  $0.5$  g. of excess  $NH_3$  per litre) to  $93\%$  amounts to  $4.5$ — $5$  kg. per ton of solution. R. T.

**Chemical transformations in ternary system copper-sulphur-oxygen.** G. SILLE (Metall u. Erz, 1935, 32, 270—283, 297—312; Chem. Zentr., 1935, ii, 1600).—The reactions undergone by the various binary systems involving Cu, CuO,  $Cu_2O$ ,  $CuSO_4$ , and  $Cu_2S$  are considered. Reactions tending to the irreversible formation of  $Cu_2S$  and  $Cu_2O$  preponderate. J. S. A.

**Three-component system  $CaO$ - $Al_2O_3$ - $H_2O$ .** II. **System rich in  $CaO$ .** R. NACKEN and R. MOSEBACH (Z. anorg. Chem., 1936, 227, 328—336).—The solubility of  $3CaO, Al_2O_3, 6H_2O$  (I) is  $0.6820$  g. per litre at  $30^\circ$ . The solid which first separates is  $2CaO, Al_2O_3, 7H_2O$ , but, as the proportion of  $CaO$  increases, (I) is more readily formed and ultimately free  $Ca(OH)_2$  is also present. It has not, so far, been possible to obtain the compound  $4CaO, Al_2O_3, 13H_2O$  under the conditions of these experiments. M. S. B.

**Solubility equilibria of sodium sulphate at temperatures from  $150^\circ$  to  $350^\circ$ .** II. **Effect of sodium hydroxide and sodium carbonate.** W. C. SCHROEDER, A. A. BERK, and A. GABRIEL (J. Amer. Chem. Soc., 1936, 58, 843—849; cf. A., 1935, 1314).—Equilibrium data for the system  $Na_2SO_4$ - $Na_2CO_3$ - $H_2O$  at intervals of  $50^\circ$  from  $150^\circ$  to  $350^\circ$  have been determined. The existence of  $Na_2CO_3 \cdot 2Na_2SO_4$  has been established. The effect of adding  $NaOH$  to the ternary system has been examined. E. S. H.

**Solubility in the system  $ZnCl_2$ - $HCl$ - $H_2O$  at  $25^\circ$ .** D. I. KUZNETZOV and A. A. KOSHUCHOVSKI (J. Appl. Chem. Russ., 1936, 9, 185—188).—Solubility data at  $25^\circ$  are recorded.  $60\%$  of the Zn content of saturated aq.  $ZnCl_2$  is pptd. as  $2ZnCl_2 \cdot HCl \cdot 2H_2O$  on saturation with  $HCl$ . R. T.

**Equilibria between water and the simple and double halides of cadmium and potassium.** H. HERING (Ann. Chim., 1936, [xi], 5, 483—586).—Data for the systems  $KCl$ - $CdCl_2$ - $H_2O$ ,  $KBr$ - $CdBr_2$ - $H_2O$ , and  $KI$ - $CdI_2$ - $H_2O$  (A., 1932, 469, 574; 1933, 906) are recorded.  $KBr, CdBr_2, H_2O$  (I),  $KBr, CdBr_2$ , and  $KBr$  coexist with solution at  $20.9^\circ$  and (I)+ $KBr$  at  $-18.1^\circ$ . Contrary to A., 1933, 906,  $CdI_2 \cdot 2KI \cdot 2H_2O$  (II) crystallises above  $-15.3^\circ$  and  $CdI_2 \cdot 2KI \cdot 3H_2O$  below  $-15.3^\circ$ . (II) and  $CdI_2 \cdot 2KI \cdot 0.5H_2O$  (III) coexist at  $81.4^\circ$ . (III) exists above  $76.3^\circ$  but is decomposed by  $H_2O$  forming  $KI$ . J. G. A. G.

**Ternary system manganese arsenate-arsenic acid-water.** G. GRUBE, A. HELLER, and W. HERRMANN (Z. Elektrochem., 1936, 42, 223—226).—Four solid phases are indicated:  $Mn_3(AsO_4)_n \cdot H_2O$ ,  $MnHASO_4 \cdot 4H_2O$ ,  $H_4[Mn(AsO_4)_2] \cdot 3H_2O$ , and  $H_4[Mn(AsO_4)_2]$ . When  $H_3AsO_4$  solutions containing  $Mn^{++}$  salts are electrolysed, it is found that  $Mn^{++}$  is gradually replaced by the complex Mn ions as the acid concn. is increased. C. R. H.

**Behaviour of silver fluoride in complex formation.** E. HAYEK (Monatsh., 1936, 68, 29—32; cf. A., 1935, 1203).— $AgI$  is sol. in conc. aq.  $AgF$  and yields a cryst. compound  $AgI, AgF \cdot 2H_2O$ . Migration experiments show the presence of a complex cation.  $AgBr$  behaves similarly, but the solubility of  $AgCl$  is only slightly increased. No reaction occurs with  $Ag_2O$ . F. L. U.

**System dodecoic acid-sodium hydroxide-water.** C. R. BURY and R. D. J. OWENS (Trans. Faraday Soc., 1936, 32, 782—787; cf. A., 1935, 303).—Phase equilibria at  $25^\circ$  are shown in a triangular diagram. Solid phases in equilibrium with solutions on the alkaline side are  $NaOH \cdot H_2O$ , anhyd. Na dodecoate ( $NaL$ ), and curd (degree of hydration undetermined). In equilibrium with solutions on the acid side are  $HL$ ,  $xNaL, yHL$ , and a liquid cryst. phase. The solubility of  $NaL$  is strongly depressed by  $NaOH$  and increased by  $HL$ . F. L. U.

**Thermal potential of a mixture.** J. E. VERSCHAFFELT (Wis- en nat. Tijds., 1935, 7, 121—132; Chem. Zentr., 1935, ii, 1318—1319).—Theoretical. J. S. A.

**Specific heat of gases as an aid in calculating equilibria.** C. SCHWARZ (Arch. Eisenhüttenw., 1935—1936, 9, 389—396).—Mathematical. Expressions have been derived for the sp. heat and heat content at any temp. of  $H_2$ ,  $O_2$ ,  $CO$ ,  $N_2$ ,  $NO$ ,  $OH$ ,  $H_2O$ ,  $CO_2$ ,  $N_2O$ ,  $CH_4$ , and  $C$ . A. R. P.

**Heat capacity of saturated sodium sulphate solution.** K. A. KOBE and C. H. ANDERSON (J. Physical Chem., 1936, 40, 429—433).—Over the range  $32.4$ — $102.8^\circ$  the heat capacity is given by  $C = 0.803 - 1.14 \times 10^{-4}t - 3.2 \times 10^{-6}t^2$ . The mean val. is  $0.780$  g.-cal. per g. of solution. The measured heat of

transition of  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  is 18,700, which agrees closely with the val. of 19,000 calc. from v.-p. data.

M. S. B.

**Specific heat of hydrates of magnesium chloride.** A. E. AUSHBEKOVITSCH (J. Appl. Chem. Russ., 1936, 9, 594—598).—On the basis of sp. heat measurements it is inferred that dehydration of  $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$  proceeds through the stages

R. T.

**Calculation of activity coefficients. Electrolytic dissociation of nitric acid.** O. REDLICH and P. ROSENFELD (Monatsh., 1936, 67, 223—230).—Probable errors in the calculation of activity coeffs. from f.p. and e.m.f. data are discussed. Comparison of data for  $\text{HNO}_3$  indicates that relatively large divergencies may be found for the vals. of the dissociation consts. and related quantities for strong electrolytes.

J. W. S.

**Heat of formation and free energy of formation of boron nitride.** S. SATOH (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 53—62).—The heat of formation of BN calc. from its v.p. and from the sp. heats of B, BN, and  $\text{N}_2$  is 28,470 g.-cal., whilst  $\Delta F_{298^\circ} = 54,760$  g.-cal.

R. S.

**Thermochemistry of chloro-substituted benzoquinones and quinols.** G. SJÖSTRÖM (Svensk Kem. Tidskr., 1936, 48, 121—123).—Heats of combustion (kg.-cal.) at  $20^\circ$  (const. vol.) are: chloro- 619.4, 2:6-, 2:5-, and 2:3-dichloro- 584.8, 584.6, 583.9, trichloro- 549.6, and tetrachloro-benzoquinone 516.5, and for the corresponding -quinols 648.7, 610.0, 609.1, 611.8, 576.8, 545.0. The heats of reaction (reduction) of the above chlorobenzoquinones at  $20^\circ$  are respectively 38.8, 42.9, 43.6, 40.2, 40.9 (at  $18^\circ$ ), 39.5.

E. P.

**Activation energies of the addition of hydrogen halides to ethylene.** C. E. SUN and C. LIU (J. Chinese Chem. Soc., 1936, 4, 98—101).—An attempt to calculate the affinity of  $\text{C}_2\text{H}_4$  for HCl, HBr, and HI on the basis of activation energies. The calc. energies for the formation of EtCl, EtBr, and EtI are respectively 48.4, 39.0, and 31.5 kg.-cal.

C. R. H.

**Measurement of conductivity of very dilute electrolytes.** W. GRALLERT (Z. Elektrochem., 1936, 42, 330—336).—Errors are discussed, and portable apparatus suitable for laboratory use is described.

F. L. U.

**Electrical conductivity, viscosity, and diffusion of certain lanthanum salts.** L. W. ÖHOLM (Soc. Scient. Fenn. Comm. Phys.-Math., 1936, 9, No. 2, 14).—Viscosities, determined by Ostwald's method, are in the order  $\text{La}_2(\text{SO}_4)_3 > \text{LaCl}_3 > \text{La}(\text{NO}_3)_3$  at corresponding normalities. Redetermination of conductivities confirms substantially former results,  $\text{LaCl}_3$  having slightly greater vals. than  $\text{La}(\text{NO}_3)_3$ .  $\text{La}_2(\text{SO}_4)_3$  much smaller vals. The diffusibilities increase with dilution in a similar way to that of the conductivities. The diffusion consts. are in the order  $\text{LaCl}_3 > \text{La}(\text{NO}_3)_3 > \text{La}_2(\text{SO}_4)_3$ .

D. C. J.

**Cathodic current distribution in electrolytes.**

I. Zinc baths. E. MANTZELL (Z. Elektrochem., 1936, 42, 303—315; cf. A., 1935, 306).—Current distribution ( $D$ ) at the cathode has been studied under varying conditions in six different types of Zn-plating bath. In all types the effect of increasing c.d. is unfavourable. Some improvement results by decreasing  $[\text{Zn}^{++}]$  whilst the conductivity ( $\kappa$ ) is const., and in acid baths by increasing  $\kappa$  by the addition of  $\text{NH}_4$  salts. Under given conditions, cyanide baths show the best  $D$ , that in alkali zincate baths being relatively poor despite their high  $\kappa$ . The distribution of metal at the cathode follows  $D$  closely in acid baths, in which the current yield approaches 100%, but is more uniform than  $D$  in zincate and cyanide baths.

F. L. U.

**Transport numbers of paraffin-chain salts in aqueous solution.** I. Measurement of transport numbers of cetylpyridinium and cetyltrimethylammonium bromides and their interpretation in terms of micelle formation, with data for cetanesulphonic acid. G. S. HARTLEY, B. COLLIE, and C. S. SAMIS (Trans. Faraday Soc., 1936, 32, 795—815; cf. A., 1935, 299).—The transport nos. ( $T$ ) of the two paraffin-chain cations increase rapidly with increase of concn. in the range where the total equiv. conductivity ( $\lambda$ ) falls, finally becoming  $\gg 1$ . In the first part of this range the increase of  $T$  is so great that the  $\lambda$  of the cation is  $>$  its val. at infinite dilution, thus demonstrating the formation in this range of mobile micelles. The accompanying decrease of total  $\lambda$  is due to a braking effect caused by adherence to the micelles of  $\text{Br}^-$  ions, the mean mobility of which is negative over a considerable range of concn. The increase of total  $\lambda$  observed at moderate concns. is due, not directly to formation of more mobile micelles from less mobile simple ions, but to the liberation of compensating ions previously attached to the micelles. An approx. estimate of the size of the micelles is given.

F. L. U.

**Faraday's law and electrolysis by spark.** P. JOLIBOIS and P. DE BECO (Compt. rend., 1936, 202, 1496—1498; cf. A., 1935, 837).—If diffusion of the acid which is formed at the positive pole is prevented the quantity of oxide formed agrees with Faraday's law.

R. S.

**Bismuth electrode.** A. HOLMQVIST (Svensk Kem. Tidskr., 1936, 48, 106—120).—On varying  $[\text{Bi}^{+++}]$  in aq. HCl,  $\text{H}_2\text{SO}_4$ , and  $\text{HClO}_4$  free from air, the potential changes in accordance with Nernst's formula. The p.d. between a normal  $\text{H}_2$  electrode and a Bi electrode in 1M- $\text{Bi}^{+++}$  is 0.289 volt.

E. P.

**Behaviour of the cadmium electrode in alkaline nickel-cadmium accumulators.** G. GRUNE and E. DOETSCH (Z. Elektrochem., 1936, 42, 247—258).—Changes in terminal voltage, in the single electrode potential, and in the electrolyte during the charge and discharge of Ni-Cd accumulators have been studied. The behaviour of Cd electrodes which contain 14.6% of  $\text{Fe}_3\text{O}_4$  has been compared with that of pure Cd electrodes prepared in various ways.

C. R. H.

**Calculation of normal potential of metals and Henry constant of ions.** I. UHARA (Phil. Mag., 1936,

[vii], 21, 958—976).—Normal potentials of metals in  $H_2O$  and non-aq. solvents are deduced thermodynamically. Calc. and experimental vals. are compared. There is a parallelism between the Henry const. and the heat of hydration of ions. H. J. E.

**Electrometric potential and concentration of electrolytes.** (MLLE.) S. VEIL (Compt. rend., 1936, 202, 1665—1666).—If  $\pi_\sigma$  is the e.m.f. of saturated aq.  $CuCl_2$  of concn.  $\sigma$  and  $\pi$  at concn.  $c$ , then  $\pi = \pi_\sigma (c/\sigma)^k$  where  $k$  is approx.  $\frac{1}{2}$  for the concn. range  $\sigma = c/10,000$  at room temp. M. S. B.

**Thermodynamical exposition of the operation of reversible gas electrodes.** J. W. H. LUGG (J. Proc. Austral. Chem. Inst., 1936, 3, 126—130).—Theoretical. The significance of the metal holding the gas is discussed, and a theory of single electrode potential, in which the characteristics of the electrode metal are considered, is formulated. E. S. H.

**Physical significance of activity coefficients in reversible electrode equilibria.** J. W. BELTON (Phil. Mag., 1936, [vii], 21, 1140—1144).—A relationship is derived between the activity coeff. of an electrolyte and the p.d. between this electrolyte and the region where ion-neutralisation occurs (adsorption potential). J. W. S.

**Influence of  $p_H$  on the Becquerel effect of coloured electrodes.** (MLLE.) C. STORA (Compt. rend., 1936, 202, 1666—1668).—Dark potentials and photopotentials of oxidation-reduction indicators, such as Nile-blue and methylene-blue, and of derivatives of xanthane,  $CH_2Ph_2$ , and  $CHPh_3$ , have been determined. The rules which govern the influence of  $p_H$  on the Becquerel effect for electrodes in metallic salts do not, in general, appear to apply to coloured electrodes. Apart from catalysis of the photochemical reaction at the electrode by  $OH^\cdot$ , it is necessary to consider the variation with  $p_H$  of the absorption of the photosensitive compound and also to use monochromatic light in the experiments. M. S. B.

**Capillary-electric phenomena in molten salts.** S. KARPATSOV and A. STROMBERG (Z. physikal. Chem., 1936, 176, 182—186).—The electrocapillary curves of Sn, Pb, Cd, and Tl in contact with molten  $KCl-LiCl$  and  $KI-LiI$  mixtures and with molten Pb as auxiliary electrode have been determined. The p.d. of the max. on the curve for a given electrolyte varies considerably according to the metal with which it is in contact. From the curves for Sn the capacity,  $C$ , of the double layer as a function of the polarising voltage has been determined. The val. of  $C$  corresponding with the equilibrium potential of Sn in both electrolytes is 90—100  $\mu F$  per sq. cm. R. C.

**Electromotive force of movement of metals in water and their electrokinetic potential.** S. PROCORIU (Compt. rend., 1936, 202, 1371—1373; cf. A., 1930, 546).—For various metals the e.m.f. decreases with time in pure  $H_2O$ , but is const. in sucrose solution, and is of the same magnitude and sign as the electrokinetic potential. The influence of velocity and of the dielectric const. of the liquid has been studied. R. S.

**Hydroelectric and contact cells.** (MLLE.) S. VEIL (Bull. Soc. chim., 1936, [v], 3, 860—865).—When Pt is placed in contact with other metals in gelatin the e.m.f. vals. obtained are: Zn 1.01, Cd 0.72, Fe 0.59, Pb 0.54, Ni 0.28, Cu 0.22 volt. The relative importance of Volta effect and chemical action in electrolytic cells is discussed. E. S. H.

**Study of the cryolite-aluminium oxide cell with particular reference to decomposition voltage.** J. W. CUTHBERTSON and J. WADDINGTON (Trans. Faraday Soc., 1936, 32, 745—760).—At 1025° the decomp. voltages of cryolite and of cryolite with  $Al_2O_3$  (16%) are respectively 2.23 and 2.20 volts with Pt, and 1.7 and 1.5 volts with graphite, anodes. The decomp. voltage of cryolite falls nearly linearly with rising temp. In the Al cell the current is carried by the cryolite. The  $Al_2O_3$  is only slightly, if at all, ionised, and functions as both a cathodic and anodic depolariser, supplying Al at the cathode and regenerating  $AlF_3$  at the anode. F. L. U.

**Mechanism of the decomposition of aluminium-magnesium solid solutions.** P. LACOMBE and G. CHAUDRON (Compt. rend., 1936, 202, 1790—1792; cf. B., 1935, 678).—The dissolution potential of a quenched Mg-Al solid solution (9% Mg), after annealing below 280°, increases at first with time of annealing but later decreases almost to its initial val. The velocity of attack by acid of fixed concn. shows a corresponding max. This is interpreted as indicating that the constituent initially pptd. is unstable and richer in Mg than the compound  $Al_3Mg_2$ . J. W. S.

**Passivity of chromium. IV. Electromotive behaviour of chromium amalgam.** E. MULLER (Z. physikal. Chem., 1936, 176, 273—288; cf. A., 1932, 473).—In  $M-HCl$  at 20°, Cr amalgam oscillates periodically between the active and passive states, a phenomenon which is ascribed to the simultaneous occurrence of the processes  $Cr \rightarrow Cr^{++} + 2e$ ,  $2e + 2H^+ = H_2$ , the second of which tends to reduce the electrode potential below the val. required for the first. In  $M-H_2SO_4$  massive Cr is passive but can be permanently rendered active by weak cathodic polarisation. Cr amalgam is rendered active temporarily by polarisation, but becomes active on shaking. In  $M-HClO_4$  the behaviour is similar, except that shaking does not cause activation. In all three acids the amalgam is rendered passive by strong cathodic polarisation. The activation potentials in the various acids are < for massive Cr, but form the same sequence. The experimental results are incompatible with Muller's coating theory of passivity. R. C.

**Measure of acidity obtained from the electromotive force of a cell without liquid junction.** D. I. HITCHCOCK (J. Amer. Chem. Soc., 1936, 58, 855—856).—The product  $m_B \gamma_{H^+} \gamma_{Cl^-}$  is regarded as a promising measure of acidity in preference to  $p_H$ . E. S. H.

**Reduction potentials of organic systems. I. Bimolecular reduction of thioindigotindisulphonate.** A. E. REMICK (J. Amer. Chem. Soc., 1936, 58, 733—736).—The reduction potential ( $E'_0$ ) of the system thioindigotindisulphonate-leuco-compound at  $p_H$  2.02—7.61 and 25° varies linearly with

the concn. of the oxidant  $[K_3Fe(CN)_6]$  at const. % oxidation. The results conform to the thermodynamic equations for a one-step bimol. reduction involving 1e per mol. of dye. H. B.

**Oxidation-reduction potential of  $\alpha$ -amino-ketobutyric ester and of reductone.**—See this vol., 888.

**Bronsted's kinetic equation and the Debye theory.** II. A. MUSIL (Monatsh., 1936, 67, 269—319; cf. A., 1932, 1209).—Anomalies in the Debye theory are eliminated by application of the Bronsted equation, enabling the theory to be applied to reaction kinetic problems. The author's theory is supported by experimental data for the hydrolysis of esters of AcOH by alkali carbonates and hydroxides in presence of KCl,  $K_3Fe(CN)_6$ ,  $K_4Fe(CN)_6$ , and K silicotungstate. J. W. S.

**Reactions produced by adiabatic expansion in systems in chemical equilibrium.** P. MONTAGNE (Compt. rend., 1936, 202, 1430—1432).—Theoretical. L. J. J.

**Kinetics of recombination of bromine atoms.** II. E. RABINOWITCH and W. C. WOOD (Trans. Faraday Soc., 1936, 32, 907—917; cf. A., 1935, 586).—The authors' optical method has been used to measure the stationary  $[Br]$  in illuminated  $Br_2$  vapour, and velocity coeffs. for three-body recombination in presence of He, A,  $H_2$ ,  $N_2$ ,  $O_2$ ,  $CH_4$ , and  $CO_2$  have been determined. The recombination rate of Br is 2—3 times < that of I with the same third body. The results in mixtures and in pure  $Br_2$  agree with theory. L. J. J.

**Oxidation of silicon hydrides.** II. H. J. EMELÉUS and K. STEWART (J.C.S., 1936, 677—684; cf. A., 1935, 1207).—The lower crit. explosion pressures ( $P_l$ ) of mixtures of  $O_2$  with  $SiH_4$ ,  $Si_2H_6$ , and  $Si_3H_8$  and the upper crit. explosion pressures ( $P_u$ ) for mixtures of  $O_2$  with  $Si_2H_6$  and  $Si_3H_8$  have been studied as a function of the composition of the gas mixture and diameter of the glass explosion vessel.  $P_l$  is lowered and  $P_u$  raised by rise of temp. The inflammability of these compounds increases with increasing at. wt. The results are in accord with chain mechanisms analogous to that previously suggested for  $SiH_4$ . J. W. S.

**Influence of pressure on the spontaneous ignition of inflammable gas-air mixtures.** IV. **Methane-, ethane-, and propane-air mixtures.** D. T. A. TOWNEND and E. A. C. CHAMBERLAIN (Proc. Roy. Soc., 1936, A, 154, 95—112; cf. A., 1934, 151, 1179).—The influence of pressure up to 30 atm. on the ignition temp. of  $CH_4$ -,  $C_2H_6$ - and  $C_3H_8$ -air mixtures has been determined. With  $CH_4$ -air mixtures the ignition points are confined to an upper range even at pressures up to 30 atm. With  $C_3H_8$ -air mixtures, a lower-temp. ignition system develops at pressures > 13 atm.; 1% of MeCHO, however, produces a reduction of this to < 5 atm.  $C_3H_8$ -air mixtures show all the ignition features of the higher paraffins, ignition in the lower system being facilitated by the presence of MeCHO or EtCHO. The influence of pressure on pre-ignition time-lags has been investigated. L. L. B.

3 G

**Initial formation of alcohols during the slow combustion of methane and ethane at atmospheric pressure.** D. M. NEWITT and J. B. GARDNER (Proc. Roy. Soc., 1936, A, 154, 329—335).—During the slow combustion of  $CH_4$  and  $C_2H_6$  at atm. pressure MeOH and EtOH, respectively, are formed in quantities comparable with those of the corresponding aldehydes. Both alcohols and aldehydes are found during the induction period, but the ratio alcohol:aldehyde diminishes as the induction nears completion. The results prove that the formation of alcohol precedes that of the corresponding aldehyde. L. L. B.

**Slow combustion of methane, methyl alcohol, formaldehyde, and formic acid.** W. A. BONE and J. B. GARDNER (Proc. Roy. Soc., 1936, A, 154, 297—328).—The induction period in the slow combustion of  $CH_4$  at 390—420° is (a) uninfluenced by separately pre-heating the reactants or exposing the reacting medium to ultra-violet light; (b) lengthened by increasing the surface/vol. ratio of a  $SiO_2$  reaction vessel; (c) shortest with a  $2CH_4 + O_2$  medium; (d) characterised by the successive formation of small equilibrium amounts of MeOH and  $CH_2O$ ; (e) shortened by previous small additions of  $NO_2$ , but lengthened by addition of I. No peroxide was detected during the induction period. Under similar conditions, the slow oxidation of MeOH is much faster and less influenced by  $SiO_2$  surface than is that of  $CH_4$  at 390°. There is no appreciable induction period, although the reaction is accelerated by small additions of  $CH_2O$  or  $NO_2$ . The most reactive medium is  $2MeOH + O_2$ . The oxidation is marked by the intermediate successive formations of  $CH_2O$  and  $HCO_2H$ , and the end products are chiefly oxides of C and steam, with a high CO/ $CO_2$  ratio. In the slow combustion of  $CH_2O$ , no induction period is observed even at 275°, and the speed of the reaction is much > that of either MeOH or  $CH_4$ .  $HCO_2H$  is formed intermediately, together with performic acid (I) and "formaldehyde peroxide" (II), the latter being dependent on the prior formation of (I). The end products are again chiefly oxides of C and steam, with a high CO/ $CO_2$  ratio. Fair amounts of  $H_2$  are formed, probably from the decomp. of (II). Experiments made on the reactions of both 2:1 and 1:1  $HCO_2H/O_2$  mixtures between 340° and 470° showed a slower disappearance of  $O_2$  than thermal decomp. of  $HCO_2H$ . The gaseous products are chiefly CO,  $CO_2$ ,  $H_2O$ , and  $H_2$ , and there is no intermediate formation of a peracid or peroxide. The results all fit the hydroxylation theory. L. L. B.

**Slow combustion of formaldehyde.** R. SPENCE (J.C.S., 1936, 649—657).— $CH_2O$  reacts rapidly with  $O_2$  in Pyrex vessels at 317°. In unpacked vessels of < 1 mm. diameter the chief products are CO and  $H_2O$  but in vessels packed with powdered glass combination to form  $CO_2$  is complete. From the kinetics of the reaction a chain mechanism is proposed. J. W. S.

**Primary process in the thermal decomposition of formaldehyde and formic acid.** F. PATAT and H. SACHSSE (Nachr. Ges. Wiss. Göttingen, Math.-phys. Kl., III, 1935, [ii], 1, 41—48; Chem.

Zentr., 1935, ii, 1526; cf. A., 1935, 708).—The decomp. in the presence of para- $H_2$  is studied. Since exchange is not observed it is concluded that the primary process involves saturated mols., contrary to the radical chain theory of Rice and Herzfeld (A., 1934, 369). H. N. R.

**Mechanism for the decomposition of ethylene oxide.** D. V. SICKMAN (J. Chem. Physics, 1936, 4, 297—299).—Theoretical. The kinetic data of Heckert and Mack (A., 1929, 1243) are in qual. agreement with an initial isomerisation to  $MeCHO$ , accompanied by a reaction producing free radicals which induce a chain decomp. of the  $MeCHO$ . L. J. J.

**Thermal decomposition of acetaldehyde and ethylene oxide.**—See this vol., 825.

**High-temperature pyrolysis of gaseous olefines.**—See this vol., 818.

**Thermal decomposition of ethylene oxide.**—See this vol., 820.

**Mechanism of flame extinction by carbon tetrachloride.**—See B., 1936, 482.

**Theory of detonation.**—See B., 1936, 525.

**Kinetics of thermal *cis-trans*-isomerisations.** V. G. B. KISTIAKOWSKY and W. R. SMITH (J. Amer. Chem. Soc., 1936, 58, 766—768).—With  $\Delta^2$ -butene the reaction is of approx. first order, but of second order with respect to initial pressure. A chain mechanism is suggested. The equilibrium composition at 633° and 620° abs. is 52.8% of *trans*-isomeride. E. S. H.

**Magnitude of radical concentration in homogeneous thermal decomposition of organic molecules.** I. Calculation of radical concentrations found by the para-hydrogen method, and the reaction  $CH_3 + H_2$ . II. Radical concentration in decomposition of dimethyl ether and propane. F. PATAT (Z. physikal. Chem., 1936, B, 32, 274—293, 294—304).—I. Partly a more detailed account of work previously described (this vol., 293). From observations of the photochemical decomp. of  $MeCHO$  the ratio  $k_1/k_2$  is found to be  $0.001e^{-(1870 \pm 900)/RT}$ . For  $Me + H \rightarrow CH_3 + H$  (I) there is a steric factor of  $\sim 10^{-4}$  and the energy of activation is  $\geq 9$  kg.-cal. The *p*- $H_2$  transformation in the photochemical decomp. of  $MeI$  and  $COMe_2$  observed by West (A., 1935, 1468) is not of paramagnetic nature, but is ascribed to H atoms formed by (I). The heat of formation of  $CH_4$  from  $Me + H$  is  $< 103$  kg.-cal.

II. The stationary  $[H]$  and  $[Me]$  in the thermal decomp. of  $Me_2O$  and  $C_3H_8$  have been determined. A review of all the available experimental data shows that in all the thermal decomp. in which the Rice-Herzfeld theory requires a chain mechanism radicals are actually formed, but in concns. so small as to be quite inadequate for the total decomp. by chains. In the homogeneous thermal decomp. of the org. mols. studied the first step is decomp. into saturated fragments, and the requisite energy of activation is  $<$  the linking energy of the weakest linking. R. C.

**Kinetic correlation of two reactions involving hydrogen peroxide.** Its oxidation by chlor-

amine-*T* and by chlorine. H. A. LIEBHAFSKY (J. Amer. Chem. Soc., 1936, 58, 705—707).—Theoretical. A mechanism for the oxidation of  $H_2O_2$  by chloramine-*T*, based on published results, is advanced.

E. S. H.

**Velocity of diazotisation.** K. ROSTOVCEVA (Z. anal. Chem., 1936, 105, 32—35).—The velocity of diazotisation of aromatic amines, relative to that of benzidine (I), is determined by mixing a solution of the amine with an equal vol. of 0.1*N*-(I), both in conc.  $HCl$ . 0.1*N*- $NaNO_2$  is added at 5°, and after 15—20 min., (I) sulphate is pptd. by adding  $Na_2SO_4$ , and is determined volumetrically. It is proposed to employ the method for analysis of mixtures of isomeric amines. J. S. A.

**Glycoside fission in non-aqueous media.** I, II.—See this vol., 827.

**Reactivity of halogen compounds.** II. Rates of reaction and energies of activation of 1 : 2 : 4-chlorodinitrobenzene with aromatic primary amines. A. SINGH and D. H. PEACOCK (J. Physical Chem., 1936, 40, 669—678; cf. A., 1935, 1465).—The velocities of reaction of 1 : 2 : 4- $C_6H_3Cl(NO_2)_2$  with  $NH_2Ph$ , *o*-, *m*-, and *p*- $C_6H_4Me \cdot NH_2$ , *m*- and *p*- $C_6H_4Cl \cdot NH_2$  and  $-C_6H_4Br \cdot NH_2$ , *o*-, *m*-, and *p*-anisidine, and  $\alpha$ - and  $\beta$ - $C_{10}H_7 \cdot NH_2$  (0.4 and 0.8*M*) have been determined at 35° and 45°, and the energies of activation calc. The effect on the energy of activation of transferring a substituent from the *m*- to the *p*-position is as predicted by the Lapworth-Robinson hypothesis. The changes in energy of activation have been compared with the dipole moments.

E. S. H.

**Mode of action of solvents on chemical reaction velocity.** C. N. HINSHELWOOD (Trans. Faraday Soc., 1936, 32, 970—972).—Theoretical. The rate of an association reaction in solution may be determined by deactivation of the product by solvent mols. The kinetic phenomena resulting from such a mechanism are discussed. L. J. J.

**Inversion of sucrose in mixtures of light and heavy water.** P. GROSS, H. STEINER, and H. SUSS (Trans. Faraday Soc., 1936, 32, 883—889).—The rate of inversion of sucrose in  $H_2O$ - $D_2O$  mixtures containing  $H_2SO_4$  at 25° increases with the  $D_2O$  content, but not linearly. The effect is due to an increase in concn. of reacting complexes, the theory of which is discussed and shown to account for the effect with Et diazoacetate. L. J. J.

**Depolymerisation of water by capillarity and the inversion of sucrose.** E. TOPORESCU (Compt. rend., 1936, 202, 1672—1674).—The e.m.f. of a Pt-Ni couple in  $H_2O$  is changed if one of the electrodes is placed in capillary  $H_2O$ . This is attributed to depolymerisation of the  $H_2O$  in the capillary. By dialysis of aq. sucrose (I) through parchment-paper the rate of inversion of (I) is increased. On the assumption that depolymerisation of  $H_2O$  takes place in the capillaries of a porous body, this result is in agreement with an earlier observation that depolymerisation of  $H_2O$  by  $NaCl$  also increases the rate of inversion of (I) (cf. A., 1932, 346). M. S. B.

**Substitution and inversion of configuration.** E. BERGMANN, M. POLANYI, and A. L. SZABO (Trans. Faraday Soc., 1936, 32, 843—852; cf. A., 1933, 574).—The rate of racemisation of  $\text{CHMePr}^*\text{I}$  and  $\text{CHMeBu}^*\text{I}$  by  $\text{I}^-$  ions has been compared with the rates of exchange between halogens in related compounds. For the racemisation,  $k$  follows the Arrhenius equation with a temp.-independent factor of approx.  $10^{10}$ , and the  $k$  vals. for any set of analogous substitution or racemisation reactions form a continuous series. L. J. J.

**"Activated complex" theory and the influence of solvents on reaction velocity.** S. GLASSTONE (J.C.S., 1936, 723—724).—From the activated complex theory of reaction velocities (A., 1935, 827, 1205) it is deduced that association of reactant mols., but not of the activated complex, should increase reaction velocity ( $v$ ), whereas association of the activated complex and not of the reactants should decrease  $v$ . Compound formation between one or both reactants and the solvent should also decrease  $v$ .

J. W. S.

**Thermal decomposition of sodium and potassium azides.** W. E. GARNER and D. J. B. MARKE (J.C.S., 1936, 657—664).—The thermal decomp. of  $\text{KN}_3$  in K vapour is very much more rapid than in a vac., but that of  $\text{NaN}_3$  is only slightly catalysed by Na vapour. Microscopical examination of partly decomposed crystals shows that reaction begins on the surface and along lines, probably cracks in the crystal, but that with  $\text{KN}_3$  in a vac. reaction later penetrates to the interior. The energies of activation of  $\text{KN}_3$  and  $\text{NaN}_3$  are 36.1 and 34.4 kg.-cal., respectively. Comparison with other azides indicates that there is no relationship between sensitivity and activation energy.

J. W. S.

**Kinetic investigations by means of the photo-electric cell of the decomposition of sodium mercury sulphide by water and of sodium tungstate by excess of strong acids.** A. LOTTERMOSER and G. VON HESSLING (Kolloid-Z., 1936, 75, 184—192).—Technique for determining the rate of formation of a sol by turbidity measurements is described. The influence of concn. of reagents has been investigated.

E. S. H.

**Decomposition of ferrous oxide.** J. BÉNARD and G. CHAUDRON (Compt. rend., 1936, 202, 1336—1338; cf. A., 1924, ii, 617).—The rate at 350—480°, measured by the change in magnetic properties,  $\propto [\text{FeO}]^3$ . The reaction is  $8\text{FeO} = \text{Fe}_3\text{O}_4 + \text{a solid solution (Fe}_4\text{FeO)}$ . Formation of the solid solution is shown by an increase in the parameter of  $\text{FeO}$ , measured by X-rays, as the reaction progresses. Above 480° the order of the reaction decreases regularly.

H. J. E.

**Pyrolysis of chlorates and perchlorates.** I. M. CRESPI and J. L. G. CAAMANO (Anal. Fis. Quím., 1936, 34, 320—326).—Apparatus for measuring the initial decomp. temp. and velocity of evolution of gas during the pyrolysis is described. Data are given for the pyrolysis of  $\text{KClO}_3$  and  $\text{KClO}_4$  with or without addition of  $\text{SiO}_2$  and  $\text{KCl}$ . The pyrolysis is autocatalytic.

F R G

**Investigation of [thermal] decomposition of [solid] barium oxalate by emanation method.** B. SAGORTSCHEV (Z. physikal. Chem., 1936, 176, 295—302).—The progress with rise of temp. of the decomp. to give  $\text{BaCO}_3$  of various preps. with admixed Th-X has been followed by observing the emanating power,  $E$ . With loss of  $\text{CO}$   $E$  increases owing to increase in the surface of the crystal. A rise in  $E$  above 500° is apparently due to a loosening of the crystal resulting in increased mobility of its component units. R. C.

**Reaction chain in thermal denaturation of proteins.** A. FISCHER (Z. physikal. Chem., 1936, 176, 260—272).—A study of the denaturation of serum-globulin and ovalbumin at 70° has shown that the mechanism is identical with that of the coagulation of blood (cf. A., 1935, 1143). There is first produced a reactive form of protein, which then promotes denaturation, apparently by a chain mechanism. If a portion of a solution of a protein in which denaturation has set in is added to a fresh solution at 70° denaturation starts there at once. Denaturation probably comes about by groups anchored at lower temp. within the globular protein mol. coming up to the surface in some of the mols. due to the shift of equilibrium with temp., whereupon all the protein mols. orient themselves by a reorganisation of their surface groupings. This view is supported by the observations that denaturation can be suppressed by causing all the  $\text{NH}_2$  groups to react with  $\text{CH}_2\text{O}$ , and that heparin reacts with denatured proteins (cf. *ibid.*, 1002). R. C.

**Water-line corrosion.**—See B., 1936, 501.

**Reactions involving proton transfers.** R. P. BELL (Proc. Roy. Soc., 1936, A, 154, 414—429).—The step determining the rate of a reaction involving general catalysis by acids or bases is the transfer of a proton from catalyst to substrate, or vice versa. Bronsted's equation relating acid-base dissociation consts. to catalytic power is generalised to include the case in which the catalyst remains the same and the substrate varies. Equations are given for the rate at which a stream of particles in temp. equilibrium pass an unsymmetrical parabolic potential barrier, taking into account the "tunnel effect." Application of these to the present problem shows that the deviations from classical behaviour will be considerable, and that a linear relation between dissociation energy and activation energy will still lead to the Bronsted equation, but not to a simple relation between the apparent activation energy and the reaction velocity. L. L. B.

**Catalysis and inhibition of a homogeneous gas reaction. Influence of nitric oxide on the decomposition of diethyl ether.** L. A. K. STAVELEY and C. N. HINSHELWOOD (Proc. Roy. Soc., 1936, A, 154, 335—348).—Small quantities of  $\text{NO}$  inhibit the normal decomp. of  $\text{Et}_2\text{O}$ , a min. in the rate being observed with about 1—2 mm. of  $\text{NO}$ . Larger amounts, however, catalyse the decomp., the catalysis resembling that caused by  $\text{I}$  in that the activation energy is  $<$  that of the normal reaction and is distributed in two square terms only. The residual

reaction occurring in presence of NO has an activation energy of 67,000 g.-cal. These must be distributed in 18 square terms (9 degrees of freedom) to explain the observed rate. There is no difference between the dependence of rate on  $[\text{Et}_2\text{O}]$  in the inhibited and uninhibited reactions. A theory involving the existence of short chains is advanced to explain the results. L. L. B.

**Homogeneous catalytic oxidation of benzene.** R. H. GRIFFITH and S. G. HILL (Trans. Faraday Soc., 1936, 32, 829—836).—The homogeneous oxidation of  $\text{C}_6\text{H}_6$  vapour has been studied at about  $430^\circ$  using  $\text{EtNO}_3$  as a catalyst. A linear relationship is found between (1) time of half change ( $T$ ) and  $[\text{EtNO}_3]$ , (2)  $1/T$  and the ratio  $\text{O}_2/\text{C}_6\text{H}_6$ , (3)  $1/T$  and total pressure, (4)  $T$  and  $1/\text{abs. temp.}$ . The relationship is direct for (2), (3), and (4), and inverse for (1). With  $> 0.35\%$  of  $\text{EtNO}_3$  the reaction is explosive. Increase of surface (Pyrex glass) causes retardation, as does the introduction of  $\text{PbEt}_4$ . The results are discussed. F. L. U.

**Decomposition of diazoacetic ester catalysed by protons and deuterons.** P. GROSS, H. STEINER, and F. KRAUSS (Trans. Faraday Soc., 1936, 32, 877—879).—At  $0^\circ$  the hydrolysis is  $\sim 3$  times as rapid in pure  $\text{D}_2\text{O}$  as in pure  $\text{H}_2\text{O}$ . In mixtures the increase in rate is not a linear function of the D content. L. J. J.

**Effect of propyl alcohol on the hydrolysis of sulphuric acid esters.** K. H. BAUER and W. POETHKE (Fettchem. Umschau, 1936, 43, 69—71; cf. A., 1930, 1019).—Octadecylsulphuric acid (I) is readily hydrolysed by aq.  $\text{HCl}$  or  $\text{H}_2\text{SO}_4$ , but more slowly than is ricinoleosulphuric acid (II); the addition of  $\text{PrOH}$  to the reaction mixture reduces the speed of hydrolysis to a very marked degree in the case of (I) (but does not completely check it) and to a smaller extent in the case of (II). The difference in the hydrolytic behaviour of the two esters is quant. and not qual. as supposed by Seck (A., 1934, 604). E. L.

**Optical activity in relation to tautomeric change. VI. Comparison of the rates of racemisation and of bromination of a ketone. Further study under conditions of basic catalysis.** S. K. HSÜ and C. L. WILSON (J.C.S., 1936, 623—625; cf. A., 1934, 849).—The rates of bromination and racemisation of *d*-2-*o*-carboxybenzylindan-1-one in  $\text{AcOH}$  solution with  $\text{NaOAc}$  as catalyst are both unimol. and have comparable velocity coeffs. J. W. S.

**Santene inversion of fenchyl alcohol and its conditions.**—See this vol., 856.

**Induced oxidation in which ascorbic acid among others is the inductor.** W. P. JORISSEN and A. H. BELINFANTE (Rec. trav. chim., 1936, 55, 374—378).—Data for the induced oxidation of lactic acid (I) and arsenite solutions (II) by glycuronic and ascorbic acids show that (I) and (II) absorb approx. the same amount of  $\text{O}_2$  as the inductor. C. R. H.

**Catalysed reaction of magnesium ethyl bromide with ethyl bromide.**—See this vol., 830.

**Action of bromine on acetone in presence of various solvents.**—See this vol., 825.

**Oxidase-like action of certain complex metal salts.** Y. SHIBATA and K. SHIBATA (Iwata Inst. Plant Biochem., Publ. 2, 1936, 1—9).—About 60 complex amines of Co, Ni, Fe, Zn, Cd, Cu, Cr, and Ag have been classified according to their catalytic activity towards oxidation reactions. Myricetin (I) was used as an oxidation indicator. The oxidising activity of a catalyst appears to be in inverse ratio to its stability in aq. solution. All the Cr, Fe, and Ag compounds examined, with one Cd and some Co compounds, are inactive. Certain factors inhibiting the action of oxidase have a similar influence on active complex metal salts. These are the increased acidity of the medium, the action of certain enzyme poisons such as KCN,  $\text{HgCl}_2$ ,  $\text{NH}_2\text{OH}$ , etc., preliminary heating of the catalyst, and preliminary treatment of (I) with an inactive complex salt. It is suggested that the oxidation takes place through the medium of  $\text{H}_2\text{O}$  and that the action of the catalyst, whether oxidase or metal complex, is to increase the reactivity of the  $\text{H}_2\text{O}$  towards the substrate through combination with both mols. by co-ordinate linkings. It is also suggested that the active nucleus of an oxidase is a metal complex. M. S. B.

**Kinetics of the oxidising action of certain complex metal salts.** Y. SHIBATA and H. KANEKO (Iwata Inst. Plant Biochem., Publ. 2, 1936, 10—31).—The catalytic action of complex Co salts on the oxidation of pyrogallol (I) has been studied. The activity diminishes in the order purpureo-  $>$  roseo-  $>$  xantho-salts, the activity of the last being very small or zero. This is also the order in which reactivity with  $\text{H}_2\text{O}$  diminishes (cf. preceding abstract). After an induction period of varying length the reaction is unimol. For  $0.004M$ -(I) the optimum concn. of complex salt is approx.  $0.002M$ . At concn.  $c$  of catalyst  $< 0.002M$   $k_1/k_2 = (c_1/c_2)^{0.1}$ . The temp. coeff. of  $k$  increases with increasing inactivity of the catalyst so that, at high temp., it approaches the same val. for the three groups of salts. Inhibitors act as previously described for other catalysed oxidations (*loc. cit.*). M. S. B.

**Decomposition of hydrogen peroxide by complex metal salts.** Y. SHIBATA and H. KANEKO (Iwata Inst. Plant Biochem., Publ. 2, 1936, 32—39).—The catalytic decomp. of  $\text{H}_2\text{O}_2$  by  $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$  and  $[\text{Cu}(\text{NH}_3)_4]\text{Cl}_2 \cdot \text{H}_2\text{O}$  is unimol. and similar to that brought about by catalase or Pt sol.  $k$  depends on  $[\text{H}^+]$  and is a max. in feebly alkaline solution.  $k$  also depends on the concn.  $c$  of the complex salt and  $k_1/k_2 = (c_1/c_2)^{1.3}$ . The mean val. of the temp. coeff. for  $10^\circ$  is 1.77.  $\text{HgCl}_2$ , KCN,  $\text{KClO}_3$ , and  $\text{K}_4\text{Fe}(\text{CN})_6$  act as catalyst poisons. M. S. B.

**Oxidising action of colloids. I. Oxidation with colloidal metals.** Y. SHIBATA and H. KANEKO. II. Oxidation with colloidal metal hydroxides and silicates. H. KANEKO (Iwata Inst. Plant Biochem., Publ. 2, 1936, 40—54, 55—73).—I. The catalytic oxidation of pyrogallol in presence of Ag, Au, Cu, Hg, Bi, Sb, and Pt sols has been followed by measurements of the extinction coeff. with the spectrophotometer. The reaction is unimol. For dil. Pt sols the connexion between  $k$  and concn.  $c$  of the sol. is  $k_1/k_2 = (c_1/c_2)^{0.35}$  and the temp. coeff. is 1.21 per  $10^\circ$ . At  $40$ — $45^\circ$  the reaction begins to show irregularities.

II. The oxidation of pyrogallol is catalysed by colloidal hydroxides of Ti, Cr, Fe<sup>III</sup>, Mn<sup>II</sup>, Ni, Co, Cu, Zn, and Al, and by Mg (I), Al, and various natural colloidal silicates. The reaction is of the first order. (I) gives  $k_1/k_2 = (c_1/c_2)^{0.45}$  and a temp. coeff. of 1.24 per 10° below 40°. Addition of a complex metal salt with no catalytic power alone, [Co(NH<sub>3</sub>)<sub>3</sub>(NO<sub>2</sub>)<sub>3</sub>] or [Cr(NH<sub>3</sub>)<sub>5</sub>Cl]Cl<sub>2</sub> increases, to a remarkable extent, the catalytic action of colloidal metal hydroxides and especially of colloidal silicates. M. S. B.

**Catalytic oxidising action of colloids.** Y. SHIBATA and K. TAMASAKI (Iwata Inst. Plant Biochem., Publ. 2, 1936, 201—206).—The influence on O<sub>2</sub> absorption by pyrogallol (I) of certain metal sols, previously shown by a spectro-photometric method to catalyse the oxidation of (I), has been examined. Pt sol causes a marked absorption of O<sub>2</sub> which varies with the method of prep. of the sol, but Ag and Au sols produce no appreciable absorption. M. S. B.

**Iodide oxidation by complex metal salts.** A. WATANABE (Iwata Inst. Plant Biochem., Publ. 2, 1936, 74—87).—The catalytic oxidation of KI by Co amines is parallel with the influence of the latter on pyrogallol oxidation. The rate of the solution rises during the reaction, but this rise may be prevented by the use of buffers, and the buffered reaction is unimol. The optimum  $p_H$  for the reaction is approx. 6. The behaviour of the amines is similar to that of iodide-oxidases. The dependence of  $k$  on ammine concn. is expressed by  $k_1/k_2 = (c_1/c_2)^{0.36}$ . For const. ammine concn.  $k$  falls with diminution of initial [KI]. Determination of  $k$  for temp. 0—30° showed that a rapid increase takes place between 10° and 20°. M. S. B.

**Catalytic action of complex metal compounds.** K. SHIBATA and A. WATANABE (Iwata Inst. Plant Biochem., Publ. 2, 1936, 97—128).—The formation of indophenol from Nadi reagent ( $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{NMe}_2$  and  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{OH}$ ) has been employed in further investigations on the oxidising action of complex metal salts (cf. preceding abstracts). *m*-Phenols, which are not oxidisable, inhibit the oxidation of *o*- and *p*-phenols, probably by attaching themselves to the metal complex in place of the latter. Certain complexes can oxidise only in presence of H<sub>2</sub>O<sub>2</sub> and so behave like peroxidase. The accelerating action of these compounds on the catalytic oxidation by active amines is due to the presence of H<sub>2</sub>O<sub>2</sub> liberated in this process. The velocity of oxidation depends on the partial pressure of O<sub>2</sub>, but oxidation can take place in a vac. or a N<sub>2</sub> atm. if a H-acceptor, such as benzoquinone or phloroglucinol, capable of forming a co-ordination compound with the ammine, is added. This constitutes another resemblance between complex metal amines and dehydrases or oxidation-reduction enzymes. M. S. B.

**Asymmetric oxidation.** I. Y. SHIBATA and R. TSUCHIDA. II. Y. SHIBATA, Y. TANAKA, and S. GODA. III. **Inhibiting action of some asymmetric organic acids on asymmetric oxidation.** Y. SHIBATA and K. SAKAI (Iwata Inst. Plant Biochem., Publ. 2, 159—166, 167—174, 190—200).—I. By observing the changes in optical rotation during the catalytic oxidation of *r*:3:4-dihydroxyphenylalanine

(I) by  $l\text{-[Co en}_2\text{NH}_3\text{Cl]Br}_2$  (II) (en=ethylenediamine) it is found that selective oxidation of *l*-(I) takes place.

(II). The catalytic oxidation of *d*-catechin (III) by *d*- and *l*-(Co en<sub>2</sub>NH<sub>3</sub>Cl)Br<sub>2</sub> has been studied both by changes in rotation and also by the amount of O<sub>2</sub> absorbed. Oxidation is more rapid by the *d*- than by the *l*-complex. Oxidation of (III) by *r*-complex follows a similar course to that by *l*-complex instead of lying between *d*- and *l*-. There is thus an analogy with the action of certain natural enzymes.

III. The action of optically active inhibiting agents on the oxidation of *d*-catechin by *d*- and *l*-(II) in buffered solutions depends on the sign of the rotation of the inhibitor. Inhibition by the combinations *d*-(II) tartaric acid and *l*-(II)+*l*-tartaric acid is > by *d*+*l*- or *l*+*d*-combinations. *l*-Cysteine has a strong retarding influence on oxidation by both *d*-(II) and *l*-(II), but on *d*-(II) it is somewhat > on *l*-(II). The inhibiting action of *d*-bromocamphor-sulphonic acid on catalysis by *l*-(II) is > on that by *d*-(II). M. S. B.

**Oxidase-like action of certain complex metal salts.** Metol. Y. SHIBATA and K. YAMASAKI (Iwata Inst. Plant Biochem., Publ. 2, 1936, 180—189).—The autoxidation of  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{NHMe}\cdot\text{H}_2\text{SO}_4$  (I) is inhibited by complex Co salts, the inhibiting action being parallel with the oxidising action of these salts on polyphenols (cf. preceding abstracts). The Co salt forms an insol. ppt. with (I). On the other hand complex Cr salts, which are not oxidation catalysts, have no inhibiting action on the autoxidation of (I) and form no ppt. This supports the assumption (cf. first abstract of this group) that combination between complex and polyphenol is necessary before oxidation is accelerated. KCN and Cr complexes, which are poisons for the accelerating action, have a similarly inhibiting effect on the retarding action. NH<sub>2</sub>OH, however, is an exception since, although a poison for catalytic oxidation, it accelerates the autoxidation of (I), but has practically no effect on the inhibiting action of Co complexes, the two effects being algebraically additive. M. S. B.

**Catalytic reduction of complex metal salts.** Y. SHIBATA and T. YAMABE (Iwata Inst. Plant Biochem., Publ. 2, 1936, 207—213).—The reduction of benzoquinone by H<sub>2</sub> is catalysed by complex Ni amines. The reaction is also accompanied by evolution of O<sub>2</sub>, probably due to the formation of H<sub>2</sub>O<sub>2</sub> during the course of the reaction and subsequent splitting up by the Ni complex (cf. a previous abstract). In order to follow the rate of H<sub>2</sub> absorption O<sub>2</sub> must be absorbed by pyrogallol. For the same Ni ammine the rate of reaction varies with the  $p_H$  of the solution. M. S. B.

**Mechanism of the catalytic exchange reaction between deuterium and water.** A. FARKAS (Trans. Faraday Soc., 1936, 32 922—932).—The velocity of the reaction between HD and H<sub>2</sub>O vapour on a Pt wire at 250—410° and 10—70 mm. is about 0.1 that of the ortho-para-H<sub>2</sub> conversion. The rate of the exchange reaction is independent of the H<sub>2</sub>O pressure and increases nearly linearly with D<sub>2</sub> pressure, indicating that H<sub>2</sub>O is strongly and H<sub>2</sub> weakly adsorbed.

*E* for the exchange reaction is 13.5 kg.-cal. The mechanism is discussed. L. J. J.

**Kinetics of para-ortho-hydrogen conversion on charcoal.** R. BURSTEIN and P. KASHTANOV (Trans. Faraday Soc., 1936, 32, 823—828; cf. A., 1935, 940).—The rate of the *o-p*-hydrogen conversion on C has a positive temp. coeff. between 20° and 573° abs., whilst when the C is poisoned it is negative in the range 90—300°, and positive between 300° and 573° abs. The results indicate the existence of two kinds of active centres, one of which becomes inactive at 20° abs. F. L. U.

**Catalytic preparation of sulphuryl chloride.**—See B., 1936, 493.

**Energetics of catalysis. VI. Kinetics of hydrogenation processes in liquid systems.** E. B. MAXTED and C. H. MOON (J.C.S., 1936, 635—637; cf. A., 1935, 1210).—The change in sign above 80—90° of the temp. coeff. of the reaction between crotonic acid and O<sub>2</sub> on a Pt surface is accompanied by a corresponding change in the kinetics of the reaction. This changes from zero order to approx. first order, in accord with the view that the change is due to a decrease in the concn. of acid adsorbed till it is insufficient to render the reaction independent of this concn. J. W. S.

**Catalytic esterification of alcohols without the use of acids.** P. J. IVANNIKOV and E. J. GAVRILOVA (J. Appl. Chem. Russ., 1936, 9, 490—491).—EtOAc or EtCO<sub>2</sub>Pr is obtained in 50—60% yield by passing EtOH or PrOH over a Cu-U catalyst at 240°.

R. T.

**Influence of the carrier on poisoning of platinum catalysts by arsenic.** I. E. ADADUROV, A. N. TZEITLIN, and L. M. ORLOVA (J. Appl. Chem. Russ., 1936, 9, 399—411).—The sensitivity to As<sub>2</sub>O<sub>3</sub> poisoning of Pt catalysts is at a min. when the radius of the cation of the carrier is 0.78 Å. (Mg, Sn, Zr), and the poisoned catalyst is most readily activated by heating in air or with CO-H<sub>2</sub>. A study of the catalytic action of Pt on Be, Mg, Ca, Sr, Ba, Ti, Sn, Si, Zr, Th, Al, Fe, and Cr sulphates or oxides shows that the action of the carrier depends on the radius, but not on the chemical nature, of the cation.

R. T.

**Effects of various fluorides on thermal synthesis of calcium silicates.** I. S. NAGAI and M. TAKAHARA (J. Soc. Chem. Ind. Japan, 1936, 39, 130—132B; cf. A., 1935, 1085).—The efficiency of fluorides as catalysts in the synthesis of Ca silicates decreases in the order Na<sub>3</sub>AlF<sub>6</sub>, NaF, Na<sub>2</sub>SiF<sub>6</sub>, MgF<sub>2</sub>, CaF<sub>2</sub>, and MgSiF<sub>6</sub>. Glass powder is slightly more efficient than feldspar. R. S.

**Catalytic oxidation by copper salts in presence of manganese salts.** P. THOMAS and (Mlle.) C. KALMAN (Compt. rend., 1936, 202, 1436—1437).—The oxidation of phenolphthalein or pyramidone by dil. H<sub>2</sub>O<sub>2</sub> solution in presence of Cu<sup>++</sup> is inhibited by Mn<sup>++</sup>. L. J. J.

**Accelerators and retarders in the reduction of silver salts.** G. OLLENDORFF and H. ANDRESEN (Z. wiss. Phot., 1936, 35, 119—123).—The speed of reduction of AgBr sols has been measured in the pre-

sence of various retarding agents, *e.g.*, gelatin, Tl salts, and accelerating agents, *e.g.*, Na<sub>2</sub>S, Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, thiosinamine. Small amounts of KI accelerate reduction; with increasing amounts a min. speed is reached, and the rate then increases steadily with larger amounts. Lowering of *p<sub>H</sub>* (omission of alkali from normal developer) also retards development.

J. L.

**Oxidation catalysis. II. Chromium oxide as catalyst.** A. KUTZELNIGG and W. WAGNER. **III. General view.** A. KUTZELNIGG (Monatsh., 1936, 67, 231—240, 241—247; cf. A., 1930, 1133).—II. The activity of pure Cr<sub>2</sub>O<sub>3</sub> [prepared by heating Cr(OH)<sub>3</sub> in H<sub>2</sub>] in catalysing the oxidation of K<sub>4</sub>Fe(CN)<sub>6</sub> by atm. O<sub>2</sub> rises with increase of drying temp. up to 450°, beyond which it decreases rapidly to zero. There is a secondary max. in the activity curve at 200°. The active Cr<sub>2</sub>O<sub>3</sub> is olive-brown and amorphous, whilst the strongly heated inactive material is green and cryst. The particle size remains approx. const. When prepared in presence of O<sub>2</sub>, the black oxide shows max. activity after heating at 300°. Finely divided Cr<sub>2</sub>O<sub>3</sub> prepared by decomp. of Hg<sub>2</sub>CrO<sub>4</sub> has the greatest activity and "glossy Cr<sub>2</sub>O<sub>3</sub>" the least of a no. of preps. tested, the products of decomp. of (NH<sub>4</sub>)<sub>2</sub>CrO<sub>4</sub>, Cr<sub>2</sub>(C<sub>2</sub>O<sub>4</sub>)<sub>3</sub>, and Cr(NO<sub>3</sub>)<sub>3</sub> being intermediate.

III. Besides Cr<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub> and CuO show max. activity in catalysing the atm. oxidation of K<sub>4</sub>Fe(CN)<sub>6</sub> when prepared at certain temp. This is associated with the elimination of adsorbed H<sub>2</sub>O layers or salts from the powders. Whereas animal charcoal promotes the reduction of K<sub>3</sub>Fe(CN)<sub>6</sub> in alkaline solution, only slight catalytic effect is found with MnO<sub>2</sub> and fuller's earth and none with NiO, Fe<sub>2</sub>O<sub>3</sub>, CuO, SiO<sub>2</sub> gel, PbO<sub>2</sub>, ZnO, or Ag<sub>2</sub>O. Oxides which catalyse the decomp. of K<sub>4</sub>Fe(CN)<sub>6</sub> also promote the evolution of O<sub>2</sub> from KClO<sub>3</sub>, KMnO<sub>4</sub>, HgO, Ag<sub>2</sub>O, and H<sub>2</sub>O<sub>2</sub>, the most active oxides being those of elements at the min. of the at. vol. curve. J. W. S.

**Kinetics of hydrogenation of ethylene on skeletal contact catalysts.** G. M. SCHWAB and H. ZORN (Z. physikal. Chem., 1936, B, 32, 169—201).—Catalysts have been prepared by making alloys with the compositions NiSi, NiSi<sub>2</sub>, and NiAl<sub>3</sub> and removing the Al with NaOH. The hydrogenation has been studied at 0—180° under total pressures, *p*, of 50—250 mm. During reaction the activity, *a*, of the catalyst falls, and may even decline at room temp., due to ageing. For a given catalyst *a* ∝ (*m*/*d*)<sup>2/3</sup> (*m*=wt.), indicating that *a* is a linear function of the grain surface of the vol. near the surface. On fresh catalysts there are numerous active centres chiefly within the grains and accessible to the reactants only by diffusion, and the rate of the process as a whole is determined by the rate of diffusion. With fewer and less active centres the rate of hydrogenation is determined by the rate of a normal chemical reaction, requiring activation. The kinetics of the reaction on NiSi after ageing are of this type. Here reaction is of the first order in respect of *p*, but of fractional orders in respect of the partial pressures of H<sub>2</sub>, *p*<sub>1</sub>, and C<sub>2</sub>H<sub>4</sub>, *p*<sub>2</sub>. The Langmuir-Hinshelwood theory is valid and the rate is given

by  $-dp/dt = kp_1p_2/(1+bp_1+cp_2)$ , where  $b$  and  $c$  are adsorption coeffs. The true heat of activation is  $18.7 \pm 1$  kg.-cal., a val. which excludes the possibility of any "tunnel" reaction, and the calc. optimum temp. is  $450-470^\circ$  abs. On the more active  $\text{NiSi}_2$  and  $\text{NiAl}_2$  the kinetics are formally similar, but  $b$  and  $c$  are not adsorption coeffs. and the rate of diffusion is the governing factor;  $\text{C}_2\text{H}_4$  now retards the reaction. X-Ray diagrams show that the active centres are probably located in the amorphous part of the catalysts. R. C.

**Kinetics of the acetylation of cellulose fibres. V, VI.** Influence of solvent and the concentration of sulphuric acid on the acetylation velocity in the fibre bundle and the ratio of the catalytic action of sulphuric and perchloric acids. I. SAKURADA and M. MIYAGUTI (J. Soc. Chem. Ind. Japan, 1936, 39, 91-94B; cf. A., 1935, 42).—The velocity of acetylation is given by  $x = kt^m$  ( $x$ =mols.  $\text{AcOH}$  per 100 mols.  $\text{C}_6\text{H}_{10}\text{O}_5$ ).  $m$  is approx. const. with increasing  $[\text{H}_2\text{SO}_4]$  but  $k$  increases according to  $k = pc^{1/q}$  where  $p$  and  $q$  are consts. The catalytic activity of  $\text{HClO}_4$  is 10 times that of  $\text{H}_2\text{SO}_4$  but the influence of different solvents is small. R. S.

**Catalytic reduction of carbon monoxide to methane.**—See B., 1936, 531.

**[Catalytic] decomposition of methane and petroleum hydrocarbons with steam.**—See B., 1936, 532.

**[Catalytic] synthesis of ethyl acetate.**—See B., 1936, 536.

**Catalytic oxidation of benzene.**—See B., 1936, 536.

**Catalytic properties of rhenium. II.**—See this vol., 820.

**Catalytic action of colloidal ferric hydroxide at different degrees of dispersion. I.** S. TELETOV and A. V. T. TJUTJUNKINA (Ukrain. Chem. J., 1936, 11, 1-3).—The velocity of catalytic decomp. of  $\text{H}_2\text{O}_2$  by  $\text{Fe}(\text{OH})_3$  sols is a function of the degree of dispersion of the latter. R. T.

**Decomposition of nitrous oxide on the surface of platinum. II.** The effect of foreign gases. E. W. R. STEACIE and J. W. McCUBBIN (Canad. J. Res., 1936, 14, B, 84-89; cf. A., 1934, 1182).—Preliminary addition of  $\text{N}_2$  diminishes the rate of decomp. of  $\text{N}_2\text{O}$  on sponge Pt by filling up the pores, but is without effect in the case of Pt gauze. The retarding effect of  $\text{He}$ ,  $\text{CO}_2$ , and  $\text{H}_2\text{O}$  has also been studied and the adsorption isotherm of  $\text{O}_2$  on Pt at  $570^\circ$  has been determined.  $\text{O}_2$  formed by decomp. of  $\text{N}_2\text{O}$  gives the same isotherm, whilst adsorption of  $\text{N}_2\text{O}$  is small. It is concluded that  $\text{O}_2$  does not retard the decomp. R. S.

**Decomposition of hydrogen sulphide and water on molybdenum filaments.** F. E. T. KINGMAN (Trans. Faraday Soc., 1936, 32, 903-907).— $\text{H}_2\text{S}$  decomposes at  $400-685^\circ$  and 0.1 mm. by a first-order reaction with  $E$  25,000 g.-cal., giving  $\text{H}_2$  and  $\text{S}$ .  $\text{H}_2\text{O}$  decomposes at  $800-1200^\circ$ , giving  $\text{H}_2$  and  $\text{Mo}$  oxide, which retards the reaction below  $1000^\circ$ .

Above  $1000^\circ$ , H atoms are formed and react with the  $\text{Mo}$  oxide.  $E=43,000$  g.-cal. L. J. J.

**Reaction mechanism. VII. Rate of catalytic hydrogenation of doubly linked carbon in chain molecules in solution.** O. SCHMIDT (Z. physikal. Chem., 1936, 176, 237-259; cf. A., 1933, 913).—The rate of hydrogenation at  $20^\circ$  of various aliphatic and aromatic hydrocarbons, alcohols, carboxylic acids, and esters having an ethenoid double linking in  $\text{MeOH}$  and other solvents with Ni, Pt, and Co as catalysts has been determined. Hydrogenation occurs in the micropores of the metal phase into which the org. mols. diffuse as far as their size allows. The rate of reaction is determined by the rate of this diffusion. The  $\text{H}_2$  dissolves in the catalyst and is activated by being converted into protons. In general, the more substituents there are in the unsaturated mol. and the larger or less compact they are the slower is hydrogenation. Chain-branching retards diffusion and with it the reaction. With compounds of the type  $\text{CH}_2\text{:CHR}$  the time for half reaction,  $\tau$ , falls only slightly as the chain length of R increases. In some cases the Ph group has a powerful retarding action.  $\tau$  is particularly high for compounds of the type  $\text{CR'R''CHR}$ . For an acid  $\tau$  is  $>$  for its Me or Et ester, suggesting that  $\text{CO}_2\text{H}$  retards diffusion more than  $\text{CO}_2\text{Me}$  and  $\text{CO}_2\text{Et}$ . If the double linking is at the end of the chain the length and position of the substituents have little effect on the velocity.  $\tau$  runs approx. parallel with the viscosity and heat of adsorption of the solvent and increases with its mol. wt. R. C.

**Catalytic activity of palladium and overvoltage of hydrogen.** C. A. KNORR and E. SCHWARTZ (Z. physikal. Chem., 1936, 176, 161-168).—Extension of a previous investigation (A., 1934, 258) shows that the val. of  $b$  in the logarithmic relation between overvoltage and c.d. falls with increasing catalytic activity of the Pd electrode. On pure active Pd  $b$  would probably approach the val. required by Tafel's theory of overvoltage, and it is inferred that here it is the slowness not of the discharge of the  $\text{H}^+$  ions but of the process  $2\text{H} \rightarrow \text{H}_2$  which is responsible for overvoltage (cf. A., 1935, 705). R. C.

**Catalytic action of Japanese acid clay. II. Promotive action of Japanese acid clay on [the] catalytic action of mercuric sulphate [in the] condensation of acetylene and acetic acid.** T. KUWATA and O. KATO (J. Soc. Chem. Ind. Japan, 1936, 39, 127-128B; cf. B., 1936, 138).—The efficiency of  $\text{HgSO}_4$  in affecting condensation of  $\text{C}_2\text{H}_2$  and  $\text{AcOH}$  is increased if it is pptd. on Japanese acid clay (I). Optimum conditions (79.5% yield) are: (I) (9.6 g.), leached with hot 18%  $\text{HCl}$  and dried at  $150-200^\circ$ , is added to  $\text{HgO}$  (2.88 g.) in  $\text{AcOH}$  (29 c.c.), to which 50% oleum (1.2 g.) is then added. Addition of (I) to a previously prepared catalyst or use of C has no effect. S. C.

**Electrolysis of manganous salts.** M. GELOSO and (MLE.) C. ROUILLARD (Compt. rend., 1936, 202, 1418-1421).—Current-anode potential curves show two ascending branches, corresponding with deposition of  $\text{MnO}_n$ ,  $n\text{MnO}$ , and evolution of  $\text{O}_2$ , respectively,

and separated by a flat portion. Data are recorded for the variation of  $\eta$  with the conditions of electrolysis. Part of the current must be carried by  $\text{OH}'$ .

L. J. J.

**Electrochemical isolation of light metals from non-aqueous solutions. I. Alkali metal salts.** M. A. KLOTSCHKO (J. Appl. Chem. Russ., 1936, 9, 420—433).—The alkali halide is fused with  $\text{AlCl}_3$  or  $\text{AlBr}_3$ , and a solution of the melt in  $\text{PhNO}_2$  is electrolysed (Ag anode, Pt cathode, with electrode diaphragms). The yield of metal varies inversely with the c.d., max. vals. being obtained using 0.0002—0.001 amp. per sq. cm. The process consists of  $\text{MAlX}_4 \rightleftharpoons \text{M}' + \text{AlX}_4'$ ;  $\text{AlX}_4' \rightarrow \text{AlX}_3 + \text{X}$  ( $\text{M} = \text{Li}, \text{Na}, \text{K}, \text{Rb}$ ;  $\text{X} = \text{Cl}, \text{Br}$ ).

R. T.

**Electrolysis of magnesium methyl halides.**—See this vol., 830.

**Electrolytic oxidation of proline and  $\gamma$ -aminobutyric acid.**—See this vol., 828.

**Oxidation of sulphur dioxide in the high-voltage arc discharge.** S. M. GOLYAND (J. Phys. Chem. U.S.S.R., 1934, 5, 1471—1472).—A criticism of Kolodkina and Netschaeva's work (cf. A., 1935, 712).

CH. ABS. (e)

**Oxidation of sulphur dioxide in the high-voltage arc discharge.** N. NETSCHEVA and L. KOLODKINA (J. Phys. Chem. U.S.S.R., 1934, 5, 1473—1474; cf. preceding abstract).—A reply.

CH. ABS. (e)

**Behaviour of gases under the influence of high-frequency discharge. Ammonia and hydrogen.** B. S. SRIKANTAN (J. Indian Chem. Soc., 1936, 13, 79—85).— $\text{NH}_3$  is greatly adsorbed by the walls of highly evacuated glass tubes. When the walls are saturated with respect to  $\text{NH}_3$ , any further addition of  $\text{NH}_3$  is immediately decomposed by the discharge into  $\text{H}_2$  and  $\text{N}_2$  which are adsorbed, leaving a residue of  $\text{NH}_3$  in equilibrium with the adsorbed  $\text{NH}_3$ . Further discharge expels the  $\text{N}_2$  from the walls.

C. R. H.

**Mechanism of the photochemical reaction between bromine and water.** H. A. PAGEL and

W. W. CARLSON (J. Physical Chem., 1936, 40, 613—617).—The kinetics of the reaction have been investigated at 25°. The reaction appears to take place as follows: (1)  $\text{Br}_2 + \text{H}_2 \rightleftharpoons \text{H}' + \text{Br}' + \text{HOBr}$ , (2)  $\text{HOBr} + h\nu \rightarrow \text{H} + \text{Br}' + \frac{1}{2}\text{O}_2$ .

E. S. H.

**Oxidation of nitrites to nitrates in sunlight.** N. R. DHAR and S. P. TANDON (J. Indian Chem. Soc., 1936, 13, 180—184).—A study of the catalytic effect of  $\text{ZnO}$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{TiO}_2$ , and soil on the photo-oxidation of aq. solutions of  $\text{NaNO}_2$  shows that in dil. solutions oxidation is complete but that in conc. solutions the equilibrium  $2\text{NaNO}_2 + \text{O}_2 \rightleftharpoons 2\text{NaNO}_3$  is attained. It is suggested that the conversion of  $\text{NH}_4$  salts into nitrates in soil may be due more to photochemical than to bacterial action.

C. R. H.

**Photochemical peroxide formation. I. Oxidation of methyl alcohol by molecular oxygen in ultra-violet light.** R. CANTIENI (Ber., 1936, 69, [B], 1101—1106).—Aq. MeOH in presence of  $\text{O}_2$  is oxidised with formation of peroxide in ultra-violet light of long and short  $\lambda$ . Peroxide formation from  $\text{MeOH}-\text{O}_2$  also occurs in absence of  $\text{H}_2\text{O}$ , the presence of which retards its formation. The peroxide becomes less stable as its concn. increases. Its formation is about 120 times as rapid in unfiltered ultra-violet light as in that which has been filtered through glass. The hypothesis that  $\text{H}_2\text{O}_2$  is produced from  $\text{H}_2\text{O}$  during the photochemical oxidation of MeOH is untenable and it is improbable that  $\text{H}_2\text{O}_2$  arises by oxidation of H formed by photolysis. The production of  $\text{OMe}\cdot\text{OH}$  is assumed which, in ultra-violet light, oxidises MeOH.  $\text{CH}_2\text{O}$ , as primary oxidation product, is present in traces when the concn. of peroxide is small.  $\text{HCO}_2\text{H}$  cannot be detected by reason of its ready oxidisability by peroxide in ultra-violet light.

H. W.

**Theory of densensitisation.** K. WEBER (Z. wiss. Phot., 1936, 35, 124—128; cf. A., 1935, 1331).—The author's theory, that desensitisers act by oxidising the optical or chemical sensitisers present, is brought into agreement with the observations of Blau and Wambacher (this vol., 37) and Arens and Eggert (A., 1929, 277) by the assumption that the process is reversible in the absence of  $\text{O}_2$ . The reactions are treated mathematically, and are shown to be in agreement with various known data.

J. L.

**Action of light on catalytic oxidation by some metallic complex salts.** Y. SHIBATA and S. GODA (Iwata Inst. Plant Biochem., Publ. 2, 1936, 175—179).—By the use of suitable light filters the influence of light of different  $\lambda$  between infra-red and 3300 Å. on the oxidation of *d*-catechin in presence of  $r\text{-[Co(en)}_2\text{NH}_3\text{Cl)]Br}_2$  (I) ( $\text{en}$  = ethylenediamine) has been examined. Aq. (I) has absorption bands at  $\lambda$  5000 and 3640 Å., but light in this region is less active than the light of longer  $\lambda$  absorbed by  $\text{H}_2\text{O}$ . This confirms the theory previously put forward that oxidation takes place through the medium of activated  $\text{H}_2\text{O}$ . The following reaction scheme is proposed:  $\text{R} + 2\text{H}\cdot\text{OH} + 0.5\text{O}_2 = \text{R}(\text{OH})_2 + \text{H}_2\text{O}$  and  $\text{R}(\text{OH})_2 = \text{RO} + \text{H}_2\text{O}$ . The mechanism of activation of  $\text{H}_2\text{O}$  by the complex salt is still obscure.

M. S. B.

**Photochemical activation of the oxidising action of complex metal salts.** A. WATANABE

(Iwata Inst. Plant Biochem., Publ. 2, 1936, 129—158).—The catalytic oxidation of KI, pyrogallol, benzidine,  $p\text{-C}_6\text{H}_4(\text{NH}_2)_2$ , and Nadi reagent, and the catalytic decomp. of  $\text{H}_2\text{O}_2$  by complex metal salts is accelerated by ultra-violet or visible light radiation. Photochemical reaction may take place even where there is no appreciable dark reaction. The infra-red radiation is active in the case of pyrogallol oxidation only. Preliminary irradiation of the separate constituents has no effect. The most active  $\lambda$  in the Hg arc is 366 m $\mu$ . Of the Co amines containing  $\text{NO}_2$  the most sensitive to light is  $[\text{Co}(\text{NH}_3)_4(\text{NO}_2)_2]\text{Cl}$ , and of the two stereoisomerides the *trans*- is more sensitive than the *cis*-form. The action is ascribed to the increased instability of the complex metal salt under the action of light. M. S. B.

**Photochemical sensitisation in solutions. I. Sensitisation of an Eder solution with eosin.** E. V. SCHPOLSKI and N. I. KOLESNIKOVA (J. Phys. Chem. U.S.S.R., 1934, 5, 1199—1209).—For light of  $\lambda\lambda$  5200 and 5460, 5760 Å. there was a short induction period, after which the reaction proceeded linearly with time. Its rate was  $\propto$  the light intensity. At concns. of  $5 \times 10^{-7}$  to  $10^{-5}$  g. per c.c. the rate  $\propto$  the concn. At concns. of  $3 \times 10^{-5}$  to  $10^{-4}$  g. per c.c. the rate was const., and at higher concns. it decreased. The concn. thresholds for the decrease in sensitisation and the damping of fluorescence coincided. The rate  $\propto$   $[\text{HgCl}_2]$  and was independent of  $[\text{C}_2\text{O}_4^{2-}]$  for concns.  $> 0.01$  g. per c.c. The temp. coeff. was 2.6 at 5—15° and 1.9 at 15—25°. The dark reaction became appreciable at  $> 30^\circ$ . The quantum yield for  $\lambda\lambda$  5470, 5760 Å., in presence of  $\text{O}_2$ , was 12.5.

CH. ABS. (e)

**Photochemical bleaching of chlorophyll.**—See this vol., 867.

**Photochemical reaction of chlorophyll with ferrous ions.**—See this vol., 907.

**Study of solid reactions by the emanation method.** R. JAGITSCH (Monatsh., 1936, 68, 1—9).—The following changes have been observed, at the temp. indicated, on heating the respective materials containing Rd—Th as a source of Tn:  $\alpha \rightarrow \beta\text{-SiO}_2$  575°;  $\beta\text{-SiO}_2 \rightarrow \beta\text{-tridymite}$  870°;  $\text{SiO}_2 + \text{CaCO}_3 \rightarrow \text{CaSiO}_3$  about 900°;  $\gamma\text{-Al}_2\text{O}_3 \rightarrow \text{corundum}$  840—950°;  $\text{Al}_2\text{O}_3 + \text{CoCO}_3 \rightarrow \text{Co}(\text{Ca})\text{Al}_2\text{O}_4$  complete at about 900°;  $\text{Fe}_2\text{O}_3 + \text{CaCO}_3 \rightarrow \text{CaFe}_2\text{O}_4$  550—600°.

F. L. U.

**Properties of sodium hexametaphosphate.** R. T. THOMSON (Analyst, 1936, 61, 320—323).—A no. of insol. salts of Ca, Ba, etc. readily dissolve in aq.  $\text{Na}_6\text{P}_6\text{O}_{18}$ . Portland cement is attacked, most of the Ca and part of the  $\text{SiO}_2$  being dissolved. E. C. S.

**Crystallisation and loss of water from copper hydroxide.** E. HAYEK (Monatsh., 1936, 67, 352—356).—Pure cryst.  $\text{Cu}(\text{OH})_2$  has been prepared by slow evaporation of  $\text{NH}_3$  from a cold solution of  $\text{CuO}$  in conc. aq.  $\text{NH}_3$  and shown to have a crystal structure identical with known forms. The relatively higher stability of this product, and of amorphous  $\text{Cu}(\text{OH})_2$  prepared by dilution of the  $\text{CuO-NH}_3$  solution, compared with  $\text{Cu}(\text{OH})_2$  obtained by pptn. with alkali, indicates that adsorbed alkali is the cause of the dehydration process at lower temp. J. W. S.

**Cuprous iodide.** R. HUERRE (J. Pharm. Chim., 1936, [viii], 23, 594—605).—The formation of  $\text{Cu}_2\text{I}_2$  from KI and  $\text{CuSO}_4$  in  $\text{H}_2\text{O}$  is inhibited in dil. solution. HCl has no effect, but excess of KI and  $\text{Na}_2\text{S}_2\text{O}_3$  favour the reaction. J. L. D.

**Preparation of the complex salt,  $\text{Cu}_2\text{HgI}_4$ .** P. G. POPOV (Ukrain. Chem. J., 1936, 11, 11—12).—8.3 g. of KI in 20 ml. of  $\text{H}_2\text{O}$  are added to 6.8 g. of  $\text{HgCl}_2$  in 100 ml. of  $\text{H}_2\text{O}$ , the washed ppt. is dissolved in 20 ml. of 41.5% KI, and the solution is added to a solution of 5 g. of  $\text{CuCl}$  in 40 ml. of 50% HCl. The ppt. of  $\text{Cu}_2\text{HgI}_4$  is washed with 50% HCl and  $\text{H}_2\text{O}$ , and dried at 100°. R. T.

**Calcium metaphosphates.** A. BOULLE (Compt. rend., 1936, 202, 1434—1435).—Data are recorded for the X-ray spectra of  $\text{Ca}(\text{PO}_3)_2$  prepared by ignition of  $\text{Ca}(\text{H}_2\text{PO}_4)_2$  at different temp. Ignition below 400° gives a new cryst. form, converted at higher temp. into a different modification, m.p.  $1010 \pm 5^\circ$ . Thermal analysis data are in agreement. L. J. J.

**Hexamethylenetetramine compounds.**—See this vol., 828.

**Potentiometric study of complex thiosulphates.**

**I. Strontium silver thiosulphate.** R. PORTILLO and J. G. TANAGO (Z. anorg. Chem., 1936, 227, 124—128).—The compounds  $[\text{Ag}_2(\text{S}_2\text{O}_3)_2]\text{Sr} \cdot \text{H}_2\text{O}$  and  $[\text{Ag}_2(\text{S}_2\text{O}_3)_3]\text{Sr} \cdot 6\text{H}_2\text{O}$  are described. Their formation is indicated by potentiometric titration of  $\text{SrS}_2\text{O}_3$  with  $\text{AgNO}_3$ , both 0.1N. F. L. U.

**Preparation of luminescent zinc orthosilicate.** J. V. GOLBREICH and I. V. EGOROVA (J. Appl. Chem. Russ., 1936, 9, 446—450).—Max. cathodal luminescence is obtained when  $\text{Zn}_2\text{SiO}_4$  containing 1% of Mn as  $\text{MnCl}_2$  or  $\text{MnSO}_4$  is heated for 30 min. at 1200°. R. T.

**Ammoniates of simple salts. II. Ammoniates of zinc salts.** G. SPACU and P. VOICHESCU (Z. anorg. Chem., 1936, 227, 129—144; cf. this vol., 573).—The existence of ammoniates of Zn salts of the following acids has been established by tensimetric methods (figures indicate no. of mols. of  $\text{NH}_3$  per mol. of anhyd. salt):  $\text{HCNS}$  8, 6, 4, 2;  $\text{HCO}_2\text{H}$  10, 6, 4, 2;  $\text{AcOH}$  8, 6, 4, 2, 1;  $\text{OH} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$  6, 4, 2;  $\text{NH}_2 \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$  5, 2, 1;  $(\text{CH}_2 \cdot \text{CO}_2\text{H})_2$  6, 5, 3, 2, 1;  $[\text{CH}(\text{OH}) \cdot \text{CO}_2\text{H}]_2$  2, 1;  $\text{BzOH}$  8, 6, 4, 2; salicylic 8, 4, 2; *o*-aminobenzoic 10, 6, 4, 2; 5-sulphosalicylic 8, 4, 2. The stability of corresponding ammoniates increases with the strength of the acid. The influence of the mol. vol. of the metal and of the acid radical is discussed. F. L. U.

**Preparation of crystalline aluminium hydroxide from chromate-aluminate solutions by precipitation with carbon dioxide.** F. F. VOLF and A. E. MOROCHOVETZ (J. Appl. Chem. Russ., 1936, 9, 412—419).—Cryst.  $\text{Al}(\text{OH})_3$  is pptd. from Na aluminate—chromate solutions at 80–90 by saturation with  $\text{CO}_2$ ; the product is readily filterable, and contains  $> 0.03\%$  of  $\text{Cr}_2\text{O}_3$  after washing. R. T.

**Activation of redwood and ash-free sugar charcoal in a current of air.** J. W. MCBAIN and R. F. SESSIONS (J. Physical Chem., 1936, 40, 603—611).—The best conditions for activating C in air

have been examined in relation to temp., duration of heating, and type of furnace. A peak of activation is observed at 350—450°, and a more pronounced peak at 920—960°. When kept for a long period, even in sealed tubes, a decrease in activity of 17—63% occurs. A higher degree of activity is attained by activating in air than by heating in N<sub>2</sub> or He.

E. S. H.

$\alpha$ - $\beta$  Transition in zirconium in the presence of hydrogen. J. H. DE BOER and J. D. FAST (Rec. trav. chim., 1936, 55, 350—356).—The solubility of H<sub>2</sub> in Zr decreases with rise of temp. except through the transition point when H<sub>2</sub> is rapidly absorbed.

C. R. H.

Lead chlorocarbonate and its applications as intermediary in the preparation of alkali nitrates. G. AUSTERWEIL and B. KOURAKINE (Bull. Soc. chim., 1936, [v], 3, 898—905).—The prep. of PbCO<sub>3</sub>.PbCl<sub>2</sub> from PbCl<sub>2</sub> and CaCO<sub>3</sub> is described. When KNO<sub>3</sub> is prepared by interaction of Pb(NO<sub>3</sub>)<sub>2</sub> and KCl, dissolved PbCl<sub>2</sub> can be removed by adding PbCO<sub>3</sub>.

E. S. H.

Nature of active nitrogen. C. R. DHODAPKAR (J. Univ. Bombay, 1935, 4, Part II, 190—199).—The production and properties of active N<sub>2</sub> are described. The first positive system of N<sub>2</sub> ( $B^3\Pi \rightarrow A^3\Sigma$ ) is due to the N<sub>2</sub> mol. The mechanism of the production and decomp. of active N<sub>2</sub> and the effects of impurities are discussed.

J. W. S.

Reaction of ammonia with phosphorus pentachloride. Amides of phosphorus and phospham. I, II. H. MOUREU and P. ROCQUET (Bull. Soc. chim., 1936, [v], 3, 821—828, 829—841).—Published work is described (cf. A., 1935, 945, 1057).

E. S. H.

Basicity of phosphorous acid. I. J. SPERBER and J. F. BODMER (Ber., 1936, 69, [B], 974—977).—Although only 2 H of H<sub>3</sub>PO<sub>3</sub> can be replaced by metal it gives esters Et<sub>3</sub>PO<sub>3</sub> and the view is expressed that it has exclusively the structure P(OH)<sub>3</sub>. Attempts to prepare K<sub>3</sub>PO<sub>3</sub> by fusion of K<sub>4</sub>PO<sub>4</sub> with CuCN lead to a product with the reactions of PO<sub>3</sub>'''. H. W.

Disproportionation of sulphurous acid by hydrogen bromide-acetic acid to sulphuric acid and sulphur. F. KROHNKE and H. TIMMLER (Ber., 1936, 69, [B], 1140—1142; cf. this vol., 592).—SO<sub>2</sub> and HBr in AcOH at room temp. slowly yield S and H<sub>2</sub>SO<sub>4</sub>: 3SO<sub>2</sub>+2H<sub>2</sub>O  $\rightarrow$  2H<sub>2</sub>SO<sub>4</sub>+S. The reaction appears complicated and the intermediate production of SOBr<sub>2</sub> and SBr<sub>4</sub> is assumed. S<sub>8</sub>Br<sub>2</sub> can be isolated and this with H<sub>2</sub>SO<sub>4</sub> are the products if the action takes place in an anhyd. medium or if dehydrating agents (Ac<sub>2</sub>O, AcBr) are present. Reaction does not occur in the presence of > about 20% of H<sub>2</sub>O.

H. W.

Sexavalent tellurium derivatives. I. Telluric acids. M. PATRY (Bull. Soc. chim., 1936, [v], 3, 845—860; cf. A., 1935, 1090).—Only two forms of telluric acid are recognised as definite compounds, viz., orthotelluric acid Te(OH)<sub>6</sub>, and polymetatelluric acid (H<sub>2</sub>TeO<sub>4</sub>)<sub>11±1</sub>. These forms exist in equilibrium in aq. solution; rise of temp. or concn. favours an increase in (H<sub>2</sub>TeO<sub>4</sub>)<sub>11±1</sub>. By heating Te(OH)<sub>6</sub> in a

sealed tube for a long time at 300°,  $\beta$ -TeO<sub>3</sub> ( $d$  6.22) is formed as a hard, grey, chemically inert mass.

E. S. H.

Preparation of chromic sulphide. S. M. VELLER (Ukrain. Chem. J., 1936, 11, 23—27).—The upper of the two layers formed when NH<sub>4</sub> hexahydrobenzoate is shaken with aq. Cr alum is (C<sub>6</sub>H<sub>11</sub>·CO<sub>2</sub>)<sub>3</sub>Cr, a boiling benzene solution of which yields Cr<sub>2</sub>S<sub>3</sub> with dry H<sub>2</sub>S. Cr<sub>2</sub>S<sub>3</sub> is also formed as an intermediate product from aq. Cr<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> as follows: Cr<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>+3(NH<sub>4</sub>)<sub>2</sub>S  $\rightarrow$  Cr<sub>2</sub>S<sub>3</sub>+3(NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>; Cr<sub>2</sub>S<sub>3</sub>+6H<sub>2</sub>O  $\rightarrow$  2Cr(OH)<sub>3</sub>+3H<sub>2</sub>S.

R. T.

Action of molybdic acid on lævorotatory  $\alpha$ -glycerophosphoric acid.—See this vol., 821.

Constitution of  $\beta$ -iron oxide monohydrate. I. M. KOLTHOFF and B. MOSKOVITZ (J. Amer. Chem. Soc., 1936, 58, 777—779).—When the  $\beta$ -oxide is shaken with dil. HCl in aq. NaCl, the [HCl] decreases continuously. The results show that the  $\beta$ -oxide has the structure  $\beta$ -FeO(OH), and is isomorphous with FeOCl, with which it forms mixed crystals.

E. S. H.

Ferrites. I. A. E. VAN ARKEL, E. J. W. VERWEY, and M. G. VAN BRUGGEN. II. E. J. W. VERWEY, A. E. VAN ARKEL, and M. G. VAN BRUGGEN (Rec. trav. chim., 1936, 55, 331—339, 340—347).—I. X-Ray diagrams of mixtures of Fe<sub>2</sub>O<sub>3</sub> and oxides of bivalent metals which have been heated to various high temp. indicate the formation of a ferrite phase which, at about 1300°, can dissolve considerable amounts of Fe<sub>2</sub>O<sub>3</sub>. The fusion points of several ferrites, most of which exhibit cubic spinel structure, were determined.

II. X-Ray investigations were extended to mixtures containing an excess of the bivalent metallic oxide. The influence of the oxide on the properties of the binary system is more marked than is the case when the Fe<sub>2</sub>O<sub>3</sub> is in excess.

C. R. H.

Complex compounds of iridium. IV. (SIR) P. C. RAY and N. P. GHOSH (J. Indian Chem. Soc., 1936, 13, 138—140).—IrCl<sub>3</sub>.3Et<sub>2</sub>S and NH<sub>3</sub> at 100° form IrCl<sub>3</sub>.2Et<sub>2</sub>S.NH<sub>3</sub>, m.p. 155°. At 130—140°, in addition to IrCl<sub>3</sub>.Et<sub>2</sub>S.2NH<sub>3</sub> and (IrCl<sub>3</sub>.5NH<sub>3</sub>)Cl<sub>2</sub> (A., 1934, 1209), a viscous liquid was obtained which, by the action of Ag<sub>2</sub>SO<sub>4</sub>, yielded (Ir.Et<sub>2</sub>S.5NH<sub>3</sub>)<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>.2H<sub>2</sub>O. Et<sub>2</sub>S and (NH<sub>4</sub>)<sub>2</sub>IrCl<sub>6</sub> at 80° form IrCl<sub>3</sub>.3Et<sub>2</sub>S (+1CHCl<sub>3</sub>), m.p. 171°.

C. R. H.

Chromatographic analysis and its application. G. HESSE (Angew. Chem., 1936, 49, 315—320).—A review of the technique and applications of chromatographic analysis, and of the relation of degree of adsorption to structure of adsorbate.

J. S. A.

Chelidonine: a fluorescent principle. M. DÉRIBÉRE (Ann. Chim. Analyt., 1936, [iii], 18, 119—120).—Practical applications of the brilliant fluorescence of chelidonine are discussed.

J. S. A.

Neville and Winther's acid as fluorescent indicator. M. DÉRIBÉRE (Ann. Chim. Analyt., 1936, [iii], 18, 120).—The acid shows a sharp change from no fluorescence to intense blue at  $p_H$  6—6.5.

J. S. A.

Determination of deuterium content of hydrogen mixtures by Farkas' micro-thermal conductivity method. K. WIRTZ (Z. physikal. Chem., 1936, B, 32, 334—340).—The difficulties in the method are discussed and ways of overcoming them described. An accuracy of  $\pm 0.1\%$  is attainable. R. C.

Drying of substances decomposing when heated. V. F. MALACHOV (J. Appl. Chem. Russ., 1936, 9, 775—777).—The substance ( $\text{NH}_4\text{NO}_3$ ) is dried until the loss in wt. in unit time becomes const., and the part of the drying curve representing this period is produced back to zero time, giving the original dry wt. R. T.

Determination of dry substance content.—See B., 1936, 527.

Drop reaction for hydrogen peroxide. L. KULBERG and L. MATVEEV (J. Appl. Chem. Russ., 1936, 9, 754—755).—A drop each of 1% *o*-tolidine in EtOH, acetate buffer at  $p_H$  4, 1% aq.  $\text{FeSO}_4$ , and of the solution under examination are placed on filter-paper; a blue coloration develops in presence of  $2.5 \times 10^{-8}$  g. of  $\text{H}_2\text{O}_2$ . R. T.

Phenosafranine, tartrazine, and rose-Bengal as adsorption indicators. A. J. BERRY (Analyst, 1936, 61, 315—319; cf. A., 1932, 1009).—A method for determining the constituents of mixtures containing  $\text{CN}'$ ,  $\text{I}'$ , and  $\text{Cl}'$  is described. Since AgBr is intermediate between AgCl and AgI in solubility and adsorption capacity for dyes, Br' cannot be determined by this method in presence of other halides. The use of adsorption indicators in titrating Ag' in acid solution with KBr and in systems such as  $\text{Ti}^{\text{IV}}$ — $\text{Ti}^{\text{III}}$  halides is described. The particular conditions for which the three indicators are best adapted are discussed. E. C. S.

Determination of hypochlorite and chlorate.—See B., 1936, 541.

Determination of bromine.—See this vol., 914.

Detection and determination of hydrobromic acid in hydrochloric acid. L. CHELLE (Ann. Falsif., 1936, 29, 229—231).—The presence of Br (120 mg. per litre; determined by the method of Denigès and Chelle, B., 1913, 141) in samples of "pure" HCl is noted. E. H. S.

Acidimetric determination of iodine. R. I. ALEXEEV (J. Appl. Chem. Russ., 1936, 9, 547—551).—10 ml. of 13%  $\text{AgNO}_3$  are shaken with 25 ml. of approx. 0.1N-I in KI, the ppt. is collected and washed, and the filtrate+washings are titrated with 0.1N-NaOH. The [I] is calc. from  $6\text{I} + 3\text{H}_2\text{O} + 6\text{AgNO}_3 \rightarrow 5\text{AgI} + \text{AgIO}_3 + 6\text{HNO}_3$ . R. T.

Determination of iodine in basic slag and mineral fertiliser.—See B., 1936, 541.

Determination of small quantities of fluorine in dicalcium phosphate. S. E. HARRIS and W. G. CHRISTIANSEN (J. Amer. Pharm. Assoc., 1936, 25, 306—310).—F is isolated as  $\text{H}_2\text{SiF}_6$  by distillation with  $\text{HClO}_4$  and determined colorimetrically by the fading effect on Zr alizarin lake. F. O. H.

Determination of fluorine. I. A. A. VASILIEV (J. Appl. Chem. Russ., 1936, 9, 747—750).—50 ml. of

$\text{H}_2\text{O}$ , 2 ml. of 2N- $\text{HNO}_3$ , 10 drops of AcOH, and 25 ml. of 2.84% KBr are added to 50 ml. of neutral aq. NaF (containing 0.1 g. of NaF), the mixture is heated to  $40^\circ$ , and 25 ml. of a solution of 5.6%  $\text{Pb}(\text{OAc})_2 \cdot 3\text{H}_2\text{O}$  in 1% AcOH are added. The ppt. of PbFBr is collected after 12—18 hr., washed successively with  $\text{H}_2\text{O}$ , aq.  $\text{PbBr}_2$ , and  $\text{H}_2\text{O}$ , and dissolved in 100 ml. of  $\text{H}_2\text{O}$  containing 5 ml. of  $\text{HNO}_3$ . 50 ml. of 0.1N- $\text{AgNO}_3$  are added, the solution is heated at  $100^\circ$  for 30 min., filtered, and the ppt. of AgBr is washed. Excess of  $\text{AgNO}_3$  is determined in the filtrate+washings by titration with 0.1N- $\text{NH}_4\text{CNS}$ . Alternatively, the ppt. of PbFBr is dried at  $105^\circ$  and weighed. R. T.

Instrument for automatic quantitative indication of hydrogen sulphide in the atmosphere. R. KRAUS (Chem. Fabr., 1936, 9, 241—242).—A continuous record of  $\text{H}_2\text{S}$  in the air is made by traversing  $\text{Pb}(\text{OAc})_2$  paper past a slit. The tint may be calibrated by exposure to the gas liberated by acid from measured amounts of aq.  $\text{Na}_2\text{S}$ . J. S. A.

Determination of small amounts of hydrogen sulphide in air. I. S. SCHERESCHEVSKAJA (J. Appl. Chem. Russ., 1936, 9, 572—575).— $\text{H}_2\text{S}$  is absorbed by 1% aq.  $\text{AgNO}_3$ , the ppt. of  $\text{Ag}_2\text{S}$  is treated with KCN, and the coloration given with Na plumbite by the  $\text{K}_2\text{S}$  formed is compared with those given by a series of standards prepared analogously from  $\text{Ag}_2\text{S}$  obtained by adding 0.1N- $\text{Na}_2\text{S}_2\text{O}_3$  to aq.  $\text{AgNO}_3$ . The method serves for the determination of  $< 0.01$  mg. of  $\text{H}_2\text{S}$ . R. T.

Gravimetric determination of selenates. (MME.) RIPAN-TILICI (Bull. Soc. chim., 1936, [v], 3, 881).—A claim for priority (cf. Spacu, this vol., 442). E. S. H.

Gravimetric determination of selenates. P. SPACU (Bull. Soc. chim., 1936, [v], 3, 881).—A reply (cf. preceding abstract). E. S. H.

Determination of selenium in steel.—See B., 1936, 548.

[Determination of nitrogen by the] Kjeldahl method. LE TOURNEUR-HUGON and CHAMBIONNAT (Ann. Falsif., 1936, 29, 227—229).—Digestion is completed in about 30 min. if  $\text{HClO}_4$  is gradually added to the boiling liquid when the material has dissolved, i.e., after about 12 min. using Gunning's technique. E. H. S.

Alkalimetry in presence of nitrite. A. S. VETROV (J. Appl. Chem. Russ., 1936, 9, 772—774).—2 g.-mol. of  $\text{H}_2\text{O}_2$  per g.-mol. of  $\text{HNO}_2$  present are added to 20 ml. of the alkaline solution at  $50$ — $60^\circ$ , 50 ml. of 0.1N- $\text{H}_2\text{SO}_4$  are added, followed by 3 drops of 0.2% Me-red, and the solution is titrated with 0.1N-NaOH. R. T.

Photometric study of the diphenylamine reaction for determining small amounts of nitrates in water. A. V. TROFIMOV (J. Appl. Chem. Russ., 1936, 9, 756—771).—Max. sensitivity is obtained when the final solution contains 73 g. of  $\text{H}_2\text{SO}_4$  per 100 ml., and 100 mols. of  $\text{NHPh}_2$  per mol. of  $\text{HNO}_3$ ; under these conditions 5 mg. of  $\text{HNO}_3$  per cu. m. of  $\text{H}_2\text{O}$  may be determined. The most satisfactory reagent for low  $[\text{HNO}_3]$  is one containing 10 mg. of  $\text{NHPh}_2$  per litre of 89%  $\text{H}_2\text{SO}_4$ , taking 5 ml. of reagent to

2 ml. of  $\text{H}_2\text{O}$ . High or low results are obtained, according to whether the  $\text{Cl}^-$  content of the standard is  $>$  or  $<$  that of the  $\text{H}_2\text{O}$ .  $\text{SO}_4^{2-}$  ( $>$  10% of  $\text{MgSO}_4$  or  $\text{Na}_2\text{SO}_4$ ),  $\text{HCO}_3^-$  ( $>$  0.1%), and  $\text{HgCl}_2$  ( $>$  0.3%) do not interfere. The rate of development of colour increases with rising temp., and that of fading still more so; using the above reagent, however, the coloration remains const. at  $25^\circ$  for  $<$  20 hr. R. T.

**Distillation and separation of arsenic, antimony, and tin.** J. A. SCHERRER (J. Res. Nat. Bur. Stand., 1936, 16, 253—259).—The sulphates are distilled in an all-glass apparatus with  $\text{HCl}$  ( $d$  1.18), in a stream of  $\text{CO}_2$ .  $\text{AsCl}_3$  distils up to  $112^\circ$ ;  $\text{H}_3\text{PO}_4$  is then added and  $\text{SbCl}_3$  distilled at  $155$ – $165^\circ$ ;  $\text{Sn}$  is distilled at  $140^\circ$  from a 75%  $\text{HCl}$  ( $d$  1.18)–25%  $\text{HBr}$  (40%) mixture.  $\text{Ge}$ ,  $\text{Re}$ , and  $\text{Mo}$ , but not  $\text{Bi}$ , interfere. L. J. J.

**Salts of silicomolybdic acid with organic bases: gravimetric determination of small amounts of silica as pyramidone silicomolybdate.** E. J. KING and J. L. WATSON (Mikrochem., 1936, 20, 49—56).—In dil. acid solution  $\text{SiO}_2$  (1 mol.) combines with  $\text{MoO}_3$  (12 mols.) to form a stable complex which yields insol. compounds (silicomolybdates) with org. bases (e.g., coniine,  $\text{C}_5\text{H}_5\text{N}$ , and pyramidone). Since 1 mol. of complex combines with 3 mols. of pyramidone, conversion of  $\text{SiO}_2$  into the heavy pyramidone silicomolybdate yields a weighable ppt. from a very small amount of  $\text{SiO}_2$ . J. W. S.

**Determination of silica by means of 8-hydroxyquinoline.** M. I. VOLINETS (Ukrain. Chem. J., 1936, 11, 18—22).—0.25 g. of the substance is melted with 5 g. of  $\text{NaOH}$ , the melt is extracted with 200 ml. of  $\text{H}_2\text{O}$ , 30 ml. of conc.  $\text{HCl}$  are added, the solution is boiled, cooled, and made up to 1 litre. 20 ml. of 20%  $(\text{NH}_4)_2\text{MoO}_4$  are added to 100 ml. of the solution, excess of 50%  $\text{HCl}$  is added, and an amount of 8-hydroxyquinoline (I) given by  $0.024153P + 0.21$  g., where  $P$  is the expected  $\text{SiO}_2$  content of 1 g. of substance. The mixture is heated at  $60$ – $70^\circ$ , cooled, made up to a known vol., filtered, and excess of (I) in 100 ml. of filtrate is determined bromometrically. Alternatively, the ppt. of  $\text{SiO}_2 \cdot 12\text{MoO}_3 \cdot 4\text{C}_8\text{H}_8\text{N}_2\text{O}_2$  is collected, washed, and weighed. R. T.

**Spectrographic method of measuring carbon dioxide concentration.** E. D. McALISTER (Physical Rev., 1936, [ii], 49, 704).—An accurate and rapid method, independent of humidity and of the presence of other gases, and having very small temp. and pressure corrections, is described. It depends on the high opacity of  $\text{CO}_2$  to radiation in the region of one of its fundamental absorption bands ( $4.2$ – $4.3 \mu$ ); this, isolated from a Nernst filament, falls on a vac. thermocouple after passing through a known optical path length of air containing  $\text{CO}_2$ . The method is sensitive to 0.0001%. N. M. B.

**Determination of carbon dioxide in gas mixtures.**—See B., 1936, 541.

**Colorimetric determination of atmospheric carbon dioxide.**—See B., 1936, 493.

**Micro-determination of potassium.** P. WENGER, C. CIMERMAN, and C. J. RZYMOWSKA (Mikro-

chem., 1926, 20, 1—28).—Emich's method (pptn. with  $\text{H}_2\text{PtCl}_6$ ), with modified washing treatment, enables about 0.5 mg. of  $\text{K}$  to be determined in presence of 5 mg.  $\text{Na}$ . A micro-method has also been developed involving conversion into  $\text{KClO}_4$  before pptn. with  $\text{H}_2\text{PtCl}_6$ . The use of Pregl tubes for filtration was unsatisfactory. The  $\text{K}_2\text{PtCl}_6$  ppt. can be treated with  $\text{KI}$  and titrated with  $\text{Na}_2\text{S}_2\text{O}_3$ , this method being advantageous for determination of  $\text{K}$  in biological media. Examples relate to blood sera and cerebrospinal fluid, which are preferably mineralised with a mixture of conc.  $\text{HNO}_3$  (5 vols.) and  $\text{HClO}_4$  ( $d$  1.67, 2 vols.). Ignition of the media causes loss of  $\text{K}$ . Micro-hot plates, filters, and water-baths are described. J. W. S.

**Micro-determination of potassium.** C. CIMERMAN and C. J. RZYMOWSKA (Mikrochem., 1936, 20, 129—143).—A review.

**Gravimetric determination of the titre of silver nitrate solutions.** E. N. TARAN (J. Appl. Chem. Russ., 1936, 9, 520—525).—2 ml. of 15% aq.  $\text{NH}_3$  and 1 ml. of 40% aq.  $\text{CH}_3\text{O}$  are added to 50 ml. of aq.  $\text{AgNO}_3$ , the solution is heated at  $100^\circ$  for 20 min., and the pptd.  $\text{Ag}$  is collected, ignited, and weighed. R. T.

**Micro-detection of beryllium with alkannin and naphthazarin.** J. V. DUBSKÝ and E. KRAMETZ (Mikrochem., 1936, 20, 57—58).—Addition of 2 drops of quinalizarin reagent [30 drops of 0.05% solution of quinalizarin in  $\text{EtOH}$  with 5 drops of 10%  $(\text{CH}_2\text{NH}_2)_2$ ] to 3 drops of test solution yields a blue colour with  $> 0.135 \times 10^{-6}$  g.  $\text{Be}$ . Similar addition of 1 drop of naphthazarin or alkannin reagent [30 drops of 0.03% naphthazarin solution in  $\text{EtOH}$  or 0.05% alkannin solution, with 5 drops of 10%  $(\text{CH}_2\text{NH}_2)_2$ ] gives reddish-violet colours with  $> 1.3 \times 10^{-6}$  g.  $\text{Be}$ . Use of  $\text{NH}_3$  or  $\text{NaOH}$  in place of  $(\text{CH}_2\text{NH}_2)_2$  reduces the sensitivity to  $2 \times 10^{-6}$  g. J. W. S.

**Coloured and dyed crystalline precipitates.** L. ROSENTHALER (Mikrochem., 1936, 20, 85—90).—The ppts. obtained on adding a 1% solution of Orange II in 0.1N- $\text{HCl}$  to solutions of various alkaloids, and on adding an  $\text{NH}_3$  solution of rhodamine GH to  $\text{NH}_3$  solutions of various derivatives of barbituric acid, are described. In  $\text{NH}_3$  solution Orange II also gives ppts. with  $\text{Ca}^{++}$ ,  $\text{Ba}^{++}$ ,  $\text{Sr}^{++}$ ,  $\text{Mg}^{++}$ ,  $\text{Mn}^{++}$ ,  $\text{Zn}^{++}$ ,  $\text{Th}^{+++}$ ,  $\text{Co}^{++}$ ,  $\text{Ni}^{++}$ , and  $\text{Cd}^{++}$ , and in 0.1N- $\text{HCl}$  with alkaline-earth metals and many heavy metals. J. W. S.

**Microchemical detection of magnesium by means of 8-hydroxyquinoline.** M. V. GAPTSCHENKO and O. G. SCHEINTZIS (J. Appl. Chem. Russ., 1936, 9, 541—543).—A drop of aq.  $\text{NH}_3$  is added to a drop of 10%  $\text{Na}$  citrate in 2N- $\text{NaOH}$ , and a drop of solution is added, followed by a drop of 5% hydroxyquinoline in  $\text{EtOH}$ ; characteristic crystals of the  $\text{Mg}$  salt are obtained when the solution contains  $<$  3.76 mg. of  $\text{Mg}$  per 100 ml. R. T.

**Detection of cupric ion.** B. M. BOGOSLOVSKI and V. S. KRASNOVA (J. Appl. Chem. Russ., 1936, 9, 751—753).—1—2 ml. of 0.5%  $p\text{-NH}_2\text{-C}_6\text{H}_4\text{-OH}$  (I) and 25—30 ml. of saturated aq.  $\text{NaCl}$  are added to 200 ml. of solution; a violet coloration appears in

presence of  $\leq 0.6$  mg. of  $\text{Cu}^{II}$ . The method also serves for detection of (I). R. T.

**Nephelometric determination of copper with salicylaldoxime in lead-free substances.** F. ALTEN, B. WANDROWSKY, and E. KNIPPENBERG (*Mikrochem.*, 1936, 20, 77—84).—The test and standard solutions, neutralised with  $\text{NH}_3$ , are treated with 3 c.c. of 30%  $\text{AcOH}$ , 1 c.c. of 20%  $\text{K}$  citrate, 2 c.c. of saturated aq.  $\text{KH}_2\text{PO}_4$ , and 0.5 c.c. of saturated aq.  $\text{NaOAc}$ , stirred, and brought into temp. equilibrium in a water-bath. 1 c.c. of 1% salicylaldoxime solution is added, and then after 1.5—2.5 hr. 1 c.c. of  $\text{AcOH}$ . The relative opacities are observed after a further 30 min. J. W. S.

**Microgravimetric determination of small amounts of mercury vapour in air.** V. A. PIANKOV (*J. Appl. Chem. Russ.*, 1936, 9, 580—582).—The air is passed over crystals of  $\text{I}$ , the  $\text{HgI}$  condensing in a cooled glass spiral is washed with  $\text{Et}_2\text{O}$ , the extract is conc. to 1—2 ml., filtered through asbestos, the filtrate + washings are evaporated to dryness at  $40^\circ$ , and the residue of  $\text{HgI}$  is weighed. Trustworthy results are obtained for concns. of  $\leq 0.385$  mg. of  $\text{Hg}$  per cu. m. of air (0.077 mg. of  $\text{Hg}$ ). R. T.

**Separation of aluminium from manganese, nickel, cobalt, and zinc.** T. KÔZU (*J. Chem. Soc. Japan*, 1935, 56, 683—688; cf. A., 1935, 1338).— $\text{Al}$  is pptd. quantitatively from sulphate solution at room temp. by adding saturated aq.  $\text{NH}_2\text{Ph}$ .  $\text{Zn}$  interferes, but  $\text{K}$ ,  $\text{Mn}$ ,  $\text{Ni}$ , and  $\text{Co}$  do not.

CH. ABS. (e)

**Solution of the manganese problem in analysis of silicate rocks.** O. HACKL (*Z. anal. Chem.*, 1936, 105, 81—95).—The mineral is fused with  $\text{Na}_2\text{CO}_3$ , and  $\text{SiO}_2$  is removed by a twofold separation.  $\text{Fe}$ ,  $\text{Al}$ ,  $\text{Mn}$ ,  $\text{Ti}$ , etc. are pptd. by aq.  $\text{NH}_3 + \text{H}_2\text{O}_2$ . The ppt. is partly dissolved in cold 40—50%  $\text{HNO}_3$ , and repptd. with  $\text{NH}_3 + \text{H}_2\text{O}_2$ . The solution is conc., and  $\text{Al} + \text{Fe}$  completely separated by addition of  $\text{NH}_3$ . The united oxide ppt. is fused with  $\text{KNaS}_2\text{O}_7$ , and the melt is dissolved in 10%  $\text{H}_2\text{SO}_4$ ; dissolved  $\text{Pt}$  is removed by  $\text{H}_2\text{S}$ . To the solution, 2—5% aq.  $\text{Ag}_2\text{SO}_4$  is added, and then solid  $\text{K}_2\text{S}_2\text{O}_8$ . The solution is warmed at  $75\text{--}80^\circ$  for  $\geq 5$  min., cooled rapidly, and colorimetrically for  $\text{Mn}$ .  $\text{H}_2\text{O}_2$  is then added, and  $\text{Ti}$  so determined colorimetrically. Finally  $\text{H}_2\text{O}_2$  is destroyed by heating at  $100^\circ$ ,  $\text{Fe}^{+++}$  is reduced by means of  $\text{H}_2\text{S}$ , and  $\text{Fe}$  is determined volumetrically. For the accurate colorimetry of  $\text{Mn}$ , solutions must be matched by dilution at equal thicknesses. J. S. A.

**Formation of hydrogen peroxide in the silver reductor: micro-analytical method for iron.** C. F. FRYLING and F. V. TOOLEY (*J. Amer. Chem. Soc.*, 1936, 58, 826—831).—Determination of small amounts of  $\text{Fe}$  by reduction with  $\text{Ag}$  followed by titration with  $\text{Ce}(\text{SO}_4)_2$  is complicated by the formation of  $\text{H}_2\text{O}_2$ . The procedure is applicable to the determination of about 1.5 mg. of  $\text{Fe}$  when the reduction is performed in an atm. of  $\text{H}_2$  and a correction is applied for the indicator. E. S. H.

**Oxidation-reduction indicators.** I. *N*-Phenylanthranilic acid. A. KIRSSANOV and V.

TSCHERKASSOV (*Bull. Soc. chim.*, 1936, [v], 3, 817—821).—The use of *N*-phenylanthranilic acid in the titration of  $\text{Fe}$ ,  $\text{V}$ , and  $\text{Cr}$  solutions is described. The oxidation-reduction potential is 1.08 volt.

E. S. H.

**Detection of cobalt in presence of other cations.** A. T. TSCHERNI (*Ukrain. Chem. J.*, 1936, 11, 13—14).—The solution is made acid with  $\text{HCl}$ ,  $\text{NH}_4\text{CNS}$  is added, and the mixture is shaken with  $\text{EtOH-Et}_2\text{O}$ ; the upper layer is coloured blue in presence of  $\text{Co}$ . If  $\text{Fe}$  is present  $\text{NH}_4\text{F}$  is added to discharge the red coloration obtained. R. T.

**Determination of chromium and chromates in waste water.**—See B., 1936, 574.

**Determination of chromium in chromite.**—See B., 1936, 541.

**Determination of tin in alloys with antimony and lead (antimony less than 2%).** H. F. HOVRIGAN (*Analyst.*, 1936, 61, 328—333).— $\text{Sn}$  and  $\text{Pb}$  in the alloy are dissolved in conc. aq.  $\text{HCl}$  in absence of  $\text{O}_2$ ,  $\text{Sb}$  is removed by filtration, and  $\text{SnCl}_2$  determined by titration with  $\text{KIO}_3$ . In presence of  $\text{Sb}^{III}$  in solution, the latter titration gives erratic results. E. C. S.

**Colorimetric determination of titanium in presence of bromine compounds.** H. A. LIEBHAFSKY (*Z. anal. Chem.*, 1936, 105, 113—114; cf. this vol., 45).—Contrary to the statement of Lutschinski and Lichatscheva,  $\text{Br}$  is best removed as  $\text{AgBr}$  by treating the acid solution with an excess of  $\text{H}_2\text{O}_2$ , followed by  $\text{AgNO}_3$ . J. S. A.

**Colorimetric detection of titanium and vanadium in steel.**—See B., 1936, 548.

**Drop reaction for zirconium.** N. A. TANANAEV and A. V. TANANAEVA (*J. Appl. Chem. Russ.*, 1936, 9, 526—531).— $\text{Zr}$  is detected in presence of other elements (except  $\text{Si}$ ) by pptn. as phosphate from solutions containing 25—30% of  $\text{H}_2\text{SO}_4$  or 20—22% of  $\text{HCl}$  or  $\text{HNO}_3$ . Directions are given for the detection and approx. determination of  $\text{Zr}$  in minerals, involving fusion with  $\text{NaOH}$ , elimination of  $\text{SiO}_2$  from the extract of the melt, pptn. of  $\text{Zr}$  as above, and ignition of the washed ppt., which is weighed as pyrophosphate. R. T.

**Determination of small amounts of germanium.** N. S. POLUEKTOV (*Z. anal. Chem.*, 1936, 105, 23—26).— $\text{Na}_2\text{GeO}_3$  solutions are acidified, freed from  $\text{CO}_2$ , and neutralised with  $\text{NaOH}$  (phenolphthalein + *p*-nitrophenol). Mannitol (I) is added, and the monobasic (I)- $\text{GeO}_2$  complex acid thereby formed is titrated with 0.1*N*- $\text{NaOH}$ .  $\leq 1$  mg. of  $\text{Ge}$  is determined colorimetrically as Mo-blue by the reduction of germanomolybdic acid by  $\text{FeSO}_4$ .  $\text{Ge}$  is first separated as  $\text{GeS}_2$ , which is dissolved in  $\text{NaOH} + \text{H}_2\text{O}_2$ , and treated with aq.  $(\text{NH}_4)_2\text{MoO}_4$  containing  $\text{FeSO}_4$  in presence of  $\text{NaOAc}$ . J. S. A.

**Detection of vanadium.** E. I. KRETSCH (*Ukrain. Chem. J.*, 1936, 11, 28—31).—The substance, containing  $\leq 0.2$  mg. of  $\text{V}_2\text{O}_5$ , is mixed with an equal wt. of  $\text{C}$ ,  $\text{Cl}_2$  is passed over the mixture at  $300\text{--}400^\circ$  and the issuing gases are passed through glass wool moistened with conc.  $\text{H}_2\text{SO}_4$ ;  $\text{V}$  is indicated by a yellow to orange coloration. R. T.

Quantitative spectral analysis, detection [and determination] of vanadium in steel, and investigation of minerals from the Dreiser Weiher (Eifel) and the Finkenberg, near Beuel-on-Rhine. W. SIEMEISTER (Z. anal. Chem., 1936, 105, 1—22).—

(a) Sensitive lines of V in the condensed spark discharge in presence of Fe are given. In presence of  $> 1\%$  of C, Mn, P, or Si, the photometric method of Hartley and de Gramont may be employed for determining V. In high alloy steels, owing to abnormal intensity relationships, the homologous line-pair method of Gerlach and Schweitzer is applicable. Where inhomogeneities (inclusions or segregations) occur, the material is first dissolved chemically. (b) Olivine, augite, and accompanying minerals from olivine bombs have been analysed spectrographically for Ni, Co, Mn, and Cr.  $\text{SiO}_2$  and Fe must first be removed chemically, Fe being extracted quantitatively by  $\text{Et}_2\text{O}$  from the HCl solution of the mineral. Ni, Mn, Co, and Cr are pptd. with  $(\text{NH}_4)_2\text{S}$ , and the arc spectrum of the ppt., on C electrodes, is matched against samples of known composition. J. S. A.

Microchemical detection of bismuth by means of quinoline thiocyanate. M. V. GAPTSCHENKO and O. G. SCHEINTZIS (J. Appl. Chem. Russ., 1936, 9, 544—546).—A drop of solution (made acid with  $\text{HNO}_3$ ) is added to a drop of reagent (1 g. of  $\text{NH}_4\text{CNS}$  in 100 ml. of saturated aq. quinoline) on a slide; characteristic yellow crystals, of the composition  $\text{C}_9\text{H}_7\text{N}.\text{HCNS}.\text{Bi}(\text{CNS})_3$ , are obtained in presence of  $< 0.3 \times 10^{-6}$  g. of Bi. Zn,  $\text{Sn}^{\text{II}}$ ,  $\text{Sb}^{\text{III}}$ ,  $\text{Hg}^{\text{I}}$ , Ag, and Cu interfere. R. T.

Micro-determination of m.p. R. C. RAY and V. DAYAL (Trans. Faraday Soc., 1936, 32, 741—743).—The angle of a V-shaped electrically heated Pt wire is brought in contact with a minute quantity of the powdered solid on a mica platform, and melting is observed microscopically. The method is rapid and fairly accurate. F. L. U.

Laboratory thermoregulator. J. S. BUCK (J. Chem. Educ., 1936, 13, 131). L. S. T.

Thermocouples for psychrometric purposes. R. W. POWELL (Proc. Physical Soc., 1936, 48, 406—414).—Factors affecting the wet-bulb depression are investigated. N. M. B.

Installation at the Bellevue Electromagnetic Laboratory of apparatus for helium liquefaction and production of temperatures below  $1^\circ \text{ abs.}$ , by the magnetic method. N. KURTI, P. LAINE, B. V. ROLLIN, and F. SIMON (Compt. rend., 1936 202, 1421—1423).—The apparatus is described. Certain paramagnetic salts become ferromagnetic at very low temp. L. J. J.

Focussing effect of double-crystal spectrometer. R. C. SPENCER (Physical Rev., 1936, [ii], 49, 704; cf. A., 1931, 1205; Barnes, A., 1933, 993).—An extension of the discussion by Parratt (cf. this vol., 181). N. M. B.

Heterochromatic photometry of the ultra-violet region. E. J. BOWEN (Proc. Roy. Soc., 1936, A, 154, 349—353).—A quartz cell containing aesculin solution, placed before a K photo-electric cell, can

be used as a relative quantum counter for  $\lambda$  3665—2500 Å. with a sensitivity much  $>$  that of a thermopile-galvanometer combination. L. L. B.

Technique of the far infra-red investigations. N. R. TAWDE, Y. G. NAIK, and D. D. DESAI (J. Univ. Bombay, 1935, 4, Part II, 181—189).—The apparatus is described. J. W. S.

X-Ray tubes with rotating anti-cathode. V. LINNITZKI and V. GORSKI (Tech. Phys. U.S.S.R., 1936, 3, 220—222).—The rotating anti-cathode simultaneously functions as a mol. Gaede pump, thus avoiding the presence of Hg vapour and giving compactness. R. S. B.

Starting the Daniels-Heidt capillary mercury-arc lamp. L. D. WILSON (J. Amer. Chem. Soc., 1936, 58, 856—857).—A magnetic device is described. E. S. H.

Stand for spark gap and interrupted arc. A. SCHLEICHER and N. KAISER (Z. anal. Chem., 1936, 105, 114—115).—Arc or spark gap and interrupter are mounted as a single rigid unit. J. S. A.

Voltage sources and amplifiers for Geiger counters. N. S. GINGRICH (Rev. Sci. Instr., 1936, [ii], 7, 207—210).—A description is given of a modified pentode stabiliser in which a Ne lamp replaces the usual battery for maintaining a const. grid bias, a simpler stabiliser in which a bank of Ne lamps supplies the stabilised voltage directly, and a new amplifier using two standard radio tubes and a small Ne lamp. A brief report is made of the use of a "Strobotron" in counter circuits. N. M. B.

Thin windows for photo-electric cells and counters. G. P. HARNWELL (Rev. Sci. Instr., 1936, [ii], 7, 216).—A method of blowing from glass tubing a very thin window of uniform thickness and capable of withstanding large pressure differences is described. N. M. B.

Determination of coefficient of magnetisation of solids. C. COURTY (Bull. Soc. chim., 1936, [v], 3, 929—933).—Good results are obtained, using the magnetic balance, when the solid is immersed in a non-solvent liquid. E. S. H.

Charts for determining  $p_H$  values when using quinhydrone and hydrogen electrodes and saturated calomel cell. G. N. PULLEY (Food Res., 1936, 1, 141—144).—Corrections for temp. between  $16^\circ$  and  $32^\circ$  are recorded graphically. E. C. S.

Apparatus for the micro-electrolysis of large volumes of solution. B. L. CLARKE and H. W. HERMAN (Mikrochem., 1936, 20, 126—128; cf. A., 1932, 492).—Improvements in the previous apparatus are described. J. W. S.

Properties of the immersion objective when used with rapid electrons. R. BEHNE (Ann. Physik, 1936, [v], 26, 372—384). A. J. M.

Blocking layer in a selenium valve photo-electric cell. S. FREIVERT (Tech. Phys. U.S.S.R., 1936, 3, 266—267).—The sensitivity of Se valve photo-cells decreases when the cell is placed in a vac., and reaches zero in 3—4 hr. The sensitivity is not regained by keeping in air. The resistance of the cell is reduced and the rectifying properties

are lost, the Se changing from grey to bluish. A shellac coating almost stops the decay in a vac. and it is suggested that the blocking layer is one either of gas or of  $\text{SeO}_2$ , which is volatile. R. S. B.

**Automatic potentiometer for thermal analysis.** R. J. M. PAYNE (J. Sci. Instr., 1936, 13, 158—161).—Improvements on an apparatus previously described (this vol., 45) are recorded. C. W. G.

**Flask with graduated neck for the rapid adjustment of titrated solutions.** J. BOUILLOT (J. Pharm. Chim., 1936, [viii], 23, 557—558).—A 925-c.c. flask with narrow neck graduated up to 1200 c.c. is described. E. W. W.

**Micro-volumetric analysis with weight burettes.** L. SZEDELLEDY and O. CLAUDER (Z. anal. Chem., 1936, 105, 26—31).—The use of hypodermic syringes as wt. burettes for precision micro-titrations is described. J. S. A.

**Accurate automatic mercury pipette.** P. H. BIGG (J. Sci. Instr., 1936, 13, 156—157).—The flow of Hg ceases automatically after filling and after delivery of  $0.3125 \pm 0.003$  ml. C. W. G.

**Apparatus with two thermionic vacuum tubes for automatic titration.** T. TASHIRO and Y. KATO (J. Chem. Soc. Japan, 1935, 56, 757—766).

CH. ABS. (e)

**Pregl's absorption apparatus for the micro-determination of carbon and hydrogen.** Influence of the nature of the capillary on the constancy of the increase in weight. H. LIEB and A. SOLTYS (Mikrochem., 1936, 20, 59—64).—The capillary constriction in Pregl's absorption apparatus must have a length of 4—6 mm. and cross-section of 0.2—0.3 mm. or inaccurate results are obtained. J. W. S.

**Atomising apparatus.** B. CLAUS (Z. tech. Phys., 1935, 16, 202—205; Chem. Zentr., 1935, ii, 1411).—The apparatus operates by the attuned piezoelectric vibrations of two  $\text{SiO}_2$  plates, and is applicable to the dispersion of substances deposited electrolytically. J. S. A.

**Absorption tube.** K. WAGENMANN (Chem.-Ztg., 1936, 60, 469).—A compact  $\text{CaCl}_2$  or soda-lime tube, with externally ground tap-stopper, is described. J. S. A.

**Fundamentals of vacuum technique for chemical laboratories.** G. MONCH (Chem.-Ztg., 1936, 60, 465—468).—A review of general technique and apparatus. J. S. A.

**Small multiple still.** F. R. PRATT (Rev. Sci. Instr., 1936, [iii], 7, 211—213).—The construction of, and performance data for, a simplified, economical, automatic still are given. N. M. B.

**Apparatus with ground-glass joints.** H. LEE (Analyst, 1936, 61, 334).—The apparatus figured is suitable for the determination of  $\text{NH}_3$  in  $\text{H}_2\text{O}$  and for the oxidation of org. matter with  $\text{HNO}_3$ — $\text{H}_2\text{SO}_4$ .

**Measurement of streaming of structure-viscous liquids.** W. PHILIPPOFF (Kolloid-Z., 1936, 75, 155—161).—Experiments with cellulose trinitrate in  $\text{BuOAc}$

show that viscosimeters of the capillary or Couette type give concordant results. E. S. H.

**Manometer of small volume.** R. A. HULL (J. Sci. Instr., 1936, 13, 165—166).—Tetralin is a satisfactory liquid for use in simple U-tube manometers. C. W. G.

**Vacuum joints in metal apparatus.** R. M. ARCHER (J. Sci. Instr., 1936, 13, 161—165).—Instructions are given for making metal-metal tube, metal-glass tube, metal-metal equatorial, and metal tube-spun nipple joints. C. W. G.

[Ultrafiltration.] H. J. C. TENDELOO (Chem. Weekblad, 1936, 33, 294).—Cyclostyle paper backed by a piece of filter-paper makes a satisfactory rapid ultrafilter medium. S. C.

**Collodion membranes.** Preparation, physical properties, and dialysis measurements in solutions. V. NOWATKE (Kolloid-Z., 1936, 75, 269—284).—The influence of method of prep. on the thickness,  $\text{H}_2\text{O}$  content, and  $\text{H}_2\text{O}$ -permeability of collodion membranes has been determined. With increasing  $\eta$  of the collodion solution, the membranes formed become thinner, more elastic, and stronger. Max. permeability is attained when a definite amount of air is used to remove the solvent. The extent to which the permeability of the membrane is altered by adding different org. compounds to the collodion solution has been determined. Dialysis measurements with alkali chloride and  $\text{CO}(\text{NH}_2)_2$  solutions are reported. The dialysis consts. tend to rise with increasing at. wt. of the cation and are in agreement with the lyotropic series (except Cs). Diffusion coeffs. have been calc. from the dialysis consts. E. S. H.

**Emulsifier.** K. FISCHER (Kolloid-Z., 1936, 75, 285—287).—Laboratory apparatus is described. E. S. H.

**Immersion pycnometer.** W. JUNG (J. Indian Chem. Soc., 1936, 13, 136—137).—A pycnometer specially adapted for obtaining the  $d$  of powders is described. The usual difficulty of weighing under  $\text{H}_2\text{O}$  is met by evacuating the pycnometer in a desiccator and allowing  $\text{H}_2\text{O}$  to flow into the desiccator until the pycnometer is filled. C. R. H.

**Surface tension.** C. C. PATEL, K. V. DESAI, and S. M. MEHTA (J. Univ. Bombay, 1935, 4, Part II, 132—139).—Methods of measuring surface tension are discussed critically. A modification of Ferguson's method (A., 1932, 828) which increases accuracy is described, and is illustrated with data for  $\text{CaCl}_2$  solutions. J. W. S.

**Impulse vacuum meter.** A. BUTSCHINSKI (Tech. Phys. U.S.S.R., 1936, 3, 223—228).—An apparatus for measuring pressures of  $10^{-4}$ —approx.  $2 \times 10^{-3}$  mm. by means of the impulse frequency of a thyratron is described. The frequency is a linear function of the pressure. R. S. B.

**Reaction vessels of variable capacity.** L. RAMBERG (Z. physikal. Chem., 1936, 176, 289—294).—These consist of two flat-bottomed glass tubes sliding one within the other. R. C.

Combustion experiment. S. C. BLACKTIN (Chem. and Ind., 1936, 402—403). D. K. M.

Weights and balances in ancient Egypt. ANON (Nature, 1936, 137, 890—892). L. S. T.

Thirty years of chromatography. L. ZECHMEISTER and L. VON CHOLNOKY (Monatsh., 1936, 68, 68—80).—A historical and descriptive summary. F. L. U.

## Geochemistry.

Temperatures and constituents of the upper atmosphere. D. F. MARTYN and O. O. PULLY (Proc. Roy. Soc., 1936, A, 154, 455—486; cf. Proc. Phys. Soc., 1935, 47, 340).—Temp. between the *E'* and *F* regions of the ionosphere are found, from consideration of the electron collision frequencies, to reach vals. of the order 1000° abs., both in summer and in winter daytime. Considerable cooling of the upper atm. occurs during the night, and from the observed rate of cooling it is found that an average concn. of 1 part in 6000 by vol. of H<sub>2</sub>O vapour is present in the ionosphere. The high temp. found are attributed mainly to the absorption of solar ultra-violet energy by O<sub>3</sub>. The attachment of electrons to neutral particles is the chief process by which free electrons are renewed from the ionised regions. L. L. B.

Abalach soda lake in Jakutia. A. D. EGOROV and V. I. NIKOLAEV (J. Appl. Chem. Russ., 1936, 9, 665—669).—The H<sub>2</sub>O contains Na<sub>2</sub>CO<sub>3</sub> 3.46, NaHCO<sub>3</sub> 2.20, and NaCl 3.22%. It can be exploited by pumping out the H<sub>2</sub>O before the ice melts in the spring, and further concn. by a combination of freezing and evaporation. R. T.

Can the difference in density between sea- and fresh water be accounted for by fractional distillation of the isotopic forms of water? K. NEUMANN and G. TOHMFOR (Z. physikal. Chem., 1936, 176, 226—228).—It is calc. that the *d* of sea-H<sub>2</sub>O will exceed that of the first fraction on isothermal distillation at 20°, which may be regarded as equiv. to fresh H<sub>2</sub>O, by  $4.3 \times 10^{-6}$ . A *d* difference of  $2.9 \times 10^{-6}$  between sea- and fresh H<sub>2</sub>O has been observed experimentally (cf. A., 1935, 600). R. C.

Heavy metals in mineral waters. II. S. MIHOLIC (Bull. Soc. Chim. Yougoslav., 1935, 6, 217—234).—Natural H<sub>2</sub>O containing U or its degradation products is characteristic of the earlier, and those containing Co and Ni of the later, Archean folding. R. T.

Conductivity of mineral waters. II. Mineral water of Rogaska Slatina. P. S. TUTUNDZIC (Bull. Soc. Chim. Yougoslav., 1935, 6, 205—215).—Conductivity and other data are recorded. R. T.

Arsenic, nickel, cobalt, silver, bismuth, and uranium ores in calcite veins in the Riesengebirge. K. HOEHNE (Chem. Erde, 1936, 10, 432—474).—Chemical analyses of the ores from different veins in the Bergfreiheit mine at Oberschmiedeberg in Silesia are given, and the several minerals present are identified in polished sections. L. J. S.

Nature of the calcium content of Thuringian iron ores. J. HOLZNER (Chem. Erde, 1936, 10, 409—431).—Analyses of different fractions of two oolitic ores from Schmiedefeld show that the chloritic

mineral is thuringite. Ca is present as a silicate with the approx. formula Ca<sub>2</sub>Al<sub>2</sub>SiO<sub>7</sub>, seen in micro-sections as a colourless (orthorhombic?) granular aggregate, which cannot be identified with any known mineral species. P is present mainly as Fe phosphate. L. J. S.

Metamorphosed Devonian phyllites in the Altvatergebirge. R. FABIAN (Chem. Erde, 1936, 10, 343—408; Diss., Breslau, 1936).—Geological and petrographical description with chemical analyses of the rocks. L. J. S.

Formation of kaolin and alumina from granite and gneiss. F. W. FREISE (Chem. Erde, 1936, 10, 311—342).—The weathering of granite and gneiss in Brazil by the action of CO<sub>2</sub> and humic acids gives rise to both kaolin and bauxite or laterite. The action of CO<sub>2</sub> and formic, lactic, and acetic acids on these materials was examined. L. J. S.

Petrological classification of the basic intrusives of Danta state (H. Gujrat). N. L. SHARMA and N. C. NANDY (Proc. Indian Acad. Sci., 1936, 3, B, 366—376). A. G. P.

New synthesis of langbeinite, vanthoffite, and polyhalite. K. H. IDE (Kali, 1935, 29, 83—86, 93—96, 103—105; Chem. Zentr., 1935, ii, 1522—1523).—K, Na, and Ca sulphates react in the solid state with MgSO<sub>4</sub> at temp. < 80°, giving langbeinite, vanthoffite, and polyhalite, respectively, in amounts recognisable by X-ray methods. The reaction is promoted by compressing the mixture. KCl similarly reacts with MgSO<sub>4</sub>, giving either langbeinite or anhydrokainite, but formation of glauberite or glaserite was not detected. J. S. A.

Geochemistry of selenium. II. V. M. GOLDSCHMIDT and L. W. STROCK (Nachr. Ges. Wiss. Gottingen, 1935, [ii], 1, 123—142; Chem. Zentr., 1935, ii, 1522; cf. A., 1934, 53).—The S:Se ratio in meteorites, deep-seated basic rocks, sulphide and arsenide ores, sedimentary rocks, and marine and lacustrine salt deposits is discussed. Pneumatolytic and high hydrothermal sulphides and arsenides contain relatively more Se than the deeper-seated ores. An enrichment of Se is found with Cu in sulphide ore deposits, and with Fe and Mn in oxidic sediments, but FeS<sub>2</sub> from sedimentary rocks is very poor in Se. J. S. A.

Selenium content of European and Japanese slates. E. MINAMI (Nachr. Ges. Wiss. Gottingen, 1935, [ii], 1, 143—145; Chem. Zentr., 1935, ii, 1522).—Data are recorded. J. S. A.

Occurrence of selenium in natural phosphates, superphosphates, and phosphoric acid.—See B., 1936, 493.

**Native blue rock-salt. IV. Rate of growth and colour.** K. PRZIBRAM (Sitzungsber. Akad. Wiss. Wein, IIa, 1934, 143, 489—497; Chem. Zentr., 1935, ii, 1504).—Blue native NaCl crystals have a deeper blue colour in the portions giving evidence of most rapid growth, and a lighter more violet colour in regions of slower growth. The effect is attributed to lattice distortion, more impurities, causing the inclusion of layer Na particles, being included where growth was rapid. A similar effect is given by artificially coloured crystals. J. S. A.

**Characterisation of nontronite ferrisilicates. Marinsk nontronites.** I. J. MIKEI (Ukrain. Chem. J., 1936, 11, 56—66).—Most of the  $H_2O$  in nontronite (I) is adsorbed on colloidal constituents; the chemically bound  $H_2O$  is eliminated at 550—660°. Adsorption by (I) of different dyes is studied. R. T.

**Disthene (cyanite) from Prilepec in the Selecka mountains.** L. BARIĆ (Z. Krist., 1936, 93, 57—92).—Mineralogical. Different specimens of the mineral are described, and goniometric data, refractive index, double refraction, extinction, pleochroism, twinning, and chemical composition are given in detail. B. W. R.

**Mineralisation of the Virginia titanium deposits.** C. S. ROSS (Amer. Min., 1936, 21, 143—149).—The deposits occur within a rock of the anorthosite type introduced as a mush of crystals. The ores and associated gangue minerals were deposited by invading solutions probably derived from a highly ferromagnesian rock which was a differentiate from the same primary magma as the anorthosite. The outstanding chemical factors of mineralisation are indicated. L. S. T.

**Helium ratios of rocks and minerals from the diamond pipes of South Africa.** A. HOLMES and F. A. PANETH (Proc. Roy. Soc., 1936, A, 154, 385—413).—He ratios have been obtained for 20 specimens of rocks and minerals with the object of determining the relative ages of the inclusions found in kimberlite. The technique of He determination and of U and Th determinations is described. The He ratio of kimberlite, corresponding with an age of  $58 \times 10^6$  years, is consistent with the late Cretaceous age assigned to the diamond pipes. Xenoliths of the amphibolite group, known to be of Pre-Cambrian age, have He ratios of a higher order than kimberlite. Xenoliths of the peridotite suite (including zircons) give low He ratios. The bearing of the results on theories of petrogenesis is discussed. L. L. B.

**Viscosity of molten lavas from Mount Alaghez.** M. P. VOLAROVITSCH, D. M. TOLSTOI, and L. I. KORTSCHEMKIN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 333—336).—of basalt, andesite-basalt, andesite, dacite, and alkaline dacite was determined by the rotating-cylinder method. The effect of temp. on  $\eta$  was also determined.  $\eta$  increases with increase of acidity of the rocks. A. J. M.

**Spectrum analysis of blende by pyroelectric concentration.** S. PINA DE RUBIES and J. M. LOPEZ DE AZCONA (Anal. Fis. Quim., 1936, 34, 307—314).—Analysis of blende from Picos de Europa (cf. Llord *et al.*, A., 1911, ii, 733) by the author's

procedure (A., 1934, 1323) reveals the presence of Ni, Co, Mn, Mo (?), Mg, Al, Si, Ca, Na, P, Cr, Ti, V, Ba, and Be. The procedure is more rapid than chemical methods, and avoids the possibility of detecting elements arising from impure reagents. Previous work on the analysis of blends is summarised.

F. R. G.

**Cleavage of ionic minerals.** M. D. SHAPPELL (Amer. Min., 1936, 21, 75—102).—Mineral cleavage is resolved into two components, viz., optical effect and cleavability which is the chief component and for which a quant. expression has been deduced. Application to minerals the constituent atoms of which have inert-gas cores gives good agreement with observation. L. S. T.

**Dickite in Missouri.** W. A. TARR and W. D. KELLER (Amer. Min., 1936, 21, 109—114).—Dickite (I) occurs in three localities near Columbia, Missouri, and in the Pb ores at Flat River, S.E. Missouri. Two of the former localities are limestone quarries in which (I) occurs in chert in association with millerite, chalcopryrite, galena (II), pyrite, and wurtzite. The associated country rock contains sphalerite and barite. (I) from the Pb ores is associated with marcasite and (II), and is a replacement of the dolomite country rock. Optical properties are recorded. L. S. T.

**Crystal form of sternbergite.** M. A. PEACOCK (Amer. Min., 1936, 21, 103—108).—Remeasurement of crystals of sternbergite,  $AgFe_2S_3$ , from Joachimsthal, Bohemia, shows that the classical data are inadequate. The crystals are orthorhombic, dipyramidal with  $a : b : c = 0.5913 : 1 : 0.6250$ . The morphology is similar to that of cubanite,  $CuFe_2S_3$ , but a close systematic relation between the two species has yet to be established. L. S. T.

**Composition of clay substance.** R. SCHWARZ and G. TRAGESER (Z. anorg. Chem., 1936, 227, 179—183).—Very pure Zettlitz kaolin (I) still contains at least 10% of admixed feldspar and mica which can be converted into kaolin by hydrothermal treatment. The  $H_2O$  content of a specimen of (I) has thus been raised to 1.76 mol. per formula-wt., and the inference drawn by Körner and others (this vol., 50) from the results of isothermal dehydration of (I) is therefore invalid. F. L. U.

**Fluorescent minerals.** M. DERIBERÉ (Ann. Chim. Analyt., 1936, [iii], 18, 117—119).—The characteristic fluorescence of autunite, blende, willemite, chalcocite, celestine, scapolite, calcite, gypsum, aragonite, sodalite, sylvine, fluorite, and rock-salt is described. J. S. A.

**Plagioclase and its determination in pegmatites.** D. BELJANKIN and V. ONISIMO-JANOVSKI (Trans. Res. Inst. Ceram., 1934, No. 43, 10—19).—The occurrence of plagioclase and methods for its microscopic determination in pegmatites are discussed. CH. ABS. (e)

**Dioritic intrusive rocks and contact metamorphism in the Cascade Range in Oregon.** A. F. BUDDINGTON and E. CALLAGHAN (Amer. J. Sci., 1936, [v], 31, 421—449).—Petrographical descriptions and chemical analyses of augite-diorite,

augite-dacite-porphyry, aplite, granite, etc. are given. These rocks are intrusive into volcanic rocks which in places are changed into tourmaline-hornfels.

L. J. S.

**Fluorite in Aberdeenshire and Banffshire.** A. RUSSELL (Min. Mag., 1936, 24, 307—317).—Details are given of the occurrence of fluorite at several localities.

L. J. S.

**Baryte from Manvers Main colliery, Yorkshire.** A. RUSSELL (Min. Mag., 1936, 24, 318—320).—A crystallographic description is given of well-developed crystals from a cavity in sandstone. Analysis by C. P. FINN (1930) gave  $\text{BaSO}_4$  98.50,  $\text{CaSO}_4$  0.65,  $\text{SrSO}_4$  0.18, ignition loss 0.33%.

L. J. S.

**Wulfenite from Cumberland and leadhillite from Kirkcudbrightshire.** A. RUSSELL (Min. Mag., 1936, 24, 321—323).—New occurrences of these rare minerals are noted.

L. J. S.

**Ettringite from Scawt Hill, Co. Antrim.** F. A. BANNISTER [with M. H. HEY and J. D. BERNAL] (Min. Mag., 1936, 24, 324—329).—Minute crystals of ettringite from the larnite-rock in the contact-zone of chalk and dolerite (A., 1934, 1197) have a hexagonal unit cell,  $a$  11.24,  $c$  21.45 Å. ( $c/a$  1.908), containing  $\text{Ca}_{12}\text{Al}_4(\text{OH})_{24}(\text{SO}_4)_6 \cdot 52\text{H}_2\text{O}$ . They are identical with crystals from the original locality (Ettringen, Laacher See, Rhine) and with artificial crystals from Portland cement.  $\omega$  1.4655,  $\epsilon$  1.4618,  $d$  1.772. The space-group is  $D_{2h}^2$ , and a structure of the zeolitic type with  $48\text{H}_2\text{O}$  in channels parallel to the  $c$ -axis is suggested. At 110° 34.4%  $\text{H}_2\text{O}$  is lost and the structure partly collapses, leaving an oriented pseudomorph of cell dimensions  $a$  8.4,  $c$  10.21 Å. and the same space-group.

L. J. S.

**Petrochemistry of granites of Tarpatak Valley of High Tatra.** E. LENGYEL (Fold. Kozlony, 1935, 65, 120—126).—Granitic rocks are characterised by the changeable ratio of the contents of alkali or alkali-lime feldspars. Some granites approach the Si-rich granitic magma in composition.

CH. ABS. (e)

**Phosphatic limestone of the lower Eocene of the East Fergana (Middle Asia).** A. V. PEIYE (Bull. soc. nat. Moscou, Sect. geol., 1933, 11, 385—404).—The most probable explanation is that the phosphates are due to bacterial activity in sea- $\text{H}_2\text{O}$  with a low  $[\text{P}_2\text{O}_5]$ .

CH. ABS. (e)

**Distribution and mineralogical classification of the decomposed pumices in the north-western part of Kwanto district, Japan.** M. HARADA (J. Sci. Soil Manure, 1935, 9, 54—62, 189—201).—Soils from the decomp. of pumice are classified into 4 groups, according to the kind and quantity of hypersthene, augite, hornblende, quartz, and small pieces of lava.

CH. ABS. (e)

**Study of [petroleum] source beds in late Mesozoic rocks on the west side of the Sacramento Valley, California.** P. D. TRASK and H. E. HAMMAR (Bull. Amer. Assoc. Petr. Geol., 1934, 18, 1346—1373).—Analytical data are recorded.

CH. ABS. (e)

**Metamorphism of organic sediments and derived oils.** D. WHITE (Bull. Amer. Assoc. Petr. Geol., 1935, 19, 589—617).—A discussion.

CH. ABS. (e)

**Carbon ratios in part of Arkansas-Oklahoma coal field.** T. A. HENDRICKS (Bull. Amer. Assoc. Petr. Geol., 1935, 19, 937—947).

CH. ABS. (e)

**Highly polymerised compounds. CXXXX.** Development of macro-molecular chemistry. H. STAUDINGER (Ber., 1936, 69, [B], 1168—1185).—Mainly historical. Reply is made to Meyer *et al.* (this vol., 586).

H. W.

**Synthesis of hydrocarbons of the aliphatic series.** A. D. PETROV (Uspechi Chim., 1934, 3, 1050—1077).—A review.

CH. ABS. (r)

**Initial formation of alcohols during slow combustion of methane and ethane.**—See this vol., 801.

**Slow combustion of methane, methyl alcohol, formaldehyde, and formic acid.**—See this vol., 801.

**Catalytic cyclisation of aliphatic hydrocarbons.** B. MOLDAVSKI and H. KAMUSCHER (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 355—359).—Paraffins are cyclised and dehydrogenated to the corresponding aromatic hydrocarbons (% yields in parentheses) by passing them over  $\text{Cr}_2\text{O}_3$  (prep. described) at  $>400^\circ$ . Very little olefine formation occurs, the gaseous products consisting mainly of  $\text{H}_2$  (74—94%) and some  $\text{C}_n\text{H}_{2n}$ . Thus  $n\text{-C}_6\text{H}_{14}$ ,  $n\text{-C}_8\text{H}_{18}$ ,  $n\text{-C}_{10}\text{H}_{22}$ ,  $n\text{-C}_{12}\text{H}_{26}$ ,  $n\text{-C}_{14}\text{H}_{30}$ ,  $n\text{-C}_{16}\text{H}_{34}$ ,  $n\text{-C}_{18}\text{H}_{38}$ ,  $n\text{-C}_{20}\text{H}_{42}$ ,  $n\text{-C}_{22}\text{H}_{46}$ ,  $n\text{-C}_{24}\text{H}_{50}$ ,  $n\text{-C}_{26}\text{H}_{54}$ ,  $n\text{-C}_{28}\text{H}_{58}$ ,  $n\text{-C}_{30}\text{H}_{62}$ ,  $n\text{-C}_{32}\text{H}_{66}$ ,  $n\text{-C}_{34}\text{H}_{70}$ ,  $n\text{-C}_{36}\text{H}_{74}$ ,  $n\text{-C}_{38}\text{H}_{78}$ ,  $n\text{-C}_{40}\text{H}_{82}$ ,  $n\text{-C}_{42}\text{H}_{86}$ ,  $n\text{-C}_{44}\text{H}_{90}$ ,  $n\text{-C}_{46}\text{H}_{94}$ ,  $n\text{-C}_{48}\text{H}_{98}$ ,  $n\text{-C}_{50}\text{H}_{102}$ ,  $n\text{-C}_{52}\text{H}_{106}$ ,  $n\text{-C}_{54}\text{H}_{110}$ ,  $n\text{-C}_{56}\text{H}_{114}$ ,  $n\text{-C}_{58}\text{H}_{118}$ ,  $n\text{-C}_{60}\text{H}_{122}$ ,  $n\text{-C}_{62}\text{H}_{126}$ ,  $n\text{-C}_{64}\text{H}_{130}$ ,  $n\text{-C}_{66}\text{H}_{134}$ ,  $n\text{-C}_{68}\text{H}_{138}$ ,  $n\text{-C}_{70}\text{H}_{142}$ ,  $n\text{-C}_{72}\text{H}_{146}$ ,  $n\text{-C}_{74}\text{H}_{150}$ ,  $n\text{-C}_{76}\text{H}_{154}$ ,  $n\text{-C}_{78}\text{H}_{158}$ ,  $n\text{-C}_{80}\text{H}_{162}$ ,  $n\text{-C}_{82}\text{H}_{166}$ ,  $n\text{-C}_{84}\text{H}_{170}$ ,  $n\text{-C}_{86}\text{H}_{174}$ ,  $n\text{-C}_{88}\text{H}_{178}$ ,  $n\text{-C}_{90}\text{H}_{182}$ ,  $n\text{-C}_{92}\text{H}_{186}$ ,  $n\text{-C}_{94}\text{H}_{190}$ ,  $n\text{-C}_{96}\text{H}_{194}$ ,  $n\text{-C}_{98}\text{H}_{198}$ ,  $n\text{-C}_{100}\text{H}_{202}$ ,  $n\text{-C}_{102}\text{H}_{206}$ ,  $n\text{-C}_{104}\text{H}_{210}$ ,  $n\text{-C}_{106}\text{H}_{214}$ ,  $n\text{-C}_{108}\text{H}_{218}$ , to isobutene was obtained. In all pyrolyses liquid products and C were formed in varying amounts. The severe conditions of pyrolysis completely masked the primary products because of extensive decomp., but experimental data and theoretical considerations indicate that the decomp. of olefines is preceded by polymerisation and that the gaseous products are produced by secondary reaction.

H. C. M.

**Catalytic hydration of olefines. II. Hydration of propylene over liquid catalysts at atmospheric pressure.** E. K. REMIZ (J. Appl. Chem. Russ., 1936, 9, 703—710).— $\text{Pr}^{\beta}\text{OH}$  is obtained in 21% yield from  $\text{CH}_2\text{:CHMe}$ , in presence of 54%  $\text{H}_2\text{SO}_4$  containing 3% of  $\text{Ag}_2\text{SO}_4$ , at  $110^\circ$ . Apparatus for the continuous production of  $\text{Pr}^{\beta}\text{OH}$  by the above method is described.

R. T.

**Polymerisation of propylene. Catalytic action of zinc chloride.** O. L. BRANDES, W. A. GRUSE, and A. LOWY (Ind. Eng. Chem., 1936, 28, 554—559).—The formation of liquid polymerides when  $\text{C}_3\text{H}_6$  is heated in presence of  $\text{ZnCl}_2$  depends on the pressure, temp., and duration of reaction. A max. yield of 81.5% is obtained at  $260\text{--}270^\circ$  and 3225 lb. per sq. in. during 75 min.; very little reaction occurs in the absence of  $\text{ZnCl}_2$ . At lower temp., the fraction of b.p.  $< 200^\circ$  increases (up to 92% of the total liquid), the tripolymeride being the main product together with smaller amounts of  $\text{C}_{10\text{--}12}$  hydrocarbons. The product obtained at  $290\text{--}310^\circ$  contains considerable amounts of  $\text{C}_{5\text{--}12}$  hydrocarbons, principally olefines and paraffins. The presence of naphthalenes is suspected.

J. L. D.

**Kinetics of *cis-trans* isomerisations.**—See this vol., 802.

**Preparation and physical constants of  $\beta$ -methyl- $\Delta^{\alpha}$ -butene.** M. L. SHERRILL and G. F. WALTER (J. Amer. Chem. Soc., 1936, 58, 742—745).— $\text{CH}_2\text{Br}\cdot\text{CHBr}\cdot\text{OEt}$  and  $\text{MgMeCl}$  give  $\beta$ -ethoxypropyl bromide, b.p.  $28.6\text{--}28.8^\circ/10$  mm.,  $138\text{--}138.1^\circ/760$  mm., converted by a large excess of  $\text{KOH}$  at  $110\text{--}150^\circ$  into  $\text{CH}_2\text{:CMe}\cdot\text{OEt}$ , b.p.  $61.2\text{--}61.8^\circ/760$  mm. Successive treatment of this with  $\text{Br}$  and  $\text{MgEtBr}$  in  $\text{Et}_2\text{O}$  affords  $\beta$ -ethoxy- $\beta$ -methylbutyl bromide, b.p.  $53.4\text{--}53.6^\circ/9.5$  mm., which with  $\text{Zn}$  dust +  $\text{Zn}\cdot\text{Cu}$  in 95%  $\text{EtOH}$  affords  $\beta$ -methyl- $\Delta^{\alpha}$ -butene (I), b.p.  $31.05\pm 0.05^\circ/760$  mm. (dibromide, b.p.  $47.4\text{--}48^\circ/8.5\text{--}9$  mm.). The ultra-violet absorption spectra of (I),  $\text{CHMe:CMe}_2$ , and  $\Delta^{\alpha}$ - and  $\Delta^{\beta}$ -pentene are given. Physical data for these hydrocarbons and  $\text{CH}_2\text{:CHPr}^{\beta}$  are recorded.

H. B.

**Raman spectra of  $\beta$ -methyl- $\Delta^{\alpha}$ - and - $\Delta^{\beta}$ -butene.** D. D. THOMPSON and M. L. SHERRILL (J. Amer. Chem. Soc., 1936, 58, 745—747; cf. Bourguet and Piaux, A., 1932, 1189).—Comparison of the spectra of  $\beta$ -methyl- $\Delta^{\alpha}$ -butene (I) and the low (A) and high (B) fractions of the hydrocarbon obtained by dehydration of *tert.*-amyl alcohol shows that (B) is practically pure  $\beta$ -methyl- $\Delta^{\beta}$ -butene (II) whilst (A) is a mixture of (I) and (II).

H. B.

**Fission and isomerisation of olefines involving a tertiary radical.** I. N. NAZAROV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 329—332).—The following are prepared from  $\text{MgRX}$  and the appropriate

ketone:  $\text{CMePr}^{\beta}\text{Bu}\cdot\text{OH}$  (Whitmore *et al.*, A., 1933, 1140),  $\beta\beta\delta$ -trimethyl- $\gamma$ -ethyl-*n*-pentan- $\gamma$ -ol, b.p.  $188\text{--}191^\circ$ ,  $\beta\beta\gamma$ -trimethyl-*n*-hexan- $\gamma$ -ol, b.p.  $170\text{--}172^\circ$ ,  $\gamma$ -*tert.*-butyl-*n*-pentan- $\gamma$ -ol, b.p.  $172\text{--}175^\circ$   $\text{CMeEtBu}\cdot\text{OH}$ , and  $\text{CMe}_2\text{Bu}\cdot\text{OH}$ . They are converted by dehydration ( $2\cdot\text{C}_{10}\text{H}_7\cdot\text{SO}_3\text{H}$  or I), respectively, into  $\text{CPr}^{\beta}\text{Bu}\cdot\text{CH}_2$  (I),  $\delta\delta$ -dimethyl- $\gamma$ -isopropyl- $\Delta^{\beta}$ -pentene (II), b.p.  $153\text{--}158^\circ$ ,  $\beta\beta\gamma$ -trimethyl- $\Delta^{\gamma}$ -hexene (III), b.p.  $130\text{--}132^\circ$ ,  $\gamma$ -*tert.*-butyl- $\Delta^{\gamma}$ -pentene (IV), b.p.  $124\text{--}132^\circ$ ,  $\text{CMeBu}\cdot\text{CHMe}$  (V), and  $\text{CMeBu}\cdot\text{CH}_2$  (VI). Fission of (I) with  $1:4\cdot\text{C}_{10}\text{H}_6\text{Br}\cdot\text{SO}_3\text{H}$  at  $130^\circ$  affords  $\text{CMe}_2\cdot\text{CH}_2$  and  $\text{CHMe:CMe}_2$ ; (II) similarly gives  $\text{CMe}_2\cdot\text{CH}_2$ ,  $\text{CHMe:CHPr}^{\beta}$ , and  $\text{CHEt:CMe}_2$ , the assumed mechanism being the isomerisation of a liberated substituted vinyl radical. (III)–(VI) do not undergo fission.

J. W. B.

**Condensation of acetylene and acetic acid.**—See this vol., 807.

**Preparation of dialkylacetylenes from acetylenic Grignard reagents and alkyl sulphates.** S. D. THORN, G. F. HENNION, and J. A. NIEUWLAND (J. Amer. Chem. Soc., 1936, 58, 796—797).— $\text{CMe}\cdot\text{CAlk}$  and  $\text{CEt}\cdot\text{CAlk}$  are prepared in good yield from  $\text{CAlk}\cdot\text{C}\cdot\text{MgBr}$  (I) (1 mol.) and  $\text{Me}_2\text{SO}_4$  and  $\text{Et}_2\text{SO}_4$  (2 mols.), respectively. The following are described: methyl-butyl-, b.p.  $110\text{--}111^\circ/747$  mm., and -hexyl-, b.p.  $155\text{--}156^\circ/747$  mm.; ethyl-butyl-, b.p.  $129\text{--}130^\circ/747$  mm., -amyl-, b.p.  $153\text{--}155^\circ/745$  mm., and -vinyl-, b.p.  $83^\circ/747$  mm., -acetylenes. (I) do not react with alkyl halides; reaction could not be catalysed by various metals and/or their salts.

H. B.

**Raman spectra of solid ethylene halides.**—See this vol., 776.

**Photochemical formation of ethylene iodide.**—See this vol., 688.

**Decomposition of ethylene oxide.**—See this vol., 802.

**Preparation of  $\alpha$ -chloro- $\gamma$ -bromopropane, and the velocity of addition of hydrogen bromide to allyl chloride.** M. S. SCHOSTAKOVSKI (J. Appl. Chem. Russ., 1936, 9, 681—683).— $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{CH}_2\text{Br}$  (I) and  $\text{CHMeCl}\cdot\text{CH}_2\text{Br}$  are obtained in equal amount from  $\text{CH}_2\text{:CH}\cdot\text{CH}_2\text{Cl}$  and  $\text{HBr}$  at  $0^\circ$ ; at  $-19^\circ/1.5\text{--}2$  atm. (I) alone is obtained, in 90% yield.

R. T.

**Substitution and inversion of configuration.**—See this vol., 803.

**Catalytic esterification of alcohols.**—See this vol., 806.

**Exchange reactions between heavy water and hydrogen compounds.** E. OGAWA (Bull. Chem. Soc. Japan, 1936, 11, 310—320).—A substance, RH, is dissolved in  $\text{H}_2\text{O}$  containing 49 mol.-% of  $\text{D}_2\text{O}$ , allowed to come to equilibrium (some RD formed), distilled, and the *d* of the distillate measured. Thus are calc.  $K_m = [\text{RD}][\text{H}_2\text{O}]/[\text{RH}][\text{HDO}]$ .  $K_m$  are 10—16% too high owing to fractionation and further reaction during distillation. Determinations with 24 substances give the following  $K_m$  at  $100^\circ$ : OH (alcoholic) 1.55 or 0.72 (1.19 at  $50^\circ$ ),  $(\text{NH}_2\text{OH}, \text{HCl})$  0.8,  $(\text{H}_3\text{BO}_3)$  0.46,  $(\text{H}_3\text{PO}_4)$  0.34; NH  $(\text{NH}_4\text{Cl})$  0.52

(0.45 at 50°),  $[\text{CO}(\text{NH}_2)_2]$  0.50 (0.71 at 50°);  $\text{CO}_2\text{H}$  ( $\text{H}_2\text{C}_2\text{O}_4$ ) 0.51 (0.62 at 50°), (succinic) 0.42, (maleic) 0.66, ( $\text{NaHC}_2\text{O}_4$ ) 0.91, ( $\text{Na H succinate}$ ) 0.4;  $\text{HSO}_4'$  0.1;  $\text{OH}'$  ( $\text{NaOH}$ ) 0.2.  $K_m$  gives a measure of the differences of zero point energies or of the chemical binding forces of RH and RD. The results do not favour co-ordination between OH and  $\text{CO}_2\text{H}$  of OH-acids nor the usual betaine formula of  $\text{NH}_2$ -acids.

R. S. C.

**Catalytic properties of rhenium. II. Dehydrogenation of the propyl alcohols.** M. S. PLATONOV, S. B. ANISSIMOV, and V. M. KRASCHE-NINNIKOVA (Ber., 1936, 69, [B], 1050—1053; cf. A., 1935, 830).—Dehydrogenation of  $\text{Pr}^\alpha\text{OH}$  is effected as efficiently by Re at 400° as by an equal column of Cu at 300°. Re causes only very slight decomp. of the  $\text{EtCHO}$  produced and does not dehydrate  $\text{Pr}^\alpha\text{OH}$ . The formation of solid or liquid by-products could not be detected. The catalyst retains its activity well.  $\text{Pr}^\beta\text{OH}$  is more efficiently dehydrogenated to  $\text{COMe}_2$  by Re than by Cu and only slight decomp. of  $\text{COMe}_2$  is observed at > 500°.

H. W.

**Isomeric forms of the optically active  $\alpha\gamma$ -dimethylallyl alcohols [ $\Delta^7$ -penten- $\beta$ -ols].** H. W. J. HILLS, J. KENYON, and H. PHILLIPS (J.C.S., 1936, 576—583).—The H phthalate, m.p. 90—90.5°, of *dl*- $\text{CHMe}:\text{CH}:\text{CHMe}:\text{OH}$  gives the brucine salt, m.p. 169—169.5°,  $[\alpha]_{5461}^{20} -15.2^\circ$  in EtOH, and thence the H ester (I), m.p. 82—84°,  $[\alpha]_{5893}^{20} +38.75^\circ$  in  $\text{Et}_2\text{O}$ , of the (+)-alcohol (II); the mother-liquors give the brucine salt, m.p. 157—159°, and thence the H phthalate (III), m.p. 82—84°,  $[\alpha]_{5893}^{20} -24.1^\circ$  in  $\text{CHCl}_3$ , of the (—)-alcohol (IV). Hydrolysis of (I) and (III) gives (II) and (IV) of varying  $\alpha$ .  $[\alpha]$  of (III) is recorded in 7 solvents; (III) is usually dextrorotatory, about  $[\alpha]_{5461}^{20} +0.84^\circ$ , but  $\alpha$  changes with time often to negative;  $[\alpha]$  also has a very high temp. coeff., changing to negative at about 30—40°. (IV) behaves similarly when kept,  $\alpha$  often decreasing numerically. The changes with time are very erratic and could not be controlled. The optical behaviour of the esters and ethers is, however, quite normal; the following are prepared from (II): *formate*, b.p. 122—123°,  $[\alpha]_{5461}^{20} -72.8^\circ$ ; *acetate*, b.p. 136—137°,  $[\alpha]_{5461}^{20} -76.1^\circ$ ; *benzoate*, b.p. 126°/13 mm.,  $[\alpha]_{5461}^{20} +26.5^\circ$ ; *o-*, b.p. 124—125°/0.1 mm.,  $[\alpha]_{5461}^{20} +29.9^\circ$ , *m-*, b.p. 126—127°/0.1 mm.,  $[\alpha]_{5461}^{20} +27^\circ$ , and *p-nitrobenzoate*, m.p. 48°,  $[\alpha]_{5461}^{20} +57.3^\circ$  in  $\text{H}_2\text{O}$ ; *Me* (by MeI on the K salt in  $\text{Et}_2\text{O}$ ), b.p. 90°,  $[\alpha]_{5461}^{20} -56^\circ$ , *Bu*, b.p. 149—150°,  $[\alpha]_{5461}^{20} -30.4^\circ$ , and *CH}\_2\text{Ph ether}*, b.p. 107°/11 mm.,  $[\alpha]_{5461}^{20} -145.6^\circ$ . (IV) with  $\text{MeOH}-\text{H}_2\text{SO}_4$  gives a *Me ether*, b.p. 90—91°,  $[\alpha]_{5461}^{20} -1^\circ$ , but with  $\text{Bu}^\alpha\text{OH}-\text{H}_2\text{SO}_4$  the *dl-Bu* ether, b.p. 150—151°. The parachor of (II), (IV), and the *dl*-alcohol varies, but is always very low;  $\text{CH}_2:\text{CH}:\text{CH}(\text{Et})\text{OH}$ ,  $\text{CH}_2:\text{CH}:\text{CH}(\text{Bu}^\alpha)\text{OH}$ , and  $\text{CHPh}:\text{CH}:\text{CH}_2\text{OH}$  also have very low parachors, but that of  $\text{CH}_2:\text{CH}:\text{CH}_2\text{OH}$  is normal. The above and some other abnormalities are mostly explained by assuming that (II), (IV), etc. are in equilibrium with large but varying amounts of the cyclic form,  $\text{CHMe} \begin{smallmatrix} \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{O} \end{smallmatrix} \text{CHMe}$  (or its analogues). This, however, does not explain many other facts, notably that

(II) gives esters of normal, or almost normal,  $[\alpha]$  after "mutarotation" has occurred. *Cis-trans* isomerism explains only a few of the abnormalities. Hydrogenation ( $\text{PtO}_2$ ) of (II) in  $\text{Et}_2\text{O}$  affords (+)-pentan- $\beta$ -ol, b.p. 118—119° (H phthalate, m.p. 34°,  $[\alpha]_{5893}^{20} +35.9^\circ$  in  $\text{CHCl}_3$ ). (II) gave a (—)-chloride, b.p. 20°/13 mm., which with  $\text{CaCO}_3$  in  $\text{H}_2\text{O}$  gives a (—)-alcohol, but it is impossible to state whether this is related to (II) or to (IV).

R. S. C.

**Dehydration of dimethylcyclobutylcarbinol.** B. A. KASANSKI (Ber., 1936, 69, [B], 950—954).—Dimethylcyclobutylcarbinol, from Et cyclobutylcarboxylate or acetylcyclobutane (I) and  $\text{MgMeI}$ , is dissolved in decahydronaphthalene and treated successively with K,  $\text{CS}_2$ , and MeI and the solution is heated. The product contains isopropylidenecyclobutane (oxidised to  $\text{COMe}_2$ ),  $\alpha$ -methylvinylcyclobutane [oxidised to (I)], a glycol, and possibly succinic acid. Catalytic hydrogenation of the mixture affords isopropylcyclobutane, b.p. 90.5—91.5°/750 mm.

H. W.

**Secondary acyclic alcohols with seven to ten carbon atoms.** M. TUOT (Compt. rend., 1936, 202, 1339—1340).—The appropriate aldehydes (prep. from the alcohols by Cu reduced very slowly at 250—265°) and Grignard reagents give 60—85% yields of heptan- $\delta$ -ol, b.p. 70°/25 mm.,  $\beta$ -methylhexan- $\epsilon$ -ol, b.p. 74°/28 mm., octan- $\delta$ -ol, b.p. 81°/17 mm.,  $\beta$ -methylheptan- $\gamma$ -ol, b.p. 73°/19 mm.,  $\beta\epsilon$ -dimethylhexan- $\gamma$ -ol, b.p. 64°/15 mm., nonan- $\gamma$ -ol, b.p. 93°/18 mm.,  $\beta$ -methyloctan- $\delta$ -, b.p. 91°/23 mm., and  $\epsilon$ -ol, b.p. 79°/15 mm.,  $\beta\zeta$ -dimethylheptan- $\gamma$ -, b.p. 88°/25 mm., and  $\delta$ -ol, b.p. 79°/15 mm., and  $\beta\eta$ -dimethyloctan- $\delta$ -ol, b.p. 96°/18 mm. Other physical data are given.

R. S. C.

**Reaction of etherates of tin and titanium tetrachloride. I. Action of thionyl chloride on the etherates.** J. L. GOLDFARB and L. M. SMORGONSKI (Ber., 1936, 69, [B], 1036—1039).— $\text{SnCl}_4$  or  $\text{TiCl}_4$  is added to a mixture of the ether and  $\text{SOCl}_2$  at 0° followed by warming on the water-bath.  $\text{Et}_2\text{O}$  affords  $\text{EtCl}$  (1.5 mols.), reaction proceeding:  $\text{Et}_2\text{O} + \text{SOCl}_2 \rightarrow \text{EtCl} + \text{OEt} \cdot \text{SOCl}$  (I) and (I)  $\rightarrow \text{EtCl} + \text{SO}_2$ . Diisooamyl ether yields  $\text{C}_5\text{H}_{11}\text{Cl}$ , but side reactions cause evolution of HCl and production of a substance containing S.  $\text{CH}_2\text{Ph} \cdot \text{OEt}$  gives EtCl, much HCl, and an amorphous substance devoid of S or Cl.  $\text{PhOEt}$  yields  $\text{SO}_2$ , much HCl, EtCl, and a material containing S which is sol. in alkali.  $\text{Et}_2\text{O}$  and  $\text{S}_2\text{Cl}_2$  afford EtCl,  $\text{SO}_2$ , and S.

H. W.

**Thermal decomposition of ethylene oxide.** H. W. THOMPSON and M. MEISSNER (Nature, 1936, 137, 870—871).—Results of a more detailed investigation (cf. A., 1929, 1243) are summarised. Over the range 435—505°, CO and  $\text{CH}_4$  are the main products of the reaction, but  $\text{H}_2$  and  $\text{C}_2\text{H}_6$  are also formed. The variation of  $k$  with pressure indicates that the reaction involves the superposition of several independent quasi-unimol. processes. The existence of appreciably long reaction chains is improbable.

L. S. T.

**Dioxan series. III. Use of zinc and cadmium chlorides in Grignard synthesis of alkyl-substituted dioxans.** R. K. SUMMERBELL and L. N. BAUER (J. Amer. Chem. Soc., 1936, 58, 759—761).—

Improved yields of 2:3-dialkyldioxans (cf. this vol., 341) are obtained from 2:3-dichlorodioxan (I) and MgAlkBr when the latter is first treated with 1 mol. of anhyd.  $\text{ZnCl}_2$  or  $\text{CdCl}_2$  and the  $\text{Et}_2\text{O}$  replaced by PhMe. The following are described: 2:3-dimethyl- (? 2 forms), b.p. 127.7—129.7/750.8 mm. and 132.2—132.7°/750.8 mm., 2:3-diethyl-, b.p. 166.5—168.5°/739 mm., 2:3-di-n-propyl-, b.p. 87°/12 mm., 202—205°/744 mm., 2:3-di-n-butyl-, b.p. 129—130°/22 mm., 238—240°/744 mm., and 2:3-diallyl-, b.p. 90.2—90.7°/16 mm., -dioxans. The gases evolved in the reaction of (I) with  $\text{Et}_2\text{O}$ -MgMeBr are  $\text{CH}_4$  (5.4%),  $\text{C}_2\text{H}_6$  (94%), and  $\text{C}_2\text{H}_4$  (0.6%). H. B.

Effect of propyl alcohol on hydrolysis of sulphuric acid esters.—See this vol., 804.

Action of molybdic acid on laevorotatory  $\alpha$ -glycerophosphoric acid. P. FLEURY (J. Pharm. Chim., 1936, [viii], 23, 541—545).—The laevorotation of  $\alpha$ -glycerophosphoric acid depends on the  $p_{\text{H}}$ ; it is max. at  $p_{\text{H}}$  8.0. In presence of  $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24}$ , the rotation becomes positive, with a max. at  $p_{\text{H}}$  4.3—4.5, at which acidity glycerophosphomolybdates are most stable (cf. A., 1932, 143). E. W. W.

Esters of thiosulphurous acid  $\text{S}_2(\text{OR})_2$ . A. MEUWSEN (Ber., 1936, 69, [B], 935—937; cf. A., 1935, 326).—In agreement with Stamm (A., 1935, 729) the greenish-yellow series of esters is regarded as non-existent, but isomerides  $\text{OR}\cdot\text{S}\cdot\text{S}\cdot\text{OR}$  and  $\text{R}\cdot\text{SO}\cdot\text{SR}$  exist. The production of colourless  $\text{S}_2(\text{OEt})_2$  from  $\text{S}_2\text{Cl}_2$  necessitates the use of an excess of NaOEt.  $\text{S}(\text{OEt})_2$  is stable towards air and  $\text{SeO}_2$  at room temp., whereas  $\text{NO}_2$ ,  $\text{O}_3$ , or  $\text{H}_2\text{O}_2$  causes separation of S. MgEtBr causes production of a little  $\text{Et}_2\text{S}_2$  without separation of S. Hydrolysis by cold  $N\text{-KOH}$ -MeOH produces S and  $\text{K}_2\text{S}_2\text{O}_3$ . Thermal decomp. probably occurs thus:  $\text{S}_2(\text{OEt})_2 \rightarrow \text{H}_2\text{S} + \text{S} + \text{EtOAc}$ . H. W.

Sulphur monoxide diethylacetal,  $\text{S}(\text{OEt})_2$  [ethyl sulphoxylate]. A. MEUWSEN and H. GEHARDT (Ber., 1936, 69, [B], 937—946).—Catalytic decomp. of  $\text{S}_2(\text{OEt})_2$  by NaOEt in EtOH affords *Et*<sub>2</sub> sulphoxylate,  $\text{S}(\text{OEt})_2$ , b.p. 35°/32 mm., 117°/733 mm., readily autoxidised at room temp. to  $\text{Et}_2\text{SO}_3$ , also obtained by use of  $\text{NO}_2$  in abs.  $\text{Et}_2\text{O}$ ,  $\text{KMnO}_4$  in  $\text{COMe}_2$ , or  $\text{SeO}_2$ ; even  $\text{O}_3$  does not produce  $\text{Et}_2\text{SO}_3$ . Hydrolysis by  $\text{KOH}$ -MeOH proceeds mainly thus:  $2\text{S}(\text{OEt})_2 + 3\text{KOH} = \text{K}_2\text{S}_2\text{O}_3 + 3\text{EtOH} + \text{KOEt}$ , small amounts of  $\text{K}_2\text{S}$  and  $\text{K}_2\text{SO}_3$  being also produced. With  $\text{Cu}_2\text{O}$  at 110°  $\text{S}(\text{OEt})_2$  affords a mixture of oxides and sulphides of Cu with some MeCHO. In a sealed tube at 130°  $\text{S}(\text{OEt})_2$  becomes carbonised with production of S and  $\text{SO}_2$ . For comparison, Mg ethylsulphinate, from  $\text{SO}_2$  and MgEtBr in  $\text{Et}_2\text{O}$ , is transformed by HCl in light petroleum of low b.p. into ethylsulphinic acid, which with cold  $\text{SOCl}_2$  affords ethylsulphinyll chloride, b.p. 53°/15—16 mm. This with cold EtOH gives *Et* ethylsulphinate, b.p. 60°/13—14 mm., which is not autoxidisable, does not yield Se with  $\text{SeO}_2$ , and converts  $\text{KMnO}_4$  into  $\text{MnO}_2$  without apparent stoichiometric relationship. It is hydrolysed to *K* ethylsulphinate. H. W.

Esters of titanium. J. S. JENNINGS, W. WARDLAW, and W. J. R. WAY (J.C.S., 1936, 637—640).—

$\text{TiCl}_4$  with NaOMe-MeOH or NaOEt-EtOH, but not with the alcohol alone (cf.  $\text{SiCl}_4$ ), gives  $\text{Ti}(\text{OMe})_4$ , sublimes at 300°/18 mm., and  $\text{Ti}(\text{OEt})_4$ , b. p. 142°/18 mm.  $\text{TiCl}_4$  and dry MeOH give dimethoxydichlorotitanium, + MeOH, a solid.  $\text{Ti}(\text{OEt})_4$  and AcCl at 70—80° yield triethoxychlorotitanium, anhyd., b.p. 176°/18 mm., and + EtOH, cryst., unaffected by HCl, which with AcCl gives diethoxydichlorotitanium, anhyd., b.p. 142°/18 mm., + MeOH and + EtOH, cryst., also obtained from  $\text{TiCl}_4$  and EtOH at 80—100° and by the method of Demarçay (A., 1875, 441), whose formulation of the compound is erroneous. Similarly are obtained diisopropoxy-, anhyd., b.p. 160°/18 mm., solid, and +  $\text{Pr}^n\text{OH}$ , cryst., and diisobutoxy-dichlorotitanium, anhyd., b.p. 184°/18 mm., solid, and + MeOH, + EtOH, and +  $\text{Bu}^n\text{OH}$  (also obtained from  $\text{TiCl}_4$  and  $\text{Bu}^n\text{OH}$  at 100—110°), cryst. R. S. C.

Complex compounds of iridium.—See this vol., 810.

Action of anhydrous ferric chloride on anhydrous acetic and formic acids.—See this vol., 691.

Mechanism of organic reactions. IV. Pyrolysis of esters and acetals. E. M. BILGER and H. HIBBERT (J. Amer. Chem. Soc., 1936, 58, 823—826).—The nos. quoted after the following compounds denote the mols. of olefine and acid, respectively, produced during their decomp. at 470—500°: EtOAc 0.174, 0.176; glycol ethylidene ether 0.023, 0.005;  $\text{Pr}^n\text{CO}_2\text{Et}$  0.139, 0.14; Et *n*-butyral (? glycol *n*-butylidene ether) 0.048, 0.029;  $\text{HCO}_2\text{Et}$  0.122, 0.026; glycol methylene ether 0.008, 0.003;  $\text{Pr}^n\text{OAc}$  0.097, 0.14; propylene acetal 0.021, 0.024; propylene *n*-heptal, b.p. 204°, 0.04, 0.015; trimethylene glycol *n*-butylidene ether 0.04, 0.009;  $\text{Bu}^n\text{OAc}$  0.151, 0.157;  $\text{Bu}^n\text{OAc}$  0.141, 0.155; *sec*.- $\text{BuOAc}$  0.177, 0.18;  $\text{Pr}^n\text{OAc}$  0.181, 0.181. The cyclic acetals are more stable than the isomeric esters and cannot be intermediates in the decomp. of the latter. Pyrolysis of  $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{OAc}$  and  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{Et}$  gives 38.1% of  $\text{CH}_2\cdot\text{CHCl}$  and 58.2% of  $\text{C}_2\text{H}_4$ , respectively. De-comp. of EtBr (at 482°) and  $\text{Bu}^n\text{Br}$  (at 484°) affords 58.7% of  $\text{C}_2\text{H}_4$  and 41.6% of  $\text{C}_4\text{H}_8$ , respectively. The olefine produced during decomp. of esters arises solely from Oalk. The results are best explained by the intermediate production of free radicals. H. B.

Exchange of hydrogen atoms in the methyl group of heavy acetic acid. A. DADIEU and W. ENGLER (Naturwiss., 1936, 24, 318).—Acetic acid prepared by the action of  $\text{H}_2\text{SO}_4$  on  $(\text{CD}_3\cdot\text{CO}_2)_2\text{Ba}$  gave a Raman line corresponding to a C-H linking. The substitution of D by H may have taken place either through the intermediate formation of  $\text{SO}_3\text{H}\cdot\text{CD}_2\cdot\text{CO}_2\text{H}$  with subsequent hydrolysis, or through an enol form of  $\text{CD}_3\cdot\text{CO}_2\text{H}$ . W. O. K.

Catalytic preparation of esters of glycol and acetic acid. II. M. B. TUROVA-POLAK and V. F. DZIOMA (J. Appl. Chem. Russ., 1936, 9, 696—702).  $(\text{CH}_2\cdot\text{OAc})_2$  (I) is obtained in 70% yield from AcOH and glycol, at 160—170°, in presence of wood-C heated at 200° with an equal wt. of  $\text{H}_3\text{PO}_4$ . Only

traces of  $\text{OH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OAc}$  are obtained from 1:1  $\text{AcOH}$ -glycol mixtures, the chief product being (I).

R. T.

**Organic deuterium compounds.** Acetic, malonic, and succinic acids. J. O. HALFORD and L. C. ANDERSON (J. Amer. Chem. Soc., 1936, 58, 736—740; cf. Wilson, A., 1935, 731).— $\text{CD}_3(\text{CO}_2\text{D})_2$ , m.p.  $130\text{--}131^\circ$  [from  $\text{C}_2\text{O}_2$  and  $\text{D}_2\text{O}$  or by successive crystallisation of  $\text{CH}_3(\text{CO}_2\text{H})_2$  from  $\text{D}_2\text{O}$ ], heated at  $150^\circ$  gives  $\text{CD}_3\cdot\text{CO}_2\text{D}$  (I), m.p.  $15\cdot8\text{--}16^\circ$ , converted by dry  $\text{HCl}$  into trideuteracetic acid (II),  $\text{CD}_3\cdot\text{CO}_2\text{H}$ , m.p.  $17\cdot2^\circ$ . Anhyd.  $\text{KOAc}$  and conc.  $\text{D}_2\text{SO}_4$  in  $\text{D}_2\text{O}$  afford acetic deuteracid (III),  $\text{CH}_3\cdot\text{CO}_2\text{D}$ , m.p.  $15\cdot4^\circ$  (cf. Lewis and Schutz, A., 1934, 391). V.p. of (I)—(III) between  $21^\circ$  and  $83\cdot6^\circ$  are recorded. Successive treatment of  $(\text{C}\cdot\text{CO}_2\text{K})_2$  with  $\text{Na-Hg}$  in  $\text{D}_2\text{O}$  and  $\text{D}_2\text{O}$ - $\text{DBr}$  gives tetradeuterosuccinic deuteracid,  $(\text{CD}_2\cdot\text{CO}_2\text{D})_2$ , m.p.  $178\text{--}179\cdot1^\circ$ , which when crystallised from  $\text{D}_2\text{O}$  affords tetradeuterosuccinic acid,  $(\text{CD}_2\cdot\text{CO}_2\text{H})_2$ , m.p.  $181\text{--}182\cdot6^\circ$ . Succinic deuteracid,  $(\text{CH}_2\cdot\text{CO}_2\text{D})_2$ , m.p.  $179\text{--}180^\circ$ , is obtained from succinic acid and  $\text{D}_2\text{O}$ . The relationship between m.p. and D content is discussed.

H. B.

**Wall effect in the thermal polymerisation of unsaturated esters.** J. W. BRETTENBACH and R. RAFF (Ber., 1936, 69, [B], 1107—1110).—Polymerisation of Me acrylate and vinyl acetate occurs fairly rapidly, but quite irregularly, when they are heated in glass vessels, and is greatly influenced by the nature and pre-treatment of the glass. In pure Ni vessels only slight polymerisation is observed after several days at  $100^\circ$ ; it is readily induced by powdered glass and, particularly, by  $\text{Na}_2\text{SiO}_3$ . Similar differences are not observed with styrene. The phenomena are attributed to the alkali of the glass towards which esters, but not hydrocarbons, are very sensitive.

H. W.

**Electrolysis of mixtures of *n*-butyrates with nitrates.** F. FICHTER and F. METZ (Helv. Chim. Acta, 1936, 19, 597—606).—By electrolysis a mixture of  $4N\text{-PrCO}_2\text{Na}$  and  $2N\text{-NaNO}_3$  at  $18\text{--}20^\circ$  with a c.d. of  $0\cdot166$  amp. per sq. cm. an oil was obtained comparable with that from the corresponding propionate electrolysis (A., 1935, 472). It contained  $\text{Pr}^a\text{NO}_2$ ,  $n\text{-C}_6\text{H}_{14}$ ,  $\text{Pr}^a\text{NO}_3$ ,  $\text{Pr}^a\text{CO}_2\text{Pr}^a$ ,  $\text{CHMeBu}^a\cdot\text{O}\cdot\text{NO}_2$ ,  $\text{CHMePr}^a\cdot\text{O}\cdot\text{NO}_2$ ,  $\text{NO}_3\cdot\text{CHMeCH}_2\cdot\text{NO}_3$ ,  $\text{NO}_3\cdot\text{CMe}_2\cdot[\text{CH}_2]_3\cdot\text{NO}_3$ , and glyceryl esters. The results are discussed with reference to previous observations (cf. loc. cit.; A., 1935, 730, 1105).

M. S. B.

**Catalytic hydrogenation of sorbic acid.**—See this vol., 808.

**Hydrogenation of  $\Delta^9$ -octadecenyl  $\Delta^9$ -octadecenoate (oleyl oleate).** T. P. HILDITCH and H. PAUL (J.C.S., 1936, 664—667).—Hydrogenation (Nikieselguhr) of oleyl oleate at  $180^\circ$  is largely non-selective, but there is slight preferential reaction of the oleyl ethylenic linking and slightly more formation of  $\text{C}_{17}\text{H}_{35}\cdot\text{CO}_2\cdot\text{C}_{18}\text{H}_{37}$  (I) than is calc. from probability data. The proportions of the products in the reaction mixture after varying times of hydrogenation are determined by the I val., oxidation by  $\text{KMnO}_4$  and isolation of unattacked (I), followed by hydrolysis and isolation of the  $\text{C}_{18}\text{H}_{37}\cdot\text{OH}$ . Other oxidation products could not be isolated quantitatively.

R. S. C.

**Higher aliphatic compounds. VI. Existence of compounds in binary systems from palmitic, margaric, stearic, tricosanoic, and tetracosanoic acids.** J. C. SMITH (J.C.S., 1936, 625—627; cf. A., 1933, 1271).—Mixed m.-p. diagrams of the pure acids indicate formation of 1:1 compounds of tricosanoic with tetracosanoic, palmitic (I) with margaric (II), stearic (III) with (II), and palmitic with stearic acid, with formation of complete solid solutions. Liquidus curves show the possibility also of compounds, 3(II):1(I), 3(II):1(III), and 1(II):3(III). Previous reports that acids with an odd no. of C do not form compounds with acids with an even no. of C were due to use of impure acids. It is suggested that the 3:1 compounds may be due to alternate layers of  $\text{RC}\begin{matrix} \text{O} \rightarrow \text{HO} \\ \text{OH} \quad \text{O} \end{matrix} \text{CR}$  and  $\text{RC}\begin{matrix} \text{O} \rightarrow \text{HO} \\ \text{OH} \leftarrow \text{O} \end{matrix} \text{CR}'$ .

R. S. C.

**Soap solutions. XI. Reactions between the systems: stearic acid-sodium oleate and oleic acid-sodium stearate.** J. MIKUMO (J. Soc. Chem. Ind. Japan, 1936, 39, 98—100b).—The reactions have been studied in  $\text{MeOH}$ ,  $\text{EtOH}$ , and  $\text{MeOH-C}_6\text{H}_6$  mixtures. The compound  $\text{C}_{18}\text{H}_{35}\text{O}_2\text{Na}\cdot\text{C}_{19}\text{H}_{36}\text{O}_2$ , m.p.  $119\text{--}120^\circ$ , is produced in each case and its crystallographic properties are described.

R. S.

**Lipins of wheat embryo. I, II.**—See this vol., 912.

**Naming of the highly unsaturated acid of the kernel fat of "akarittom," *Parinarium laurinum*.** M. TSUJIMOTO (J. Soc. Chem. Ind. Japan, 1936, 39, 116—117b).—The name *parinaric acid* (I) is suggested for the unsaturated acid  $\text{C}_{18}\text{H}_{28}\text{O}_2$  (Farmer et al., A., 1935, 1041) isolated from the kernel fat of *P. laurinum* (B., 1933, 476). (I) is not identical with coueupic acid.

J. W. B.

**Determination of hydroxyl number of hydroxy fatty acids.** K. HINSBERG (Biochem. Z., 1936, 285, 125—129).—The acid (0.6 g. of dihydroxystearic acid) is acetylated with a known amount of dry  $\text{C}_5\text{H}_5\text{N-Ac}_2\text{O}$  and an aliquot of the reaction product distilled in vac. in a described apparatus, the  $\text{Ac}_2\text{O}$  remaining and the  $\text{AcOH}$  formed being absorbed in standard  $\text{KOH}$  and the OH val. being calc. by difference.

P. W. C.

**Optical properties of fermentation lactic acid. III.**—See this vol., 899.

**M.-p. curves of optical isomerides.** J. D. M. ROSS (J.C.S., 1936, 718—723).—Mixed setting-point curves of the *d*- and *l*-forms of  $\text{CCl}_3\cdot\text{CH}(\text{OH})\cdot\text{CH}_2\cdot\text{CO}_2\text{R}$  (I:  $\text{R}=\text{H}$ . II:  $\text{R}=\text{Me}$ ) and  $\text{OH}\cdot\text{CHPh}\cdot\text{CO}_2\text{R}$  (III;  $\text{R}=\text{Me}$  or  $\text{Et}$ ) show formation of the racemate in all cases. Kremann's method shows dissociation of the racemates as follows: (I) 10, (II) 16, (III) 20%; van Laar's method gives erroneous results.  $\text{OH}\cdot\text{CHPh}\cdot\text{CO}_2\text{H}$  decomposes slightly at the m.p.

R. S. C.

**Behaviour of laevulyl chloride and acetyl-laevalic acid in the Friedel-Crafts reaction.** J. H. HELBERGER (Annalen, 1936, 522, 269—277).—Laevalyl chloride (I) (1 mol.) (from the acid and  $\text{SOCl}_2$ ),  $\text{C}_6\text{H}_6$  (excess), and  $\text{AlCl}_3$  (1 mol.) at  $50^\circ$  give 58% of phenacetylacetone (II), b.p.  $158^\circ/12\text{ mm.}$

m.p. 28—29°, and some of the diphenylvaleric acid (III), m.p. 116—118°, of Eykman (A., 1908, i, 22); in presence of  $\text{PhNO}_2$ , about the same amount of (III) but little (II) result. The formation of (II) shows that (I) can react as  $\text{CH}_2\text{Ac}\cdot\text{CH}_2\cdot\text{COCl}$ . Acetyl-lævulic acid [ $\gamma$ -acetoxy- $\gamma$ -valerolactone],  $\text{C}_8\text{H}_8$ , and  $\text{AlCl}_3$  (3 mols.) at 45—50° afford (II) (60%), (III) (trace), and a little  $\text{COPhMe}$ ; with  $\text{PhMe}$  and  $\text{PhOMe}$ , *p*-methyl-, b.p. 168°/12 mm., m.p. 53°, and *p*-methoxyphenacylacetone, respectively, are formed.  $\text{NH}_2\text{Ph}$  and (II) with a little  $\text{AcOH}$  at 100° give 1:5-diphenyl-2-methylpyrrole, m.p. 83°; *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$  similarly affords a pyrrole,  $\text{C}_{17}\text{H}_{11}\text{O}_2\text{N}_2$ , m.p. 103°; *o*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  yields a pyrrole,  $\text{C}_{18}\text{H}_{15}\text{O}_2\text{N}_2$ , m.p. 184° (becoming red); *p*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  furnishes pyrroles,  $\text{C}_{17}\text{H}_{16}\text{N}_2$ , m.p. 137°, and  $\text{C}_{28}\text{H}_{21}\text{N}_2$ , m.p. 230° [from 1 and 2 mols. of (II), respectively]; benzidine gives a pyrrole,  $\text{C}_{31}\text{H}_{23}\text{N}_2$ , m.p. 229°.

H. B.

Raman spectrum of oxalic acid.—See this vol., 777.

Detection of oxalate ion by decolorisation of indigotin solution according to Tananaev and Budkevitch. A. S. KOMAROVSKI and V. A. NASHARENKO (Z. anal. Chem., 1936, 104, 413—416; cf. this vol., 190).—The reaction is not sp. Other org. acids,  $\text{NO}_2$ , and small amounts of  $\text{Fe}^{++}$  produce the same effect, whilst Mo, W, or Zr inhibit the action by complex formation.

J. S. A.

Tetradeterosuccinic acid and derivatives. A. McLEAN and R. ADAMS (J. Amer. Chem. Soc., 1936, 58, 804—810).— $(\text{C}\cdot\text{CO}_2\text{Me})_2$  is reduced ( $\text{D}_2$ ,  $\text{PtO}_2$ ,  $\text{EtOAc}$ ) to *Me tetradeterosuccinate*, b.p. 190.3°/743 mm., m.p. 17°, hydrolysed (very dil.  $\text{HNO}_3$ ) to *tetradeterosuccinic acid*, m.p. 180—180.5° (anhydride, m.p. 119.3—119.6°). Other physical data are given. Reduction occurs more slowly with  $\text{D}_2$  than with  $\text{H}_2$ . Apparatus for (i) the production of  $\text{D}_2$ , (ii) reduction, and (iii) determination of *d* for solids which melt without decomp., is described.

H. B.

Mol. wts. of polymeric substances in pyrocatechol and their bearing on the nature of coal and derived products. R. C. SMITH and H. C. HOWARD (J. Amer. Chem. Soc., 1936, 58, 740—742).—Mol. wt. determinations (f.-p. method) of various polymeric substances (e.g.,  $\text{C}_2\text{H}_4$  succinate, adipic anhydride, lactide, tetraethylene glycol, synthetic resins) in *o*- $\text{C}_6\text{H}_4(\text{OH})_2$  and  $\text{Ph}_2$  (when sol.) indicate that (except when chemical degradation occurs) the anomalous behaviour exhibited by the products derived from coal (B., 1935, 534) is generally absent. The latter products must be built up of relatively small units.

H. B.

Constitution of the reduction product of trichloromethylparaconic acid. A. N. MEDRUM and R. D. KOTWAL (J. Indian Chem. Soc., 1936, 13, 213—216).—The reduction product of trichloromethylparaconic acid ( $\text{Me}_2$ , m.p. 77°,  $\text{Et}_2$ , b.p. 173°/10 mm., and  $\text{Et H}$  esters, b.p. 190°/20 mm.; anilide, m.p. 165—166°; *p*-toluidide, m.p. 173—174°; anilic acid, m.p. 121—122°) is not

et al., A.,

251) but is *8,8-dichloro-n-butane- $\alpha,\beta$ -dicarboxylic acid* [ $\text{Me}_2$ , b.p. 135°/11 mm., and  $\text{Et}_2$ , b.p. 215°/50 mm., esters; anhydride, m.p. 70—77°; acid chloride, b.p. 123°/5 mm. (not pure); dianilide, m.p. 176—177°; *di-p*-toluidide, m.p. 209—210°], converted by conc.  $\text{H}_2\text{SO}_4$  at 100° into tricarballic acid.

J. W. B.

Active methyldiglycollic acid and its derivatives. M. GODCHOT and P. VIELLES (Compt. rend., 1936, 202, 1358—1360).—*d*-Lactic acid (1 mol.), anhyd.  $\text{CuSO}_4$  (1 mol.), and the alcohol (4 mols.) when heated for 16 hr. give the *Me*, b.p. 49°/20 mm.,  $[\alpha]_D^{20}$  -9.61 and *Et* esters, b.p. 58°/20 mm.,  $[\alpha]_D^{20}$  +12°. These with  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{R}$  give *methyldiglycollic* [ $\alpha$ -carballoxy-methoxypropionic] esters, in which (a)  $\text{R}=\text{R}'$  *Me*, b.p. 118°/20 mm.,  $[\alpha]_D^{20}$  -4.47°, and *Et* (I), b.p. 127°/20 mm.,  $[\alpha]_D^{20}$  -9.77°, (b)  $\text{R}=\text{Me}$ ,  $\text{R}'=\text{Et}$ , b.p. 124°/20 mm.,  $[\alpha]_D^{20}$  -2.07°, and (c)  $\text{R}=\text{Et}$ ,  $\text{R}'$  *Me*, b.p. 125°/20 mm.;  $[\alpha]_D^{20}$  -11.96°. Hydrolysis of (I) by  $\text{NaOH}$   $\text{EtOH}$  gives the *l*-acid, m.p. 70°,  $[\alpha]_D^{20}$  -6.71° in  $\text{Et}_2\text{O}$ , which with hot  $\text{Ac}_2\text{O}$  gives the *anhydride*, b.p. 118°/17 mm.,  $[\alpha]_D^{20}$  in  $\text{Et}_2\text{O}$ , easily hydrolysed to the active acid.

R. S. G.

Constitution of some tartaric complexes and their physico-chemical applications. I. Tungsto-, II. Molybdo-, III. Boro-, IV. Alumino-, V. Antimonio-tartaric complexes. T. K. HENG (J. Chim. phys., 1936, 33, 356—377, 377—383, 383—403, 403—413).—A polarimetric study has been made of the complexes formed by some compounds of W, B, Mo, Al, and Sb with tartaric acid ( $\text{H}_2\text{T}$ ), tartaric acid ( $\text{H}_2\text{T}$ ), tartramide [ $(\text{NH}_2)_2\text{T}$ ] in aq. solution, in order to determine which parts of the  $\text{H}_2\text{T}$  mol. are involved in each case.

I. (Cf. Gernez, A., 1888, 938; Grossmann and Potter, A., 1906, ii, 211; Henderson and Barr, J.C.S., 1896, 69, 1451).  $\text{H}_2\text{WO}_4$  gives with  $\text{H}_2\text{T}$ ,  $\text{H}_2\text{WO}_4\cdot 2\text{H}_2\text{T}$  (I), and with  $\text{HNH}_2\text{T}$ ,  $\text{H}_2\text{WO}_4\cdot 2\text{HNH}_2\text{T}$ , hence only 1  $\text{CO}_2\text{H}$  of each  $\text{H}_2\text{T}$  mol. in (I) is fixed.  $\text{NaHWO}_4$  gives with  $\text{H}_2\text{T}$  [ $\text{H}_2\text{T}\cdot 2\text{WO}_3$ ] $\text{Na}_2$ , and with  $\text{HNH}_2\text{T}$ , [ $\text{HNH}_2\text{T}\cdot 2\text{WO}_3$ ] $\text{Na}_2$ .  $\text{Na}_2\text{WO}_4$  gives with  $\text{H}_2\text{T}$ , [ $\text{H}_2\text{T}\cdot \text{WO}_3$ ] $\text{Na}_2$  (II); with  $\text{NaHT}$ ,  $(2\text{H}_2\text{T}\cdot \text{WO}_3)\text{Na}_4$  (III); with  $\text{HNH}_2\text{T}$ , [ $\text{HNH}_2\text{T}\cdot 2\text{WO}_3$ ] $\text{Na}_2$ ; with  $\text{NaNH}_2\text{T}$ , no compound, indicating that in (II), both  $\text{CO}_2\text{H}$  of the  $\text{H}_2\text{T}$  mol. are fixed. (III) can be obtained cryst. in very small quantity. With malic acid ( $\text{H}_2\text{M}$ ),  $\text{H}_2\text{WO}_4$  gives  $\text{NaHWO}_4$  gives [ $\text{H}_2\text{M}\cdot 2\text{WO}_3$ ] $\text{Na}_2$  (cryst. powder hydrated);  $\text{Na}_2\text{WO}_4$  gives [ $2\text{H}_2\text{M}\cdot \text{WO}_3$ ] $\text{Na}_2$  (very easily cryst.,  $\alpha_D^{20}$  -34.5). No compound [ $\text{H}_2\text{M}\cdot \text{WO}_3$ ] $\text{Na}_2$  exists.

II. (Cf. Gernez, A., 1887, 540; Rosenheim and Itzig, A., 1900, i, 272; Grossmann and Potter, loc. cit.).  $\text{H}_2\text{MoO}_4$  gives with  $\text{H}_2\text{T}$ ,  $2\text{H}_2\text{T}\cdot \text{H}_2\text{MoO}_4$ , but with  $\text{HNH}_2\text{T}$ ,  $\text{HNH}_2\text{T}\cdot \text{H}_2\text{MoO}_4$ .  $\text{NaHMoO}_4$  gives with  $\text{H}_2\text{T}$ , [ $\text{H}_2\text{T}\cdot 2\text{MoO}_3$ ] $\text{Na}_2$  (IV); with  $\text{NaHT}$ , (V).  $\text{Na}_2\text{MoO}_4$  and  $\text{H}_2\text{T}$  give [ $\text{H}_2\text{T}\cdot \text{MoO}_3$ ] $\text{Na}_2$  (VI). Corresponding with these three Na compounds with  $\text{H}_2\text{T}$ , only one, [ $2\text{HNH}_2\text{T}\cdot \text{MoO}_3$ ] $\text{Na}_2$  (VII), with  $\text{HNH}_2\text{T}$  exists. Structural formulae for (IV)—(VII) are advanced.

III. (Cf. Darmon, A., 1926, 251, 457; 1930, 854; Lowry, J.C.S., 1929, 2853; Jones, J.C.S., 1933,

952). Gradual addition of  $\text{KBO}_2$  to  $\text{H}_2\text{T}$  gives at first  $\text{H}_2\text{T} \cdot \text{KBO}_2$ , and later  $\text{BTK}_2$ ; finally (considerable excess of  $\text{KBO}_2$ )  $\text{BTK}$ . The complex  $2\text{H}_2\text{T} \cdot \text{KBO}_2$  (or  $\text{BT}_2\text{K}$ ) described by Lowry does not exist in aq. solution.  $\text{Me}_2\text{T}$  gives with  $\text{KBO}_2$ , at first  $\text{Me}_2\text{T} \cdot \text{BO}_2\text{K}$ , but after 2 months  $\text{H}_2\text{T} \cdot \text{KBO}_2$ , and not  $2\text{H}_2\text{T} \cdot \text{KBO}_2$ , as found by Darmois (A., 1927, 448) by hydrolysis of  $\text{Et}_2\text{T}$  with  $\text{KBO}_2$ .  $\text{NaBO}_2$  gives with  $(\text{NH}_2)_2\text{T}$ ,  $(\text{NH}_2)_2\text{T} \cdot \text{NaBO}_2$ ,  $\alpha_D^{20} + 69.5^\circ$ , analogous to the spirans, and with  $\text{HNH}_2\text{T}$ ,  $2\text{NH}_2\text{HT} \cdot \text{NaBO}_2$ .

IV. (Cf. Quadrat and Korecky, A., 1909, i, 762).  $\text{Al}(\text{OH})_3$  dissolves in aq.  $\text{H}_2\text{T}$  to give  $\text{H}_2\text{T} \cdot \text{Al}(\text{OH})_3$  which is levorotatory in conc., and dextrorotatory in dil., solution.  $\text{HNH}_2\text{T}$  gives  $\text{HNH}_2\text{T} \cdot \text{Al}(\text{OH})_3$ , which is levorotatory in all concns.  $(\text{NH}_2)_2\text{T}$  gives no compound. Addition of  $\text{NaOH}$  to a mixture of  $\text{Na}_2\text{T}$  and  $\text{Al}_2(\text{SO}_4)_3$  gives a very basic solution of  $(\text{AlT}_3)\text{Na}_3$ , from which  $\text{Al}$  cannot be pptd. by  $\text{Na}_2\text{HPO}_4$ . The mechanism of formation of this compound is discussed.  $(\text{AlT}_3)\text{K}_3$  can be obtained by hydrolysis of  $\text{Me}_2\text{T}$  with  $\text{KAlO}_2$ . From these results a polarimetric method of studying the corrosion of  $\text{Al}$  by  $\text{NaOH}$  is suggested.

V. (Cf. Darmois, A., 1927, 448). A mixture of  $\text{SbF}_3$  and  $\text{H}_2\text{T}$  when gradually neutralised gives a ppt. of tartar emetic at the correct concn. Similar compounds are obtained when  $\text{H}_2\text{T}$  is replaced by any of its salts, inorg. or org. Since aq.  $\text{SbF}_3$  attacks glass (by hydrolysis), a polarimetric method of studying the corrosion of glass by  $\text{HF}$  is indicated and developed.

R. C. M.

**Determination of citric acid by conversion into acetone.** II. K. TAUFEL and K. SCHOERER (Z. Unters. Lebensm., 1936, 71, 297—310; cf. A., 1933, 807).—Citric acid is pptd. by aq.  $\text{Bi}(\text{NO}_3)_3$ -mannitol, and oxidised either with  $\text{KMnO}_4$  to  $\text{COMe}_2$ , which is determined by the  $\text{CHI}_3$  method, or with  $\text{Fe}_2(\text{SO}_4)_3$  in presence of light to acetonedicarboxylic acid, which is determined by pptn. with Deniges'  $\text{HgSO}_4$  reagent. An improved procedure is described for the removal of substances which interfere in the former method.

E. C. S.

**Polarimetric study of the formation of complex molybdosaccharates.**—See this vol., 691.

**Synthesis of aldobionic acid of gum acacia.** R. D. HOTCHKISS and W. F. GOEBEL (J. Amer. Chem. Soc., 1936, 58, 858—859).—Me acetobromoglycuronate (A., 1935, 1483), 1:2:3:4-dusopropylidenegalactose, and  $\text{Ag}_2\text{O}$  in  $\text{Et}_2\text{O}$  give 1:2:3:4-dusopropylidenegalactose-6- $\beta$ -triacetylglucuronide Me ester, m.p. 112.5—114°,  $[\alpha]_D^{25} - 68^\circ$  in  $\text{CHCl}_3$ , hydrolysed [first  $\text{Ba}(\text{OH})_2$  then dil.  $\text{H}_2\text{SO}_4$ ] to galactopyranose-6- $\beta$ -glucuronopyranoside (I), which is identical with the aldobionic acid (II) from gum acacia (Heidelberg and Kendall, A., 1930, 66; cf. Challinor *et al.*, A., 1931, 465). (I) and (II) with  $\text{CH}_2\text{N}_2$  give the same Me ester, m.p. 119° (decomp.),  $[\alpha]_D^{25}$  (in  $\text{H}_2\text{O}$ )  $-2.9^\circ \rightarrow -9.1^\circ$  (Ac. derivative, m.p. 202—203°,  $[\alpha]_D^{25} - 17.5^\circ$  in  $\text{CHCl}_3$ ).

H. B.

**Synthesis of the hepta-acetyl methyl ester of gentiobiuronic acid.** R. D. HOTCHKISS and W. F. GOEBEL (Science, 1936, 83, 353—354).—Condensation of  $\beta$ -glucose 1:2:3:4-tetra-acetate, with Me 1-

bromotriacetylglucuronate in  $\text{CHCl}_3$  in presence of  $\text{Ag}_2\text{O}$  yields the  $\beta$ -hepta-acetyl Me ester (I) of the aldobionic acid, glucose-6- $\beta$ -glucuronide. (I), m.p. 198—199° has  $[\alpha]_D^{25} - 11.0$  in  $\text{CHCl}_3$ , and is converted into the  $\alpha$ -isomeride, m.p. 201—202°,  $[\alpha]_D^{25} + 48.4^\circ$  in  $\text{CHCl}_3$ , by the action of  $\text{ZnCl}_2$  in  $\text{Ac}_2\text{O}$ . L. S. T.

**Disulphoacetic acid.** H. J. BACKER and N. BENNINGA (Rec. trav. chim., 1936, 55, 370—373).—Oxidation of  $\text{CH}(\text{SO}_3\text{H})_2 \cdot \text{CHO}$  with either  $\text{AcO}_2\text{H}$ -aq.  $\text{H}_2\text{O}_2$  at  $50^\circ$  or  $\text{Ag}_2\text{O}$  on a water-bath affords disulphoacetic acid + 2.5  $\text{H}_2\text{O}$ , sinters  $78^\circ$ , m.p. 85—86°, isolated as its  $\text{Ag}_3 + \text{H}_2\text{O}$  salt ( $\text{Ba} + 9\text{H}_2\text{O}$ ,  $\text{K} + \text{H}_2\text{O}$ ,  $\text{NH}_2\text{Ph}$ , strychnine + 8 $\text{H}_2\text{O}$ , and quinine + 5 $\text{H}_2\text{O}$  salts). When heated at 110—130° it decomposes into  $\text{CO}_2$  and  $\text{CH}_2(\text{SO}_3\text{H})_2$ . J. W. B.

**Compounds of thiol-acids with aldehydes.** M. P. SCHUBERT (J. Biol. Chem., 1936, 114, 341—350).—Aldehydes,  $\text{RCHO}$ , and  $\text{SH} \cdot \text{CH}_2 \cdot \text{CO} \cdot \text{NHPh}$  (I) in  $\text{EtOH}$  give  $\alpha$ -hydroxyalkylthiolglycolanilides (II),  $\text{OH} \cdot \text{CHR} \cdot \text{S} \cdot \text{CH}_2 \cdot \text{CO} \cdot \text{NHPh}$ , which, although they can be recrystallised, are more or less dissociated in solution, but give rather more stable Ac derivatives.  $\text{AcCO}_2\text{H}$ , benzoquinone, and isatin give similar compounds, but  $\text{COMe}_2$ ,  $\text{COPhMe}$ ,  $\text{Ac}_2$ , and  $\text{Bz}$ , do not. Cysteine and aldehydes in  $\text{EtOH}$  or  $\text{H}_2\text{O}$  give thiazole derivatives,  $\text{CHR} \cdot \text{S} \cdot \text{CH}_2 \cdot \text{CO} \cdot \text{NH} \cdot \text{CH} \cdot \text{CO}_2\text{H}$

which dissociate to a smaller extent;  $\text{AcCO}_2\text{H}$ , however, gives ( $\beta$ -lactic acid)thiolalanine,  $\text{CO}_2\text{H} \cdot \text{CMe}(\text{OH}) \cdot \text{S} \cdot \text{CH}_2 \cdot \text{CH}(\text{NH}_2) \cdot \text{CO}_2\text{H}$  (III), which is of type (II). The following derivatives of (II) are described, in which  $\text{R} = \text{H}$ , m.p. 91—92° (Ac derivative, m.p. 91—92°),  $\text{Pr}$ , m.p. 73—75°,  $\text{CCl}_3$ , m.p. 111—112° (Ac derivative, m.p. 133—134°), and compounds,  $\text{OH} \cdot \text{CR} \cdot \text{S} \cdot \text{CH}_2 \cdot \text{CO} \cdot \text{NHPh}$ , in which  $\text{R}$  is a residue from benzoquinone, m.p. 165—166°, and isatin, m.p. 101°, and ( $\beta$ -lactic acid)thiolacetanilide (from  $\text{AcCO}_2\text{H}$ ), m.p. 90—92°. These OH-compounds give a colour with Na nitroprusside (IV) in aq.  $\text{NaHCO}_3$  [although less strongly than does (I)] and can be titrated with I [1 atom consumed to give ( $\text{S} \cdot \text{CH}_2 \cdot \text{CO} \cdot \text{NHPh}$ )]]; the Ac derivatives consume I only very slowly and give no colour with (IV). (I) reacts with the compound (V) from  $\text{CHO} \cdot \text{COPh}$  and  $\text{SH} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$  to ppt. the less sol. hydroxybenzoyl-methylthiolacetanilide,  $\text{COPh} \cdot \text{CH}(\text{OH}) \cdot \text{S} \cdot \text{CH}_2 \cdot \text{CO} \cdot \text{NHPh}$ , m.p. 148°. 4-Carboxytetrahydrothiazole, m.p. 195° (decomp.), and its 2- $\text{CCl}_3$  (VI), cryst., - $\text{Pr}$  (VII), m.p. 167—168°, - $\text{Ph}$  (VIII), m.p. 159—160° (Ac derivative, m.p. 202°), and 2'-furyl (IX) derivative, m.p. 125—126°, are described; they liberate  $\text{CO}_2$  from  $\text{NaHCO}_3$  and dissolve in aq.  $\text{NaOAc}$ . Only (VI) gives a colour with (IV) in aq.  $\text{NaHCO}_3$ , but in dil. aq.  $\text{NH}_3$  (VI), (VII), and (IX) give the test strongly and (VIII) weakly. Even if the test is negative, some dissociation occurs, since in  $\text{NaHCO}_3$  (VIII) and  $\text{CH}_3\text{I} \cdot \text{CO}_2\text{Na}$  produce  $\text{PhCHO}$  and  $\text{CO}_2\text{H} \cdot \text{CH}_2 \cdot \text{S} \cdot \text{CH}_2 \cdot \text{CH}(\text{NH}_2) \cdot \text{CO}_2\text{H}$ , and  $\text{CHPh} \cdot \text{N} \cdot \text{NHPh}$  is obtained from (VIII) and  $\text{NH}_2 \cdot \text{NHPh}$  in 2M-aq.  $\text{KOAc}$ . The thiazoles, but not the Ac derivative, absorb I readily to give cystine. (III), m.p. 150—151°, but not its  $\text{Ac}_2$  derivative (prep. by  $\text{AcOH} \cdot \text{C}_2\text{H}_5\text{N}$ ), m.p. 201—202° (decomp.), can be titrated with I; neither gives a colour with

(IV), even in dil. aq.  $\text{NH}_3$ . (I) and (V) give *Ac* derivatives, m.p.  $91^\circ$  and  $202^\circ$ , respectively.

R. S. C.

**Preparation of carboxylic acids of organic selenides.** A. FREDGA (Svensk Kem. Tidskr., 1936, 48, 91—98).—Selenolcarboxylic acids  $\text{SeR}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  are prepared by interaction (air excluded) of  $\text{Hg}(\text{Se}\cdot\text{CH}_2\cdot\text{CO}_2\text{Na})_2$  and  $\text{Na}_2\text{S}$  in  $\text{H}_2\text{O}$  to give  $\text{SeNa}\cdot\text{CH}_2\cdot\text{CO}_2\text{Na}$ , and treatment of the resulting solution with the alkyl halide in  $\text{MeOH}$  or  $\text{EtOH}$ . Thus from the appropriate halide are obtained *benzyl*-, m.p.  $71$ — $72^\circ$  (*Cu* salt), *methylenebis*-, m.p.  $122.5$ — $123^\circ$  (*Cu* salt), *ethane- $\alpha\beta$ -di*-, m.p.  $153$ — $154^\circ$  (only 2% yield, much  $\text{C}_2\text{H}_4$  formed) (*Cu* salt), and *propane- $\alpha\gamma$ -di-selenolacetic acid*, m.p.  $77$ — $78^\circ$  (*Cu* salt). Similarly from  $\text{Hg}(\text{Se}\cdot[\text{CH}_2]_2\cdot\text{CO}_2\text{H})_2$  are prepared  *$\beta$ -benzylselenolpropionic acid*, m.p.  $75$ — $76^\circ$  (*Cu* salt), and  *$\beta$ -carboxymethylselenolpropionic acid*, m.p.  $91$ — $92^\circ$ .

J. W. B.

**Slow combustion of formaldehyde.**—See this vol., 801.

**Reaction of formaldehyde with hydrogen peroxide in heavy water.**—See this vol., 688.

**Thermal decomposition of acetaldehyde and ethylene oxide: existence of short-lived intermediates.** M. W. TRAVERS and R. V. SEDDON (Nature, 1936, 137, 906—907).—The rates of decomp. are accelerated initially, the acceleration being more marked in the case of  $(\text{CH}_2)_2\text{O}$ , which exhibits an induction period. The processes involved are evidently more complex than hitherto supposed. With  $\text{MeCHO}$  at  $360$ — $500^\circ$  over a wide range of concn., decomp. follows alternative courses either into (i)  $\text{CH}_4$  and  $\text{CO}$  or (ii) propylene and  $\text{CO}$ . (i) is dominant in unpacked and (ii) in packed tubes. Some propylene is always formed in (i) and it undergoes some condensation to produce a 6-carbon hydrocarbon and more complex products. Although packing retards (i) and accelerates (ii) the total rate of decomp. is independent of the nature or dimensions of the reaction tube. The formation of a short-lived intermediate is probable.

L. S. T.

**Electrolytic reduction of aliphatic ketones.**—See this vol., 687.

**Action of bromine on acetone in presence of various solvents.** T. TOMONARI (Z. physikal. Chem., 1936, B, 32, 222—228).—The bromination is retarded by  $\text{H}_2\text{O}$  and to a smaller extent by alcohols, the effect falling and ultimately changing in sign with increasing chain length. This phenomenon is ascribed to the  $\text{COMe}_2\cdot\text{H}_2\text{O}$  or  $\text{COMe}_2\cdot\text{alcohol}$  complex retarding the enolisation of the  $\text{COMe}_2$ . In  $\text{COMe}_2\text{--CS}_2$  and  $\text{COMe}_2\text{--C}_6\text{H}_{14}$  mixtures and in pure  $\text{COMe}_2$  the rate is determined primarily by the amount of catalyst.

R. C.

**Metal ketyls of the aliphatic series. IV. Action of sodium on *tert*.-butyl *tert*.-amyl and on *tert*.-butyl *tert*.-hexyl ketones.** I. N. NAZAROV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 71—75).— $\text{COBu}^\gamma\cdot\text{CMe}_2\text{Et}$  (I) (from  $\text{COPr}^\delta\text{Bu}^\gamma$ ,  $\text{NaNH}_4$ , and  $\text{EtI}$ ) in  $\text{Et}_2\text{O}$  with  $\text{Na}$  for 26 days affords (I) and *tert*.-butyl-*tert*. amylcarbinol (II), b.p.  $186$ — $190^\circ$ . From the above reaction mixture and  $\text{EtI}$ , (I), (II),

and  $\text{NH}_2\cdot\text{CO}_2\text{Ph}$  are obtained. Using  $\text{BzBr}$  instead of  $\text{EtI}$  the main product is *benzoyl-tert*.-butyl-*tert*.-amylcarbinol, b.p.  $182$ — $186^\circ/22\text{ mm.}$ , partly converted by  $6N\cdot\text{KOH}\text{--EtOH}$  during 7 hr. into (II). Reaction between  $\text{COBu}^\gamma\cdot\text{CMe}_2\text{Et}$  (III) (from  $\text{COBu}^\gamma\cdot\text{CHEt}_2$ ,  $\text{NaNH}_4$ , and  $\text{MeI}$ ) and  $\text{Na}$  in  $\text{Et}_2\text{O}$  was incomplete after 4 months. Decomp. of the reaction mixture affords (III) and *tert*.-butyl-*tert*.-hexylcarbinol (IV), b.p.  $190$ — $208^\circ$  (*phenylurethane*, m.p.  $97$ — $98^\circ$ ). (III) and (IV) are also obtained from the above reaction mixture and  $\text{EtI}$ .

P. G. C.

**Crystalline constituent of essential oil of matsubasa.**—See this vol., 651.

**Diacyetyl.** J. PIEN, J. BAISSÉ, and R. MARTIN (Ann. Falsif., 1936, 29, 204—225).—The prep. of  $\text{Ac}_2$  from  $\text{CMeEt}\cdot\text{N}\cdot\text{OH}$ , its recognition by formation of the yellowish-brown xyloquinone, and the characterisation by means of the phenylhydrazone and particularly by its reaction with 3 : 4-tolylenediamine and  $\text{H}_2\text{SO}_4$  are described. The yellow colour of the quinoxaline is appreciable at dilutions of 1 : 100,000 and for the determination,  $\text{K}_2\text{Cr}_2\text{O}_7$  solutions may be used as colour standards. Conversion into the dioxime and treatment with a  $\text{Ni}$  salt is not sensitive. The formation of  $\text{Ac}_2$  in milk products and its isolation and determination are discussed.

E. H. S.

**Cobalt salts of glyoximes. I. II. Diglyoxime and sesquiglyoxime cobaltic salts.** L. CAMBI and (SIGNA.) C. CORISELLI (Gazzetta, 1936, 66, 81—91, 91—99).—I. The red series of complex Co derivatives of glyoximes represents  $\text{Co}^{\text{II}}$ , whilst the green series (A., 1924, i, 20) represents  $\text{Co}^{\text{III}}$ ,  $\text{Co}^{\text{II}}$  salts being very readily oxidised in presence of glyoximes. The magnetic susceptibilities ( $\chi$ ) at  $84$ — $294^\circ\text{ abs.}$  of a no. of complexes are tabulated. In simple additive compounds of the type  $(\text{DH}_2)_2\text{Co}^{\text{II}}\text{X}_2$  ( $\text{DH}_2 = \text{OH}\cdot\text{N}\cdot\text{CMe}\cdot\text{CMe}\cdot\text{N}\cdot\text{OH}$ ),  $\chi$  is additive; salts of the red series (A., 1931, 938) belong to this type. Those of the green series are diamagnetic, and thus have the structure  $[(\text{DH})(\text{DH}_2)\text{Co}^{\text{III}}\text{X}_2]$  or  $[(\text{DH}_2)_2\text{Co}^{\text{III}}\text{X}_2]\text{H}$ ; they are obtained in  $\text{EtOH}$  from  $\text{CoX}_2$  and  $(\text{DH}_2)$ , in presence of acid and of  $\text{O}_2$ . With  $\text{NH}(\text{CH}_2\text{Ph})_2$ , and of other *sec.* amines,  $[(\text{DH})(\text{NH}_2)\text{CoBr}]$  (I) forms salts of type  $[(\text{DH})_2\text{CoBr}_2]\text{NH}_2(\text{CH}_2\text{Ph})_2$ , which are reconverted into (I) by  $\text{HBr}$ . With  $\text{NH}_3$ , the complex  $[(\text{DH})_2\text{Co}(\text{NH}_3)_2]\text{Br}$  is formed, or, using  $\text{NH}_4\text{OAc}$ ,  $[(\text{DH})_2\text{Co}(\text{NH}_3)_2]\text{Br}$ . With  $\text{AgNO}_2$  and  $\text{NaOAc}$ , (I) yields the complex  $[(\text{DH})_2\text{Co}(\text{NO}_2)_2]\text{Na}\cdot\text{H}_2\text{O}$ , in which  $\text{Na}$  can be replaced by the ion  $\text{NH}_2\text{Bu}^\delta$ , or by  $\text{H}$ . With  $\text{KOH}$ , (I) gives the salt  $[(\text{DH})_2\text{Co}(\text{OH})_2]\text{K}$ . Action of  $\text{KOAc}$  on (I) yields the diamagnetic complexes  $[(\text{DH})_2\text{Co}(\text{OH})]$  and  $[(\text{DH})\text{Co}(\text{D})]$ , which are reconverted into (I) by  $\text{HBr}$ .

II.  $\text{Co}(\text{OAc})_2 + \text{AcOH}$  and  $\text{DH}_2$  in boiling  $\text{EtOH}$  absorb  $\text{O}_2$  to form the complex  $[\text{Co}_2(\text{D})_3]$  (II), also obtained from  $[(\text{DH})\text{Co}(\text{D})]$  and  $\text{DH}_2$ , or from  $\text{Co}$  and  $\text{DH}_2$ ; (II) with  $\text{HBr}$  yields  $[(\text{DH})(\text{DH}_2)\text{CoBr}_2]$ . The *p*-tolylmethyl- and diphenyl-glyoxime analogues of (II) behave similarly.  $\chi$  of (II) varies according to method of prep. The structures of  $[(\text{DH})\text{Co}(\text{D})]$  and of (II) are discussed.

E. W. W.

**Methylalkoxyglyoximes as chelate groups.** E. SHARRATT and W. WARDLAW (J.C.S., 1936, 563—

567).—When  $\text{OH}\cdot\text{N}\cdot\text{CH}\cdot\text{CMe}\cdot\text{N}\cdot\text{OH}$  (I) (*Ni* derivative, decomp.  $243^\circ$ ) and  $\text{CuCl}_2$  react in  $\text{EtOH}$  and the complex (I) produced (this vol., 410) is removed, the filtrate slowly deposits *Cu methylethoxyglyoxime dichloride* (III), m.p.  $165^\circ$  (decomp.), decomposed by  $\text{H}_2\text{O}$ ,  $\kappa=3.471\times 10^{-5}$  at  $25^\circ$ ; it is produced from (II) and  $\text{EtOH}$  by oxidation and its structure is proved by the following reactions. (III) is not obtained from (II) in the absence of air, with aq.  $\text{Na}_2\text{S}$  gives *methylethoxyglyoxime* (IV), m.p.  $142^\circ$  (*Ni* derivative, m.p.  $197^\circ$ ), and with  $\text{H}_2\text{S}$ -aq.  $\text{EtOH}$  gives  $\text{OH}\cdot\text{N}\cdot\text{CHMe}\cdot\text{CO}_2\text{Et}$ , m.p.  $95^\circ$  [produced from (IV) by the  $\text{HCl}$  liberated; modified prep.]. (I) and  $\text{CuCl}_2$  in  $\text{MeOH}$  do not ppt. a complex analogous to (II), but slowly yield *Cu methylethoxyglyoxime dichloride* (V), m.p.  $176^\circ$  (decomp.), which with  $\text{Na}_2\text{S}$  and  $\text{H}_2\text{S}$  gives *methylmethoxyglyoxime*, m.p.  $148^\circ$  (*Ni* derivative, m.p.  $223^\circ$ , decomp.  $285^\circ$ ), and  $\text{OH}\cdot\text{N}\cdot\text{CHMe}\cdot\text{CO}_2\text{Me}$ , m.p.  $71^\circ$  (lit.  $69^\circ$ ), respectively. When heated in  $\text{EtOH}$  or  $\text{MeOH}$  in air, (II) gives (III) and (V), respectively. Dimethyl-, methyl-ethyl- (*Ni* derivative, decomp.  $260^\circ$ ), and benzyl-methyl-glyoxime yield no such compounds, since they do not possess an oxidisable H. R. S. C.

**Harding sugar reagent.** E. J. KING, G. A. D. HASLEWOOD, and G. A. GRANT (*Nature*, 1936, 137, 872).—The Harding-Downs factor for glucose (A., 1933, 964) can be consistently reproduced when reagents of a sufficiently high grade are used. Van der Plank's results (this vol., 650) may be due to the use of inferior reagents. L. S. T.

**Enolisation of sugars under the action of different bases.** A. KUSIN (*Ber.*, 1963, 69, [B], 1041–1049).—Solutions of glucose (I) and  $\text{Ca}(\text{OH})_2$  when acidified after 1 hr. at  $30^\circ$  immediately decolorise dichloroindophenol and absorb I from acid solution, thus showing the presence of enolic OH. In similar circumstances solutions of (I) and  $\text{NaOH}$  or  $\text{NaOH}\cdot\text{Na}_2\text{HPO}_4$  ( $p_{\text{H}}$  12) have no reducing properties in acid solution. The existence of enolic OH is further established by the rapid disappearance of the reducing action and a fugitive coloration with  $\text{FeCl}_3$ . After 24 hr. at room temp. mannose (II) is present in appreciable amount in solution of (I) and  $\text{Ca}(\text{OH})_2$ , whereas after 48 hr. fructose (III) can scarcely be detected. In solutions of (I) and  $\text{NaOH}$  (III) can be isolated as *Ca fructosate* after 24 hr., whereas (II) is present only in traces. It is considered that the enolic form is produced from (I) by  $\text{Ca}(\text{OH})_2$  without rupture of the pyranose ring, whereas the much less stable enol formed by the action of  $\text{NaOH}$  has the open-chain structure. H. W.

**Optical rotation of *l*-threose.** V. DEULOFEV (*J. Amer. Chem. Soc.*, 1936, 58, 855; cf. Hockett, this vol., 191).—*d*-Threosediacetamide triacetate, prepared by the method (A., 1933, 147) used for the *l*-erythrose derivative, has m.p.  $176\text{--}177^\circ$   $[\alpha]_{\text{D}} +38^\circ$  in  $\text{H}_2\text{O}$ . The compounds of the *l*-threose series (A., 1930, 68) need correction for sign and vals. H. B.

**Monomethylhexoses. II. Revision of the constitutions of the supposed 4-methylgalactose and 4-methylmannose of Pacsu, and their for-**

**mulation as 6-methylgalactose and 2-methylmannose, respectively.** J. MUNRO and E. G. V. PERCIVAL (*J.C.S.*, 1936, 640–644; cf. A., 1935, 1108).—The so-called 4-methylgalactose of Pacsu and Lob (A., 1930, 197) is 6-methylgalactose (I). The experiments of Pacsu and von Kary (A., 1930, 70) on the methylation of diisopropylidenemannose-dibenzylmercaptal (II) could not be repeated; the supposed 4-methylmannose was probably 2-methylmannose (III) mixed with mannose and some polymethylated derivatives. (I) was recognised by (a) comparison with authentic specimens of the sugar, m.p.  $122\text{--}123^\circ$ ,  $[\alpha]_{\text{D}} +112^\circ$  (4 min.)  $\rightarrow +66^\circ$  in 6 hr. in  $\text{H}_2\text{O}$ , its phenylosazone, m.p.  $200\text{--}201^\circ$ ,  $[\alpha]_{\text{D}} +144^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , and phenylhydrazone, m.p.  $179^\circ$ ,  $[\alpha]_{\text{D}} +24^\circ \rightarrow +14.8^\circ$  in 24 hr. in  $\text{C}_5\text{H}_5\text{N}$ , (b) formation of the  $\text{Ac}_3$  derivative, triacetyl-methylgalactosidyl bromide, methyltriacetyl-methylgalactoside, reaction with  $\text{Me}_2\text{SO}_4\text{--NaOH}$ -aq.  $\text{COME}_2$  and then with  $\text{MeI}\text{--Ag}_2\text{O}$ , and finally hydrolysis by 8%  $\text{HCl}$  at  $100^\circ$  to 2:3:4:6-tetramethylgalactose, (c) oxidation by  $\text{Br}$  at  $35^\circ$  to a  $\gamma$ -lactone, and (d) formation of a mixture of methyl-furanoside and -pyranoside with 0.5%  $\text{HCl}\text{--MeOH}$ . (II), when heated, gives mannosedi-benzylmercaptal,  $[\alpha]_{\text{D}} +79^\circ$  in  $(\text{CHCl}_3)_2$ . Pacsu and von Kary's conditions of methylation gave a syrup, yielding a mixture ( $\text{OMe}$  2.4%), m.p.  $118^\circ$  (sharp),  $[\alpha]_{\text{D}} -48^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ ; with  $\text{HgCl}_2$ , the syrup gave only an oil (IV), which afforded a mixture ( $\text{OMe}$  11.1%) of methyl-tetra-acetyl- and -triacetyl-methyl-mannosides. More drastic methylation gives products with higher  $\text{OMe}$  contents which are, however, always mixtures. These syrups all give mannose-phenylhydrazone ( $<20\%$ ) and after removal thereof glucosazone (which must owe its formation to the presence of 2-methylmannose) and small amounts of methylated by-products. The structures of Pacsu's glucose-, galactose-, and mannose-dibenzylmercaptals need revision. R. S. C.

**Syntheses with 5:6-anhydroisopropylidene-glucose; *d*-glucosyl-6-phthalimide.** H. OHLE and E. EULER (*Ber.*, 1936, 69, [B], 1022–1026; cf. this vol., 192).—5:6-Anhydroisopropylideneglucose and pure  $\text{o-C}_6\text{H}_4(\text{CO})_2\text{NH}$  do not interact at  $140\text{--}150^\circ$ , but in presence of a suitable catalyst, notably  $\text{C}_5\text{H}_5\text{N}$ , isopropylidene-*d*-glucosyl-6-phthalimide (I) m.p.  $174^\circ$ ,  $[\alpha]_{\text{D}} +14.38^\circ$  in  $\text{COME}_2$ , is formed in 80% yield. The constitution of (I) follows from its conversion by  $\text{COME}_2$  containing  $\text{CuSO}_4$  and  $\text{H}_2\text{SO}_4$  into isodisopropylidene-*d*-glucosyl-6-phthalimide, m.p.  $124.5\text{--}125.5^\circ$ ,  $[\alpha]_{\text{D}} +18.92^\circ$  in  $\text{CHCl}_3$ , also obtained from isodisopropylideneglucose 6-*p*-toluenesulphonate through isodisopropylidene-*d*-glucosyl-6-amine, b.p.  $120^\circ$  (bath)/0.08 mm.,  $[\alpha]_{\text{D}} +39.9^\circ$  in  $\text{CHCl}_3$ . The  $\text{NH}_2$  in the isopropylideneglucosylamine of Ohle *et al.* (A., 1928, 870) is shown to occupy position 6, since the compound is converted by  $\text{o-C}_6\text{H}_4(\text{COCl})_2$  into a non-homogeneous product transformed by alkaline hydrolysis into isopropylidene-*d*-glucosyl-6-phthalamic acid, m.p.  $183^\circ$  (decomp.), also obtained from (I) and boiling dil.  $\text{NaOH}$ . (I) is hydrolysed by 50%  $\text{AcOH}$  at  $100^\circ$  to *d*-glucosyl-6-phthalimide, m.p.  $192^\circ$ ,  $[\alpha]_{\text{D}} +105.13^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , which strongly reduces Fehling's solution and gives approx. correct

results when titrated with I. When warmed with  $\text{NHPh}\cdot\text{NH}_2$  (3 mol.) and  $\text{AcOH}$  (3 mol.) at  $100^\circ$  it gives a (?) *phenylhydrazone*, m.p.  $171^\circ$ ,  $[\alpha]_D^{20} +81.66^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , whereas addition of it to a solution of  $\text{NHPh}\cdot\text{NH}_2$  (3 mol.) in excess of 25%  $\text{AcOH}$  at  $100^\circ$  affords a "semiosazone,"  $\text{C}_{46}\text{H}_{12}\text{O}_{10}\text{N}_8$ , m.p.  $177^\circ$ ,  $[\alpha]_D^{20} +80^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ . H. W.

**Mechanism of carbohydrate oxidation. XIX. Preparation of disaccharide antipodes.** L. C. KREIDER and W. L. EVANS (J. Amer. Chem. Soc., 1936, 58, 797—800).—The appropriate acetobromopentose (1 mol.) added in 10 portions to a stirred mixture of  $\text{OH}\cdot\text{CH}_2\cdot\text{CO}_2\cdot\text{CH}_2\cdot\text{OAc}$  (2 mols.),  $\text{Ag}_2\text{CO}_3$  (1 mol.), and "Drierite" (4 mols.) in  $\text{C}_6\text{H}_6$  (25 mols.) gives  $\beta$ -d- (I), m.p.  $102^\circ$  (all m.p. are corr.),  $[\alpha]_D^{21} +9.04^\circ$  in  $\text{CHCl}_3$ , and  $\beta$ -l- (II), m.p.  $102^\circ$ ,  $[\alpha]_D^{21} -9.07^\circ$  in  $\text{CHCl}_3$ , -arabinosido- and  $\beta$ -d-, m.p.  $117^\circ$ ,  $[\alpha]_D^{22} -60.3^\circ$  in  $\text{CHCl}_3$ , and  $\beta$ -l-, m.p.  $117^\circ$ ,  $[\alpha]_D^{23} +60.2^\circ$  in  $\text{CHCl}_3$ , -xylosido-dihydroxyacetone tetra-acetates in yields of 20—35%. The  $\beta$ -dl-arabinosido-derivative, from (I) and (II), has m.p.  $116^\circ$ . Acetobromo-1-xylose, m.p.  $102^\circ$ ,  $[\alpha]_D +212.2^\circ$ , is prepared in 28% yield by Levene and Raymond's method (A., 1931, 336). The contribution of the group  $\text{OAc}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{CH}_2\cdot\text{O}\cdot\text{CH}$  towards the mol. rotation is calc. to be about  $\pm 33,600$  according to the position of the O ring. H. B.

**Carbohydrates. XX. New syntheses of gentiobiose and 1- $\beta$ -glucosidofructose.** P. BRIGL and O. WIDMAIER (Ber., 1936, 69, [B], 1219—1227).—The constitution of the 5:6-benzylidene-1:2-isopropylideneglucose (I) of Levene *et al.* (A., 1923, i, 92; 1933, 378) is confirmed by converting it into the acetate, m.p.  $104$ — $105^\circ$ , which passes when kept in 80%  $\text{AcOH}$  or catalytically hydrogenated into 1:2-isopropylideneglucose 3-acetate. The dibenzylidenefructose of Brigl *et al.* (A., 1932, 1115) is 2:3:4:5-dibenzylidenefructopyranose (II) since it readily affords a 1-p-toluenesulphonate, m.p.  $171^\circ$  (decomp.),  $[\alpha]_D -34.9^\circ$  in  $\text{CHCl}_3$ , and is converted by  $\text{MeI}$  and  $\text{Ag}_2\text{O}$  into 2:3:4:5-dibenzylidene-1-methylfructose, m.p.  $113$ — $114^\circ$ ,  $[\alpha]_D^{20} -30.5^\circ$  in  $\text{CHCl}_3$ , hydrolysed to non-cryst. 1-methylfructose, which affords 1-methyl-2:3:4:5-diisopropylidenefructose, m.p.  $48$ — $49^\circ$ . The possibility that the  $\text{CHPh}$  and  $\text{CMe}_2$  residues are not similarly placed is excluded since the condensation of fructose with  $\text{PhCHO}$  in presence of  $\text{ZnCl}_2$  gives also 2:3-benzylidenefructose, m.p.  $181^\circ$ ,  $[\alpha]_D^{20} -183.3^\circ$  in  $\text{C}_5\text{H}_5\text{N}$  (triacetate, m.p.  $112^\circ$ ,  $[\alpha]_D^{20} -158.9^\circ$  in  $\text{CHCl}_3$ ; tribenzoate,  $[\alpha]_D^{20} -327.1^\circ$  in  $\text{CHCl}_3$ ), which does not reduce Fehling's solution, is oxidised by  $\text{Pb}(\text{OAc})_4$ , and is converted by  $\text{PhCHO}$  and  $\text{ZnCl}_2$  into (II). Condensation of (I) with acetobromoglucose (III) and  $\text{Ag}_2\text{O}$  in  $\text{CHCl}_3$  (free from  $\text{EtOH}$ ) followed by regulated catalytic hydrogenation of the product leads to 3:5-benzylidene-1:2-isopropylidene-6- $\beta$ -glucosidoglucose tetra-acetate, m.p.  $166^\circ$ ,  $[\alpha]_D^{20} -20.7^\circ$  in  $\text{CHCl}_3$ , hydrolysed (Zemplen) to 3:5-benzylidene-1:2-isopropylidene-6- $\beta$ -glucosidoglucose, m.p.  $219^\circ$ ,  $[\alpha]_D^{21} -13.9^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , whence gentiobiose. Similarly (II) and (III) afford 2:3:4:5-dibenzylidene-1- $\beta$ -glucosidofructose tetra-acetate, m.p.  $144^\circ$ ,  $[\alpha]_D^{20} -4.5^\circ$  in  $\text{CHCl}_3$ , converted by  $\text{NH}_3$ - $\text{MeOH}$  into 2:3:4:5-dibenzylidene-1- $\beta$ -glucosidofructose, m.p.  $176$  after softening at  $166^\circ$ ,  $[\alpha]_D^{21} -40.5^\circ$  in  $\text{CHCl}_3$ ,

which is catalytically hydrogenated to 1- $\beta$ -glucosidofructose, m.p.  $134$ — $138^\circ$ ,  $[\alpha]_D^{20} -59.4^\circ$  in  $\text{H}_2\text{O}$  (octa-acetate, m.p.  $128$ — $129^\circ$ ,  $[\alpha]_D^{20} -13.91^\circ$  in  $\text{CHCl}_3$ ).

H. W.

**Catalytic hydrogenation of sucrose. I. Hydrogenation with reduced nickel as catalyst.** T. TANNO (Bull. Chem. Soc. Japan, 1936, 11, 204—207).—Hydrogenation of sucrose at 100 atm. in presence of reduced Ni (prep. described) consists of a rapid reaction at  $155$ — $175^\circ$  and a slow one at about  $225^\circ$ . In one experiment  $3\text{H}_2$  were absorbed at  $170$ — $175^\circ$ , giving *d*-mannitol (I) (0.5 mol.) and *d*-sorbitol (II) (0.5 mol.) with a mixture (III) of  $\text{OH}\cdot\text{CHMe}\cdot\text{CH}_2\cdot\text{OH}$  and glycerol. In a second experiment  $2\text{H}_2$  were absorbed at  $155$ — $160^\circ$  giving (I) and (II) and a resinous mixture, which was further reduced at  $170$ — $175^\circ$  to (III). Fructose gives similarly (I) and (II), but no (III), whence it is inferred that (III) is derived from the glucose portion of the mol. R. S. C.

#### Glycoside fissions in non-aqueous media.

**I. Alcoholysis of phenylglucosides.** W. VOSS and W. WACHS. **II. Alcoholysis of disaccharides.** W. VOSS, H. HEISIG, and W. WACHS (Annalen, 1936, 522, 240—261, 261—268).—I. The reaction between various phenylglucosides and  $\text{MeOH}\cdot\text{HCl}$  (0.5*N*) in presence of about 10% of  $\text{MeCl}$  at  $25\pm 0.05^\circ$  is followed by titration of the  $\text{PhOH}$  formed with  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{N}_2\text{Cl}$  (Chapin, A., 1920, ii, 563). The mean vals. of  $k\times 10^5$  are:  $\alpha$ - and  $\beta$ -phenylglucosides, 82.8 and 49, respectively [corresponding vals. for hydrolysis with aq. 0.5*N*- $\text{HCl}$  are 1.48 and 0.43, respectively];  $\alpha$ - and  $\beta$ -phenylglucoside tetra-acetates, 122 and 44.9, respectively [vals. for acetolysis with  $\text{AcOH}\cdot\text{HCl}$  (0.5*N*) are 112 and 7.5, respectively]; tetramethyl- $\alpha$ -, b.p.  $132.5$ — $133^\circ/0.05$  mm.,  $145$ — $146^\circ/0.19$  mm.,  $[\alpha]_D^{22} +158.5^\circ$  in  $\text{MeOH}$ , and - $\beta$ -, m.p.  $78$ — $78.5^\circ$ ,  $[\alpha]_D^{22} -65.8^\circ$  in  $\text{MeOH}$ , -phenylglucosides (prepared from the acetates and  $\text{Me}_2\text{SO}_4$  in  $\text{MeOH} + 50\%$   $\text{NaOH}$  at  $55^\circ$ ), 29.8 and 7.6, respectively. Polarimetric data for the methanolyses show that Walden inversion occurs, i.e.,  $\alpha$ - and  $\beta$ -methylglucosides are formed from  $\beta$ - and  $\alpha$ -phenylglucosides, respectively; subsequent equilibration may take place. Much  $\alpha$ - and a little  $\beta$ -methyl-*d*-glucoside are isolable from the reaction product from the above  $\beta$ -tetra-acetate. The first stage in the methanolysis is considered to be the addition of 1 mol. of  $\text{HCl}$  to give an oxonium-like compound.

**II. Methanolysis (as above) of heptamethyl- $\beta$ -methylcellobioside (I) and -methylmaltoside** is followed polarimetrically. The data for (I) show that inversion occurs, i.e., tetramethyl- $\alpha$ - and 2:3:6-trimethyl- $\beta$ -methylglucosides are formed. The conclusions of Hess *et al.* (A., 1928, 1359) are thus invalidated.

H. B.

**Synthetic nucleosides. IV. Theophylline-5-methyl-*l*-rhamnofuranoside.** P. A. LEVENE and J. COMPTON (J. Biol. Chem., 1936, 114, 9—26; cf. A., 1931, 940).—Theophylline-5-methyl-*l*-rhamnofuranoside (I) is prepared and certain aspects of rhamnose derivatives are discussed. Methyl- $\beta$ -5-methyl-*l*-rhamnofuranoside, b.p.  $58$ — $60^\circ/0.3$  mm.,  $[\alpha]_D^{25} +6.3^\circ$  in  $\text{H}_2\text{O}$ , is obtained from isopropylidene-*l*-rhamnose (II), m.p. 92 93, by

Mel- $\text{Na}_2\text{SO}_4$ - $\text{Ag}_2\text{O}$ , which proves the  $\beta$ -structure of (II). The  $\alpha$ -glucoside (impure), b.p.  $58-60^\circ/0.3$  mm.,  $[\alpha]_D^{24} -21.6^\circ$  in  $\text{H}_2\text{O}$ , is obtained similarly from the isopropylidene compound (III), m.p.  $79-81^\circ$ , which proves the  $\alpha$ -structure of (III). Both glucosides are hydrolysed by 1.5%  $\text{H}_2\text{SO}_4$  to syrupy 5-methyl-1-rhamnofuranose (IV), the phenylhydrazone, m.p.  $162-163^\circ$ ,  $[\alpha]_D^{24} -18.4^\circ \rightarrow +8.1^\circ$  in 7 days in  $\text{C}_5\text{H}_5\text{N}$ , of which with PhCHO affords the furanose with m.p.  $102-103^\circ$ ,  $[\alpha]_D -4.3^\circ$  (const.) in  $\text{H}_2\text{O}$ , and with  $\text{NHPh}\cdot\text{NH}_2$  gives the phenylosazone, m.p.  $123-124^\circ$ ,  $[\alpha]_D +65.3^\circ \rightarrow +44.4^\circ$  in 3 days in  $\text{C}_5\text{H}_5\text{N}$ -abs. EtOH (3:2). (IV) with cold  $\text{Ac}_2\text{O}-\text{C}_5\text{H}_5\text{N}$  gives the  $\alpha$ - $\text{Ac}_3$  derivative (V), m.p.  $115-116^\circ$ ,  $[\alpha]_D^{25} -76.3^\circ$  in dry MeOH, and the  $\beta$ - $\text{Ac}_3$  compound, b.p.  $128-132^\circ/0.8$  mm.,  $[\alpha]_D^{24} -13.6^\circ$  in dry MeOH. (IV) with MeOH-HCl gives amongst other substances methyl- $\alpha$ -5-methyl-1-rhamnopyranoside (VI), m.p.  $59-60^\circ$ ,  $[\alpha]^{23} -89.2^\circ$  in  $\text{H}_2\text{O}$ . (V) and liquid HBr at room temp. (25 mm.) give the furanosidyl bromide, which with Ag theophylline in PhMe gives (I), m.p.  $212-213^\circ$ ,  $[\alpha]_D -46.3^\circ$  in  $\text{H}_2\text{O}$ . The crude mixture of 4- and 5-methyl-1-rhamnose triacetates with HBr-AcOH at  $0^\circ$  gives readily acetyl-4-methyl-1-rhamnosidyl bromide (VII) (previously considered to be the 5-Me compound), m.p.  $104-105^\circ$ ,  $[\alpha]_D^{25} -184.2^\circ$  in  $\text{CHCl}_3$  [also obtained from the pure 4-Me compound (VIII)], which with Ag theophylline in xylene at  $80-90^\circ$  gives theophylline- $\beta$ -4-methyl-1-rhamnopyranoside (IX), m.p.  $179-180^\circ$ ,  $[\alpha]^{23} -71.8^\circ$  in  $\text{H}_2\text{O}$ , also obtained by condensation of (VII) and hydrolysis of the resulting amorphous  $\text{Ac}_3$  compound. (VII) with  $\text{Ag}_2\text{O}$ -MeOH or its  $\text{Ac}_2$  derivative with  $\text{Ba}(\text{OMe})_2$ -MeOH gives methyl- $\beta$ -4-methyl-1-rhamnopyranoside, b.p.  $105-106^\circ/0.3$  mm.,  $[\alpha]_D^{24} -13.9^\circ$  in  $\text{H}_2\text{O}$ . Deacetylation of (VIII) affords about equal amounts of  $\beta$ - (XI), m.p.  $125-126^\circ$  [phenylosazone, m.p.  $162-163^\circ$ ,  $[\alpha]_D^{24} -25.8^\circ \rightarrow +14.3^\circ$  in 2 weeks in  $\text{C}_5\text{H}_5\text{N}$ -EtOH (3:2)], and  $\alpha$ -4-methyl-1-rhamnose, a syrup; the latter crude ether gives methyl- $\alpha$ -4-methyl-1-rhamnopyranoside (X), b.p.  $104-105^\circ/0.3$  mm.,  $[\alpha]^{23} -50.2^\circ$  in  $\text{H}_2\text{O}$ . Theophylline- $\beta$ -1-triacetyl-rhamnopyranoside and  $\text{Ba}(\text{OMe})_2$ -MeOH at  $0^\circ$  gives theophylline- $\beta$ -1-rhamnopyranoside, m.p.  $190-191^\circ$ ,  $[\alpha]^{25} -89.3^\circ$  in  $\text{H}_2\text{O}$ . (I) and (IX) are hydrolysed by 0.03N-HCl at  $100^\circ$  at about equal rates, but this is due to some peculiarity of the purine substituent, since (VI) is hydrolysed much faster than is (X). Mutarotation of (IV) could not be observed, but is assumed to occur very rapidly, since the presence of free CHO is contradicted by the absorption spectra. Mutarotation of (XI) in  $\text{H}_2\text{O}$  is rapid, resembling that of  $\beta$ -1-rhamnose.

Colloid behaviour of starch, cellulose, and glycogen.—See this vol., 795.

Highly polymerised compounds. CXXXVIII. Tearing of the thread molecules of cellulose by grinding. H. STAUDINGER and E. DREHER (Ber., 1936, 69, [B], 1091-1098).—Intensive grinding of cellulose (I) under  $\text{H}_2\text{O}$  in an agate ball mortar causes degradation of the thread mols.; after 12 hr. the material has a mean degree of polymerisation about 300. The degraded cellulose nitrates obtained from the partly depolymerised materials form a

polymeric-analogous series; on further grinding they suffer marked degradation. The non-degraded eucolloidal celluloses are tenacious and long-fibred, dissolve with marked swelling, and give highly viscous solutions. The degraded mesocolloidal celluloses of degree of polymerisation 300 are friable and readily sol. without swelling to solutions of low viscosity. The degradation of eucolloidal polystyrene when ground under  $\text{H}_2\text{O}$  is more pronounced than that of (I); it is also degraded when its solutions are forced through very fine holes in a Pt foil, whereas cellulose nitrate in amyl acetate is not greatly changed.

H. W.

Hexamethylenetetramine compounds. P. BOUCHEREAU (J. Pharm. Chim., 1936, [viii], 23, 549-556).—The compounds  $M(\text{CaCl}_2)_2 \cdot 2\text{H}_2\text{O}$ ,  $M(\text{MgCl}_2)_2 \cdot 2\text{H}_2\text{O}$ , and  $M(\text{MgSO}_4)_2 \cdot 2\text{H}_2\text{O}$  [ $M = (\text{CH}_2)_6\text{N}_4$ ] are described. Their antiseptic action is ascribed to free  $\text{CH}_2\text{O}$ .

Reaction of carbonyl chloride with hexamethylenetetramine.—See this vol., 689.

Characterisation and determination of tri-(hydroxyethyl)amine. D. FLORENTIN and (MME.) I. RUIZ (Ann. Falsif., 1936, 29, 197-204).—The isolation of  $\text{N}(\text{C}_2\text{H}_4\cdot\text{OH})_3$  from its preps. and characterisation by means of the platinichloride, aurichloride, and silicotungstate, and its gasometric determination by decomp. with hypobromite are described.

E. H. S.

Amino-acids and related compounds. IX. Electrolytic oxidation of proline and  $\gamma$ -aminobutyric acid. Y. TAKAYAMA (Bull. Chem. Soc. Japan, 1936, 11, 138-141; cf. A., 1935, 92).—Electrolytic oxidation of proline gives mainly succinimide with a little  $(\cdot\text{CH}_2\cdot\text{CO}_2\text{H})_2$  and a solution, which with hot  $\text{Ba}(\text{OH})_2$  gives  $\text{NH}_3$ , pyrrolidine, and  $\text{NH}_2\cdot[\text{CH}_2]_3\cdot\text{CO}_2\text{H}$  (I) and which thus probably contained pyrrolidone. Similar oxidation of (I) gives  $\text{NH}_3$  and  $(\cdot\text{CH}_2\cdot\text{CO}_2\text{H})_2$ . (I) is considered to be the primary product indicating preferential attack at the *tert*-C.

Delayed oxidation of cysteine and ascorbic acid.—See this vol., 685.

Condensation products of glucidic acid derivatives with amines. O. VON SCHICKH (Ber., 1936, 69, [B], 976-974).— $\alpha\beta$ -Oxido- $\beta$ -methyl-n-butyramide (I), m.p.  $121^\circ$ , is obtained by the action of conc. aq.  $\text{NH}_3$  on the corresponding Et ester or, preferably, by the action of Na on  $\text{CH}_2\text{Cl}\cdot\text{CO}\cdot\text{NH}_2$  in  $\text{COMe}$ , at  $0-2^\circ$ .  $\alpha\beta$ -Oxido- $\beta$ -phenyl- $\alpha$ -methylpropionamide, m.p.  $134^\circ$ , and -methylamide, m.p.  $116^\circ$ , are derived from the corresponding Et ester.  $\alpha\beta$ -Oxido- $\beta$ -phenyl-n-valeramide has m.p.  $119-121^\circ$ ,  $\text{CH}_2\text{Cl}\cdot\text{CO}\cdot\text{NEt}_2$ ,  $\text{NaNH}_2$ , and  $\text{COMe}_2$  at  $0-5^\circ$  affords  $\alpha\beta$ -oxido- $\beta$ -methyl-n-butyrdiethylamide, b.p.  $122-124^\circ/12$  mm. Et  $\alpha\beta$ -oxido- $\beta$ -phenyl- $\alpha$ -methylpropionate and  $\text{NH}_2\text{Me}\cdot\text{H}_2\text{O}$  at  $100^\circ$  give  $\beta$ -methylamino- $\alpha$ -hydroxy- $\beta$ -phenyl- $\alpha$ -methylpropionmethylamide hydrochloride, m.p.  $240-242^\circ$  (decomp.), hydrolysed by HCl (*d* 1.19) at  $150^\circ$  to  $\beta$ -methylamino- $\alpha$ -hydroxy- $\beta$ -phenyl- $\alpha$ -methylpropionic acid hydrochloride, m.p.  $224-225^\circ$  (decomp.).  $\text{NH}_2\text{Ph}$  and (I) at  $120^\circ$  afford  $\alpha$ -anilino- $\beta$ -hydroxy- $\beta$ -methylbutyramide, m.p.  $102^\circ$ , whilst Et  $\alpha$ -anilino- $\beta$ -

hydroxy- $\beta$ -methylbutyrate, b.p. 171—175°/11 mm., m.p. 70—71°, is derived from the requisite Et ester and  $\text{NH}_2\text{Ph}$  at 170°. Et  $\alpha$ -methylanilino- $\beta$ -hydroxy- $\beta$ -methylbutyrate has b.p. 172—174°/8 mm. When heated with the requisite amine (I) affords  $\alpha$ -p-phenetidino-, m.p. 105°,  $\alpha$ -p-allyloxyanilino-, (+ $\text{H}_2\text{O}$ ), m.p. 70—72°,  $\alpha$ -4-aminoantipyril-, m.p. 151°, and  $\alpha$ -2-aminopyridyl-, m.p. 182—183°, - $\beta$ -hydroxy- $\alpha$ -methylbutyramide.  $\alpha$ -6-Methoxy-8-quinolylamino- $\beta$ -hydroxy- $\beta$ -methylbutyrdiethylamide has m.p. 170—171° (decomp.).  $\text{NHPh}\cdot\text{NH}_2$  and (I) at 150—180° give 4-hydroxy-1-phenyl-3:3-dimethylpyrazolid-5-one, m.p. 182—183°, transformed by  $\text{Me}_2\text{SO}_4$  and alkali into 4-hydroxy-1-phenyl-2:3:3-trimethylpyrazolid-5-one, m.p. 109°. With  $\text{CO}(\text{NH}_2)_2$  at 150—200° (I) yields 5-hydroxy-2:6-diketo-4:4-dimethylhydro-pyrimidine, m.p. 196—197°. H. W.

**Condensation of chloral with acid amides. Properties of  $\text{CH}(\text{OH})\cdot\text{CCl}_3$  group.** A. N. MELDRUM and M. G. BHOJRAJ (J. Indian Chem. Soc., 1936, 13, 185—186; cf. Yelburgi *et al.*, A., 1934, 770).—Condensation of  $\text{CCl}_3\cdot\text{CHO}$  with the appropriate  $\text{R}\cdot\text{CO}\cdot\text{NH}$ , affords chloral-propion-, m.p. 166—167°, -isobuty-, m.p. 156—157°, -n-valer-, m.p. 142°, -n-hexo-, m.p. 139°, -n-hepto-, m.p. 125—126°, and -phenylacet-, m.p. 141°, -amide. Reduction of these with  $\text{Zn}\cdot\text{AcOH}$  at <40° affords  $\beta\beta$ -dichlorovinyl-acet-, m.p. 88—89°, -propion-, m.p. 100—101°, -isobuty-, m.p. 84—85°, -n-valer-, m.p. 65—66°, -n-hexo-, m.p. 62—64°, -n-hepto-, m.p. 38—39°, and -phenylacet-, m.p. 90—92°, -amide. J. W. B.

**Determination of carbamide by the Folin distillation method. Determination by steam-distillation.** F. H. L. TAYLOR and M. A. ADAMS (J. Lab. Clin. Med., 1935, 20, 983—985).—Steam-distillation is preferred to the original direct distillation. CH. ABS. (p)

**Preparation of carbamides.** J. S. BUCK and C. W. FERRY (J. Amer. Chem. Soc., 1936, 58, 854).—*N*-Phenyl-*N*-n-butyl-, *N*-o-tolyl-*N*-n-propyl- and -n-butyl-, *N*-m-tolyl-*N*-ethyl- and -n-propyl-, and *N*-p-tolyl-*N*-n-propyl-carbamides are best prepared (61—91% yields) (cf. A., 1935, 1488) by cautious warming of  $\text{NHArAlk}$  (1 mol.) with  $\text{NO}_2\cdot\text{NH}\cdot\text{CO}\cdot\text{NH}_2$  (1.15 mols.) in 95% EtOH (4—5 vols.). H. B.

**Dialkylaminoacetylcarbamides.** T. C. DANIELS (J. Amer. Pharm. Assoc., 1936, 25, 285—286).—The following aminoacetylcarbamides were prepared: diethyl m.p. 102°, di-n-propyl-, m.p. 123°, di-n-butyl-, m.p. 122°, diisobutyl-, m.p. 68°, di-n-amyl-, m.p. 97°, and diisoamyl-, m.p. 99°. None possesses hypnotic properties. F. O. H.

**Aliphatic carbimides and their conversion into  $\alpha$ -aryl- $\beta$ -alkylcarbamides.** J. W. BOEHMER (Rec. trav. chim., 1936, 55, 379—391).—Alkyl-carbimides are rapidly prepared (50—95% yields) by slow addition of  $\text{R}\cdot\text{COCl}$  to activated  $\text{NaN}_3$  (Nelles, A., 1932, 1118) in  $\text{C}_6\text{H}_6$  or PhMe and then boiling until the theoretical vol. of  $\text{N}_2$  has been evolved. Thus are obtained methyl-, ethyl-, n- and iso-propyl- and -butyl-carbimide. By addition of the appropriate  $\text{NH}_2\text{Ar}$  s-arylalkylcarbamides are obtained of

which the following are new: s-p-methoxy-, m.p. 178°, p-acetyl-, m.p. 184°, m-, m.p. 119° and p-chloro-, m.p. 200°, and m-bromo-phenyl-, m.p. 134°, o-phenyl-, m.p. 170°,  $\beta$ -naphthyl-, m.p. 187°, and 5-, m.p. 221°, and 8-quinolyl-, m.p. 192°, -methylcarbamide; s-p-tolyl-, m.p. 123°, p-methoxy-, m.p. 136°, p-ethoxy-, m.p. 147°, p-acetyl-, m.p. 123°, m-, m.p. 107°, and p-chloro-, m.p. 189°, m-, m.p. 110° and p-bromo-phenyl-, m.p. 197°, o-phenyl-, m.p. 126°,  $\alpha$ -, m.p. 177° and  $\beta$ -naphthyl-, m.p. 177°, 2-pyridyl-, m.p. 103°, and 5-, m.p. 186° and 8-quinolyl-, m.p. 167°, -n-propyl-carbamide; s-p-tolyl-, m.p. 157°, p-methoxy m.p. 154°, p-ethoxy-, m.p. 183°, p-acetyl-, m.p. 153°, m-, m.p. 135°, and p-chloro-, m.p. 217°, m-, m.p. 133° and p-bromo-phenyl-, m.p. 212°, o-, m.p. 157°, and p-phenyl-, m.p. 214°,  $\alpha$ -, m.p. 200° and  $\beta$ -naphthyl-, m.p. 192°, 2-pyridyl-, m.p. 104°, 5-, m.p. 232°, and 8-quinolyl-, m.p. 184°, -isopropylcarbamide, s-phenyl-, m.p. 130°, p-tolyl-, m.p. 119°, p-methoxy-, m.p. 116°, p-ethoxy-, m.p. 146°, p-acetyl-, m.p. 125°, m-, m.p. 83°, and p-chloro-, m.p. 173°, m-, m.p. 75°, and p-bromo-phenyl-, m.p. 185°, o-phenyl-, m.p. 120°,  $\alpha$ -, m.p. 149°, and  $\beta$ -naphthyl-, m.p. 175°, 2-pyridyl-, m.p. 88°, 5-, m.p. 179°, and 8-quinolyl-, m.p. 134°, -n-butylcarbamide; s-p-tolyl-, m.p. 154°, -p-methoxy-, m.p. 114°, -p-ethoxy-, m.p. 137°, -p-acetyl-, m.p. 72°, -m-, m.p. 114°, and -p-chloro-, m.p. 168°, -m-, m.p. 106°, and -p-bromo-phenyl-, m.p. 167°, -o-, m.p. 128°, and -p-phenyl-, m.p. 191°,  $\alpha$ -, m.p. 178°, and  $\beta$ -naphthyl-, m.p. 152°, 5-, m.p. 167°, and 8-quinolyl-, m.p. 164°, -isobutylcarbamide. With  $\text{NHPhMe}$  are obtained  $\alpha$ -phenyl- $\alpha$ -methyl- $\beta$ -n-, m.p. 46°, and - $\beta$ -isobutylcarbamide, m.p. 54°. With  $\text{H}_2\text{O}$  RNCO gives  $\text{CO}(\text{NHR})_2$  and thus are obtained s-di-n-, m.p. 100°, and -di-iso-propyl-, m.p. 192°, -di-n-, m.p. 71°, and -di-iso-butyl-, m.p. 134°, -carbamide. J. W. B.

**Complex compounds of semicarbazides.**—See this vol., 692.

**Synthesis of  $\beta\gamma$ -dihydropropylguanidine.** S. KAWAI and N. SUGIYAMA (Bull. Chem. Soc. Japan, 1936, 11, 141—143).—Heating  $\text{NH}_2\cdot\text{CH}_2\cdot\text{CH}(\text{OBz})\cdot\text{CH}_2\cdot\text{OBz}$  with  $\text{CN}\cdot\text{NH}_2$  or O-methyl- $\phi$ -carbamide in dry EtOH or  $\text{C}_2\text{H}_5\text{N}$  at 120—130° causes only migration of Bz to yield  $\text{NHBz}\cdot\text{CH}_2\cdot\text{CH}(\text{OH})\cdot\text{CH}_2\cdot\text{OBz}$ , but  $\text{NH}_2\cdot\text{CH}_2\cdot\text{CH}(\text{OH})\cdot\text{CH}_2\cdot\text{OH}$  and S-methyl- $\phi$ -thiocarbamide hydriodide in EtOH at 100° give  $\beta\gamma$ -dihydroxypropylguanidine, an oil (picrate, m.p. 126°). R. S. C.

**Reduction of nitroguanidine.** V. Synthesis of  $\gamma$ -amino- $\alpha$ -methyl-, - $\alpha$ -ethyl-, and - $\alpha$ -n-butyl-guanidine. G. W. KIRSTEN and G. B. L. SMITH (J. Amer. Chem. Soc., 1936, 58, 800—801).— $\gamma$ -Amino- $\alpha$ -methylguanidinium iodide, m.p. 121—122° [corresponding sulphate, m.p. 229—230° (decomp.)], and picrate, m.p. 162—163°, is prepared from  $\text{SMe}\cdot\text{C}(\text{NH})\cdot\text{NHMe}\cdot\text{HI}$  and  $\text{N}_2\text{H}_4$  or from  $\text{SMe}\cdot\text{C}(\text{NH})\cdot\text{NH}\cdot\text{NH}_2\cdot\text{HI}$  and  $\text{NH}_2\text{Me}$ .  $\gamma$ -Amino ethylguanidinium iodide, m.p. 84.5—86° (corresponding sulphate, m.p. 161—163°, and picrate, m.p. 113—114.5°), and  $\gamma$ -amino- $\alpha$ -n-butylguanidinium iodide, m.p. 51—52°, are similarly obtained from  $\text{SMe}\cdot\text{C}(\text{NH})\cdot\text{NH}\cdot\text{Et}\cdot\text{HI}$  and S-methyl-n-butylisothiocarbamide hydriodide, m.p. 88—89° (from  $\text{NH}_2\cdot\text{CS}\cdot\text{NHBu}^\alpha$

and EtOH-MeI), respectively.  $\gamma$ -Amino- $\alpha$ -phenylguanidine could not be similarly prepared. H. B.

**Dyes from furfuraldehyde.** T. BOEHM and (FRL.) M. GROHNWALD (Arch. Pharm., 1936, 274, 318—326).—Hydrofurfuramide,  $\text{CHR}\cdot\text{N}\cdot\text{CHR}\cdot\text{N}\cdot\text{CHR}$  ( $\text{R}=\text{2-furyl}$ ), and  $\text{CH}_2(\text{CN})_2$  (I) in EtOH give  $\text{NH}_3$  and  $\gamma$ -hydroxy- $\Delta^{\alpha\gamma\epsilon}$ -heptatrienyl  $\alpha\alpha\eta$ -tetracyanide (II), violet, decomp.  $225^\circ$ , anhyd. (from MeOH),  $+0.66\text{EtOH}$  (0.33 mol. retained at  $120^\circ/0.1$  mm.),  $+0.5\text{Pr}^{\text{B}}\text{OH}$ ,  $+C_5H_5N$ , and  $+AcOH$ . The liberated  $\text{NH}_3$  plays a part in the reaction, for (II) is also obtained from furfurylidene malonitrile (III) and  $\text{NH}_2\text{R}\cdot\text{EtOH}$ , R being H, Me, Et, Ph, or, best,  $\text{CH}_2\text{Ph}$ , or  $\text{NHMe}_2$  or  $\text{NHEt}_2\cdot\text{EtOH}$ . The presence of a free OH in (II) is shown by formation ( $\text{Ac}_2\text{O}\cdot\text{C}_5\text{H}_5\text{N}$ ) of an Ac derivative (IV), decomp.  $210^\circ$ ,  $+C_5H_5N$  and anhyd. (III) and  $\text{NH}_2\cdot\text{CH}_2\text{Ph}$  give also as by-product N- $\delta$ -hydroxy- $\zeta\zeta$ -dicyanohexatrienylbenzylamine (V), blue, m.p.  $161^\circ$ , decomposes when recrystallised (hydrochloride,  $+MeOH$ , m.p.  $140^\circ$  after decomp. from about  $140^\circ$ ), which with  $\text{NHPh}\cdot\text{NH}_2$  in a little EtOH gives N- $\delta$ -hydroxy- $\zeta\zeta$ -dicyano- $\Delta^{\alpha\gamma\epsilon}$ -hexatrienyl-N'-phenylhydrazine, m.p.  $186^\circ$  after sintering at  $176^\circ$ , and with (I) yields (III) immediately. (II) is thus formed by primary reaction to (V) or its analogous amine and further reaction thereof with (I). Furfurylidene cyanoacetamide and  $\text{NH}_2\cdot\text{CH}_2\text{Ph}$  in hot EtOH give similarly  $\gamma$ -hydroxy- $\alpha\eta$ -dicyano- $\Delta^{\alpha\gamma\epsilon}$ -heptatrienedicarbonamide,  $+H_2O$ , m.p.  $240\text{--}244^\circ$  (decomp.). (II) and cold conc. HCl give a substance, possibly the monoamide,  $C_{11}H_8O_2N_4$ , m.p.  $250\text{--}255^\circ$  (decomp.),  $+1.5AcOH$  and  $+EtOH$  [Ac derivative (by  $\text{Ac}_2\text{O}\cdot\text{C}_5\text{H}_5\text{N}$ ), decomp.  $215\text{--}220^\circ$ ]. Hydrogenation of (II) gives mixtures; if that (2% Pd-BaSO<sub>4</sub>) of (IV) in  $\text{COMe}_2$  is stopped after adsorption of  $2H_2$ , there is obtained a substance, possibly an amide,  $C_{13}H_{12}O_2N_4$ , m.p.  $94\text{--}96^\circ$ , which is sol. in KOH, from which after some hours HCl ppts. an acid,  $C_{13}H_{11}O_5N_3$ , m.p.  $86^\circ$ . R. S. C.

**Arsinocarboxylic acids.** H. J. BACKER and C. H. K. MULDER (Rec. trav. chim., 1936, 55, 357—370).—Arsinocarboxylic acids are prepared by the reaction  $K_3AsO_3 + \text{CHBr}\cdot\text{CO}_2K \rightarrow \text{AsO}_3K_2\cdot\text{CHR}\cdot\text{CO}_2K + KBr$ , and are isolated from their Pb salts. Kinetic studies in the case  $\text{R}=\text{Me}$  show that the rate increases with increasing concn. of reactants more rapidly than is required by a bimol. reaction and optimum yields (in parenthesis) are obtained when the mol. ratio  $\text{KOH}/\text{As}_2\text{O}_3=6:1$ . Thus are prepared arsinoacetic,  $\alpha$ -arsino-propionic (I), m.p.  $134^\circ$  (71%) ( $\text{Ag}$ ,  $\text{Ba}_3+5H_2O$ , and  $\text{Pb}$  salts),  $n$ -butyric, m.p.  $127^\circ$  (68%) ( $\text{Ag}$ ,  $\text{Ba}+H_2O$ ,  $\text{Ba}_3+7H_2O$ , and  $\text{Pb}$  salts),  $\alpha$ -valeric, m.p.  $116\text{--}117^\circ$  (40%) ( $\text{Ba}+H_2O$  and  $+2H_2O$ ,  $\text{Ba}_3$ , and  $\text{Pb}$  salts),  $n$ -hexoic, m.p.  $96^\circ$  (33%),  $n$ -heptoic, m.p.  $82\text{--}83^\circ$  (19%) (together with  $\alpha$ -hydroxy- $n$ -heptoic acid, m.p.  $63^\circ$ ),  $n$ -octoic, m.p.  $114^\circ$  (12%) (with  $\alpha$ -hydroxy- $n$ -octoic acid, m.p.  $79^\circ$ ), and  $n$ -nonoic acid, m.p.  $115^\circ$ . Similarly  $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{CO}_2K$  gives  $\beta$ -arsinopropionic acid (II), m.p.  $145^\circ$  (56%) ( $\text{Na}_2+5H_2O$ ,  $\text{Ag}$ , and  $\text{quinine}+6H_2O$  salts). Reduction ( $H_3PO_2$ ) of (I) and (II) affords respectively  $\alpha$ -, ( $\text{As}\cdot\text{CHMe}\cdot\text{CO}_2H$ )<sub>2</sub>, decomp.  $85\text{--}90^\circ$ , and  $\beta$ -arsenopropionic acid, m.p.  $155\text{--}157^\circ$ .  $K_3AsO_3$  with either  $\text{CH}_2\text{Br}\cdot\text{CHBr}\cdot\text{CO}_2K$  or

$\text{CH}_2\cdot\text{CBr}\cdot\text{CO}_2K$  gives  $\alpha$ -arsinoacrylic acid, m.p.  $159^\circ$  (43%—50%) ( $\text{quinine}+6H_2O$  salt), reduced to  $\alpha$ -arsenoacrylic acid, m.p.  $180^\circ$  (decomp.). Phenyl-arsinoacetic acid, sinters  $100^\circ$ , m.p.  $110^\circ$ , is similarly prepared. These acids titrate as dibasic acids to phenolphthalein. Some crystallographic data are given. J. W. B.

#### Organic reactions with silicon compounds.

**I. Use of silicon tetrafluoride in formation of esters and absorption reactions.** J. A. GIERUT, F. J. SOWA, and J. A. NIEWLAND (J. Amer. Chem. Soc., 1936, 58, 786—787).—Quant. yields of  $\text{MeOAc}$  and  $\text{EtOAc}$  and 20—60% yields of  $\text{Pr}^{\text{B}}\text{OAc}$ ,  $\text{Bu}^{\text{O}}\text{Ac}$ , and  $\text{Bu}^{\text{B}}\text{OAc}$  are obtained from  $\text{SiF}_4$  (from  $\text{Na}_2\text{SiF}_6$ ,  $\text{SiO}_2$ , and conc.  $\text{H}_2\text{SO}_4$ ),  $\text{AcOH}$ , and the appropriate alcohol (which forms an unstable 4:1 additive compound with  $\text{SiF}_4$ );  $\text{NH}_2\text{Ac}$  (for  $\text{AcOH}$ ) similarly gives 13—20% of ester. With  $\text{BzOH}$ , the yield of ester is much smaller.  $\text{Bu}^{\text{B}}\text{OH}$  and  $\text{AcOH}$  similarly afford 4.3% of  $\text{Bu}^{\text{B}}\text{OAc}$ . Stable additive compounds are formed from  $\text{SiF}_4$  and  $\text{NH}_3$ ,  $\text{NBu}_3$ , and  $\text{NH}_2\text{Ac}$ .  $\text{SiF}_4$  is not absorbed by  $\text{PhOH}$ ,  $\text{PhOPr}^{\text{B}}$ ,  $\text{Et}_2\text{O}$ ,  $\text{EtOAc}$ , or  $\text{AcOH}$ . H. B.

**Etherates of iodobismuthous and iodoantimonious acids.**—See this vol., 690.

**Electrolysis of magnesium methyl halides in ether solutions.** W. V. EVANS and E. FIELD (J. Amer. Chem. Soc., 1936, 58, 720—724; cf. A., 1934, 517).—Electrolysis (apparatus described) of  $\text{Et}_2\text{O}\cdot\text{MgMeHal}$  gives (mainly)  $\text{CH}_4$  and  $\text{C}_2\text{H}_6$ , together with small amounts of  $\text{C}_2\text{H}_4$  and  $\text{CO}_2$  and (after hydrolysis)  $\text{EtOH}$ ,  $\text{Pr}^{\text{B}}\text{OH}$ , and a non-volatile halogen-free saturated substance;  $\text{H}_2$  and isobutene are not produced (cf. *loc. cit.*). The ratio  $\text{CH}_4:\text{C}_2\text{H}_6$  decreases rapidly with increase in c.d. to a limiting val. which is unaffected by concn. The efficiency of the electrolysis is, however, inversely  $\propto$  the concn. above a limiting val. and decreases in the order  $\text{Cl}$ ,  $\text{Br}$ ,  $\text{I}$ . The following reactions occur:  $\text{Me}+\text{H}$  (from  $\text{Et}_2\text{O}$ , which also gives rise to the above minor products)  $\rightarrow \text{CH}_4$ ;  $2\text{Me} \rightarrow \text{C}_2\text{H}_6$ . The mechanism of formation of Me is:  $\text{Me}_2\text{Mg}\cdot\text{MgX}_2 \rightarrow [\text{MeMgX}_2]^- + [\text{MgMe}]^+$ ;  $[\text{MeMgX}_2]^- - e \rightarrow \text{Me} + \text{MgX}_2$ ;  $[\text{MgMe}]^+ + e \rightarrow 1/2\text{Mg} + 1/2\text{MgMe}_2$ . H. B.

**Catalysed reaction of magnesium ethyl bromide with ethyl bromide.** C. B. LINN and C. R. NOLLER (J. Amer. Chem. Soc., 1936, 58, 816—819).—In agreement with Jolibois (A., 1927, 233) and contrary to Job and Dubien (*ibid.*, 233), the reaction between  $\text{EtBr}$  and  $\text{MgEtBr}$  in presence of  $\text{Cu}_2\text{Cl}_2$  is heterogeneous; no conclusions concerning the mechanism can, therefore, be reached from rate measurements. The catalyst is Cu (formed by reduction of the  $\text{Cu}_2\text{Cl}_2$  with  $\text{MgEtBr}$ ). Ordinary Cu does not catalyse the reaction; Cu prepared by reduction ( $\text{H}_2$ ) of powdered CuO is fairly active. Solutions of  $\text{MgEt}_2$  behave in exactly the same manner as  $\text{MgEtBr}$ . The following reactions are considered to occur:  $2\text{Cu} + \text{C}_2\text{H}_4 + \text{C}_2\text{H}_6 + \text{MgBr}_2 + \text{MgCl}_2 \rightarrow \text{Cu}_2\text{Cl}_2 + 2\text{MgEtBr} \rightarrow 2\text{Cu} + 2\text{C}_2\text{H}_4 + \text{H}_2 + \text{MgBr}_2 + \text{MgCl}_2$ . H. B.

**Catalysts for autoxidation of saturated cyclic hydrocarbons.**—See this vol., 685.

**cycloPropane.** Raman spectrum and polymerisation by ultra-violet light.—See this vol., 777.

**Ultra-violet absorption of cyclopropane and propylene; their preparation and b.p.** A. A. ASHDOWN, L. HARRIS, and R. T. ARMSTRONG (J. Amer. Chem. Soc., 1936, 58, 850—852).—*cycloPropane* (I), b.p.  $-32.89 \pm 0.05^\circ/755.9$  mm. [prep. (cf. Gustavson (A., 1888, 240) from  $(\text{CH}_2)_3\text{Br}_2$  (3 mols.) and Zn wool (4 mols.) in EtOH with exclusion of  $\text{H}_2\text{O}$ , thus practically eliminating reduction to  $\text{C}_3\text{H}_8$ ], and  $\text{C}_3\text{H}_6$ , b.p.  $-47.67 \pm 0.1^\circ/759.1$  mm. (from  $\text{Pr}^\beta\text{OH}$  and  $\text{H}_3\text{PO}_4$ , whereby a considerable amount of  $\text{Pr}_2^\beta\text{O}$  is produced), show continuous absorption in the ultra-violet; mol. extinction coeffs. are determined. (I) resembles a paraffin hydrocarbon. H. B.

**Synthesis of monosubstituted cyclopentane homologues with branched side chains.** B. A. KASANSKI, A. F. PLATE, and K. M. GNATENKO (Ber., 1936, 69, [B], 954—960).—The action of Grignard's reagents on *cyclopentanone* and subsequent dehydration of the *tert.* alcohols thus produced does not afford monosubstituted *cyclopentanes* in satisfactory yield. Hydrogenation of dimethylfulvene, b.p.  $45-47^\circ/12$  mm., from *cyclopentadiene* and  $\text{COMe}_2$ , proceeds slowly in EtOH with Pd-Ni, more rapidly in AcOH (Pd-black) giving *isopropylcyclopentane*, b.p.  $123-124^\circ/731.6$  mm. Similarly methyl-ethyl- and diethyl-fulvene afford *sec.-butylcyclopentane*, b.p.  $152.5-153.5^\circ/763.7$  mm., and *sec.-amylcyclopentane*, b.p.  $174-176^\circ$ , respectively. Hydrogenation of diphenylfulvene (I) (Ni-EtOH) at  $100-120^\circ/40$  atm. gives a substance  $\text{C}_{18}\text{H}_{18}$ , m.p.  $62.5-63^\circ$ , which becomes liquid when exposed to air. In EtOH (Pt or Pd) (I) absorbs 2 H very readily and a further 2 H more slowly, after which reaction nearly ceases. The crude product is, however, converted by Na in EtOH into *diphenylmethylcyclopentane*, m.p.  $32.5-33^\circ$ . H. W.

**Multiplanar isomerism of cyclohexanes.** R. F. MILLER and R. ADAMS (J. Amer. Chem. Soc., 1936, 58, 787—791).—Assuming that multiplanar forms of the *cyclohexane* ring are possible, the theoretical no. of isomerides of the types  $aa\text{C}_6\text{H}_8bb$ ,  $aa\text{C}_6\text{H}_8bc$ , and  $ab\text{C}_6\text{H}_8cd$  is 4 (3 "C," 1 "Z"), 8 (6 "C," 2 "Z"), and 16 (12 "C," 4 "Z"), respectively. Fractional crystallisation of 4-methyl- and 4:4-dimethyl-*cyclohexane-1:1-diacetic acids* and 4:4-dimethyl-*cyclohexane-1-carboxylic-1-acetic acid*, their  $\text{NH}_4$  salts, and anhydrides has failed to reveal the existence of more than one form (cf. Qudrat-i-Khuda, A., 1931, 1055; 1935, 1236; Goldschmidt and Grafinger, A., 1935, 489; Desai and Hunter, *ibid.*, 1495).

Reduction of 4-methyl-4-dichloromethyl- $\Delta^{2:5}$ -*cyclohexadienone* with  $\text{H}_2$  and Raney Ni in EtOH-NaOH (calc. amount to neutralise HCl produced) gives 4:4-dimethyl-*cyclohexanol*, b.p.  $68^\circ/7$  mm., m.p.  $37^\circ$ , oxidised (method: von Auwers and Keil, A., 1903, i, 100) to 4:4-dimethyl-*cyclohexanone* (I), m.p.  $40-42^\circ$ .  $\beta\beta$ -Dimethylglutaric acid is reduced [ $\text{H}_2$  (250 atm.), Cu-Cr oxide] to  $\gamma\gamma$ -dimethylpentane- $\alpha$ -diol, b.p.  $132^\circ/1$  mm., converted by  $\text{SOCl}_2$  into  $\alpha$ -dichloro-, b.p.  $135^\circ/80$  mm., and thence by NaCN

in 50% EtOH into  $\alpha\epsilon$ -dicyano- $\gamma\gamma$ -dimethylpentane, b.p.  $155-157^\circ/7$  mm., which is hydrolysed (EtOH-conc.  $\text{H}_2\text{SO}_4$ ) to *Et*  $\gamma\gamma$ -dimethylpimelate, b.p.  $135^\circ/7$  mm. Hydrolysis of this with aq.  $\text{Ba}(\text{OH})_2$ , evaporation of the reaction mixture to dryness, and subsequent heating to  $300^\circ$  (bath) gives (I). *Et* 4:4-dimethyl-*cyclohexylidenecyanoacetate*, b.p.  $155^\circ/7$  mm., m.p.  $50^\circ$  [from (I),  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$  (II), and piperidine], with aq. EtOH-KCN followed by hydrolysis (conc. HCl) of the resultant K salt, affords 4:4-dimethyl-*cyclohexane-1-carboxylic-1-acetic acid*, m.p.  $189^\circ$  (bloe Maquenne) (*anhydride*, m.p.  $124^\circ$ ). (I), (II), and  $\text{NH}_3$  in EtOH give 4:4-dimethyl-*cyclohexane-1:1-dicyanoacetic acid imide*, m.p.  $230^\circ$  (decomp.), hydrolysed (70%  $\text{H}_2\text{SO}_4$ ) to 4:4-dimethyl-*cyclohexane-1:1-diacetic acid*, m.p.  $213-218^\circ$  (tube),  $230^\circ$  (bloe) (*anhydride*, m.p.  $86^\circ$ ). H. B.

**Ring enlargement during the catalytic dehydrogenation of a cyclopentane derivative.** C. D. NENITZESCU and E. CIORANESCU (Ber., 1936, 69, [B], 1040—1041).—Methylcyclopentane is unchanged when passed over Pt-C at  $310^\circ$  or  $350^\circ$ . Under similar conditions small amounts of  $\text{C}_{10}\text{H}_8$  are obtained from 1-methylhydrindene or 1-methylhexahydrohydrindene, b.p.  $182-183^\circ$ . H. W.

**Kinetics of formation and decomposition of dicyclopentadiene.**—See this vol., 684.

**Fused carbon rings. X. Fundamental properties of 0:3:3-dicyclooctane ring.** J. W. BARRETT and R. P. LINSTAD (J.C.S., 1936, 611—616).—Reduction of pure samples of *cis*- (I) and *trans*- $\beta$ -0:3:3-dicyclooctanone (Clemmensen or Kishner-Wolff methods) affords *cis*- (II) and *trans*- (III), m.p.  $-29^\circ$  (corr.) (A., 1935, 750 gives m.p.  $-36^\circ$ ). 0:3:3-dicyclooctane, the heats of combustion of which are 1197.7 and 1203.8 kg.-cal. per mol. for liquid at const. vol. (Becker). (II) is not dehydrogenated by Pt-asbestos (active to decalin) at  $300-320^\circ$  ( $\text{H}_2$  atm.). (I) and  $\text{CH}_2\text{Ph}\cdot\text{MgCl}$  afford 2-benzyl-*cis*-0:3:3-dicyclooctan-2-ol, m.p.  $66-67^\circ$ , and a liquid stereoisomeride, both dehydrated by  $\text{H}_2\text{C}_2\text{O}_4$  at  $120^\circ$  to 2-benzylidene-*cis*-0:3:3-dicyclooctane, b.p.  $126-127^\circ/3$  mm.; this with Se at  $300-330^\circ$  is partly decomposed and partly unchanged. Under the same conditions *trans*-2-benzyl-octalin (by dehydration of *trans*-2-benzyl-2-decalol, b.p.  $170^\circ/3$  mm.) readily gives 2- $\text{C}_{10}\text{H}_7\cdot\text{CH}_2\text{Ph}$ . Reduction of (I) with Na-moist  $\text{Et}_2\text{O}$  or catalytically (Adams) gives *cis*-0:3:3-dicyclooctan-2-ol, b.p.  $85-86^\circ/10$  mm. (*H* phthalate, m.p.  $72^\circ$ ; phenylurethane, m.p.  $116^\circ$ ), which is a mixture of stereoisomerides, unchanged by Se at  $300-310^\circ$ , conditions under which *trans*- $\beta$ -decalol is also stable. With  $\text{AlCl}_3$  at room temp. (II) is converted mainly into (the more strained) 1:2:3-dicyclooctane, identical with a synthetic specimen (Komppa *et al.*, this vol., 333). (III) is unchanged by passage with  $\text{H}_2$  over Pt-asbestos (active to  $\text{C}_6\text{H}_6$ ) at  $200^\circ$ . J. W. B.

**Reactivity of aromatic hydrogen atoms.** O. ZWECKER (Ber., 1936, 69, [B], 993—997; cf. A., 1935, 1112).—The general hypothesis is that an aromatic H under the influence of an *o*-substituent, B, reacts more rapidly or more slowly with a given

reagent than when under the influence of a substituent *C* according as the compound *HB* reacts more rapidly or more slowly than *HC*. In this connexion the following changes are considered: chlorination, sulphonation, and nitration of  $\text{NH}_2\text{Ph}$  and its *N* derivatives; nitration of  $\text{PhMe}$ ,  $\text{CH}_2\text{PhCl}$ ,  $\text{CHPhCl}$ ,  $\text{CPhCl}_2$ ,  $\text{PhCHO}$ , and  $\text{BzOH}$  in comparison with the corresponding  $\text{CH}_3$  compounds; chlorination of  $\text{PhNO}_2$  and nitration of  $\text{PhCl}$ . H. W.

**Influence of solvent on the course of chemical reactions. VIII. Evidence of the ionoid course of substitution. Formulation of aromatic hydrocarbons.** K. LAUER and R. ODA (Ber., 1936, 69, [B], 1061—1065).—Evidence in favour of the view that the aromatic hydrocarbons have the annexed, dynamic limiting constitutions (in which — and +

denote the anionoid and cationoid nature of a position) is found in the observation that the chlorination of  $\text{C}_6\text{H}_6$  in  $\text{AcOH}$  is greatly hampered by  $\text{HCl}$  or chlorides whereas that of the condensed aromatic hydrocarbons is greatly accelerated. H. W.

**Condensation of benzene with unsaturated hydrocarbons and their halogen derivatives in presence of acid catalysts.** R. TRUFFAULT (Compt. rend., 1936, 202, 1286—1289).—With  $\text{P}_2\text{O}_5$  much polymerisation occurs in the condensation of unsaturated hydrocarbons with  $\text{C}_6\text{H}_6$ .  $\text{C}_6\text{H}_4$  and  $\text{C}_3\text{H}_6$  give, respectively, some  $\text{PhEt}$  and  $\text{PhPr}^a$ , but  $\text{C}_5\text{H}_{10}$  gives only  $(\text{C}_5\text{H}_{10})_2$ , and cyclohexene (I) gives mainly its dimeride and some phenylcyclohexane (II). No such polymerisation occurs when  $\text{H}_2\text{SO}_4$  at room temp. is used. Thus (I) gives a 70% yield of (II) and 25% of  $\text{C}_{18}$  hydrocarbons, mainly *p*-dicyclohexylbenzene.  $\text{C}_6\text{H}_6$  and  $\text{CH}_2=\text{CH}\cdot\text{CH}_2\text{Cl}$  afford  $\beta$ -chloroisopropylbenzene (III), converted by  $\text{KCN}$  into the nitrile, hydrolysed to the amide of  $\beta$ -phenyl- $\beta$ -methylpropionic acid, which is readily obtained by the action of  $\text{CO}_2$  on the  $\text{Mg}$  compound of (III).

J. W. B.

**Addition and additive products of halogens and benzene derivatives. V. Addition of chlorine to three trichlorobenzenes.** T. VAN DER LINDEN (Rec. trav. chim., 1936, 55, 315—324).—The rate of addition of liquid  $\text{Cl}_2$ , at room temp. in sunlight, to 1:2:3- (I), 1:2:4- (II), and 1:3:5- (III)- $\text{C}_6\text{H}_3\text{Cl}_3$  decreases in this order. (I) affords only one isomeride of 1:1:2:2:3:3:4:5:6-nonachloro-cyclohexane, m.p.  $80^\circ$ . (II) gives a series of (unseparable) mixed crystals, m.p.  $112$ — $114^\circ$ ,  $120^\circ$ ,  $135^\circ$ , and  $82^\circ$ , of two isomerides of 1:1:2:2:3:3:4:4:5:6- $\text{C}_6\text{H}_3\text{Cl}_9$  (stable to boiling  $\text{EtOH}$ ), and 1:2:2:3:3:4:4:5:6-octachloro- $\Delta^6$ -cyclohexene, m.p.  $107$ — $108^\circ$ , obtained by loss of  $\text{HCl}$  from a third unstable isomeride. (III) affords one isomeride of 1:1:2:3:3:3:4:5:5:6-nonachlorocyclohexane, m.p.  $116^\circ$ . Addition is assumed to occur most readily at double linkings unsubstituted in both Kekule forms, and these and previous results, and the substitution of  $\text{PhCl}$ , are discussed on this basis. J. W. B.

**Tin vanadate as catalyst in the oxidation of toluene.**—See this vol., 686.

**Halogenation. XIV. Iodination of aromatic hydrocarbons and bromotoluenes.** P. S. VARMA and C. SREENIVASMURTHYACHAR. XV. Chlorination and bromination of cumene and *p*-cymene. P. S. VARMA and M. K. SRINIVASAN. XVI. Bromination and iodination of mesitylene. P. S. VARMA and T. S. SUBRAHMANYAN (J. Indian Chem. Soc., 1936, 13, 187—188; 189—191; 192—193).—XIV. Iodination of several aromatic hydrocarbons is effected by heating with I-fuming  $\text{HNO}_3$ -conc.  $\text{H}_2\text{SO}_4$  on a water-bath.

XV. Passage of  $\text{Cl}_2$  into cumene containing 15% I-AcOH in diffused sunlight affords *p*-chlorocumene and *p*-chloro- $\alpha$ -chloroisopropylbenzene, m.p.  $181^\circ$ . By similar methods are obtained *p*-bromo-, m.p.  $226^\circ$ , and *p*-chloro- $\alpha$ -bromoisopropylbenzene, m.p.  $207^\circ$ . 2-Chloro-*p*-cymene with  $\text{Br-Fe}$  affords its 5-*Br*-derivative, b.p.  $247^\circ$ . The products obtained using various halogen-carriers are tabulated.

XVI. Mesitylene (I) with Br-fuming  $\text{HNO}_3$  gives its 2-*Br*-derivative, and, with Br-AcOH-fuming  $\text{HNO}_3$ , its 2:4- $\text{Br}_2$ - and 2:4:6- $\text{Br}_3$ -derivatives. (I) and I-AcOH- $\text{NO}_2\text{SO}_3\text{H}$  give the 2:4- $\text{I}_2$ -derivative further iodinated to the 2:4:6- $\text{I}_3$ -derivative. 2-Bromomesitylene similarly gives 2-bromo-4-iodomesitylene, m. p.  $175$ — $176^\circ$ . J. W. B.

**Toluene series. V. Sulphinic and sulphonic acids of the mono- and di-chlorotoluenes.** W. A. SILVESTER and W. P. WYNNE. VI. Nitration of the 4-chlorotoluene-2- and -3-sulphonic acids, 3-chlorotoluene-6-sulphonic acid, and their sulphonyl chlorides. W. P. WYNNE. VII. Nitration of 2-chlorotoluene-4- and -5-sulphonic acids and their sulphonyl chlorides. (Miss) E. G. TURNER and W. P. WYNNE (J.C.S., 1936, 691—696, 696—707, 707—716; cf. J.C.S., 1898, 73, 730).—V. The orientation of the sulphonation products of the isomerides,  $\text{C}_6\text{H}_4\text{MeCl}_2$  (J.C.S., 1892, 61, 1042; Proc. C.S., 1895, 11, 151), is established by synthesis. In all cases orientation is normal, except that 2:3- $\text{C}_6\text{H}_3\text{MeCl}_2$  gives 89% of 6- and 11% of 5-sulphonic acid (cf. 10% of 6- and 90% of 4- $\text{NO}_2$ -derivative) and that *p*- $\text{C}_6\text{H}_4\text{MeCl}$  gives 86% of 2- and 14% of 3-sulphonic acid (cf. 42% of 2- and 58% of 3- $\text{NO}_2$ -derivative). *m*- $\text{C}_6\text{H}_4\text{MeNHAc}$  with  $\text{Cl}_2$  (1 mol.) in  $\text{AcOH}$  gives mixtures of  $\text{Cl-}$  with 4:6- and 2:6- $\text{Cl}_2$ -derivatives, and with  $\text{Cl}_2\text{-H}_2\text{O}$  a poor yield of 6-chloro-*m*-toluidine;  $\text{S}_2\text{Cl}_2$  (1 part) in  $\text{CS}_2$  (5 parts) gives, however, 80% of 6-, 12% of 4-, and 8% of 2- $\text{Cl}$ -derivative, and further reaction with  $\text{S}_2\text{Cl}_2$  (0.8 part) in  $\text{CS}_2$  gives a mixture containing much 4:6- and some 2:6- $\text{Cl}_2$ -compound. The diazonium sulphite of 3-chloro-*p*-toluidine with Cu-bronze gives a good yield of 3-chlorotoluene-4-sulphinic acid, m.p.  $110^\circ$  (*Ba* salt,  $+4\text{H}_2\text{O}$ ), oxidised by  $\text{KMnO}_4$  to the sulphonic acid (*K* salt; chloride, m.p.  $46^\circ$ ; amide, m.p.  $186^\circ$ ). Similar reactions give 3-chlorotoluene-6-sulphinic (*Ba* salt,  $+4\text{H}_2\text{O}$ ) and sulphonic acid [chloride, m. p.  $54^\circ$ ; amide, m.p.  $185^\circ$ ; obtained (*loc. cit.*) from *m*- $\text{C}_6\text{H}_4\text{MeCl}$ ], 2:3-dichlorotoluene-6-sulphinic, m.p.  $133^\circ$  (*Ba* salt,  $+4\text{H}_2\text{O}$ ), and -sulphonic acid (chloride, m.p.  $51$ — $52^\circ$ ; amide, m.p.  $228^\circ$ ),

-4-sulphinic, m.p. 142° (*Ba* salt, +H<sub>2</sub>O), and -sulphonic acid (*K* salt; *chloride*, m.p. 40–41°; *amide*, m.p. 237°), 2 : 4-dichlorotoluene-5-sulphinic, m.p. 132° (*K* salt), and sulphonic acid [*K* salt, +2H<sub>2</sub>O (only one lost at 190°); *chloride*, m.p. 72°; *amide*, m.p. 176°; obtained from 2 : 4-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>], 2 : 6-dichlorotoluene-3-sulphinic (poor yield), m.p. about 105° (*Ba* salt, +4H<sub>2</sub>O), and -sulphonic acid (*chloride*, m.p. 59°; *amide*, m.p. 203°; obtained from 2 : 6-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>), 3 : 5-dichlorotoluene-4-, m.p. about 127°, and -2-sulphinic acid, m.p. 115–116° (*Ba* salt, +4H<sub>2</sub>O), and -4- (*K* salt, +H<sub>2</sub>O; *chloride*, m.p. 56°; *amide*, m.p. 154–155°) and -2-sulphonic acid (*chloride*, m.p. 43°; *amide*, m.p. 168°; obtained from 3 : 5-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>). 5 : 6-Dichloroacet-*o*-toluidide, m.p. 143°, with 50% H<sub>2</sub>SO<sub>4</sub> at 90° gives 5 : 6-dichloro-toluidine, m.p. 33°, b.p. 288–290°/739 mm. (sulphate). 3-Chloro-*o*-toluidine-5-sulphonic acid (*Ba* salt, +3H<sub>2</sub>O) with 75% H<sub>2</sub>SO<sub>4</sub> at 160° gives 3-chloro-*o*-toluidine, an oil (Ac derivative, m.p. 163°), which affords (Sandmeyer) 1 : 2 : 3 : 5-C<sub>6</sub>H<sub>2</sub>MeCl<sub>2</sub>·SO<sub>3</sub>H (97% yield; *chloride*, m.p. 88°; *amide*, m.p. 184–185°; *Ba*, +3H<sub>2</sub>O, and *Na*, +0.5H<sub>2</sub>O, salts). Nitration of 2 : 3-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub> is best effected by H<sub>2</sub>SO<sub>4</sub>-HNO<sub>3</sub> (*d* 1.42) at <50° and gives a mixture, reduced to a mixture of 2 : 3-dichloro-*p*-, m.p. 40°, b.p. 271–276°/40 mm. (Ac derivative, m.p. 131°), and -*o*-toluidine (10%), which is best separated by fractional neutralisation of the hydrochlorides; similar nitration of 2 : 6-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>, b.p. 199–200°, gives the 3-NO<sub>2</sub>-compound, m.p. 50°, and on reduction solely 2 : 6-dichloro-*m*-toluidine, m.p. 57°, b.p. 266–268°. If Cl<sub>2</sub> (1 mol.) is passed into 5-chloroacet-*o*- or 3-chloroacet-*p*-toluidide in cold AcOH and the solution is warmed to 75° after some hr. and diluted with H<sub>2</sub>O, there are formed the 3 : 5-, m.p. 180°, and 2 : 3-Cl<sub>2</sub>-, m.p. 198°, -compounds, respectively, which are hydrolysed to the bases, m.p. 45° and b.p. 249°/772 mm., respectively.

[With J. KENNER.] The formation of 6- and 5-SO<sub>3</sub>H derivatives from 2 : 3-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub> is confirmed (cf. J.C.S., 1902, 81, 1334).

VI. The products of nitration of 1 : 4 : 2- (I), 1 : 4 : 3- (II), and 1 : 3 : 6- (III), -C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>·SO<sub>3</sub>H can be separated only by way of the acid chlorides (obtained from the *Na* salts by PCl<sub>5</sub>-POCl<sub>3</sub>). Orientations are determined by the reactions, NO<sub>2</sub>·C<sub>6</sub>H<sub>2</sub>MeCl<sub>2</sub>·SO<sub>3</sub>H + NH<sub>2</sub>·C<sub>6</sub>H<sub>2</sub>MeCl<sub>2</sub>·SO<sub>3</sub>H →

C<sub>6</sub>H<sub>2</sub>MeCl<sub>2</sub>·SO<sub>3</sub>H → C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub> → C<sub>6</sub>H<sub>3</sub>Cl<sub>2</sub>·CO<sub>2</sub>H. (II) is remarkable in giving 31% of 5-, 15% of 6-, and 54% of 2-NO<sub>2</sub>-compound (although only 64% of the total material is accounted for), whereas the corresponding acid chloride gives 78% of 5-, 22% of 2-, and no 6-NO<sub>2</sub>-compound. All nitrations are effected by fuming HNO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub> at or about room temp. (II) gives 4-chloro-5- [*Ba*, +2H<sub>2</sub>O, *K*, +H<sub>2</sub>O, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 62.5° (crystallographic data given); *amide*, m.p. 196°], -6- (*Ba*, +2H<sub>2</sub>O, *K*, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 92°; *amide*, m.p. 188°), and -2-nitrotoluene-3-sulphonic acid (*Ba*, +8H<sub>2</sub>O, *K*, and *Na*, +3H<sub>2</sub>O, salts; *chloride*, m.p. 122°; *amide*, m.p. 177°; with conc. H<sub>2</sub>SO<sub>4</sub> at 220° affords 4 : 2-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>·NO<sub>2</sub>), which gives ("reduced" Fe-dil. H<sub>2</sub>SO<sub>4</sub>) 4-chloro-5-, +H<sub>2</sub>O (*Ba*, +1.5H<sub>2</sub>O, *K*, +H<sub>2</sub>O, and *Na*, +H<sub>2</sub>O,

salts), -6- (*Ba*, +9H<sub>2</sub>O, *K*, +H<sub>2</sub>O, and *Na*, +5H<sub>2</sub>O, salts), and -2-aminotoluene-3-sulphonic acid (*Ba*, +0.5H<sub>2</sub>O, decomp. 140°, *K*, and *Na*, +1.5H<sub>2</sub>O, salts), and thence 4 : 5- (*Ba*, *K*, +H<sub>2</sub>O, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 64°; *amide*, m.p. 158°), 4 : 6- (*Ba*, +2H<sub>2</sub>O, *K*, and *Na*, +1.5H<sub>2</sub>O, salts; *chloride*, m.p. 72°; *amide*, m.p. 178°), and 2 : 4-dichlorotoluene-3-sulphonic acid (*Ba*, +H<sub>2</sub>O, *K*, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 19.5°; *amide*, m.p. 188°), respectively, converted by H<sub>3</sub>PO<sub>4</sub> and steam at about 240° into the dichlorotoluenes. (I) or its chloride gives mainly 4-chloro-6- [*Ba*, +4H<sub>2</sub>O, *K*, +0.5H<sub>2</sub>O, and *Na*, +1.5H<sub>2</sub>O, salts; *chloride*, m.p. 60° (crystallographic data given); *amide*, m.p. 167°] with some -3-nitrotoluene-2-sulphonic acid (*Ba* salt, +5H<sub>2</sub>O, *K*, and *Na*, +4H<sub>2</sub>O, salts; *chloride*, m.p. 154°; *amide*, m.p. 183°), converted into 4-chloro-6-, +H<sub>2</sub>O (*Ba*, *K*, +H<sub>2</sub>O, and *Na*, +H<sub>2</sub>O, salts), and -3-amino- (*Ba*, *K*, +H<sub>2</sub>O, and *Na*, +H<sub>2</sub>O, salts), 4 : 6- (*Ba*, *K*, +H<sub>2</sub>O, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 54°; *amide*, m.p. 186°) and 3 : 4-dichloro-toluene-2-sulphonic acid (*Ba*, *K*, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 49°; *amide*, m.p. 186°). (III) or its chloride (IV) gives mainly 3-chloro-4- (*Ba*, +3H<sub>2</sub>O, *K*, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 116°; *amide*, m.p. 170°) and a very little -2-nitrotoluene-6-sulphonic acid (*Ba*, *K*, and *Na* salts; *chloride*, m.p. 96°; *amide*, m.p. 176°), converted into 3-chloro-4- (*Ba*, +2H<sub>2</sub>O, *K*, and *Na*, +H<sub>2</sub>O, salts) and -2-amino-, +H<sub>2</sub>O, 3 : 4- (optical data of chloride given) and 2 : 3-dichloro-toluene-6-sulphonic acid (*Na*, +H<sub>2</sub>O, salt; *chloride*, m.p. 54°), respectively. (IV) is obtained with a little 4 : 4'-dichloro-3 : 3'-dimethyldiphenylsulphone, m.p. 130°, from *m*-C<sub>6</sub>H<sub>4</sub>MeCl and ClSO<sub>3</sub>H in CS<sub>2</sub>.

VII. Nitration (as above) of 1 : 2 : 4-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>·SO<sub>3</sub>H gives 95% of 5- and 5% of 6-NO<sub>2</sub>-derivative, 80% and 20%, respectively, being obtained from the chloride. 1 : 2 : 5-C<sub>6</sub>H<sub>3</sub>MeCl<sub>2</sub>·SO<sub>3</sub>H and its chloride give 67 and 98% of the 3- and 33 and 2% of the 4-NO<sub>2</sub>-derivative, respectively. *K* chloronitrotoluenesulphonates, in which the NO<sub>2</sub> has both an *o*-SO<sub>3</sub>K and a *p*-Cl, give with PCl<sub>5</sub>-POCl<sub>3</sub> poor yields of sulphonyl chloride with much dichloronitrotoluenesulphanyl chloride. Orientations are established as above. The following are described. 2-Chloro-5- (*K* salt; crystallographic data of chloride given) and -6-nitro- (*K* salt), -5- (*Ba*, +H<sub>2</sub>O, and *K*, +2H<sub>2</sub>O, salts) and -6-amino- (*K* salt), and 2 : 6-dichlorotoluene-4-sulphonic acid (*K* salt). 2-Chloro-5-nitro- (*Ba*, +H<sub>2</sub>O, and *Na* salts) and -amino-, +0.33H<sub>2</sub>O (*Na* salt), and 3 : 5-dichloro-toluene-6-sulphonic acid (*Ba*, *K*, and *Na*, +H<sub>2</sub>O, salts; *chloride*, m.p. 38°; *amide*, m.p. 180°). 2-Chloro-3- (*Ba*, +3.5H<sub>2</sub>O, *K*, and *Na* salts; *chloride*, m.p. 52°; *amide*, m.p. 201°) and -4-nitro- (*Ba*, +2H<sub>2</sub>O, *K*, and *Na*, +1.5H<sub>2</sub>O, salts; *chloride*, m.p. 97°; *amide*, m.p. 172°), -3- (*K* salt) and -4-amino- (*Na* salt) and 2 : 4-dichloro-toluene-5-sulphonic acid (*Na* salt, +H<sub>2</sub>O). 2 : *x*-Dichloro-5-nitrotoluene-4-, decomp. 128° (darkening at 95–100°), and -6-sulphanyl chloride, m.p. 119° (decomp.); the former is oxidised by dil. HNO<sub>3</sub> to a sulphonic acid (*K* salt); both react with AgNO<sub>3</sub> in dil. HNO<sub>3</sub> (1Cl removed), 1% aq. NaOH, and Fe(OH)<sub>3</sub>.

[Addendum. G. M. BENNETT.] Summary of the above results shows the high *o*- and less high *p*-directing power of Me and SO<sub>3</sub>H diminished as expected by conversion of SO<sub>3</sub>H into SO<sub>2</sub>Cl owing to the higher electron-attracting power of SO<sub>2</sub>Cl, inability of SO<sub>2</sub>Cl to ionise, and lesser attraction of SO<sub>2</sub>Cl for HNO<sub>3</sub>. Similarly PhSO<sub>3</sub>Cl gives 90% of *m*-NO<sub>2</sub>-derivative, whereas PhSO<sub>3</sub>H gives 27% of *o*-compound.

R. S. C.

**Reaction between triarylmethyl halides and magnesium phenyl bromide. II.** C. S. SCHOEFFLE and S. G. TREFF (J. Amer. Chem. Soc., 1936, 58, 791—794; cf. A., 1932, 1240).—MgPhBr (in Et<sub>2</sub>O) and CPh<sub>3</sub>Cl or CPh<sub>3</sub>Br (in C<sub>6</sub>H<sub>6</sub>) afford 5—7.5% of CPh<sub>4</sub> and 50—77% of diphenyldiphenylmethane (I). With Et<sub>2</sub>O-free MgPhBr and CPh<sub>3</sub>Cl (in C<sub>6</sub>H<sub>6</sub>, PhMe, PhBr, C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub>, or dioxan) 20—25% of CPh<sub>4</sub> is obtained; (I) could not be isolated. In the latter case there appears to be a smaller tendency to favour the quinonoid form (cf. *loc. cit.*) of the CPh<sub>3</sub>Cl. The rate of reaction of the benzenoid form is very slow in comparison with the quinonoid. Other products isolated in the first-named (?) reaction are CHPh<sub>3</sub> (5%), phenyldi(diphenyl)- (3%), tri(diphenyl)- (trace), and *p*-phenyltetraphenyl- (0.6%) -methanes; reaction mechanisms are discussed briefly. 4 : 4' : 4''-Tribromo-, m.p. 234—235° (43—45% yield), 4 : 4' : 4''-trichloro-, m.p. 207—207.5° (38—49%), and 4 : 4' : 4''-trimethyl-, m.p. 177—178° (31—41%), -tetraphenylmethane are prepared from MgPhBr (in Et<sub>2</sub>O) and CAr<sub>3</sub>Cl (in C<sub>6</sub>H<sub>6</sub>); the higher yields (cf. above) are ascribed to the lessened tendency of the CAr<sub>3</sub>Cl to become quinonoid.

H. B.

**Influence of solvent on the course of chemical reactions. VII.** Spectra of aromatic hydrocarbons in solution. K. LAUER (Ber., 1936, 69, [B], 986—993).—The absorption spectrum of C<sub>10</sub>H<sub>8</sub> has been observed for the vapour and cryst. states and in *n*-hexane, Et<sub>2</sub>O, EtOH, MeOH, cyclohexene, and C<sub>6</sub>H<sub>6</sub>. The displacements show that the bands of longest  $\lambda$  are due in the first place to the polar, cationoid positions of the mol. which must be an  $\alpha$ -position. Such polar atoms not only attract the polar positions of the solute indirectly but also cause production of associates, solvates, or mol. compounds. Further bands are due to the entire mol. and show the peculiarities observed with C<sub>6</sub>H<sub>6</sub>. The second part of the spectrum, in the region of shorter  $\lambda$ , is due to the aromatic nucleus and the displacements correspond qualitatively with those of C<sub>6</sub>H<sub>6</sub>. To C<sub>10</sub>H<sub>8</sub>

the constitution (I) is therefore assigned, this being regarded as a limiting formula. Similar limiting formulae are proposed for anthracene indicating the strong cationoid polarity of the 9:10 positions.

(I) In general the displacements observed with phenanthrene are similar to those with C<sub>6</sub>H<sub>6</sub>. The first band is more markedly displaced towards the red in alcohols than in hexane and is therefore due to the 9 and 10 positions both of which are cationoid but weakened in comparison with anthracene, in consequence of their *o*-position to one

another. The displacement of the limits of absorption by linear annelation of C<sub>6</sub>H<sub>6</sub> nuclei is discussed.

H. W.

**Influence of solvent on the course of chemical reactions. VI.** Bromination of aromatic compounds. K. LAUER and R. ODA (Ber., 1936, 69, [B], 978—985).—The bromination of C<sub>10</sub>H<sub>8</sub> is accompanied by rapid diminution of the reaction const. In the cases of Me oleate and cyclohexene halogenation proceeds rapidly at first but very slowly towards the end of the change; addition of unsaturated material immediately restores the rate. With C<sub>10</sub>H<sub>8</sub> this is not the case so that the decay in rate is not attributable to the C<sub>10</sub>H<sub>8</sub> mol. Retardation appears due to HBr and the production of polybromides which have no brominating action. The phenomena are complex. Similar retardation is caused by bromides and to a smaller extent by alkali chlorides but not by HCl. I accelerates greatly due to union with HBr. The bromination of C<sub>6</sub>H<sub>6</sub>, anthracene (I), phenanthrene, *lm*-benzanthracene (II), 9-bromoanthracene, dihydroanthracene, *o*-xylene, and Ph<sub>2</sub> usually in hexane and (or) AcOH has been studied. The rate of bromination is dependent on the concn. due to the formation of polybromides and of associates of the aromatic mols. The aromatic hydrocarbons do not appear to be present in two forms one of which has a diradical nature; this is shown by the course of bromination after addition of fresh solution and by the observation that (II) is halogenated more slowly than (I).

H. W.

**Fused carbon rings. XI.** Action of aluminium chloride on decahydronaphthalene. R. L. JONES and R. P. LINSTAD (J.C.S., 1936, 616—621; cf. this vol., 713).—The low-boiling products of the action of AlCl<sub>3</sub> on decahydronaphthalene at 130° probably contain 1:4- (or, less probably, 2:5-) dimethyl-0:3:3-dicyclooctane (I); other fractions yield by dehydrogenation C<sub>6</sub>H<sub>6</sub>, PhMe, and mesitylene, proving the presence of cyclohexane, methyl- and 1:3:5-trimethyl-cyclohexane; formation of the last-mentioned product must have involved drastic degradation and resynthesis. A methylhyrindane may also have been present. (I), b.p. 158—163°, is stable to Br and KMnO<sub>4</sub>, and hardly affected by Ni-Al dehydrogenating catalysts; it gives a (?1)-Cl-derivative, b.p. 88—91°/16 mm., and thence (NH<sub>2</sub>Ph or *p*-NO<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>-CO<sub>2</sub>Ag) 1:4-dimethyl- $\Delta^{1,1,0}$ :3:3-dicyclooctene (II), b.p. 54—60°/20 mm., oxidised by KMnO<sub>4</sub> to ? 3-acetyl-1-methylcyclopentane-2-acetic acid, m.p. 120° (semicarbazone, m.p. 195°; gives CHI<sub>3</sub>). The structure of (I) is not certain, but is probable from the above reactions and from correspondence of *n* and *d* for (I) and (II) with those of analogous compounds described below; the above compounds are probably *trans*. The Na derivative of Et 5-methylcyclopentanone-2-carboxylate (modified prep.; 70—80% yield) and CHMeBr·CO<sub>2</sub>Et give Et 5-methylcyclopentanone-2-carboxylate-2- $\alpha$ -propionate, b.p. 171—175°/19 mm. (with some open-chain ester, b.p. 180—190°/20 mm.), which with hot HCl yields 5-methylcyclopentanone-2- $\alpha$ -propionic acid, m.p. 76° (phenylhydrazone, m.p. 192°), the Et ester, b.p. 127—128°/12 mm., of which could not be condensed with

CN·CH<sub>2</sub>·CO<sub>2</sub>Et. Et 4-methylcyclopentanone-2-carboxylate, b.p. 123—125°/24 mm., is obtained in 30% yield from 4-methylcyclohexanol by way of crude β-methyladipic acid and its Et ester, b.p. 138—144°/16—17 mm.; its Na derivative with CH<sub>2</sub>Cl·CO<sub>2</sub>Et affords Et<sub>2</sub> 4-methylcyclopentanone-2-carboxylate-2-acetate (65% yield), b.p. 180—183°/24 mm., converted by conc. HCl into methylcyclopentanone-2-acetic acid (crude), b.p. 183—190°/24 mm., the Et ester, b.p. 130—133°/23 mm. (semicarbazone, m.p. 141°), of which with CN·CHK·CO<sub>2</sub>Et affords Et<sub>2</sub> 4-methylcyclopentylidene-1-cyanoacetate-2-acetate, b.p. 194°/4 mm. (35% yield). Hydrogenation (Adams) in EtOH gives Et<sub>2</sub> 4-methylcyclopentane-1-cyanoacetate-2-acetate, b.p. 205°/17 mm., which with HCl affords 38% of 4-methylcyclopentane-1:2-diacetic acid (III), m.p. 173—174°, and a little 5-methyl-0:3:3-dicyclooctan-2-one (IV), b.p. 104°/26 mm. (semicarbazone, m.p. 183°), obtained in 32% yield from (III) and Ba(OH)<sub>2</sub> at 270—280°. (IV) and MgMeI give a carbinol, dehydrated by NH<sub>2</sub>Ph·HBr to 2:5-dimethyl-Δ<sup>1</sup>-0:3:3-dicyclooctene (70% yield), b.p. 167°, which is hydrogenated (Adams; no solvent) to 2:5-dimethyl-0:3:3-dicyclooctane, b.p. 165—167°. R. S. C.

**Syntheses of 1-phenylnaphthalenes.** W. N. HOWELL and A. ROBERTSON (J.C.S., 1936, 587—589). —1-Keto-1:2:3:4-tetrahydronaphthalene and *p*-OMe·C<sub>6</sub>H<sub>4</sub>·MgBr in Et<sub>2</sub>O give 1-*p*-anisyl-3:4-dihydronaphthalene, b.p. 198—200°/12 mm., m.p. 76°, dehydrogenated by Se at 280—300° to 1-*p*-anisyl-naphthalene, m.p. 116.5° (NO<sub>2</sub>-derivative, m.p. 129°). 6:7-Dimethoxy-1-keto-1:2:3:4-tetrahydronaphthalene and MgPhBr give similarly 6:7-dimethoxy-1-phenyl-3:4-dihydronaphthalene, b.p. 215—217°/14 mm., m.p. 68.5°, and 6:7-dimethoxy-1-phenylnaphthalene (I), m.p. 110°, and thence by HI·Ac<sub>2</sub>O at 140—145° the (OH)<sub>2</sub>-compound, m.p. 167—168°. Similar reactions give 7-methoxy-1-phenyl-, m.p. 42.5—43.5°, and 1-*p*-anisyl-2-methyl- (with *pp'*-dianisyl), m.p. 91—92°, 3:4-dihydronaphthalene, and 7-methoxy-1-phenyl-, m.p. 48—50°, b.p. 214—215°/19 mm., and 1-*p*-anisyl-2-methyl-naphthalene, m.p. 108°. The Na derivative of CH<sub>2</sub>Bz·CH<sub>2</sub>·CO<sub>2</sub>Et and veratraldehyde (II) give the

lactone (III), 3:4-(OMe)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·CH·C<math display="block">\begin{array}{c} \text{CO}\cdot\text{O} \\ \text{CH}\cdot\text{C}\_6\text{H}\_4 \end{array}, m.p. 131°, converted by hot MeOH into *Me* β-benzoyl-α-veratrylidene-*propionate* (IV), m.p. 96°, and thence by cold NaOMe into the corresponding acid, m.p. 168°. (III) with I in CHCl<sub>3</sub> at room temp. (5 days) yields 6:7-dimethoxy-1-phenylnaphthalene-3-carboxylic acid, m.p. 265° [also obtained by boiling (III) or (IV) with HCl·MeOH and hydrolysing the resulting *Me* ester, m.p. 124°], which with Cu-bronze in boiling quinoline affords (I). The Na derivative of *p*-OMe·C<sub>6</sub>H<sub>4</sub>·CO·CH<sub>2</sub>·CH<sub>2</sub>·CO<sub>2</sub>Et and PhCHO with Ac<sub>2</sub>O at 100° yield the lactone, m.p. 174°, analogous to (II), and thence β-*p*-anisoyl-α-benzylidene-*propionic acid*, +0.5C<sub>6</sub>H<sub>6</sub>, m.p. 170° (*Me* ester, m.p. 74—75°); none of these products could be cyclised. (OMe)<sub>3</sub>C<sub>6</sub>H<sub>2</sub>·CO·CHN<sub>2</sub> and HCl·Et<sub>2</sub>O at 0° give ω-chloro-3:4:5-trimethoxyacetophenone, m.p. 86—87°, giving with KOAc·EtOH and a trace of I the *c*-derivative, m.p. 85—86°, and with CHNa(CO<sub>2</sub>Et)<sub>2</sub> 3:4:5-trimethoxybenzoylmalonic acid,

m.p. 167—168°, and thence (160°) 3:4:5-trimethoxybenzoylpropionic acid (V), dimorphic, m.p. 116° and 122°; the Na derivative of (V) with (IV) affords the γ-lactone, m.p. 172—173°, of β-3:4:5-trimethoxybenzoyl-α-veratrylidene-*propionic acid*. R. S. C.

**Aromatic fluoro-compounds. XXI. "ortho-Effect" in the "2-fluoro-1-nitronaphthalene"** of Willstaedt and Scheiber. G. SCHIEMANN and E. LEY (Ber., 1936, 69, [B], 960—964; cf. A., 1935, 856).—Repetition of the work of Willstaedt *et al.* (A., 1934, 522) shows that diazotisation of 1:2-NO<sub>2</sub>·C<sub>10</sub>H<sub>6</sub>·NH<sub>2</sub> in conc. HCl is accompanied by replacement of NO<sub>2</sub> by Cl. The "2-fluoro-1-nitronaphthalene" is therefore 1-chloro-2-fluoronaphthalene, m.p. 62.5°. The isolation of 2:1-C<sub>10</sub>H<sub>6</sub>F·NO<sub>2</sub> from the products of the nitration of 2-C<sub>10</sub>H<sub>7</sub>F is very difficult, but the crude product can be reduced by the usual methods. H. W.

**Structure of anthracene.** L. F. FIESER and W. C. LOTHROP (J. Amer. Chem. Soc., 1936, 58, 749—753; cf. A., 1935, 1230).—Structure (A) (cf. Fries *et al.*, *ibid.*, 761) is indicated by the observation that 1:5-disubstituted-2:6-dihydroxyanthracenes do not couple with diazotised *p*-NH<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·SO<sub>3</sub>H or *p*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·NH<sub>2</sub>. The position of equilibrium between the tautomeric forms of unsymmetrical derivatives (e.g., 2-OH-, 2-NH<sub>2</sub>-, 1-NO<sub>2</sub>-, 1:2-benz-) can be inferred from oxidation-reduction potential data for quinones.

6-Hydroxy-*o*-toluic acid (I) (from Na β-naphthylamine-4:8-disulphonate and 50% NaOH at 250—275°) is methylated (Me<sub>2</sub>SO<sub>4</sub>, alkali) to the 6-*OMe*-acid, m.p. 145—146°; the chloride, m.p. 40°, of this with AlCl<sub>3</sub> in CS<sub>2</sub> gives 4—10% of 2:6-dimethoxy- (II), m.p. about 305° (decomp.), and 3—7% of 2:6-dihydroxy-, decomp. about 330° (diacetate, m.p. 253°), -1:5-dimethylantraquinone. Reduction of (II) with SnCl<sub>2</sub> and AcOH·conc. HCl affords the hydroxyanthrone (?), decomp. about 295°, which is further reduced (method: Hall and Perkin, J.C.S., 1923, 123, 2029) to 2:6-dimethoxy-1:5-dimethylanthrane, m.p. 250° (decomp.), demethylated (48% IIBr, AcOH) to 2:6-dihydroxy-1:5-dimethylanthrane, decomp. from about 340° [diacetate, m.p. 266° (decomp.)]. An anthraquinone could not be obtained from (I) and ZnCl<sub>2</sub> (cf. G.P. 87,620), H<sub>2</sub>SO<sub>4</sub>, H<sub>2</sub>SO<sub>4</sub>·B<sub>2</sub>O<sub>3</sub>, or P<sub>2</sub>O<sub>5</sub>. (I) and SOCl<sub>2</sub> in Et<sub>2</sub>O give the *deside*, OH·C<sub>6</sub>H<sub>3</sub>Me·CO<sub>2</sub>·C<sub>6</sub>H<sub>3</sub>Me·OH, m.p. 211°. 2:6-Diallyloxylantraquinone, m.p. 149° [from the (OH)<sub>2</sub>-derivative, allyl bromide, and K<sub>2</sub>CO<sub>3</sub> in COMe<sub>2</sub>], is reduced [as for (II)] to 2:6-diallyloxylanthrane, m.p. 201°, which when heated in NPhEt<sub>2</sub>·Ac<sub>2</sub>O and N<sub>2</sub> at 160—180° affords 2:6-diacetoxy-1:5-diallylanthrane, m.p. 179° [the 2:6-(OH)<sub>2</sub>-derivative could not be obtained cryst.]. H. B.

**Polycyclic aromatic hydrocarbons. XIV. Synthesis of 3:4-benzphenanthrene.** C. I. HEWETT (J.C.S., 1936, 596—599; cf. A., 1935, 1359).—A 7.3% over-all yield of 3:4-benzphenanthrene (I) is obtained from CO<sub>2</sub>H·CH<sub>2</sub>·CH(CHPh<sub>2</sub>)·CO<sub>2</sub>H (II). Difficulty of ring-closure in the last stage indicates resistance to formation of ring-structure of

(I), possibly due to steric hindrance. (II) and  $\text{AcCl}$  give the anhydride, which (crude) with  $\text{AlCl}_3$  in  $\text{PhNO}_2$  at  $0^\circ$  gives 4-keto-1-phenyl-1 : 2 : 3 : 4-tetrahydro-2-naphthoic acid, m.p. 208—209° (*Et* ester, m.p. 122—123°). Ordinary Clemmensen reduction gives poor yields, but reaction in boiling  $\text{PhOMe}$  and purification by way of the ester gives a 78% yield of 1-phenyl-1 : 2 : 3 : 4-tetrahydro-2-naphthoic acid, m.p. 148—148.5°, b.p. 200°/0.8 mm.; the *Et* ester, b.p. 170—173°/0.8—1 mm., thereof with  $\text{Na-EtOH}$  gives 1-phenyl-1 : 2 : 3 : 4-tetrahydro-2-naphthylcarbinol, b.p. 175—180°/1 mm., m.p. 93—94°, and thence ( $\text{SOCl}_2$ ) the chloride, m.p. 71—72°, b.p. 168°/0.8 mm.; the Grignard reagent with  $\text{CO}_2$  affords 1-phenyl-1 : 2 : 3 : 4-tetrahydronaphthyl-2-acetic acid (III), m.p. 138—139° after sintering (*Et* ester, m.p. 55—56°), with a little 1-phenyl-2-methyl-1 : 2 : 3 : 4-tetrahydronaphthalene, m.p. 46—47°, and  $\alpha\beta$ -bis-(1-phenyl-1 : 2 : 3 : 4-tetrahydro-2-naphthyl)ethane, m.p. 169.5—170.5°. Cyclisation of (III) was effected only by the action of  $\text{AlCl}_3$  in  $\text{CS}_2$  on the chloride (obtained by  $\text{SOCl}_2$ ) and yielded 2-keto-1 : 2 : 9 : 10 : 11 : 12-hexahydro-3 : 4-benzphenanthrene (IV), m.p. 154—155° (oxime, m.p. 191—192°), the semicarbazone, m.p. 235°, of which with  $\text{NaOEt}$  at 175—180° gives 1 : 2 : 9 : 10 : 11 : 12-hexahydro-3 : 4-benzphenanthrene, b.p. 148—153°/0.2 mm., m.p. 47.5—48°, dehydrogenated by  $\text{Pd-black}$  at 310—320° to (I). (IV) and  $\text{MgMeI}$  yield a carbinol, which by dehydration by  $\text{KHSO}_4$  at  $100^\circ$  and dehydrogenation by  $\text{Pd-black}$  at 300—310° gives 2-methyl-3 : 4-benzphenanthrene, m.p. 69.5—70°. R. S. C.

**Preparation of amino- and halogeno-phenanthrenes.** W. E. BACHMANN and C. H. BOATNER (J. Amer. Chem. Soc., 1936, 58, 857—858).—Hydrolysis of the products obtained by Beckmann rearrangement of the oximes of 1-, m.p. 112—113°, 2-, 3-, and 9-acetylphenanthrenes gives 1-, m.p. 145—146°, 2-, 3-, and 9-aminophenanthrenes, respectively. The following have been prepared: 1-, m.p. 120—120.5°, 2-, m.p. 85.5—86°, and 3-, m.p. 80.5—81.5°, chloro-; 1-, m.p. 109.5—110°, 2-, m.p. 95—96°, and 3-, m.p. 83—84°, bromo-; 1-, m.p. 112.5—113°, 2-, m.p. 116—116.5°, and 3-, m.p. 83.5—84°, iodo-phenanthrene. H. B.

**Diradical formula of rubenes.** C. DUFRAISSE (J. Amer. Chem. Soc., 1936, 58, 858).—Schonberg's claim (this vol., 326) to priority is disputed. H. B.

**[Reversible chemical absorption of free oxygen by organic compounds.]** C. DUFRAISSE (Ber., 1936, 69, [B], 1228).—A reply to Schonberg (this vol., 600). H. W.

**Catalytic condensation of acetylene with aromatic amines.** I. Condensation of acetylene with aniline in presence of cuprous and cupric chlorides. N. S. KOZLOV and P. N. FEDOSEEV (J. Gen. Chem. Russ., 1936, 6, 250—258).— $\text{NH}_2\text{Ph}$  and  $\text{C}_2\text{H}_2$  in presence of  $\text{CuCl}_2$  yield a product, from which quinaldine (I) and tetrahydroquinaldine (II) are obtained by distillation. In presence of excess of  $\text{NH}_2\text{Ph}$  *cis-trans*- $\text{NHPh}\cdot\text{CHMe}\cdot\text{CH}\cdot\text{CH}\cdot\text{NHPh}$  (III), also affording (I) and (II) when heated, is obtained. In presence of  $\text{CuCl}$  the products isolated after 1—10 days were (I) (50% yield), (II), (III), and  $\text{NHPhEt}$ ;

$\text{NPhEt}_2$  and  $\text{NHPhBu}$  were not found. The process is represented:  $2\text{NH}_2\text{Ph} + \text{C}_2\text{H}_2 \rightarrow \text{CHMe}(\text{NHPh})_2$  (IV);  $2(\text{IV}) \rightarrow 2\text{NH}_2\text{Ph} + (\text{III})$ ;  $\text{NH}_2\text{Ph} + \text{C}_2\text{H}_2 \rightarrow \text{NPh}\cdot\text{CHMe}$  (V);  $2(\text{V}) \rightarrow (\text{III}) \rightarrow (\text{I}) + \text{NH}_2\text{Ph} + \text{H}_2$ ;  $(\text{I}) + 2\text{H}_2 \rightarrow (\text{II})$ . The catalytic action of  $\text{CuCl}$  and  $\text{CuCl}_2$  appears to depend on formation of triple salts with  $\text{NH}_2\text{Ph}$  and  $\text{C}_2\text{H}_2$ . R. T.

**Reactivity and structure of primary aromatic amines.** G. VAVON and L. BOURGEOIS (Compt. rend., 1936, 202, 1446—1448).— $\text{CH}_3\text{PhBr}$  and 2 : 4 : 6- $\text{C}_6\text{H}_2\text{Me}_3\cdot\text{CH}_2\text{Br}$  with aromatic amines afford derivatives, the times of half formation of which are measured by the  $\text{HBr}$  liberated. When no steric factors are involved, the less basic amines react more slowly. *o*-Derivatives react more slowly than *p*-, the dimensions of the *o*-substituent being the determining factor. J. L. D.

**Rates of reaction and energies of activation of 1 : 2 : 4-chlorodinitrobenzene with aromatic primary amines.**—See this vol., 802.

**Stereochemistry of tervalent nitrogen compounds.** I. Attempted resolution of substituted derivatives of aniline. E. V. MENON and D. H. PEACOCK (J. Indian Chem. Soc., 1936, 13, 104—108).— $\text{NPhEt}\cdot\text{CH}_2\text{Ph}$  and 20% oleum at  $80^\circ$  give sulphobenzylethylaniline, the *brucine* salt, m.p. 164—165°, of which (after 5 crystallisations) yields an inactive Na salt. *N-Benzyl-p-toluenesulphon-m-nitroanilide* (I), m.p. 118° [from *p*-toluenesulphon-m-nitroanilide (modified prep.) and  $\text{CH}_2\text{PhCl}$  in  $\text{EtOH-NaOH}$ ], is reduced ( $\text{Sn}$ , conc.  $\text{HCl}$ ,  $\text{EtOH}$ ) to the -*m*-aminoanilide, m.p. 137° (*H tartrate*, m.p. 136°,  $[\alpha]^{25} + 4.57^\circ$  in  $\text{COMe}_2$ ;  $\gamma$ -phenoxy- $\alpha$ -methylbutyryl derivative, m.p. 117°), methylated ( $\text{MeI}$ , aq.  $\text{Na}_2\text{CO}_3$ ) to the -*m*-dimethylaminoanilide, m.p. 101° (methiodide, m.p. 111—112°, which affords a non-cryst. product with  $\text{Ag bromocamphorsulphonate}$ ). *N-Benzyl-p-toluenesulphon-p-nitroanilide*, m.p. 128° [obtained similarly to, but less readily than, (I)], is reduced to the -*p*-aminoanilide, m.p. 162° ( $\gamma$ -phenoxy- $\alpha$ -methylbutyryl derivative, m.p. 143°), which does not form a tartrate. The dry Na salt of *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\cdot\text{NHPh}$  and *m*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\text{Cl}$  at 140—150° give *N-m-nitrobenzyl-p-toluenesulphonanilide*, m.p. 95°, reduced to *N-m-aminobenzyl-p-toluenesulphonanilide*, m.p. 129° (*H tartrate*, m.p. 133°,  $[\alpha]^{25} + 4.6^\circ$  in  $\text{COMe}_2$ ;  $\gamma$ -phenoxy- $\alpha$ -methylbutyryl derivative, m.p. 111°). None of the above  $\text{NH}_2$ -derivatives shows signs of dissymmetry. H. B.

**Mesomeric effect of the dimethylamino-group in dimethylaniline, and the nature of its interaction with halogen groups.** R. J. B. MARSDEN and L. E. SUTTON (J.C.S., 1936, 599—606).—The dipole moments of  $\text{NPhMe}$ , and its *p*-Me, -Cl, -Br, -I, - $\text{NO}_2$ , and - $\text{NH}_2$ -derivatives, measured in  $\text{C}_6\text{H}_6$  solution at  $25^\circ$ , are 1.58, 1.29, 3.29, 3.37, 3.24, 6.87, and  $1.42 \times 10^{-18}$  e.s.u., respectively. On the assumption that the interaction between  $\text{Me}$  and  $\text{NMe}_2$  is zero the mesomeric effect of the latter group is calc. to be 1.55, the angle between the moment of  $\text{NPhMe}_2$  and the  $\text{C-NMe}_2$  linking being  $38^\circ$  (cf.  $33.5^\circ$ , the smaller of the two possible vals. obtained by Hertel *et al.*, this vol., 12). The interaction moment  $\mu_{\text{int}}$  (that moment parallel to the axis passing through the two

substituent-bearing C atoms necessary to convert the calc. to the observed val.) between  $\text{NMe}_2$  and substituent groups are calc. to be Cl 0.34, Br 0.46, I 0.69, and  $\text{NO}_2$  1.86:  $\text{NMe}_2$  thus reduces the mesomeric effect of the halogens, suppressing it almost completely in the I-derivative: decreases in the order  $\cdot\text{NMe}_2 > (\cdot\text{NH}_2, \cdot\text{OPh}, \cdot\text{OMe}) > \cdot\text{OH}$ , and is always positive relatively to the main group for any of the substituent groups used (cf. also Bennett *et al.*, A., 1934, 831). The nature of mesomeric effects and their mutual interaction are fully discussed especially in relation to excited structures, the increase or decrease in the relative importance of which may be produced not only by similar or dissimilar requirements of valency arrangements of the two groups, but also by the fields of the groups, and an attempt to assess the relative importance of such "valency" and "polar" effects is made. J. W. B.

**De-ethylation of diethylaniline.** G. I. GERSCHON and G. BERENSCHTEIN (J. Appl. Chem. Russ., 1936, 9, 496—501).—A mixture of  $\text{NH}_2\text{Ph}$ ,  $\text{NPhEt}$ , and  $\text{NPhEt}_2$  is obtained by heating  $\text{NH}_2\text{Ph}$  and  $\text{NPhEt}_2$  in presence of  $\text{HCl}$  or  $\text{C}_6\text{H}_5\text{Me}(\text{SO}_3\text{H})_2$ .  $\text{EtCl}$  and  $\text{C}_2\text{H}_4$  are obtained as by-products. R. T.

**Catalytic synthesis of diphenylamine.** G. I. GERSCHON and R. P. LASTOVSKI (J. Appl. Chem. Russ., 1936, 9, 502—504).— $\text{NHPh}_2$  is obtained in good yield from  $\text{NH}_2\text{Ph}\cdot\text{HCl}$  (I) (2 mols.) and  $\text{AlCl}_3$  (0.43 mol.) (220—240°; 20 hr.). The reaction is represented as  $3\text{NH}_2\text{Ph} + \text{AlCl}_3 \rightarrow \text{Al}(\text{NH}_2\text{Ph})_3$  (II); (II) + 3(I)  $\rightarrow$   $3\text{NHPh}_2 + 3\text{NH}_4\text{Cl} + \text{AlCl}_3$ . R. T.

**Preparation of di- $\alpha$ -naphthylmethylamine.** H. RUPE and W. BRENTANO (Helv. Chim. Acta, 1936, 19, 581—588).—Hydrogenation (Ni) of  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{CN}$  (I) in  $\text{EtOH-EtOAc-H}_2\text{O}$  at 75°/70 atm. gives 71.1% of  $\text{NH}(\text{CH}_2\text{-C}_{10}\text{H}_7\text{-}\alpha)_2$  (II) and 5% of  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{CH}_2\cdot\text{OH}$ , m.p. 59—60°. Mostly  $\text{NH}_2\cdot\text{CH}_2\cdot\text{C}_{10}\text{H}_7\text{-}\alpha$  (III) is obtained at 75°/1 atm., room temp./75 atm., or room temp./1 atm. Other methods give poor yields of (II). 15 g. of  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{CH}_2\text{Cl}$  (IV), m.p. 31—32°, b.p. 150—155°/10 mm. (modified prep. by  $\text{CH}_3\text{O-HCl}$ ), and  $\text{NH}_3\text{-EtOH}$  at 160° give 5 g. of (III), 5.1 g. of (II), and 1.5 g. of tri-( $\alpha$ -naphthylmethyl)amine, m.p. 300° [hydrochloride, nitrate, phosphate, sulphate, and acetate, more sol. than the salts of (II)]. 10 g. of  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{CH}_2\text{Br}$  (improved prep. by Br at 190° in ultra-violet light) and  $\text{NH}_3\text{-EtOH}$  at 100° give 1.5 g. of (II) and 4.8 g. of (III), at 150° 6 g. of (III). (I) (prep. by diazo-reaction with  $\text{K}_2\text{Ni}(\text{CN})_4$  in 75—78% yield), b.p. 147—148°/12 mm., and  $\text{NH}_3\text{-H}_2\text{S-EtOH}$  at 100° give a very poor yield of (III).  $\alpha$ -Naphthylmethylphthalimide, m.p. 174—175°, with conc.  $\text{HCl}$  at 100° gives 86% of (II), 10 g. of which with (IV) give 1.8 g. of (II). (IV),  $p\text{-C}_6\text{H}_4\text{Me-SO}_2\text{-NH}_2$ , and hot  $\text{KOH-EtOH}$  give a good yield of  $p$ -toluenesulphon-di-( $\alpha$ -naphthylmethyl)amide, m.p. 134° (obtained also in 50—55% yield by hot  $\text{NaOBu}^t\text{-Bu}^t\text{OH}$ ), with conc.  $\text{HCl}$  at 100° gives a poor yield of (I).  $\alpha\text{-C}_{10}\text{H}_7\cdot\text{CHO}$  [prep. from (IV) by  $(\text{CH}_2)_6\text{N}_4$  in 48% yield], b.p. 158—159°/14 mm., and (III) give  $\alpha$ -naphthylidene- $\alpha$ -naphthylmethylamine, m.p. 105°, giving by hydrogenation (Ni) in  $\text{EtOH-H}_2\text{O}$  10% of (II).

R. S. C.

[Pharmacology of] quaternary ammonium iodides.—See this vol., 892.

**Reduction of nitro-compounds by hydrazine.** [Preparation of 4:4'-azoxyphenetole.] B. M. BOGOSLOVSKI (J. Appl. Chem. Russ., 1936, 9, 725—727).—A 100% excess of  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  added to 4-nitrophenetole (I) in hot  $\text{NaOEt-EtOH}$  gives 4:4'-azoxyphenetole in 62% yield. With 4-nitrotoluene in place of (I), the chief product is an unidentified substance, m.p. 265°, together with some 4:4'-azoxytoluene. R. T.

**Action of Grignard compounds on phenylhydrazones.** Preparation of  $s$ -alkylphenylhydrazines. P. GRAMMATIKAKIS (Compt. rend., 1936, 202, 1289—1291).—Contrary to Busch *et al.* (A., 1905, i, 519) arylphenylhydrazones react with  $\text{MgRX}$ :  $\text{CHAr}\cdot\text{N}\cdot\text{NHPh} + \text{MgRX} \rightarrow \text{CHRAr}\cdot\text{NH}\cdot\text{NHPh}$ . Thus  $\text{CHPh}\cdot\text{N}\cdot\text{NHPh}$  and  $\text{MgEtBr}$  give  $s$ -phenyl- $\alpha$ -phenyl- $n$ -propylhydrazine (I), b.p. 210°/15 mm. [hydrochloride, m.p. 217° (decomp.);  $\text{Ac}_1$  derivative, m.p. 138°; phenylurethane, m.p. 140°], reduced by  $\text{Zn-AcOH}$  quantitatively to  $\text{NH}_2\text{Ph}$  and  $\text{NH}_2\cdot\text{CHPhEt}$ , which, with  $\text{COPhPr}^a$ , are also obtained as secondary products in the formation of (I). (I) has the usual basic and reducing properties of  $s$ -alkylphenylhydrazines. J. W. B.

**Velocity of diazotisation.**—See this vol., 802.

**Mechanism of diazotisation.** J. BOESEKEN and H. SCHOUTISSEN (Rec. trav. chim., 1935, 54, 956—958).—The conclusions of Reilly *et al.* (A., 1935, 1232), who have overlooked previous work by the authors and others, are criticised. Attention is drawn to the conclusion of Schoutissen (A., 1934, 67) that substituents in the  $\text{C}_6\text{H}_5$  nucleus exert a twofold opposing influence on the velocity of diazotisation, by affecting the basicity of the amine and the rate of transformation of the  $\text{NH}_2$ -group. H. G. M.

**Double salts of aryldiazonium chlorides with heavy-metal chlorides.** K. A. KOTSCHESCHKOV and A. N. NESMEJANOV (J. Gen. Chem. Russ., 1936, 6, 144—160).—128 double salts of  $o$ -,  $m$ -, and  $p$ - $\text{R}\cdot\text{C}_6\text{H}_4\cdot\text{N}_2\text{Cl}$  ( $\text{R}=\text{H}, \text{Cl}, \text{Br}, \text{I}, \text{NO}_2, \text{Me}, \text{OMe}, \text{OH}$ ) with  $\text{ZnCl}_2$ ,  $\text{CdCl}_2$ ,  $\text{TiCl}_3$ ,  $\text{SnCl}_4$ ,  $\text{PbCl}_4$ ,  $\text{BiCl}_3$ ,  $\text{AuCl}_3$ ,  $\text{PtCl}_4$ , and  $\text{FeCl}_3$  are described. R. T.

**Double salts of lead halides and benzene-diazonium halides, and their decomposition.** K. A. KOTSCHESCHKOV, A. N. NESMEJANOV, and N. K. GIPP (J. Gen. Chem. Russ., 1936, 6, 172—175).—The double salts  $\text{PhN}_2\text{Cl}\cdot\text{PbCl}_2$ ,  $\text{PhN}_2\text{Br}\cdot\text{PbBr}_2$ , and  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{N}_2\text{Br}\cdot\text{PbBr}_2$  are described. The above salts, as well as  $2\text{PhN}_2\text{Cl}\cdot\text{PbCl}_4$  (I), react with Zn or Cu in boiling  $\text{COMe}_2$ ,  $\text{AcOEt}$ , or  $\text{Et}_2\text{O}$  to yield  $\text{C}_6\text{H}_6$ ,  $\text{Ph}_2$  or  $(\text{C}_6\text{H}_4\text{R})_2$ ,  $\text{PhX}$ ,  $\text{PhOH}$ , and tarry products; in the case of (I),  $\text{PbPh}_3\text{Cl}$  is also obtained in small yield. R. T.

**Nature of the reaction between diazotised sulphanilic acid and proteins.** H. EAGLE and P. VICKERS (J. Biol. Chem., 1936, 114, 193—197).— $p\text{-SO}_3\text{Na}\cdot\text{C}_6\text{H}_4\cdot\text{N}_2\text{Cl}$  (I) at  $p_H$  7.2—7.6 is inactivated by glycine, alanine, lysine, ornithine, phenylalanine, proline, hydroxyproline, and indole, but not by diketopiperazine,  $\text{NH}_2\text{Ac}$ , or arginine. Each  $\text{NH}_2$

inactivates about 2 mols. of (I). This explains why proteins commonly inactivate more (I) than can be accounted for by the histidine- and tyrosine-Ph components, since free  $\text{NH}_2$  and  $\text{NH}$  and indole groups also react.

R. S. C.

**Condensation of oximes with aromatic diazo-compounds.** A. MANGINI (Atti R. Accad. Lincei, 1935, [vi], 22, 452—457).—Structures proposed for these compounds (cf. A., 1892, 163, 1079; 1906, i, 421; 1907, i, 567) are examined. The products from acetoxime and *p*-toluene- and *p*-nitrobenzene-diazo-compounds are hydrolysed by acid to  $\text{COMe}_2$ , *p*-toluidine or *p*-nitroaniline, and *p*-toluene- or *p*-nitrobenzene-diazoimide. The *p*-toluene compound with  $\text{BzCl}$  or  $\text{C}_6\text{H}_4\text{Br}\cdot\text{COCl}$  yields benz- or bromobenz-*p*-toluidine, and with  $\text{PhNCO}$  yields *N*-phenyl-*N'*-*p*-tolylcarbamide. The *p*-nitrobenzene compound with  $\text{PhNCO}$  gives the same product as the latter and acetoxime, viz.,  $\text{CMe}_2\cdot\text{N}\cdot\text{O}\cdot\text{CO}\cdot\text{NHPh}$ . These reactions are in agreement with Bamberger's formulæ (A., 1899, i, 589), viz.,  $\text{CMe}_2\cdot\text{N}\cdot\text{O}\cdot\text{CMe}_2\cdot\text{N}(\text{OH})\cdot\text{N}\cdot\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{X}$  ( $\text{X}=\text{p-Me}$  or  $\text{p-NO}_2$ ), if the tautomeric formula  $\cdot\text{N}(\text{O})\cdot\text{N}\cdot\text{NH}\cdot$  is also admitted. Acetoxime Me ether and *p*-toluenediazo-compounds do not give  $\text{CMe}_2(\text{OH})\cdot\text{N}(\text{OMe})\cdot\text{N}\cdot\text{R}$ , but only *p*-toluenediazo-*p*-cresol.

E. W. W.

**Aliphatic diazo-compounds. II. Phenyl- $\alpha$ -naphthylhydrazomethane.** G. C. HARROLD and M. G. HEMPHILL [with F. E. RAY] (J. Amer. Chem. Soc., 1936, 58, 747—749).—*dl*-Phenyl- $\alpha$ -naphthylmethylamine, prepared by reduction of  $\text{Ph}\cdot\alpha\text{-C}_{10}\text{H}_7$  ketoxime (modified prep.), is resolved by *d*-camphorsulphonic acid (cf. Berlingozzi, A., 1920, i, 480) into the *l*-form,  $[\alpha]_D -56.8^\circ$  in  $\text{Et}_2\text{O}$ , which with  $\text{ClCO}_2\text{Et}$  in  $\text{Et}_2\text{O}+5\%$   $\text{NaOH}$  gives *Et phenyl- $\alpha$ -naphthylmethylcarbamate*, m.p.  $125^\circ$ ,  $[\alpha]_D -28^\circ$  in  $\text{EtOH}$ . The *NO*-derivative, m.p.  $87-89^\circ$  (decomp.),  $[\alpha]_D^{25} +9.2^\circ$  in  $\text{EtOH}$ , of this with  $\text{KOMe}$  in  $\text{COMe}_2$  at  $-20^\circ$  affords inactive *phenyl- $\alpha$ -naphthylhydrazomethane* (I), m.p.  $58^\circ$  (decomp.), together with an active by-product. The inactivity of (I) may be due to its rapid racemisation or to the symmetrical structure of the diazo-group.

H. B.

**Reaction between cresols and hydrogen peroxide in presence of ferrous sulphate.** K. ONO and T. OYAMADA (Bull. Chem. Soc. Japan, 1936, 11, 132—137).—Oxidation of *o*-cresol with 2%  $\text{H}_2\text{O}_2$ -aq.  $\text{FeSO}_4$  under various conditions affords *p*-toluquinol (I) [ $1:2:5\text{-C}_6\text{H}_3\text{Me}(\text{OH})_2$ ] and a black substance, separated into  $\text{Et}_2\text{O}$ -sol. (A) and  $\text{Et}_2\text{O}$ -insol. (B) portions. Fractional pptn. of A with ligroin affords an insol. substance (II)  $\text{C}_{23}\text{H}_{20}\text{O}_8\text{Fe}$ , reduced by  $\text{Zn-EtOH-HCl}$  to  $2:5:2':5'$ -tetrahydroxydi-*m*-tolyl, m.p.  $202^\circ$ .

[converted into the known  $\text{Ac}_2$  derivative (III), m.p.  $135^\circ$ ], and, from the mother-

liquor, ditolyldiquinone

converted by

reduction-acetylation into (III). B is a black substance, (?)  $\text{C}_{23}\text{H}_{22}\text{O}_8\text{Fe}$ , possibly identical with the

complex of Majima *et al.* (A., 1920, i, 837), converted in small yield by  $\text{Zn-Ac}_2\text{O-NaOAc}$  into an acetate, m.p.  $193-195^\circ$ , probably  $4:4':5:5'$ -tetra-acetoxydi-*m*-tolyl. Oxidation of *m*- and *p*-cresol gives (I) (only from *m*-) and similar black substances containing Fe not definitely identified.

J. W. B.

**Mobility of the nitro-group. I. Nitro-group mobility in 3:4-dinitroanisole. II. Preparation of 3:4-dinitroanisole.** K. S. TOPTSCHIEV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 201—204, 204—106).—I. 3:4-Dinitroanisole when heated ( $140-150^\circ$ ; 8 hr.) with  $\delta$ -amino- $\alpha$ -diethylaminopentane gives  $\delta$ -(2-nitro-5-methoxyanilino)- $\alpha$ -diethylaminopentane, b.p.  $205^\circ/2$  mm. The constitution of this was confirmed by reduction ( $\text{SnCl}_2\text{-HCl}$ ) to the corresponding 2- $\text{NH}_2$ -compound, b.p.  $190-192^\circ/3$  mm., which when heated with  $\text{H}_3\text{AsO}_4$ , glycerol, and  $\text{H}_2\text{SO}_4$  (Skraup) gives 8-diethylamino-6-hydroxy-*sec*-amylaminoquinoline, also obtained when the corresponding 6- $\text{OMe}$ -derivative is heated with  $\text{HCl}$  (sealed vessel) (cf. lit.).

II. Nitration of  $1:4\text{-OMe}\cdot\text{C}_6\text{H}_4\cdot\text{NHAc}$  gives the 3- $\text{NO}_2$ -derivative, which when successively hydrolysed, diazotised in presence of excess of  $\text{H}_2\text{SO}_4$ , and then treated with  $\text{CuSO}_3\cdot\text{Cu}_2\text{SO}_3$  (cf. "Abegg's Handbuch, Kupfer," p. 462)- $\text{NaNO}_2\text{-H}_2\text{O}$  gives 3:4-dinitroanisole in good yield.

H. G. M.

**Condensation of polyhydric phenols with acetone.** C. H. FISHER, R. W. FURLONG, and M. GRANT (J. Amer. Chem. Soc., 1936, 58, 820—822).—In agreement with Baker (A., 1935, 80), the compound obtained from  $\alpha\text{-C}_6\text{H}_4(\text{OH})_2$  and  $\text{COMe}_2$  (method: *loc. cit.*) is considered to be  $5:6:5':6'$ -tetrahydroxy-3:3:3':3'-tetramethylbis-1:1'-spirohydrindene (I). Guaiacol and  $\text{COMe}_2$  similarly yield the 6:6'-dihydroxy-5:5'-dimethoxy-derivative, m.p.  $266-267^\circ$ , methylated ( $\text{Me}_2\text{SO}_4$ , 20%  $\text{KOH}$ ) to the  $\text{Me}_4$  ether (II), m.p.  $155-156^\circ$ , of (I). (II) could not be oxidised ( $\text{CrO}_3$ ,  $\text{AcOH}$ ).  $1:2:4\text{-C}_6\text{H}_3(\text{OAc})_3$  and  $\text{COMe}_2$  or phorone in  $\text{AcOH}$ -conc.  $\text{HCl}$  give  $4:6:7:4':6':7'$ -hexahydroxy-3:3:3':3'-tetramethylbis-1:1'-spirohydrindene, m.p.  $265-267^\circ$  (decomp.). Oily products were obtained from  $\text{COMe}_2$  and quinol or toluquinol.

H. B.

**Cyclic ethers by condensation of pyrocatechol with aldehydes and ketones.** G. SLOOF (Rec. trav. chim., 1935, 54, 995—1010).—Pyrocatechol (I) with  $\text{COMe}_2\text{-P}_2\text{O}_5$  gives isopropylidenepyrocatechol (II), b.p.  $182^\circ/760$  mm. [ $4\text{-NO}_2$ , m.p.  $92^\circ$ ,  $4:5\text{-(NO}_2)_2$ , (III), m.p.  $161^\circ$ ,  $4\text{-Cl}$ , b.p.  $223^\circ/760$  mm.,  $4:5\text{-Cl}_2$ , m.p.  $88^\circ$ ,  $4\text{-Br}$ , m.p.  $12^\circ$ , b.p.  $122^\circ/20$  mm.,  $4:5\text{-Br}_2$ , m.p.  $92^\circ$ , b.p.  $166^\circ/20$  mm.,  $4\text{-chloro-5-bromo}$ , m.p.  $78^\circ$ ,  $4\text{-NH}_2$  (IV), m.p.  $35^\circ$ , b.p.  $135^\circ/11$  mm.,  $4\text{-I}$ , m.p.  $47^\circ$ , b.p.  $130^\circ/12$  mm.,  $4\text{-chloro-5-nitro}$ , m.p.  $118^\circ$ ,  $4\text{-bromo-5-nitro}$ , m.p.  $130^\circ$ ,  $4\text{-iodo-5-nitro}$ , m.p.  $114^\circ$ , derivatives].  $4\text{-Chloro-5-bromo}$ , m.p.  $90^\circ$  ( $\text{Ac}_2$  derivative, m.p.  $104^\circ$ ),  $4\text{-chloro-5-nitro}$ , m.p.  $169^\circ$  ( $\text{Ac}_2$  derivative, m.p.  $119^\circ$ ), and  $4\text{-bromo-5-nitro}$ , m.p.  $172^\circ$  ( $\text{Ac}_2$  derivative, m.p.  $122^\circ$ ), -pyrocatechol are described. Diazotised (IV) couples with (IV) giving the red-brown compound (V), m.p.  $179^\circ$ , from which the  $\text{CMe}_2$  is readily hydrolysed by  $\text{H}_2\text{SO}_4$ . (III) with a little  $\text{NH}_3\text{-H}_2\text{O-H}_2\text{S-EtOH}$  gives the

sulphide (VI), m.p. 230°, with more of this reagent gives the corresponding disulphide, m.p. 247° (de-

comp.), and with excess gives 5-nitro-4-aminopyrocatechol, m.p. 127°. The condensation products of (I) with the following ketones are described (b.p./20 mm. are given in parenthesis): COMeEt (94°); COMePr<sup>a</sup> (107°); COMeBu<sup>a</sup> (114.5°); COMe-C<sub>6</sub>H<sub>13</sub> (118°); COEt<sub>2</sub> (105°); COEtPr<sup>a</sup> (121°); CPr<sup>a</sup><sub>2</sub> (131.5°); CH<sub>2</sub>Ac·CO<sub>2</sub>Et (155°); cyclopentanone (124°); and cyclohexanone (141°). Hydrolysis of the product from (I) and CH<sub>2</sub>Ac·CO<sub>2</sub>Et gives an acid, m.p. 61° [the 4-NO<sub>2</sub>-derivative (VII), m.p. 125°, crystallises from PhMe and CHCl<sub>3</sub> with 1 mol. of solvent and has m.p. 41° from CHCl<sub>3</sub>], decomposed by heat into (II). (VII) is resolved by cinchonine and then has m.p. 117.5°, [α]<sub>D</sub><sup>15</sup> +41.0° in EtOH (cinchonine salt of the d-acid has [α] +167°).

The Et ester (VIII), m.p. 71°, of (VII) with KOH-EtOH at room temp. gives Et β-(2-hydroxy-5-nitrophenoxy)crotonate (IX), m.p. 127° (Ac derivative, m.p. 59°; Me ether, m.p. 120°), as the K salt, which when heated passes irreversibly into a second form which yields an isomeride of (IX), m.p. 137° [Ac derivative, m.p. 67°; Me ether (X), m.p. 106°]. (IX) and its isomeride are converted by heat into (VIII), and with Ag<sub>2</sub>O-MeI give the same ether (X); this change of configuration is avoided by the use of CH<sub>2</sub>N<sub>2</sub>. With H<sub>2</sub>SO<sub>4</sub> both the foregoing Me ethers give the same nitroguaiacol. (VIII) when boiled (1 hr.) with KOH-EtOH gives a mixture of the two forms of β-(2-hydroxy-5-nitrophenoxy)crotonic acid, decomp. 167° and 170°, respectively (corresponding Me<sub>2</sub> derivatives, m.p. 92° and 130°, obtained with CH<sub>2</sub>N<sub>2</sub>; Ag<sub>2</sub>O-MeI gives the latter derivative with both acids); the former acid is less sol. than the latter in EtOAc. The two forms of the foregoing compounds are *cis-trans*-isomerides. (I) when heated with MeCHO and P<sub>2</sub>O<sub>5</sub> gives a little ethyldienepyrocatechol, b.p. 75—79°/20 mm. (4-NO<sub>2</sub>-derivative, m.p. 82°); in the cold, however, the compound

$\text{o-C}_6\text{H}_4\left\langle \begin{array}{c} \text{O-CHMe} \\ \text{O-CHMe} \end{array} \right\rangle \text{O}$ , m.p. 34°, b.p. 118°/20 mm (4-NO<sub>2</sub>-derivative, m.p. 111—112°), is formed. Only resins were obtained from (I) and CH<sub>2</sub>O. The equilibrium const. for the reaction (I)+COMe<sub>2</sub> cyclic acetal+H<sub>2</sub>O is ±0.001, and is much < would be expected from the parallelism between this quantity for other diols and the formation of boric acid complexes. A stereochemical explanation for this divergence is given.

H. G. M.

**Synthesis of vanillin from cresols.** I. Synthesis of homopyrocatechol. K. OXO and M. IMORO (Bull. Chem. Soc. Japan, 1936, 11, 127—131).—Rearrangement of *m*- and *p*-C<sub>6</sub>H<sub>4</sub>Me·OAc with AlCl<sub>3</sub> at 130—160° gives, respectively, 2-hydroxy-4-methyl- and 6-hydroxy-3-methyl-aceto-

phenone, both oxidised by 3% H<sub>2</sub>O<sub>2</sub>-NaOH at room temp. to homopyrocatechol [1:3:4-C<sub>6</sub>H<sub>3</sub>Me(OH)<sub>2</sub>] [Ac<sub>2</sub> derivative, m.p. 57—58°, oxidised by 0.5*N*-H<sub>2</sub>SO<sub>4</sub>-2% KMnO<sub>4</sub> to 1:3:4-CO<sub>2</sub>H·C<sub>6</sub>H<sub>4</sub>(OAc)<sub>2</sub>], methylation of which gives homoveratrole and creosol, oxidised by EtO·NO to veratric acid and vanillin, respectively. *o*-C<sub>6</sub>H<sub>4</sub>Me·OAc rearranges to 2-hydroxy-3-methylacetophenone, which gives no definite product by Dakin's oxidation.

J. W. B.

**Synthesis of 4-hydroxy-3-ethoxy-1-allylbenzene (eugenol).** N. HIRAO (Bull. Chem. Soc. Japan, 1936, 11, 179—184).—Eugenol Me ether and MgMeI in xylene at 160—180° give chavibetol (I) and eugenol, separated by fractional crystallisation of their benzoates and isomerised (KOH at 220°) to isochavibetol (II) [1:3:4-CHMe·CH·C<sub>6</sub>H<sub>3</sub>(OH)·OMe]. *iso*Eugenol Me ether similarly gives *isoeugenol* and (I); eugenol and *isoeugenol* Et ether give, respectively saфро- and *isosaфро*-eugenol. (II) with KEtSO<sub>4</sub>-KOH at 150—160° gives its Et ether, converted by MgMeI into *isohomogenol* [1:3:4-CHMe·CH·C<sub>6</sub>H<sub>3</sub>(OEt)·OH] (III). Chavibetol with EtBr-KOH at 80—90° gives its Et ether, b.p. 114°/6.5 mm. (oxidised to 4-methoxy-3-ethoxyallylbenzoic acid), converted by MgMeI into 4-hydroxy-3-ethoxyallylbenzene (*homogenol*), b.p. 112°/6.5 mm. (*phenylurethane*, m.p. 93.5—94.5°; *benzoate*, m.p. 45.5°), which is isomerised (KOH at 170—220°) to (III).

J. W. B.

**Raman spectra and decomposition reactions of ozonides; ozonides of *isoeugenol* methyl ether, *eugenol* methyl and ethyl ether, ethyl maleate and fumarate.** E. BRINER, E. PERROTTET, H. PAILLARD, and B. SUSZ (Helv. Chim. Acta, 1936, 19, 558—568).—When a substance is ozonised, the O<sub>3</sub> absorbed (taking account of a blank on the solvent) gives the max. (a), and determination of a product gives the min. (b) amount of ozonide formed. *iso*-Eugenol Me ether gives (a) 45, (b) 38%, eugenol Me and Et ethers (a) 30 and 47, (b) 20 and 38%, respectively, of ozonide, (b) being determined by yields of aldehyde. Et<sub>2</sub> maleate and fumarate give (a) 31 and 33, (b) 30 and 27%, respectively, (b) being determined by yields of Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub>; Et<sub>2</sub> maleate reacts very slowly, Et<sub>2</sub> fumarate very quickly. The eugenol and *iso*-eugenol ether ozonides retain the Raman spectra of the Ph but have lost those of the unsaturated side-chain which are replaced by new bands characteristic of the ozonide linking. The ozonides of Et<sub>2</sub> maleate and fumarate differ from those of the esters themselves only by an additional new band at 1821 cm.<sup>-1</sup>

R. S. C.

**Raman spectra of compounds belonging to the anethole, safrole, and eugenol groups.**—See this vol., 777.

**Condensation of ethylene chlorohydrin with resorcinol.** D. C. MOTWANI and T. S. WHEELER (J. Univ. Bombay, 1935, 4, Part II, 104—105).—*m*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub>, CH<sub>2</sub>Cl·CH<sub>2</sub>·OH, and 40% KOH at 100° give, according to the relative amounts, *resorcinol* β-*hydroxyethyl*, b.p. 185—195°/10 mm. (*diacetate*, m.p. 75°; *dibenzoate*, m.p. 90—91°), or *di-β-hydroxyethyl ether*, m.p. 95—96° (*diacetate*, m.p. 75—76°; *dibenzoate*, m.p. 110°). The ethers with

$\text{PCL}_5$  afford *m*-chlorophenyl  $\beta$ -hydroxyethyl ether, m.p. 78—79°, and *resorcinol di- $\beta$ -chloroethyl ether*, m.p. 63—64°, b.p. 130—150°/1 mm. R. S. C.

**C-Alkylresorcinols. I. 4 : 6-Diethylresorcinol and its reactions.** R. C. SHAH and P. R. MEHTA (J. Univ. Bombay, 1935, 4, Part II, 109—113).—5-Ethylresacetophenone (prep. by the Nencki-Sieber and Hoesch methods), m.p. 118—119° ( $\text{Bz}_2$ , m.p. 91—92°, 3-Br-, m.p. 123—125°, and 3 : *x* : *x*-Br<sub>3</sub>-derivative, m.p. 144—145°; phenylhydrazone, m.p. 232—233°; oxime, m.p. 141—143°; semicarbazone, m.p. 300—302°), is reduced (activated Zn-Hg; HCl) to 4 : 6-diethylresorcinol, unstable, b. p. 150—151°/7 mm., m.p. 65—67° after softening at 55° (*di-p*-nitrobenzoate, m.p. 163—165°;  $\text{CO}_2\text{Me}$ -derivative, m.p. 83—85°), which with  $\text{PhN}_2\text{Cl}$  gives the 2-benzeneazo-compound, m.p. 89°, with  $\text{Hg}(\text{OAc})_2$  in EtOH yields the 2-acetoxymethyl-derivative, decomp. 200°, with 40%  $\text{CH}_2\text{O}$  and 2*N*-HCl gives *di*-(2 : 6-dihydroxy-3 : 5-diethylphenyl)methane, m.p. 119°, and with  $\text{H}_2\text{SO}_4$  and malic acid or  $\text{CH}_2\text{Ac}\cdot\text{CO}_2\text{Et}$  affords 5-hydroxy-6 : 8-diethyl-, m.p. 148—149°, or 5-hydroxy-4-methyl-6 : 8-diethyl-coumarin, m.p. 169—170°, respectively. R. S. C.

**Mechanism of formation of benzaldehyde-resorcinol resins.** E. MERTENS and M. FONTEYN (Bull. Soc. chim. Belg., 1936, 45, 186—188).—Equimol. amounts of  $\text{PhCHO}$  and *m*- $\text{C}_6\text{H}_4(\text{OH})_2$  in 0.5%  $\text{NaOH}$ -EtOH at 100° in an inert atm. gives 2 : 4-dihydroxydiphenylcarbinol (cf. J.C.S., 1910, 97, 78), which with  $\text{PhCHO}$  in 10%  $\text{NaOH}$ -EtOH affords the same resin as is obtained from *m*- $\text{C}_6\text{H}_4(\text{OH})_2$  and excess of  $\text{PhCHO}$ . J. L. D.

**Nitration of 1 : 8-dihydroxynaphthalene.** F. CALVET and (in part) (MISS) M. C. CARNERO (J.C.S., 1936, 556—560).—With  $\text{HNO}_3$  (*d* 1.4) at 25—30° 1 : 8- $\text{C}_{10}\text{H}_6(\text{OAc})_2$  gives the 8-*O*-Ac derivative, m.p. 200° (decomp.) [*Me* ether (I), m.p. 115—117°], of 2 : 4-dinitro-1 : 8-dihydroxynaphthalene (II), m.p. 180—182° [*Me*<sub>2</sub> ether (III), m.p. 137—139°], obtained as its *K* salt (IV) by  $\text{KOH}$ -MeOH hydrolysis. Hydrolysis of (I) with cold  $\text{KOH}$ -MeOH affords some (IV) and 2 : 4-dinitro-8-hydroxy-1-methoxynaphthalene, m.p. 170—171°, hydrolysed to (II). Hydrolysis of (III) with boiling 2*N*-NaOH affords 2 : 4-dinitro-1-hydroxy-8-methoxynaphthalene, m.p. 179—180° (decomp.), reduced ( $\text{Sn}$ -HCl) to the dihydrochloride of the 2 : 4-( $\text{NH}_2$ )<sub>2</sub>-derivative, oxidised by  $\text{HNO}_3$  to 3-methoxyphthalic acid. Similar reduction of (II) affords the dihydrochloride of 2 : 4-diamino-1 : 8-dihydroxynaphthalene [ $\text{Bz}_4$  derivative, m.p. 257—258° (decomp.)]. Nitration of 1 : 8-methylenedioxy-naphthalene with  $\text{AcOH}$ - $\text{HNO}_3$  (*d* 1.5) affords its (?) 2 : 7- (V), m.p. 198—200°, and 4 : 5-( $\text{NO}_2$ )<sub>2</sub>-derivative (VI), m.p. 177—179°. Hydrolysis of (V) with boiling 2*N*-NaOH affords (?) 2 : 7-dinitro-1 : 8-dihydroxynaphthalene (VII) +  $\text{H}_2\text{O}$  and anhyd., m.p. 171—173° (decomp.) [ $\text{Ac}_1$ , m.p. 125—170° (decomp.) and  $\text{Ac}_2$  derivative, m.p. about 228° (decomp.)]; *Me*<sub>2</sub> ether, m.p. 268—270° (decomp.)]. With boiling  $\text{KOH}$ -MeOH (V) gives (?) 2 : 7-dinitro-1-hydroxy-8-methoxynaphthalene, m.p. 218—220° (*Ac* derivative, m.p. 183—185°). Reduction of (VII) gives the hydrochloride of the 2 : 7-( $\text{NH}_2$ )<sub>2</sub>-derivative [ $\text{Bz}_4$  derivative, m.p. about 300°

(decomp.)]. By similar methods (VI) affords 4 : 5-dinitro-1 : 8-dihydroxynaphthalene, m.p. about 225° (decomp.) [ $\text{Ac}_2$  derivative, m.p. 158—160°; *Me*<sub>2</sub> ether, darkens 140°, m.p. 147—150° (decomp.)], and the  $\text{Bz}_4$  derivative, m.p. 255—256° (decomp.), of 4 : 5-diamino-1 : 8-dihydroxynaphthalene.

J. W. B.

**Preparation of substituted benzene-*o*-dithiols for use as specific reagents for tin.** R. E. D. CLARK (Tech. Publ. Internat. Tin Res. and Dev. Council, 1936, A, No. 41, 7 pp.).—The prep. of toluene- and 1-chlorobenzene-3 : 4-dithiol is described. These reagents give an intense red coloration with  $\text{Sn}^{\text{II}}$  salts. E. S. H.

**Synthesis of 2 : 3-di- and 2 : 3 : 4-tri-methylbenzyl alcohol. Anomalous reactions.** T. REICHSTEIN, A. COHEN, M. RUTH, and H. F. MELDAHL (Helv. Chim. Acta, 1936, 19, 412—418).—Reaction of  $\text{MgCl}\cdot\text{CH}_2\text{R}$  ( $\text{R}=\text{Ph}$ ,  $\text{C}_6\text{H}_4\text{Me}$ , or  $\text{C}_6\text{H}_3\text{Me}_2$ ) with  $\text{CH}_2\text{O}$  results in introduction of *o*- $\text{CH}_2\text{OH}$  with reduction of the original  $\text{CH}_2\text{Cl}$  to *Me* (cf. A., 1903, i, 48). *o*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{CH}_2\text{OH}$  (prep. described), b.p. 115—120°/14 mm., with cold conc. HCl in ligroin gives an 85—92% yield of the chloride, b.p. 76—80°/14 mm., the Grignard reagent from which with  $\text{CH}_2\text{O}$  gives 50% of 2 : 3-dimethylbenzyl alcohol (I), b.p. about 125°/12 mm., m.p. 64° (oxidised to 2 : 3- $\text{C}_6\text{H}_3\text{Me}_2\cdot\text{CO}_2\text{H}$ ), and (*o*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{CH}_2$ )<sub>2</sub>, b.p. about 170—180°/12 mm., m.p. 65°. (I) gives similarly a 90% yield of the chloride, b.p. 99°/12 mm., and thence a poor yield of 2 : 3 : 4-trimethylbenzyl alcohol, m.p. 49—50° (*H* phthalate; oxidised to 2 : 3 : 4- $\text{C}_6\text{H}_2\text{Me}_3\cdot\text{CO}_2\text{H}$ ), and probably 2 : 2' : 3 : 3'-tetramethyldibenzyl, m.p. 111—112°, and 1 : 2 : 3- $\text{C}_6\text{H}_3\text{Me}_3$ . R. S. C.

**Reduction of  $\gamma$ -phenyl- $\alpha$ -methylallyl alcohol with deuterium.** J. B. M. COPPOCK and S. M. PARTRIDGE (Nature, 1936, 137, 907).—There is no change in b.p.,  $\mu$ , or optical rotatory power in the reduction products of this alcohol with  $\text{H}_2$  and  $\text{D}_2$ . The results indicate that an asymmetric system of the type  $\text{CHDRR}'$  has no optical rotatory power, and that the electrical fields associated with H and D in combination with C are approx. equiv. L. S. T.

**Synthesis of 3-nitro-4-methoxybenzyl alcohol and of its alkyl ethers.** R. QUELET and (Mlle.) Y. GERMAIN (Compt. rend., 1936, 202, 1442—1444; cf. A., 1921, i, 23).—*o*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{OMe}$  with  $\text{CH}_2\text{O}$ ,  $\text{ZnCl}_2$ , and HCl (gas) at 80—90° affords 3-nitro-4-methoxybenzyl chloride (I), m.p. 85.5—86° (free from 3 : 3'-dinitro-4 : 4'-dimethoxyphenylmethane; cf. A., 1934, 999), which when boiled with aq. NaOAc gives 3-nitro-4-methoxybenzyl acetate, m.p. 37°, hydrolysed ( $\text{KOH}$ ) to 3-nitro-4-methoxybenzyl alcohol (phenylurethane, m.p. 129°), which with  $\text{KMnO}_4$  gives 3-nitro-4-methoxybenzoic acid. (I) reacts with Na alkoxides to give ethers. The following are prepared: 3-nitro-4-methoxybenzyl *Me*, m.p. 30°, *Et*, b.p. 181°/16 mm., and *Pr*<sup>*n*</sup> ether, b.p. 190°/15 mm. (decomp.). J. L. D.

**Lumisterol.** K. DIMROTH (Ber., 1936, 69, [B], 1123—1129).—Lumisteryl acetate with  $\text{BzO}_2\text{H}$  in  $\text{CHCl}_3$  gives the corresponding oxide (I),  $\text{C}_{30}\text{H}_{48}\text{O}_3$ , m.p. 133°,  $[\alpha]_D^{20} +119.2^\circ$  in  $\text{COMe}_2$ , hydrolysed by

cautious treatment with KOH-MeOH to *lumisterol oxide*, m.p. 132°,  $[\alpha]_D^{25} +173^\circ$  in  $\text{CHCl}_3$ . (I) is converted by hot  $\text{H}_2\text{O}$  into *lumistadienetriol acetate*, m.p. 178—179° (decomp.),  $[\alpha]_D^{25} +27.8^\circ$  in  $\text{CHCl}_3$ , hydrolysed to *lumistadienetriol*, m.p. 180—183° (decomp.) when rapidly heated,  $[\alpha]_D^{25} +37.9^\circ$  in  $\text{CHCl}_3$  (*diacetate*, m.p. 143°,  $[\alpha]_D^{25} +113.6^\circ$  in  $\text{COMe}_2$ ), isomeric with the compounds of Heilbron *et al.* (A., 1935, 1493). Lumisterol has thus the same structural formula as ergosterol; in the initial stages, therefore, irradiation causes only steric transformations, prob-

ably at  $\text{C}_{(9)}$  or  $\text{C}_{(10)}$ . Dehydrolumisterol (Heilbron, *loc. cit.*) has the same absorption spectrum as dehydroergosterol and hence is probably (II). Catalytic hydrogenation of its acetate (III) (Pt in AcOH) ceases after absorption of  $3\text{H}_2$  and yields a product, m.p. 142—143°,  $[\alpha]_D^{25} -69.2^\circ$  in  $\text{CHCl}_3$ , which is further reduced to perhydropyrocalficeryl acetate, m.p. 135—136°,  $[\alpha]_D^{25} +26.38^\circ$  in  $\text{CHCl}_3$ , hydrolysed to perhydropyrocalfiferol. The identity of the products proves that no further steric transformations in other parts of the mol. occur during the conversion of lumisterol into tachysterol and vitamin-D. Ultraviolet light causes primarily fission between  $\text{C}_{(9)}$  and  $\text{C}_{(10)}$  and subsequently a displacement of the double linkings. Exposure to sunlight of (III) and eosin in EtOH affords a compound  $\text{C}_{60}\text{H}_{86}\text{O}$ , m.p. 183—184°. H. W.

#### Synthesis of sterols with modified side-chains and their $\alpha$ -derivatives from lithocholic acid.

F. REINDEL and K. NIEDERLANDER (Annalen, 1936, 522, 218—239).—Norepicoprostan-3:24-diol (I) (A., 1935, 1494) is converted by boiling  $\text{Ac}_2\text{O}$  into norepi- $\Delta^{24}$ -coprostenyl acetate (II) (not characterised), which is reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ , AcOH) to norepicoprostan-3-one-24-ol (III), m.p. 83—84° (cf. Ruzicka and Goldberg, *ibid.*, 749). Energetic hydrolysis (5% EtOH-NaOH) of (III) affords norepicoprostan-3-one-24-ol (IV), m.p. 147—148° (cf. *loc. cit.*), whilst mild hydrolysis (0.1% MeOH-NaOH) gives a 1:1-compound (+ $2\text{H}_2\text{O}$ ), m.p. 110—112°, of (III) and (IV). Oxidation [ $\text{CrO}_3$  (=60), AcOH] of (II) yields the Ac derivative (V), m.p. 145—146°, of *norlithocholyl Me ketone* (VI), m.p. 157—158° [semicarbazone, m.p. 226—227° (decomp.)]. Reduction (as above) of (V) affords the Ac derivative, m.p. 91—92°, of *norlithocholylmethylcarbinol* (+ $0.5\text{H}_2\text{O}$ ), m.p. 155—157°, also formed by Wolff-Kishner reduction (V) semicarbazone, m.p. 217—218° (decomp.). (IV) is oxidised ( $\text{CrO}_3$ , AcOH) to norcoprostan-3-one [semicarbazone, m.p. 167—168° (decomp.)], reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ , AcOH-conc. HCl) to *norcoprostan-3-ol* (VII), m.p. 117—118° (acetate, m.p. 122—123°), which is pptd. by digitonin. Similar reduction of *norcoprostan-3-one-24-ol*, m.p. 80—81° [semicarbazone, m.p. 168—169° (decomp.)] [from (I) and  $\text{CrO}_3$ -AcOH], gives a product containing some 24-

chlorocoprostan-3-ol, since subsequent treatment with EtOH-NaOH affords some  $\Delta^{24}$ -*norcoprostan-3-ol* (+ $0.5\text{H}_2\text{O}$ ), m.p. 92—93°; (VII) is obtained from the non-cryst. material by successive treatment with  $\text{Ac}_2\text{O}$ , reduction, and hydrolysis. Et lithocholate and  $\text{MgPr}^{\text{Br}}\text{Cl}(\text{Br})$  (6 mols.) give a little *epicoprostan-3-ol-24-one* (VIII), m.p. 177—178° [Ac derivative, m.p. 179—180°; semicarbazone, m.p. 241—242° (decomp.)]; *hydrazone*, m.p. 135—140° (decomp.), and (mainly) 24-isopropylepicoprostan-3:24-diol (+ $0.5\text{H}_2\text{O}$ ) (IX), m.p. 106—107°, m.p. (anhyd.) 150—152° (*diacetate*, m.p. 82—83°). (VIII) is oxidised ( $\text{CrO}_3$ , AcOH) to coprostan-3:24-dione, m.p. 184—186°, whilst (IX) (as acetate) gives (VIII). Wolff-Kishner reduction of (VIII) affords a pinacol,  $\text{C}_{54}\text{H}_{94}\text{O}_4\cdot\text{H}_2\text{O}$ , m.p. 140—145°, m.p. (anhyd.) 182—183°, acetylated ( $\text{Ac}_2\text{O}$ ) to a *diacetate*, m.p. 175—176° (X); an isomeric *diacetate*, m.p. 145—147° (XI), is obtained by reduction ( $\text{H}_2$ ,  $\text{PtO}_2$ , AcOH) of the acetate of (VIII). (XI) is converted into (X) by boiling  $\text{Ac}_2\text{O}$ , whilst hydrolysis (EtOH-NaOH) of (X) and (XI) gives the pinacol. Clemmensen reduction of (VIII) affords a bimol. compound,  $\text{C}_{54}\text{H}_{92(94)}\text{O}_3$ , m.p. 196—197° (*diacetate*, m.p. 150—151°).  $\text{MgMeI}$  and (VIII) yield  $\psi$ -epiergostane-3:24-diol (+ $0.5\text{H}_2\text{O}$ ), m.p. 212—214°, m.p. (anhyd.) 223—224° also prepared from (VI) and  $\text{MgPr}^{\text{Br}}\text{Br}$ , which with  $\text{Ac}_2\text{O}$  gives the *diacetate*, m.p. 165—166°, of  $\psi$ -epiergostanediol 24:24'-ether, m.p. 208—209°.  $\text{MgEtI}$  and (VIII) yield  $\psi$ -epistigmastane-3:24-diol, m.p. 240—241° [24:24'-ether, m.p. 186—188° (*diacetate*, m.p. 160—161°)]. Biscoprocoprostan-3:23-diol (XII) (A., 1935, 1494) is converted by  $\text{Ac}_2\text{O}$  into the acetate (not characterised) of *biscoprocoprostan-3-ol* (+ $0.5\text{H}_2\text{O}$ ), m.p. 120—123°, which is reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ , AcOH) to the acetate, m.p. 93—94°, of *biscoprocoprostan-3-ol*, m.p. 134—135°. The latter is oxidised to *biscoprocoprostanone* [semicarbazone, m.p. 158—161° (decomp.)], which is reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ , AcOH-conc. HCl) to *biscoprocoprostan-3-ol* (XIII), m.p. 126—127° (acetate, m.p. 103—104°). Similar reduction of *biscoprocoprostan-3-one-23-ol*, m.p. 161—163° [semicarbazone, m.p. 173—175° (decomp.)], prepared by oxidation of (XII), gives a product (pptd. by digitonin) which on successive treatment with  $\text{Ac}_2\text{O}$ , reduction, and hydrolysis affords (XIII).

Comparison of the m.p. of various sterols and bile acids shows that the form pptd. by digitonin is more fusible than the *epi*-derivative in both the *cis*- and *trans*-series; shortening of the side-chain is generally accompanied by an increase in m.p. H. B.

**Detection of oxysterol and its behaviour in the organism.** K. YAMASAKI (Fukuoka Acta med., 1935, 28, 109).—Oxysterol gives a blue colour with conc.  $\text{H}_2\text{SO}_4$ . Cholesterol exposed to solar radiation gives the blue colour and the m.p. is lowered. NUTR. ABS. (m)

**Action of selenium dioxide on sterols and bile acids. II. Formation of isomeric dihydroxycholadienic acids from apocholic acid and dihydroxycholenic acid; oxidation products of dihydroergosterol.** R. K. CALLOW (J.C.S., 1936, 462—469).—Prep. of the dihydroxycholadienic acids

(I) obtained by action of Br on *apocholic acid* (II) or on *dihydroxycholenic acid* (A., 1922, i, 1027; 1931, 957) or by other methods (A., 1931, 841; 1932, 615; 1933, 158) is repeated. Variation of  $[\alpha]$  is due to (I) being varying mixtures of  $\alpha$ -*dihydroxycholadienic acid* (III), m.p. 252—255°,  $[\alpha]^{20}_D$  —35.3°,  $[\alpha]^{20}_{4401}$  —47.7° (in EtOH), absorption max. at 243 m $\mu$  (broad) [obtained by action of BzO<sub>2</sub>H on (II)], with  $\beta$ -*dihydroxycholadienic acid* (IV), m.p. 253—255°,  $[\alpha]^{20}_D$  +71.0°,  $[\alpha]^{20}_{4401}$  +82.1°, absorption max. at 249 m $\mu$  (sharp), with subsidiary max. at 242 m $\mu$  [obtained by action of aq. SeO<sub>2</sub> on (II) in EtOH]. Catalytic reduction of (III) yields (II); (IV) is reduced to  $\beta$ -*apocholic acid*, m.p. 163—165°,  $[\alpha]^{20}_D$  +78.5°,  $[\alpha]^{20}_{4401}$  +92.4° [AcOH compound (V), m.p. 150—155°,  $[\alpha]^{20}_D$  +73.5°,  $[\alpha]^{20}_{4401}$  +86.5°; *xylene* compound, m.p. 156.5—161°;  $[\alpha]^{20}_D$  +69.7°,  $[\alpha]^{20}_{4401}$  +82.5°; *Me* ester (+1.5H<sub>2</sub>O), m.p. 84—87°,  $[\alpha]^{20}_D$  +79°,  $[\alpha]^{20}_{4401}$  +90°, prepared from the *Ag* salt]. When (V) is treated with SeO<sub>2</sub>, the resulting  $\beta$ -*dihydroxycholadienic acid* has m.p. 233—240°,  $[\alpha]^{20}_D$  +77.7°,  $[\alpha]^{20}_{4401}$  +92.8° (absorption max. at 250 m $\mu$ ). When these are taken as the vals. for  $[\alpha]^{20}_D$  and  $[\alpha]^{20}_{4401}$  of (IV), and theoretical vals. of each for mixtures of (III) and (IV) are plotted against composition, observed  $[\alpha]^{20}_D$  and  $[\alpha]^{20}_{4401}$  for specimens of (I) from various sources indicate that these are a series of mixtures of (III) and (IV), the same composition being deduced for any one prep. from either  $[\alpha]^{20}_D$  or  $[\alpha]^{20}_{4401}$ .

The  $\Delta^{7:8}$ -formula proposed by Wieland and Dane (A., 1932, 615; 1933, 158) for *dihydroxycholenic acid* (VI) is similar to that for  $\gamma$ -ergosterol, but since the latter is isomerised by Pt to non-reducible  $\alpha$ -ergosterol, whilst (VI) is reduced normally, (VI) is now re-formulated as the  $\Delta^{14:15}$ -compound [*A*; X=OH, R=C<sub>4</sub>H<sub>8</sub>·CO<sub>2</sub>H (cf.  $\beta$ -ergosterol)]. As (II) and (VI) are directly interconvertible, (II) is regarded as the  $\Delta^{8:14}$  compound.

Of the six conceivable positions of the ethylenic linkings in the dienic acids, absorption spectra and general chemical grounds eliminate all but the  $\Delta^{7:8:14:15}$  structures. As the latter would be expected to have the higher absorption at longer  $\lambda$ , (III) is regarded as the  $\Delta^{7:8:14:15}$  and (IV) as the  $\Delta^{9:8:14:15}$  compound.  $\alpha$ - and  $\beta$ -*apocholic acids* differ in the position of H at C<sub>9</sub>; SeO<sub>2</sub> attacks the latter position, BzO<sub>2</sub>H the C<sub>17</sub>. Ergosterol-*D* (A., 1933, 605) is regarded as the analogue of (IV), and thus formulated as the  $\Delta^{9:8:14:15}$ -compound [*A*; X=H, R=C<sub>9</sub>H<sub>17</sub>], ergosterol-*B*<sub>3</sub> as the analogue of (III), with the  $\Delta^{7:8:14:15}$  structure, being derived from the decomp. of dihydroergosterol oxide, in which the oxide-bridge is in the 8:14-position.

$\alpha$ -Ergosterol and SeO<sub>2</sub> give dehydroergosterol (3:5-dinitrobenzoate, m.p. 163—166°,  $[\alpha]^{20}_D$  —3.0°,  $[\alpha]^{20}_{4401}$  —5.7° in C<sub>6</sub>H<sub>6</sub>), which is now formulated as the  $\Delta^{9:8:14:15}$ -compound; X=H, R=C<sub>9</sub>H<sub>19</sub>. *Me apocholate* and SeO<sub>2</sub> yield (IV), of which the *Ag* salt gives *Me*  $\beta$ -*dihydroxycholadienate*, m.p. 87—89°,  $[\alpha]^{20}_D$  +62.5°,  $[\alpha]^{20}_{4401}$  +71°. The oxidation of *Me* *dihydroxycholenate* (*bis*-3':5'-*dinitrobenzoyl* derivative, m.p. 209—210.5°) and of  $\beta$ -*apocholic acid* by SeO<sub>2</sub>, and by BzO<sub>2</sub>H is also studied. E. W. W.

**Polyterpenes and polyterpenoids. CVI. Oxidation of dihydrobetulin and dihydrobetulonic acid by nitric acid.** L. RUZICKA and O. ISLER (Helv. Chim. Acta, 1936, 19, 506—509; cf. this vol., 607).—The prep. of betulin (I), dihydrobetulin (II), and dihydrobetulonic acid (III) is modified. (III) and fuming HNO<sub>3</sub> in AcOH at —5° to 0° give an acid (IV), C<sub>27</sub>H<sub>46</sub>(CO<sub>2</sub>H)<sub>3</sub>, m.p. 275° (*Me*<sub>3</sub> ester, m.p. 145°, liberates only 1 CO<sub>2</sub>H with *N*-KOH-EtOH), which at 330°/high vac. gives CO<sub>2</sub> (1 mol.), H<sub>2</sub>O (1 mol.), and a *keto-acid*, C<sub>29</sub>H<sub>46</sub>O<sub>3</sub>, m.p. 259° [*oxime*, m.p. 278° (decomp.); *Me* ester, m.p. 178°, gives no colour with C(NO<sub>2</sub>)<sub>4</sub>]. (I) and HNO<sub>3</sub>-AcOH give a *ketone* (V), C<sub>30</sub>H<sub>48</sub>O<sub>2</sub>·NO<sub>2</sub>, m.p. 209°, an acid (VI), NO<sub>2</sub>·C<sub>28</sub>H<sub>47</sub>O(CO<sub>2</sub>H)<sub>2</sub>, m.p. between 158° and 170° according to the rate of heating [*Me*<sub>3</sub> ester, m.p. 124°; *anhydride* (VII), m.p. 215°; also obtained from (V) by CrO<sub>3</sub> or HNO<sub>3</sub>]. (VI) and (VII) at 330° give CH<sub>2</sub>O, also obtained from (V) at 260—300° along with a substance, ? C<sub>28</sub>H<sub>46</sub>O, m.p. about 200—204° (1 active H). The anhydride of the acid, C<sub>30</sub>H<sub>46</sub>O<sub>6</sub>, from hydroxymethylencallobetulinone has m.p. 193° (lit. 293°). These and previously recorded reactions lead to the formulæ shown, based on that (*loc. cit.*) for hederagenin (VIII). The ethylenic linking in

(I) may be as in (Ia), in which case *allobetulin* has the grouping (IX); but (I) is preferable, because the similar differences in  $[\alpha]$  between the diols and diol acetates from (a) (I) and (II) and (b) *hederabetulin* and *dihydrohederabetulin* indicate a close relationship between (I) and (VIII).

[With M. FURTER] *d* and *n* are determined for the diacetates of (I) and (II) above the m.p. R. S. C.

**s-Di-*p*-anisylpinacol.** C. W. SHOPPEE (J.C.S., 1936, 506—507).—Di-*p*-anisyl ketone (I) (2:4-dinitrophenylhydrazone, m.p. 197°) is reduced by Al-Hg in EtOH to 4:4'-dimethoxybenzhydrol (II) and *s*-di-*p*-anisylpinacol, new m.p. 183° (cf. A., 1933, 68) [decomp. to (I) and (II)]. The last with AcOH and a trace of I forms anisyl trianisylmethyl ketone (*loc. cit.*). Attempts to obtain the pinacol from Mg anisyl bromide and Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (cf. Bouvet, Bull. Soc. chim., 1915, [iv], 17, 209) gave an oil consisting mainly of (*p*-OMe·C<sub>6</sub>H<sub>4</sub>)<sub>2</sub>C(OH)·CO<sub>2</sub>Et. Anisil and Mg *p*-anisyl bromide yield *anisoyldianisylcarbinol*, m.p. 117.5°. E. W. W.

**Olivil.** P. DREYFUSS (Gazzetta, 1936, 66, 98—99).—Olivil *Me*, ether is oxidised by K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>-AcOH to

the lactone of 6:7-dimethoxy-1-(3':4'-dimethoxyphenyl)-3-hydroxymethylnaphthalene-2-carboxylic acid (A., 1935, 860), to tetramethoxy-benzoylbenzoic acid and -phenylphthalide, and to a small amount of 2:3:6:7-tetramethoxyanthraquinone, apparently formed by way of an internal anhydro-compound. These results support the formulæ proposed (A., 1934, 1099) for olivil and for isoolivil. E. W. W.

**Nitration of benzanilide and its derivatives.** W. B. VAN HORSSEN (Rec. trav. chim., 1936, 55, 245—262).—The action of abs.  $\text{HNO}_3$  on several benzanilides (from the amine and acid chloride in tetralin) introduces  $\text{NO}_2$ -groups into both Ph radicals; the  $\text{NO}_2$  enters the 3-position of the Bz unless one or more  $\text{NO}_2$  are already present, when nitration is restricted to the  $\text{NH}_2$ Ph radical. The following are described: 3:5-dinitrobenz-2':4'-dinitro-, m.p. 213°, 2-nitrobenz-4'-nitro-, m.p. 212°, 4-nitrobenz-4'-nitro-, m.p. 269°, 3:5-dinitrobenz-4'-nitro-anilide, m.p. 280°; 3-nitrobenz-2':6'-dinitro-, m.p. 213°, 4-nitrobenz-2':6'-dinitro-, m.p. 227°, 3:5-dinitrobenz-2':6'-dinitro-p-toluidide, m.p. 275°; 3-nitrobenz-, m.p. 176°, 3-nitrobenz-2':6'-dinitro-, m.p. 213°, 4-nitrobenz-, m.p. 231°, 4-nitrobenz-2':6'-dinitro-, m.p. 210°, 3:5-dinitrobenz-, m.p. 237°, 3:5-dinitrobenz-2':6'-dinitro-4'-chloroanilide, m.p. 265°; 3-nitrobenz-, m.p. 182°, 3-nitrobenz-2':6'-dinitro-, m.p. 226°, 4-nitrobenz-, m.p. 247°, 4-nitrobenz-2':6'-dinitro-, m.p. 214°, 3:5-dinitrobenz-p-bromoanilide, m.p. 251°. P. G. C.

**Condensations by sodium. V. Preparation of acids. Dicarboxylic acids from monohalogen compounds.** A. A. MORTON, W. J. LEFEVRE, and I. HECHENBLEIKNER (J. Amer. Chem. Soc., 1936, 58, 754—757; cf. A., 1932, 158).— $\text{PhCl}$ , *m*- and *p*- $\text{C}_6\text{H}_4\text{MeCl}$ , *p*- $\text{C}_6\text{H}_4\text{PhCl}$ , and *o*- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{CHO}$  with  $\text{CO}_2$  (40—400 lb. pressure), and Na in  $\text{C}_6\text{H}_6$  give  $\text{BzOH}$  (max. yield 78%), *m*- (88%) and *p*- (95%)  $\text{-C}_6\text{H}_4\text{Me}\cdot\text{CO}_2\text{H}$ , *p*- $\text{C}_6\text{H}_4\text{Ph}\cdot\text{CO}_2\text{H}$  (67%), and *o*- $\text{CHO}\cdot\text{C}_6\text{H}_3\cdot\text{CO}_2\text{H}$  (47%), respectively. With *n*-amyl chloride,  $\text{CO}_2$ , and Na in light petroleum, the following reactions occur: (i) Wurtz (predominates at pressures up to 100 lb.); (ii)  $\text{C}_5\text{H}_{11}\text{Cl} + \text{CO}_2 + 2\text{Na} \rightarrow \text{C}_5\text{H}_{11}\cdot\text{CO}_2\text{Na} + \text{NaCl}$ ; (iii)  $\text{C}_5\text{H}_{11}\text{Cl} + 2\text{CO}_2 + 4\text{Na} \rightarrow 2\text{NaCl} + \text{C}_5\text{H}_{12} + \text{CHBu}(\text{CO}_2\text{Na})_2$  (appreciable at 200—400 lb. pressure); (iv) formation of  $\text{Na}_2\text{CO}_3$  and  $\text{Na}_2\text{C}_2\text{O}_4$  (major products at higher pressures). The use of  $\text{C}_6\text{H}_6$  as solvent leads to some *m*- and *p*- $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ .  $\text{AlkCO}_2\text{H}$  and  $\text{CHAlk}(\text{CO}_2\text{H})_2$  or  $\text{CAlkAlk}'(\text{CO}_2\text{H})_2$  are formed (yields recorded) from  $\text{EtCl}$ ,  $\text{Bu}^n\text{Cl}$ , *n*-hexyl and cetyl chlorides,  $\beta$ -chloropentane and  $\gamma$ -methylbutane, and  $\text{CH}_3\text{PhCl}$ . H. B.

**Differential reduction of the nitro-group by means of glucose.** G. BACHARACH and R. WEINSTEIN (Rec. trav. chim., 1935, 54, 931—933).—Reduction of *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$  with  $\text{NaOH}\cdot\text{H}_2\text{O}$ -glucose at 50° gives *p*-azoxybenzoic acid, decomp. above 355°, and at 75° gives *p*-azobenzoic acid, decomp. above 300°. The consens. of the reagents in the two cases are specified. H. G. M.

**Iodo-silver nitrobenzoate complex and its action on some allyl derivatives.** R. JACQUEMAIN and A. MUSKOVITS (Compt. rend., 1936, 202, 497—

499).—*o*-, *m*-, and *p*- (I)  $\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{Ag}$  when treated in dry  $\text{C}_6\text{H}_6$  with I yield the corresponding *I*-complexes (cf. A., 1933, 711), which convert ethylene derivatives into the diester of the corresponding  $\alpha$ -glycol. Thus allyl *p*-nitrobenzoate and the complex obtained from (I) yield glycerol tri-*p*-nitrobenzoate. The following derivatives of glycerol  $\alpha$ -benzoate were similarly prepared in good yield from allyl benzoate:  $\alpha'\beta$ -di-*o*-, m.p. 93°,  $\alpha'\beta$ -di-*m*-, m.p. 103° and  $\alpha'\beta$ -di-*p*-, m.p. 153°, -nitrobenzoate. H. G. M.

**Two new dichloro-*o*-nitrobenzoic acids.** P. RUGGLI and H. ZAESLIN (Helv. Chim. Acta, 1936, 19, 434—439).—4:5-Dichloro-2-nitrotoluene and  $\text{CrO}_3\cdot\text{H}_2\text{SO}_4$  at  $\Delta$   $-15^\circ$  give 4:5-dichloro-2-nitrobenzoic acid, m.p. 165°, possibly identical with the acid, m.p. 160°, of Claus *et al.* (A., 1887, i, 828). 2:4:6- $\text{C}_6\text{H}_2\text{Me}(\text{NO}_2)_3$  and  $\text{NH}_4\text{HS}\cdot\text{EtOH}$  give an 85% yield of 2-nitro-4:6-diaminotoluene, m.p. 135° (lit. 132°), converted, best (70%) by addition of aq.  $\text{NaNO}_2$  to its solution with  $\text{CuCl}$  in conc.  $\text{HCl}$  at 50—70°, to 4:6-dichloro-2-nitrotoluene, m.p. 60° (obtained also much less well by other methods), oxidised with 15%  $\text{HNO}_3$  at 150—160° (not by other methods) into 4:6-dichloro-2-nitrobenzoic acid, m.p. 189—190°. *p*- $\text{C}_6\text{H}_4\text{MeCl}$  and fuming  $\text{HNO}_3$  give a mixture of 2- and 3- $\text{NO}_2$ - and 2:5-, 3:5-, and 2:6- $(\text{NO}_2)_2$ -compounds (cf. lit.). 4-Chloro-2-nitrotoluene and fuming  $\text{HNO}_3$  at 10—15° give 66% of 2:5- and 33% of 2:6- $(\text{NO}_2)_2$ -compounds (cf. lit.). R. S. C.

**Synthesis of 1:9-dimethyltetrahydrophenanthrene-2-carboxylic acid and of 1:9-dimethylphenanthrene.** G. DARZENS and A. LÉVY (Compt. rend., 1936, 202, 427—428; cf. A., 1935, 975).—1:4- $\text{C}_{10}\text{H}_6\text{Me}\cdot\text{CH}_2\text{Cl}$  gives  $\text{Et}_2$  4-methyl-1-naphthylmethylmalonate, b.p. 201—203°/2.5 mm., and thence  $\text{Et}_2$  4-methyl-1-naphthylmethylallylmalonate ( $\alpha$ -4-methyl-1-naphthyl- $\Delta^5$ -pentene-3,3-dicarboxylate), hydrolysed to the corresponding acid, m.p. 184.5°, which decomposes at about 190° into  $\alpha$ -4-methyl-1-naphthylmethyl- $\Delta^7$ -pentenoic acid, m.p. 93.5°, and about 4% of the  $\gamma$ -lactone, b.p. 204°/2 mm. This acid is cyclised by  $\text{H}_2\text{SO}_4\cdot\text{AcOH}$  (40°, 3 days) to 4:9-dimethyl-1:2:3:4-tetrahydrophenanthrene-2-carboxylic acid, m.p. 201°; about 40% of the  $\delta$ -lactone, m.p. 91°, is also formed. The acid with S at 230—300° yields 4:9-dimethylphenanthrene-2-carboxylic acid, m.p. 266°, but dehydrogenation with Se at 340—350° is accompanied by decarboxylation giving 1:9-dimethylphenanthrene [picrate, m.p. 163.5° (lit. 160°); styphnate, m.p. 181°]. All yields are good. H. G. M.

**Keto-lactol tautomerism. V. Influence of methylcyclohexane rings on the tautomerism of  $\delta$ -ketonic acids.** M. QUDRAT-I-KHUDA and A. MUKHERJI (J.C.S., 1936, 570—573).—4-Methylcyclohexenylacetone (a mixture of  $\Delta^5$ -30-3, and  $\Delta^5$ -69-7%, isomerides obtained from  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{Et}\cdot\text{NaOEt}\cdot\text{EtOH}$ -4-methylcyclohexanone) heated with  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{NH}_2\cdot\text{NaOEt}\cdot\text{EtOH}$  gives 4-methylcyclohexane-1:4-spiro-2'-hydroxy-6'-keto-5'-cyano-2-methylpiperidine (I), m.p. > 300°, hydrolysed (conc.  $\text{HCl}$ ) to the dilactone (II), m.p. 172°, converted by 10%  $\text{NaOH}$  and acidification at 0° into 1-acetonyl-

4-methylcyclohexane-1-malonic acid (*Ag* salt) which slowly reverts to (II), and is decarboxylated at 170°

to the corresponding -1-acetic acid (III), b.p. 183°/6 mm. [*Ag* salt; semicarbazone, m.p. 195° (decomp.); *Me* ester, b.p. 120°/2 mm. (semicarbazone, m.p. 155°]. The anhydride of 4-methylcyclohexane-1:1-diacetic acid with boiling EtOH gives the *Et H* ester (*Ag* salt), converted by successive treatment with SOCl<sub>2</sub> and ZnMeI into *Et* 1-acetonyl-4-methylcyclohexane-1-acetate, b.p. 133°/3 mm. (semicarbazone, m.p. 140°), hydrolysed by KOH-aq. EtOH to (III). Reduction of (III) with Na-boiling EtOH affords the lactone (IV)

$C_5H_9Me > C \begin{matrix} \diagup CH_2 \cdot CRMe \\ \diagdown CH_2 \cdot CO \end{matrix} O$  (R=H), b.p. 142°/3 mm. By similar methods 3-methylcyclohexenyl-acetone affords the imide, m.p. > 300° [as (I)], hydrolysed to the dilactone [as (II)], m.p. 144°, hydrolysed to 1-acetonyl-3-methylcyclohexane-1-malonic acid (*Ag* salt), decarboxylated to the -1-acetic acid (V), b.p. 161°/2 mm. {semicarbazone, m.p. 212°; *Me* ester, b.p. 135—136°/13 mm. [semicarbazone, m.p. 162° (decomp.)]}. Similarly from 3-methylcyclohexane-1:1-diacetic anhydride are obtained the *Et H* ester (*Ag* salt), *Et* 1-acetonyl-3-methylcyclohexane-1-acetate (VI), b.p. 129°/5 mm. [semicarbazone, m.p. 105° (decomp.)], hydrolysed to (V), and converted by NaOEt into 3-methylcyclohexanespirocyclohexane-3':5'-dione. (VI) and MgMeI afford the lactone [as (IV), R=Me], b.p. 159°/10 mm. Reduction of (V) gives the lactone [as (IV), R=H], b.p. 187°/4 mm. The relative proportions of (III) and (II) formed in the 4- and 3-Me series are, respectively, 35.7:58 and 25:67%.

J. W. B.

**Derivatives of salicylic acid. IX. Stability of the sulphonic acid group in 4-sulphosalicylic acid. I. Nitration of 4-sulphosalicylic acid. X. II. Bromination of 4-sulphosalicylic acid.** N. W. HIRWE and M. R. JAMBHEKAR (Proc. Indian Acad. Sci., 1936, 3, A, 236—239, 261—264).—IX. 4-Sulphosalicylic acid (I) and HNO<sub>3</sub> (*d* 1.4)—Ac<sub>2</sub>O at < 5° give a mixture of its 3:5-(NO<sub>2</sub>)<sub>2</sub>- (II), decomp. > 261° (*K*, *K H*, and *Ba*, +2H<sub>2</sub>O salts), and its 5-NO<sub>2</sub>-derivative +2H<sub>2</sub>O (III), m.p. 166—167° (isolated as its *K H* salt by addition of conc. aq. KCl to the mother-liquor: *Ba* salt, +H<sub>2</sub>O). When heated with HNO<sub>3</sub> (*d* 1.4) at 100° (I) gives 2:4:6-trinitrophenol-3-sulphonic acid +4H<sub>2</sub>O, m.p. 105° (replacement of CO<sub>2</sub>H by NO<sub>2</sub>). Reduction of (III) with (NH<sub>4</sub>)<sub>2</sub>S-EtOH affords *o*-amino-4-sulphosalicylic acid, decomp. > 260°. Similar reduction of (II) gives 3-nitro-5-amino-4-sulphosalicylic acid, decomp. > 280°, and with Fe-HCl the 3:5-(NH<sub>2</sub>)<sub>2</sub>-acid, decomp. > 290°, is obtained.

X. Passage of Br vapour into an aq. solution of (I) affords a mixture of its 5-Br-, +4H<sub>2</sub>O, m.p. 210° (*Ba*, +4H<sub>2</sub>O, and *K H* salts), 3:5-Br<sub>2</sub>-, +4H<sub>2</sub>O, m.p. 83° (*Ba*, +H<sub>2</sub>O, and *K H* salts), and 3:5:6-Br<sub>3</sub>-derivative, m.p. 115° (*Ba* salt). The non-replacement of CO<sub>2</sub>H or SO<sub>3</sub>H by Br results from the

combination of the directing influences of OH and CO<sub>2</sub>H, and of Br and SO<sub>3</sub>H. J. W. B.

**Condensation of chloral with salicylic acid.** F. CALVET and M. N. MEJUTO (J.C.S., 1936, 554—556).—Condensation of CCl<sub>3</sub>·CH(OH)<sub>2</sub> and *o*-OH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H in presence of conc. H<sub>2</sub>SO<sub>4</sub> gives (after esterification) the *Me* ester (I), m.p. 200—202° (*Ac*<sub>2</sub> derivative, m.p. 207—209°), of βββ-trichloro-4:4'-dihydroxy-3:3'-dicarboxy-α-diphenylethane (II), m.p. 290—292°, and 2-hydroxy-5-βββ-trichloro-α-hydroxyethylbenzoic acid (III), m.p. 180—182° [*Ac*<sub>2</sub> derivative, m.p. 190—192°, which gives a colour with FeCl<sub>3</sub>; *Me* ester, m.p. 97—99° (*Ac*<sub>2</sub> derivative, m.p. 90—92°, giving no FeCl<sub>3</sub> colour)]. Condensation of (III)-*o*-OH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H-H<sub>2</sub>SO<sub>4</sub> also gives (II). When boiled with KOH-MeOH (I) affords ββ-dichloro-4:4'-dihydroxy-3:3'-dicarboxy-α-diphenylethane, m.p. 295—297° (*Me* ester, m.p. 120—122°), and (III) similarly treated gives 6-hydroxyisophthalaldehydic acid (IV), oxidised to 4-hydroxyisophthalic acid which is also obtained by KMnO<sub>4</sub>-NaOH oxidation of (III). Hydrolysis of (III) with conc. H<sub>2</sub>SO<sub>4</sub> also gives (IV). Reduction of (III) with Zn-HCl-EtOH affords (?) 2-hydroxy-5-ββ-dichlorovinylbenzoic acid, m.p. 170—172°. J. W. B.

**Isomeric, optically inactive menthyl mandelates. New type of racemism.** A. MCKENZIE and E. M. LUIS (Ber., 1936, 69, [B], 1118—1123).—Esterification of (+)-mandelic acid with (+)-menthol in presence of HCl at 100° yields (+)-menthyl (+)-mandelate (I), m.p. 81—82°, [α]<sub>D</sub><sup>25</sup> +138.1°, [α]<sub>D</sub><sup>25</sup> +164.8° in EtOH. (+)-Menthyl *r*-mandelate, m.p. 85—86°, [α]<sub>D</sub><sup>25</sup> +73.2° in EtOH, is obtained by direct esterification or mixing equal amounts of (I) and (+)-menthyl (−)-mandelate in COMe<sub>2</sub> and removing the solvent at room temp. dl-Menthyl (+)-mandelate, m.p. 76—77°, [α]<sub>D</sub><sup>25</sup> +64.4° in EtOH, prepared by mixing equal amounts of (I) and (−)-menthyl (+)-mandelate in COMe<sub>2</sub> and removing the solvent, suffers partial resolution when recryst. successively from EtOH and light petroleum. dl-Menthyl *r*-mandelate (provisional nomenclature), m.p. 103—704°, is derived from equal amounts of (I) and (−)-menthyl (−)-mandelate, by esterification of *r*-mandelic acid by dl-menthol in presence of HCl, or from equal wts. of (+)- and (−)-menthyl *r*-mandelate. It is isomeric with *r*-menthyl *r*-mandelate, m.p. 80—81° (A., 1934, 777). The forms differ from one another in appearance. Each can be recryst. without change. The possibility of dimorphism appears excluded. Both isomerides can be isolated by fractional crystallisation from dil. alcohol of the product derived by mixing dl-menthyl (+)- with (−)-mandelate in equal proportions. Fractional esterification of dl-menthol with (−)-mandelic acid by Marekwald and McKenzie's method gives a laevorotatory unesterified alcohol. H. W.

**Synthesis of 3-hydroxynaphthyl-2-acetic acid and of acylcarbinols.** B. EISTERT (Ber., 1936, 69, [B], 1074—1079; cf. A., 1935, 858).—Gradual addition of 3-acetoxy-2-naphthoyldiazomethane (I) to a suspension of Ag<sub>2</sub>O in EtOH at 60° gives *Et* 3-acetoxy-2-naphthylacetate (II), b.p. 187—189°/4 mm., hydrolysed by 2*N*-NaOH to 3-hydroxy-2-naphthylacetic acid, m.p. 178—180° (decomp.), which passes

when heated above its m.p. or, better, when boiled with  $\text{Ac}_2\text{O}$ , into 5:6-benzo-2-coumaranone (III). The "hydroxynaphthylacetic acid hydrate" (*loc. cit.*) is identified as the *K H* salt,  $\text{C}_{12}\text{H}_{10}\text{O}_3 \cdot \text{C}_{12}\text{H}_9\text{O}_3\text{K}$ , decomp. 243—244°. (II) and boiling  $\text{NH}_2\text{Ph}$  give 3-hydroxynaphthyl-2-acetanilide, m.p. 220—222°, converted by boiling  $\text{Ac}_2\text{O}$  into 3-acetoxynaphthyl-2-acetanilide, m.p. 196°, also obtained from (I),  $\text{NH}_2\text{Ph}$ , and  $\text{Ag}_2\text{O}$  in hot  $\text{EtOH}$ . (I) suspended in dioxan is transformed by  $2\text{N-H}_2\text{SO}_4$  at room temp. into 3-acetoxy-2-naphthoylecarbinol, m.p. about 120—124° (slight decomp.), transformed by boiling  $\text{EtOH}$  containing conc.  $\text{HCl}$  into (III), also obtained from (I) and  $2\text{N-H}_2\text{SO}_4$  in boiling  $\text{EtOH}$ . 1-Acetoxy-2-naphthoic acid, m.p. 158°, is converted by  $\text{SOCl}_2$  in light petroleum at 80—90° into 1-acetoxy-2-naphthoyle chloride, m.p. 113—114° (gradual decomp.).

H. W.

**Addition of aromatic hydrocarbons to maleic anhydride and green radicals from diaryldihydrofuranones.** R. PUMMERER and E. BUCHTA (*Ber.*, 1936, 69, [B], 1005—1017).—It appears impossible to conduct the action between  $\text{C}_6\text{H}_6$ , maleic anhydride, and  $\text{AlCl}_3$  so that phenylsuccinic anhydride and thence phenylmaleic anhydride are produced, the products being  $\beta$ -benzoyl- or, with  $\text{PhMe}$ ,  $\beta$ -toluoyl- (I) -acrylic acid. If, however, hydrocarbon and  $\text{AlCl}_3$  are used in large excess  $\beta$ -toluoyl- $\alpha$ -tolyl-propionic acid (II), m.p. 151°, is obtained in 20% yield, also prepared from (I),  $\text{PhMe}$ , and  $\text{AlCl}_3$ . (II) is stable to  $\text{ClSO}_3\text{H}$  at 15—20° but is converted by boiling  $\text{AcCl}$  containing a little conc.  $\text{H}_2\text{SO}_4$  into the dilactone (III),  $\text{C}_{36}\text{H}_{30}\text{O}_4$ , decomp. 263° after softening and darkening, and by  $\text{Ac}_2\text{O}$  at 100° into (III) and the monolactone (IV),  $\text{C}_{18}\text{H}_{16}\text{O}_2$ , m.p. 104°. (IV) is transformed into (III) by  $\text{Br}$  in warm  $\text{AcOH}$ , by  $\text{FeCl}_3$  in  $\text{AcOH}$ , or by warm  $\text{Ac}_2\text{O}$  containing a little  $\text{H}_2\text{SO}_4$ . (III) is converted into (IV) by reduction with  $\text{Zn-Hg}$  and boiling  $\text{AcOH}$  whereas  $\text{Zn}$  dust and  $\text{AcOH}$  convert it into a substance,  $\text{C}_{36}\text{H}_{32}\text{O}_3$ , m.p. 98°. (III) appears unchanged by hydrazobenzene in boiling  $\text{PhCl}$ . Oxidation of (III) by  $\text{CrO}_3$  in  $\text{AcOH}$  affords  $p$ - $\text{C}_6\text{H}_4\text{MeCO}_2\text{H}$ . (IV) is hydrolysed in the usual manner by  $\text{KOH-MeOH}$  whereas (III) is converted with difficulty into di-( $\beta$ -toluoyl- $\alpha$ -tolyl)propionic acid,  $\text{C}_{36}\text{H}_{34}\text{O}_6$ , m.p. 166°. (III) and anhyd.  $\text{AlCl}_3$  in  $\text{PhCl}$  at 120° yield a lactonic acid,  $\text{C}_{36}\text{H}_{34}\text{O}_5$ , m.p. 163°, reconverted into (III) when heated in  $\text{Ac}_2\text{O}$  at 100°. (II) and boiling  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$  or (IV) and  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$  in boiling  $\text{EtOH}$  afford 1:3-ditolyl-2:3:4:5-tetrahydropyridazol-4-one, m.p. 165°. 3:3'-Di-(5-N-phenyl-1:3-ditolyl-2:3:4:5-tetrahydropyridazin-4-one, m.p. 160°, is prepared from (III) and  $\text{NHPhNH}_2$  in boiling xylene. When warmed in media of b.p. > 100° (III) dissociates into green radicals with marked red fluorescence.

By analogy the constitution

is ascribed to Pechmann's dye.  $\text{CHBz:CHCO}_2\text{H}$ ,  $\text{AlCl}_3$ , and  $\text{PhMe}$  at 100° give  $\beta$ -benzoyl- $\alpha$ -tolylpropionic acid, m.p. 149°. Fumaric acid is obtained from maleic anhydride,  $m\text{-C}_6\text{H}_4(\text{OH})_2$ , and  $\text{AlCl}_3$  in  $\text{CS}_2$ .

H. W.

**Derivatives of benzoylbenzoic acids.** M. HAYASHI, S. TURUOKA, I. MORIKAWA, and H. NAMIKAWA

(*Bull. Chem. Soc. Japan*, 1936, 11, 184—200).—3-Methylphthalic anhydride (I) (*imide*, m.p. 188.5—189°) condenses ( $\text{AlCl}_3$ ) with  $\text{C}_6\text{H}_6$  to give a substance (II),  $\text{C}_{21}\text{H}_{16}\text{O}_2$ , m.p. 116—117° (structures suggested), 2-benzoyl-3- (III), m.p. 171—172° (*Me* ester, m.p. 106.5—107.5°), and 2-benzoyl-6-methylbenzoic acid, m.p. 126.5—127.5° (*Me* ester, m.p. 122.5—123°) (also by the action of conc.  $\text{H}_2\text{SO}_4$  on the -3-acid), oxidised by 1%  $\text{KMnO}_4$  to benzophenone-2:6-, m.p. 255—256°, and -2:3-dicarboxylic acid,  $+\text{H}_2\text{O}$ , m.p. indefinite 121—146°, and anhyd., m.p. 140—141° (decomp.), respectively. (I) is converted by the usual methods into its 1-*Me* 2-*H*,  $+\text{H}_2\text{O}$  and anhyd. (IV), m.p. 114.5—115°, *Me*<sub>2</sub> b.p. 169°/21 mm., and 1-*Et* 2-*H*,  $+\text{H}_2\text{O}$ , m.p. 75—85°, and anhyd., m.p. 86—87°, esters, and 4-methylphthalic anhydride (*imide*, m.p. 194.5—195°) into its 2-*Me* 1-*H*,  $+\text{H}_2\text{O}$  and anhyd. (V), m.p. 89—90°, and *Et*<sub>2</sub> esters, b.p. about 193—195°/27 mm. The acid chloride of (IV) and  $\text{C}_6\text{H}_6 \cdot \text{AlCl}_3$  give (II) and (III), and the acid chloride of (V) similarly affords 2-benzoyl-5-methylbenzoic acid (cf. below). (I) condenses with  $\text{PhOH}$  to give 2-(2'-hydroxybenzoyl)-, m.p. 220—221°, and 2-(4'-hydroxybenzoyl)-3-methylbenzoic acid, m.p. 197—198°, isomerised by conc.  $\text{H}_2\text{SO}_4$  at room temp. to 2-(2'-hydroxybenzoyl)-, m.p. 141—142°, and 2-(4'-hydroxybenzoyl)-6-methylbenzoic acid, m.p. 183—184°, respectively. (I) and  $\text{PhCl}$  give (?) 2-(4'-chlorobenzoyl)-3-methylbenzoic acid, m.p. 175.5—176°. Contrary to Lawrance (A., 1920, i, 741) 3-nitrophthalic anhydride and  $\text{C}_6\text{H}_6$  give only 3-nitro-2-benzoylbenzoic acid (VI), m.p. 236—237°. Condensation of the acid chloride of 1-*Me* 2-*H* 3-nitrophthalate with  $\text{C}_6\text{H}_6$  gives only (VI), whereas the 2-*Me* 1-*H* ester gives mainly 6-nitro-2-benzoylbenzoic acid, m.p. 160—161°, and a little (VI). 2-Amino-6-, -3-, -5-, and -4-methylbenzoic acid and boiling  $\text{Ac}_2\text{O}$  afford, respectively, 6-, m.p. 84°, 3- (VII), m.p. 136—137°, 5- (VIII), m.p. 123—124°, and 4-methylacetoanthranil, m.p. 102—103° (all of type  $\text{C}_6\text{H}_3\text{Me} < \begin{array}{c} \text{CO} \cdot \text{O} \\ \text{N} = \text{CMe} \end{array}$ ).

Acetoanthranil and  $\text{C}_6\text{H}_6$  give 2-anilino-, m.p. 121.5—122° [*hydrochloride*, m.p. 165—167° (decomp.)], and 2-amino-benzophenone, m.p. 109—110° [*hydrochloride*, m.p. 179—180° (decomp.)]; (VII) similarly gives only 2-anilino-3-methylbenzophenone, m.p. 123—123.5° [*hydrochloride*, m.p. 166—173° (decomp.)], and (VIII) gives 2-amino- (IX) and 2-anilino-5-methylbenzophenone, m.p. 163.5°. Diazotisation of (IX), treatment with  $\text{Cu}_2(\text{CN})_2$  [substance, m.p. 189—190°, possibly di-(2-benzoyl-*p*-tolyl)amine, obtained], and hydrolysis of the crude nitrile affords 2-benzoyl-4-methylbenzoic acid, m.p. 150—150.5° [described in Part II (A., 1930, 1183) as the 5(or 4)-*Me* acid]; hence the 4(or 5)-*Me* acid, m.p. 145—145.5°, is 2-benzoyl-5-methylbenzoic acid. The following corrections to Parts III and IV (*loc. cit.*) are proposed: 2-(5'-chloro-2'-hydroxybenzoyl)-5-, m.p. 239.5—240.5° becomes -4-, and -4-, m.p. 227—228.5°, becomes -5-methylbenzoic acid. In all cases where the alternative 3(or 6)- and 6(or 3)-methylbenzoic acid occurs the first no. is correct.

J. W. B.

**Synthesis of *cis*- and *trans*-*dl*-norcaryophyllenic acids and of dehydronorcaryophyllenic acid.**

H. N. RYDON (J.C.S., 1936, 593—596).— $\beta\beta$ -Dimethyladipic acid (improved prep.) is converted by  $\text{SOCl}_2$ -Br into *Et*  $\alpha\alpha'$ -dibromo- $\beta\beta$ -dimethyladipate, b.p. 178—182°/12 mm., converted by NaCN-boiling EtOH and hydrolysis of the product with conc. HCl at 180° into *dl-trans*-3:3-dimethylcyclobutane-1:2-dicarboxylic acid (I), m.p. 148—149°, identical with the *dl*-norcaryophyllenic acid (Ramage *et al.*, A., 1935, 489, 756, who describe it as *cis*) and converted by the method of these authors into 3:3-dimethyl- $\Delta^1$ -cyclobutene-1:2-dicarboxylic acid, m.p. 195°, identical with dehydronorcaryophyllenic acid. When heated with  $\text{Ac}_2\text{O}$  at 220° (I) affords (through the crude anhydride) the *dl-cis*-acid, m.p. 149—150°, converted by  $\text{AcCl}$  into the *cis*-anhydride, m.p. 40—41°, b.p. 100—102°/1 mm., identical with norcaryophyllenic anhydride (Ruzicka *et al.*, A., 1935, 351). The stereochemistry of norcaryophyllenic acid is still doubtful but (I) is certainly the *trans*-acid and the *dl*-acid, m.p. 149—150°, of Ruzicka *et al.* is the *dl-cis*-acid. The natural *d*-acid is probably *cis*. Neither  $\alpha$ -isopropylglutaric acid (improved prep.) nor  $\alpha$ -isobutylglutaric acid, m.p. 68° [from  $\text{CH}_3\text{Bu}^\beta(\text{CO}_2\text{Et})_2$ -NaOEt- $\text{CH}_2\text{Cl}$ - $\text{CH}_2$ - $\text{CO}_2\text{Et}$  and hydrolysis], could be oxidised by  $\text{CrO}_3$  to the  $\alpha$ -OH-acid.  $\gamma$ -Carboxy- $\gamma$ -isheptolactone with  $\text{PBr}_2$ - $\text{PBr}_3$  affords *Et*  $\alpha$ -bromo- $\alpha$ -isopropylglutarate, b.p. 138—142°/11 mm., and a substance, m.p. 126—127°, which contains Br.

J. W. B.

**Valency-deflexion hypothesis.** R. D. DESAI (J. Univ. Bombay, 1935, 4, Part II, 206—214).—Mostly a brief review. 1-Carboxy-4-methylcyclohexane-1-acetic acid exists in only two forms (cf. A., 1931, 1055; 1935, 489). Attempts to isolate "extra" forms of six similar cyclohexane derivatives failed. These and other data show failure of the usual methods to prove strain in the methylcyclohexane ring.

R. S. C.

**Isomeric 1-carboxy-4-, -3-, and -2-methylcyclohexane-1-acetic acids.** R. D. DESAI, R. F. HUNTER, G. KHAN, and G. S. SAHARIA (J.C.S., 1936, 416—419).—Hydrolysis of *Et* 1-cyano-4-methylcyclohexane-1- $\alpha$ -cyanoacetate, b.p. 162—164°/15 mm. (obtained by action of  $\text{CN}\cdot\text{CHNa}\cdot\text{CO}_2\text{Et}$  on 1-hydroxy-1-cyano-4-methylcyclohexane, b.p. 128°/20 mm., prepared from 4-methylcyclohexanone by  $\text{NaHSO}_3$  and KCN), yields two 1-carboxy-4-methylcyclohexane-1-acetic acids, m.p. 137° (I) and 173° (II), identical with those obtained by oxidation of the two  $\alpha$ -keto-4-methylcyclohexane-1:1-diacetic acids (A., 1932, 741). Repetition of the work of Quadrat-i-Khuda (A., 1931, 1055) shows that his *A* and *C* acids are identical with (I) and (II), but that his "*B*" is a mixture of *A* and *C* (cf. A., 1935, 489); "*D*" was not obtained. The anhydride (III), m.p. 104°, derived from (II) forms an *imide*, m.p. 171°, an *amic acid*, m.p. 195°, a *p-toluidinic acid*, m.p. 168—169°, a *p-tolylimide*, m.p. 160°,  $\alpha$ - and  $\beta$ -naphthylamic acids, m.p. 140° and 185°, and  $\alpha$ - and  $\beta$ -naphthylimides, m.p. 163° and 185°. The anhydride (IV), m.p. 77°, from (I) forms an *imide*, new m.p. 130°. In presence of  $\text{AlCl}_3$ , (III) and  $\text{C}_6\text{H}_6$  yield 1-benzoyl-4-methylcyclohexane-1-acetic acid *A* (V), m.p. 165° (semicarbazone, m.p. 165°), and a neutral substance,  $\text{C}_{16}\text{H}_{18}\text{O}_2$ , m.p. 160°, formulated as

(V) is reduced (Zn—

Hg) to 1-benzyl-4-methylcyclohexane-1-acetic acid *A*, m.p. 98°. (IV) and  $\text{C}_6\text{H}_6$  yield 1-benzoyl-4-methylcyclohexane-1-acetic acid *B* (VI), m.p. 140—141° (semicarbazone, m.p. 150°), with a neutral substance, m.p. 89°. Reduction of (VI) gives 1-benzyl-4-methylcyclohexane-1-acetic acid *B*, m.p. 127°, with a neutral substance,  $\text{C}_{11}\text{H}_{20}\text{O}_2$ , m.p. 250°. 1-Hydroxy-1-cyano-3-methylcyclohexane, b.p. 120°/15 mm., prepared from 3-methylcyclohexanone, yields  $(\text{CN}\cdot\text{CHNa}\cdot\text{CO}_2\text{Et})$  *Et* 1-cyano-3-methylcyclohexane-1- $\alpha$ -cyanoacetate, b.p. 185°/15 mm., which is hydrolysed (HCl) to 1-carboxy-3-methylcyclohexane-1-acetic acid, m.p. 163° (decomp.) (VII), identical with that obtained by Desai (A., 1932, 741), and to a second form (VIII), m.p. 108° (*Ag* salt). The "third form" claimed by Desai and Hunter (A., 1935, 618) is a mixture of (VII) with (VIII). Treatment of *Et* 3-methylcyclohexylidenecyanoacetate with KCN followed by HCl yields (VII) and (VIII). (VII) forms an anilic acid, new m.p. 176° (decomp.), an anil, new m.p. 143°, an *imide*, m.p. 180—181°, a *p-toluidinic acid*, m.p. 180° (decomp.), *p-tolylimide*, m.p. 145°,  $\alpha$ - and  $\beta$ -naphthylamic acids, m.p. 150° and 192° (decomp.), and  $\alpha$ - and  $\beta$ -naphthylimides, m.p. 142° and 189°. (VIII) forms an anhydride, m.p. 50°, b.p. 145—148°/15 mm.; anilic acid, m.p. 207°; anil, m.p. 107°; *imide*, m.p. 92°; *p-toluidinic acid*, m.p. 185°; *p-tolylimide*, m.p. 102—103°;  $\alpha$ - and  $\beta$ -naphthylamic acids, m.p. 207° and 183°;  $\alpha$ - and  $\beta$ -naphthylimides, m.p. 115° and 116°. 1-Hydroxy-1-cyano-2-methylcyclohexane, b.p. 114—116°/15 mm., prepared from 2-methylcyclohexanone (IX), yields *Et* 1-cyano-2-methylcyclohexane-1- $\alpha$ -cyanoacetate, b.p. 180°/15 mm., hydrolysed to two 1-carboxy-2-methylcyclohexane-1-acetic acids, m.p. 170° (decomp.) [anhydride, b.p. 142—143°/12 mm.; anilic acid, m.p. 148°], and m.p. 160° [anhydride, b.p. 141—142°/12 mm.; anilic acid, m.p. 161—162°]. With  $\text{CN}\cdot\text{CHNa}\cdot\text{CO}_2\text{Et}$ , (IX) yields *Et* 2-methylcyclohexylidenecyanoacetate, b.p. 150—160°/15 mm., which with KCN yields the above pair of acids; since the m.p. of each of these differs from those of Quadrat-i-Khuda's "*B*" and "*D*" acids, Thorpe's suggestion (J.C.S., 1931, 1023) that the latter arose from (IX) in the starting material is eliminated. E. W. W.

**Fused carbon rings. VIII. Dehydration of 2-methyl-1- $\Delta^7$ -butenylcyclohexanol.** D. C. HIBBIT, R. P. LINSTEAD, and A. F. MILLIDGE. IX. Synthesis of stereoisomeric 1-methylcyclohexane-1:2-dicarboxylic acids and of various methylcyclohexanecarboxylic-acetic acids. Influence of the angular methyl group on the stability of their anhydrides. R. P. LINSTEAD and A. F. MILLIDGE (J.C.S., 1936, 476—478, 478—486).—VIII.  $\text{CH}_2\text{CH}[\text{CH}_2]_2\text{MgBr}$  and 2-methylcyclohexanone readily react in  $\text{Et}_2\text{O}$  to form 2-methyl-1- $\Delta^7$ -butenylcyclohexanol, b.p. 104—108°/18 mm. When heated with  $\text{H}_3\text{PO}_4$ , this is dehydrated to 2-methyl-1- $\Delta^7$ -butenylcyclohexene, b.p. 75—78°/10 mm., or, on prolonged heating, to *cis*-9-methyl- $\Delta^2$ -octahydronaphthalene (cf. this vol., 713), oxidised ( $\text{KMnO}_4$ ) to two 1-methylcyclohexane-1:2-diacetic acids as

before. The acid of m.p. 163—165° gives (MeOH-H<sub>2</sub>SO<sub>4</sub>) a Me<sub>2</sub> ester, b.p. 122—125°/1 mm., and with Ba(OH)<sub>2</sub> yields 8-methyl-2-hydrindone.

IX. The two forms of 1-methylcyclohexane-1:2-dicarboxylic acid are prepared. Et 1-methylcyclohexan-2-one-1-carboxylate, prepared by action of MeI on the Na derivative of Et cyclohexan-2-one-1-carboxylate, is converted (HCN) into Et 2-cyano-1-methylcyclohexan-2-ol-1-carboxylate, b.p. 148—149°/12 mm., which on prolonged treatment with HCl gives 1-methylcyclohexan-2-ol-1:2-dicarboxylic acid, m.p. 166—167°. This with Ac<sub>2</sub>O gives the anhydride, m.p. 86—87°, of 2-acetoxy-1-methylcyclohexane-1:2-dicarboxylic acid, m.p. 168°. The above cyanohydrin with SOCl<sub>2</sub> in C<sub>5</sub>H<sub>5</sub>N yields Et 2-cyano-1-methyl-Δ<sup>2</sup>-cyclohexene-1-carboxylate, b.p. 140—141°/9 mm. (not reduced by Al-Hg), hydrolysed to 1-methyl-Δ<sup>2</sup>-cyclohexene-1:2-dicarboxylic acid, m.p. 229—230° (decomp.) (anhydride, m.p. 67—68°; Ag<sub>2</sub> salt; Me<sub>2</sub> ester, b.p. 140°/11 mm.), which with 5% MeOH-H<sub>2</sub>SO<sub>4</sub> gives 2-carbomethoxy-1-methyl-Δ<sup>2</sup>-cyclohexene-1-carboxylic acid, m.p. 112—114°. When the Me<sub>2</sub> ester is heated with KOH-MeOH, 1-carbomethoxy-1-methyl-Δ<sup>2</sup>-cyclohexene-2-carboxylic acid, m.p. 119—120°, is formed. The Me<sub>2</sub> ester is hydrogenated (Adams) to a mixture of saturated esters, b.p. 122—129°/9 mm. [hydrolysed to a mixed acid (I), m.p. about 170°], which is treated with K in Et<sub>2</sub>O, followed by dil. acid; hydrolysis of the resulting ester, b.p. 124—126°/10 mm., with HCl gives a mixture, m.p. 200°, containing 40% of *cis*-acid, recrystallised to give *cis*-1-methylcyclohexane-1:2-dicarboxylic acid (II), m.p. 213°. The mixture (I) treated with conc. HCl at 190° gives 85% of *cis*-acid, recrystallised to *cis*-1-methylcyclohexane-1:2-dicarboxylic acid (III), m.p. 160°. The composition of mixtures of (II) and

(III) is determined by thermal analysis. (II) forms (AcCl) the *trans*-anhydride, m.p. 80°. (III) with Ac<sub>2</sub>O gives an anhydride, m.p. 60—65°, b.p. 144—146°/19 mm., hydrated to an 80% *cis*-acid. (II) and (III) are both racemates; their constitutions are based on analogy and are not certain. (III) and (II) are considered to be *cis* and *trans* since their anhydrides are low- and high-melting, respectively, resembling those of *cis*- and *trans*-hexahydrophthalic acid; also the anhydride of (III) is the more stable; this evidence is preferred to that of the action of HCl on (I). The action of angular Me is to stabilise the *cis*-form.

Both forms of 1-methylcyclohexane-1-carboxylic-2-acetic acid have been synthesised from Et 2-methylcyclohexanone-2-carboxylate, which with CN-CH<sub>2</sub>-CO<sub>2</sub>Et and C<sub>5</sub>H<sub>11</sub>N at room temp. gives no condensation products, but at very high pressure forms Et<sub>2</sub> 2-methylcyclohexylidene-1-cyanoacetate-2-carboxylate (IV), b.p. 160—165°/1 mm., which deposits a small amount of solid, m.p. 85—86°. (IV) reduced (Al-Hg) and hydrolysed yields *cis*-1-methylcyclohexane-1-carboxylic-2-acetic acid, m.p. 174—175°. The *cis*-configuration is assigned by analogy with previous results;

(V) differs from the isomeride obtained by Chuang *et al.* (A., 1935, 859), which is therefore the *trans*-form, identical with that obtained from 8-methyl-2-hydrindanone (this vol., 713). Attempted prep. of (V) from 1-methylcyclohexanol-2-acetic acid lactone, b.p. 140—141°/15 mm. (obtained from Et cyclohexanone-2-acetate and MgMeI), is unsuccessful. Both forms of 1-methylcyclohexane-2-carboxylic-1-acetic acid are prepared. 1-Carbethoxy-9-methyl-decahydronaphthalene-2:4-dione is hydrolysed to 9-methyldecahydronaphthalene-2:4-dione, which with NaOBr gives a mixture of *cis*- (VI), m.p. 171.5°, and *trans*-1-methylcyclohexane-2-carboxylic-1-acetic acid (VII), m.p. 131—132°. Mixtures are determined by thermal analysis. (VII) with Ac<sub>2</sub>O gives the *trans*-

anhydride, b.p. 163—165°/19 mm.; (VI) an anhydride, m.p. 50°, b.p. 152—154°/19 mm., hydrolysed to 45% of *cis*-acid, from which (VII) is isolated. (VII) is almost unchanged by HCl at 190—200°, but (VI) gives 90% of (VII). (VI) with 20% Ba(OH)<sub>2</sub> at 350° gives the *cis*-anhydride (no ketone). Arguments for the *cis*- and *trans*-structures of (VI) and (VII) are discussed. (VI) is synthesised from the lower homologue. With H<sub>2</sub> and Ni at 220—240°, the anhydride of (III) gives only a hydrocarbon, b.p. 130—140° (1:2-dimethylcyclohexane?), but with EtOH and Na, it yields a lactone, b.p. 129—132°/12 mm., which is probably a mixture of 2-methylol-1-methylcyclohexanecarboxylic acid lactone with the 2-Me isomeride, and with KCN at 280—290° yields a CN-acid hydrolysed to (VI).

Two forms of 1-methylcyclohexane-2-carboxylic-3-acetic acid are synthesised. The cyanohydrin of 2-methylcyclohexanone is obtained as a semi-solid mixture of stereoisomerides, b.p. 122—123°/10 mm., dehydrated by SOCl<sub>2</sub> and C<sub>5</sub>H<sub>5</sub>N to tetrahydro-*o*-toluonitrile, b.p. 85—86°/10 mm. This is probably a mixture of the Δ<sup>1</sup>- and Δ<sup>6</sup>-forms, but only the latter reacts with Na, EtOH, and CH<sub>2</sub>(CO<sub>2</sub>Et)<sub>2</sub>, forming Et<sub>2</sub> 2-cyano-1-methylcyclohexane-3-malonate, b.p. 180—188°/11 mm., hydrolysed to a mixture of “*cis*” m.p. 164—165°, and “*trans*”-1-methylcyclohexane-2-carboxylic-3-acetic acid, m.p. 138—140° (Ba salts). With HCl at 200°, the former gives the latter. α-Methylglutaconic acid (improved prep.) forms a Me<sub>2</sub> ester, b.p. 117°/13 mm. Attempted condensation of butadiene with this or with Me<sub>2</sub> β-methylglutaconate, b.p. 109—110°/12 mm., to give methylcyclohexane-carboxylic-acetic acids was unsuccessful. E. W. W.

Condensation of phenols and phenolic ethers with acetonedicarboxylic acid. II. β-Substituted cyclobutenonecarboxylic acids. V. M. DIXIT (J. Univ. Bombay, 1935, 4, Part II, 153—160; cf. A., 1932, 512).—The keto-acids obtained (*loc. cit.*) from CO(CH<sub>2</sub>-CO<sub>2</sub>H)<sub>2</sub> and PhOH, *o*- and *p*-C<sub>6</sub>H<sub>4</sub>Me-OMe are 3-aryl-Δ<sup>2</sup>-cyclobutenone-2-carboxylic acids, because of the following reactions. The 3-*p*-hydroxyphenyl-acid, m.p. 224°, more readily obtained by a modified method, is monobasic (Ba salt), is

obtained from  $\beta$ -*p*-hydroxyphenylglutaconic acid (I) by heating alone at 195° or with AcCl at 100°, and is converted into (I) by 10% NaOH; it gives *Ac*<sub>2</sub> (II), m.p. 123° (*Ba* salt), and *Ac* derivative (III), m.p. 171°; with PCl<sub>3</sub> at 100° it affords 1-chloro-3-*p*-hydroxyphenyl- $\Delta^2$ :4-cyclobutadiene-2-carboxylic acid (IV), m.p. 143°; it gives a semicarbazone, m.p. 258° (decomp.), hydrazone, m.p. 193°, and oximino-derivative, m.p. 201° (decomp.). (III) gives a semicarbazone, m.p. 279°, and oximino-derivative, m.p. 212°, with Ac<sub>2</sub>O yields (II), with PCl<sub>3</sub> the *Ac* derivative, m.p. 126°, of (IV), and with dil. NaOH the *Ac* derivative of (I). *p*- and *o*-Cresol afford similarly 3-*p*-, m.p. 160° (*Ac* derivative, m.p. 118°; semicarbazone, m.p. 213°; hydrazone, m.p. 188°), and -*o*-anisyl- $\Delta^2$ -cyclobutenone-2-carboxylic acid, m.p. 166° [*Ac* derivative, m.p. 137° (*Ba* salt); semicarbazone, m.p. 197°; hydrazone, m.p. 189°], and 1-chloro-3-*p*-, m.p. 162°, and -*o*-anisyl- $\Delta^2$ :4-cyclobutadiene-2-carboxylic acid, m.p. 176° (decomp.). The "anhydride" obtained (J.C.S., 1912, 107, 859) from  $\beta$ -phenylglutaconic acid and AcCl is considered to be a similar cyclic compound. R. S. C.

**Dehydrogenation.** III. Dehydrogenation of hydroaromatic carboxylic acid derivatives and ketones by selenium. L. RUZICKA (Helv. Chim. Acta, 1936, 19, 419—423; cf. A., 1935, 738).—Hydroaromatic substances containing groups derived from CO<sub>2</sub>H may give with Se aromatic acids or methylated hydrocarbons. Hydroaromatic ketones may give phenols. Et  $\Delta^1$ -tetrahydro-*o*-toluate with Se at 360° gives PhMe and *o*-C<sub>6</sub>H<sub>4</sub>Me·CO<sub>2</sub>H. Me<sub>2</sub> 1:3:3-trimethyl- $\Delta^1$ -cyclohexene-4:5-dicarboxylate at 360° gives *m*-xylene-4:5-dicarboxylic anhydride, m.p. 115—116°, sublimes at 100°/0.1 mm. [corresponding acid, m.p. 183° (loss of H<sub>2</sub>O)], also obtained, but only at 400°, from Me<sub>2</sub> 1:3:3-trimethylcyclohexene-4:5-dicarboxylate. 1:1-Dimethyloctahydronaphthalene-6:7-dicarboxylic anhydride [from myrcene (I) and maleic anhydride] at 330—350° gives 1:6:7-C<sub>10</sub>H<sub>5</sub>Me<sub>3</sub>, which proves conclusively the position of the ethylenic linkings in (I). *trans*- $\beta$ -Decalone at 260° gives 3-C<sub>10</sub>H<sub>7</sub>·OH and a substance, C<sub>20</sub>H<sub>12</sub>Se, m.p. 307—308°, whilst 3-methyl- $\Delta^2$ -cyclohexenone gives *m*-cresol. R. S. C.

**Oxidation of isosafrole.** M. IMOTO (J. Soc. Chem. Ind. Japan, 1936, 39, 132B; cf. A., 1934, 403).—The yield of piperonylic acid obtained from isosafrole and the theoretical amount of KMnO<sub>4</sub> is increased by various catalysts, most (to 62.8%) by active C. R. S. C.

**Synthesis of  $\alpha$ -substituted glutaconic acids.** N. L. PHALNIKAR and K. S. NARGUND (J. Univ. Bombay, 1935, 4, Part II, 106—108).—Esters, CH<sub>2</sub>R·CO<sub>2</sub>Et (R=Me, CH<sub>2</sub>Ph, or Ph), with HCO<sub>2</sub>Et and "mol." Na give the  $\alpha$ -aldehydo-acids, which are condensed without isolation with CH<sub>2</sub>(CO<sub>2</sub>H)<sub>2</sub> and piperidine to give Et H glutaconates; purification by way of the Et<sub>2</sub> esters and subsequent hydrolysis then affords *trans*- $\alpha$ -methyl-, m.p. 144° (Et<sub>2</sub> ester, b.p. 180—185°/120 mm.), -benzyl-, and -phenyl-glutaconic acid, m.p. 164° (Et<sub>2</sub> ester, b.p. 220°/80 mm.). R. S. C.

**Condensation of phenylpyruvic acid with acetophenone.** P. CORDIER (Compt. rend., 1936, 202, 1440—1442).—Interaction of CH<sub>2</sub>Ph·CO·CO<sub>2</sub>H with CPhMe in aq. KOH-EtOH affords, after treatment with dil. HCl,  $\alpha$ -hydroxy- $\beta$ -benzoyl- $\alpha$ -benzylpropionic acid, m.p. 140°, which is unchanged by cold HCl, but with hot HCl in AcOH is converted into  $\beta$ -benzoyl- $\alpha$ -benzylidenepropionic acid (I), m.p. 160—165° (decomp.), and 2-keto-5-phenyl-3-benzylidene-2:3-dihydrofuran, m.p. 149—150°, easily hydrolysed to (I). J. L. D.

**Syntheses in the thujane group. I. Synthesis of ketopolymethylene-1:3-dicarboxylic esters.** P. C. GUHA and N. K. SESHADRIENGAR (Ber., 1936, 69, [B], 1207—1212).—CH<sub>2</sub>(CH<sub>2</sub>Br)<sub>2</sub> and the Na derivative of CO(CH<sub>2</sub>·CO<sub>2</sub>Et)<sub>2</sub> in C<sub>6</sub>H<sub>6</sub> give the compound CH<sub>2</sub>< $\begin{array}{c} \text{CH}_2 \cdot \text{CH}_2 \cdot \text{O} \\ \text{CH}_2 \cdot \text{C}(\text{CO}_2\text{Et}) \end{array}$ >C·CH<sub>2</sub>·CO<sub>2</sub>Et (obtained by Perkin in alcoholic solution) and compounds obtained by the action of Na on CO(CH<sub>2</sub>·CO<sub>2</sub>Et)<sub>2</sub>·CH<sub>2</sub>(CH<sub>2</sub>Br)<sub>2</sub> and the Mg derivative of CO(CH<sub>2</sub>·CO<sub>2</sub>Et)<sub>2</sub> in boiling EtOH afford Et<sub>2</sub> cyclohexanone-1:3-dicarboxylate, b.p. 142°/2 mm., hydrolysed by boiling H<sub>2</sub>SO<sub>4</sub> (1:1) to cyclohexanone, unchanged material, CH<sub>2</sub>Ac·CO<sub>2</sub>Et, and Et cyclohexanonecarboxylate. Under similar conditions C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub> gives Et<sub>2</sub> cyclopentanone-2:5-dicarboxylate, b.p. 143°/4 mm. (Cu derivative, m.p. 200°), hydrolysed to cyclopentanone, whilst CH<sub>2</sub>Br<sub>2</sub> affords Et<sub>2</sub> cyclobutanone-2:4-dicarboxylate and two compounds, m.p. 102° and 286°, respectively. H. W.

**Degradation of  $\beta$ -anisyl- and  $\beta$ -halogenoanisylglutaric acids to succinic acids through  $\gamma$ -butyrolactones and other reactions [thereof].** D. B. LIMAYE and R. G. CHITRE (J. Univ. Bombay, 1935, 4, Part II, 94—103).—Ag salts of 3-*p*-anisyl-(I) [anhydride, m.p. 152°; monoanilide, m.p. 157°; Et<sub>2</sub>, b.p. 206°/14 mm., EtH, m.p. 78°, and (COPh·CH<sub>2</sub>)<sub>2</sub> ester, m.p. 95°] and  $\beta$ -3-halogeno-*p*-anisylglutaric acids with I at 150° do not give butyrolactones. Ag  $\beta$ -3:5-dihalogeno-*p*-anisylglutarates, however, give CO<sub>2</sub> and butyrolactones, which with K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> give the substituted succinic acids. (I) is substituted, yielding the 3-*I*-derivative, m.p. 160° [anhydride, m.p. 148°; monoanilide, m.p. 182°; Et<sub>2</sub>, m.p. 83°, Me<sub>2</sub>, m.p. 79°, and (COPh·CH<sub>2</sub>)<sub>2</sub> ester, m.p. 131°], also obtained by I and HIO<sub>3</sub> in hot H<sub>2</sub>O. The substituted Et<sub>2</sub> glutarates with Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub> and "mol." Na (not NaOEt) give cyclopentadione derivatives. The following are described; direct halogenation, where recorded, is effected in AcOH.  $\beta$ -3-Bromo- [from (I)], m.p. 147° [anhydride, m.p. 143°; monoanilide, m.p. 150°; Et<sub>2</sub>, m.p. 66°, Me<sub>2</sub>, m.p. 74°, and (COPh·CH<sub>2</sub>)<sub>2</sub> ester, m.p. 125°], -3-chloro- [from (I)], m.p. 157° [anhydride, m.p. 128°; monoanilide, m.p. 143°; Et<sub>2</sub>, m.p. 40.5°, and Me<sub>2</sub> ester, m.p. 59°], -3:5-dichloro- [from (I)], m.p. 195° [anhydride, m.p. 182°; monoanilide, m.p. 172°; Et<sub>2</sub>, b.p. 320° (decomp.), Me<sub>2</sub>, m.p. 63.5°, and (COPh·CH<sub>2</sub>)<sub>2</sub> ester, m.p. 120°], and -3:5-dibromo-*p*-anisylglutaric acid, m.p. 211° [anhydride, m.p. 233°; monoanilide, m.p. 180°; Et<sub>2</sub>, b.p. 315° (decomp.), and Me<sub>2</sub> ester, m.p. 62°].  $\beta$ -3:5-Di-chloro-, m.p. 72°, and -bromo-*p*-anisyl- $\gamma$ -butyrolactone, m.p. 98°. 3:5-Di-chloro- [also

obtained from  $\text{CO}_2\text{H}\cdot\text{CH}_2\cdot\text{CH}(\text{C}_6\text{H}_4\cdot\text{OMe})\cdot\text{CO}_2\text{H}$  (II) and  $\text{Cl}_2\text{-AcOH}$ , m.p.  $173^\circ$ , and *-bromo-* [also obtained from (II) and dry Br at  $100^\circ$ ], m.p.  $198^\circ$  (*anhydride*, m.p.  $110^\circ$ ), and *3-bromo-p-anisylsuccinic acid*, m.p.  $175^\circ$  (*anhydride*, m.p.  $168^\circ$ ). *Et\_2* 1-*p-anisyl-*, m.p.  $123^\circ$ , 1-3'-*chloro-*, m.p.  $126^\circ$ , *-bromo-*, m.p.  $129^\circ$ , *-iodo-*, m.p.  $133^\circ$ , 3':5'-*dichloro-*, m.p.  $164^\circ$ , and *-dibromo-p-anisyl-cyclopentadione-2:5-dicarboxylate*, m.p.  $168^\circ$ . 3:5-Dibromo-*p-anisaldehyde* [*semi-carbazone*, m.p.  $236^\circ$  (decomp.)]; *phenylhydrazone*, m.p.  $135^\circ$ ] could not be condensed with  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}_2\text{Na}$ . 3:5-Dibromo-4-hydroxybenzaldehydesemicarbazone has m.p.  $233^\circ$  (decomp.). R. S. C.

**Methoxylated o-benzoylbenzoic acids.** C. WEIZMANN and E. BERGMANN (J.C.S., 1936, 567—569).—Demethylation by  $\text{AlCl}_3$  in condensations occurs only if the reaction is slow. Thus phthalic anhydride (I) with  $\alpha$ - and  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{OMe}$ , and 1:5- $\text{C}_{10}\text{H}_6(\text{OMe})_2$  and  $\text{AlCl}_3$  at room temp. afford, respectively, *o*-4'- and *o*-2'-methoxy- [also from (I) and the Mg compound of 1:2- $\text{C}_{10}\text{H}_6\text{Br}\cdot\text{OMe}$ ] and *o*-1':5'-dimethoxy-4'-naphthoylbenzoic acid. Pyrogallol  $\text{Me}_3$  ether and 2:3- $\text{C}_{10}\text{H}_6(\text{CO})_2\text{O}$  or hemipinic anhydride (II) with  $\text{AlCl}_3$  in  $\text{CS}_2$  give, respectively 3-(4'-hydroxy-2':3'-dimethoxybenzoyl)-2-naphthoic acid and 6-(4'-hydroxy-2':3'-dimethoxybenzoyl)-2:3-dimethoxybenzoic acid. *o*-(2':3':4'-Trimethoxybenzoyl)benzoic acid, m.p.  $196^\circ$ , is obtained by the action of (I) on 4-lithio-1:2:3-trimethoxybenzene ( $\text{N}_2$ ), the product, m.p.  $169^\circ$  (Bentley *et al.*, J.C.S., 1908, 93, 436) being partly demethylated. (II) and  $\text{MgPhBr}$  afford 2-benzoyl-3:4-dimethoxybenzoic acid, cyclised by  $\text{H}_2\text{SO}_4$  to alizarin 1:2- $\text{Me}_2$  ether and a substance, m.p.  $192^\circ$ . (II) and  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{MgBr}$  give 2- $\alpha$ -naphthoyl-3:4-dimethoxybenzoic acid, cyclised to 1:2-dimethoxy-7:8-benzanthraquinone; (II) and the Mg compound of 2:6- $\text{C}_{10}\text{H}_6\text{Br}\cdot\text{OMe}$  give 2-(6'-methoxy- $\beta$ -naphthoyl)-3:4-dimethoxybenzoic acid, dimorphous, m.p.  $237^\circ$  and  $240^\circ$ . J. W. B.

**Dyes derived from acetylenedicarboxylic acid.** R. N. MISRA and S. DUTT (J. Indian Chem. Soc., 1936, 13, 98—103).— $(\text{C}\cdot\text{CO}_2\text{H})_2$  (I) condenses with some phenols and amines, preferably in presence of  $\text{SnCl}_4$  or a little conc.  $\text{H}_2\text{SO}_4$ , to yield dyes which are more deeply coloured (generally pink in alkali) and possess higher absorption max. than analogous compounds containing C:C (cf. A., 1927, 969). The following are described: *phenol-* (II), m.p.  $119$ — $120^\circ$  (decomp.) (softens at  $115^\circ$ ), *resorcinol-*, decomp.  $185^\circ$  [ $\text{Br}_4$ -derivative, m.p.  $115$ — $117^\circ$  (decomp.)], *phloroglucinol-*, m.p.  $>310^\circ$ , *orcinol-*, m.p.  $155$ — $157^\circ$  (decomp.), *m-dimethyl-*, m.p.  $126^\circ$  (decomp.), and *m-diethyl-*, m.p.  $109^\circ$  (decomp.), *-aminophenol-*, and *m-phenylenediamine-*, decomp.  $260^\circ$ , *-acetylenein*. Solutions of these [except (II)] show strong fluorescence. Condensation does not occur with *o*- and *p*-cresol, *m*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$ , and *o*-, *m*-, and *p*-xylenols; pure products could not be isolated from (I) and *o*- $\text{C}_6\text{H}_4(\text{OH})_2$  or pyrogallol. H. B.

**Quinovic acid.** V. H. WIELAND, A. HARTMANN, and H. DIETRICH (Annalen, 1936, 522, 191—217).—*o*-dehydrogenation (Se at  $350$ — $360^\circ$ ; Pd-C at  $340$ — $350^\circ$ ) of quinovic (I) or pyroquinovic (II) acid gives a hydrocarbon (III),  $\text{C}_{24}\text{H}_{24}$  or  $\text{C}_{26}\text{H}_{26}$ , m.p.  $202$ — $203^\circ$ , together with the trimethylpicene (IV), m.p.  $306^\circ$  (corr.) [previously described (A., 1932, 945) as a hydrocarbon  $\text{C}_{20}\text{H}_{16}$ ], obtained by Ruzicka *et al.* (cf. A., 1934, 530) from various sapogenins. Siarensinic acid is also dehydrogenated (Se at  $310$ — $320^\circ$ ) to a little (IV); the main products are [unlike (I) or (II)]  $\text{C}_{10}\text{H}_8$  derivatives. (IV) is oxidised ( $\text{CrO}_3$ ,  $\text{AcOH}$ ) to an *o*-quinone,  $\text{C}_{25}\text{H}_{18}\text{O}_2$  (?), m.p.  $252$ — $255^\circ$  (decomp.), purified by adsorption on activated  $\text{Al}_2\text{O}_3$ ; (III) similarly gives non-cryst. material. Structure (A) is now assigned to (I); (II) is formulated as (B) with  $\text{CO}_2\text{H}=\text{H}$ .

Oxidation (2%  $\text{KMnO}_4$ , 0.5%  $\text{KOH}$ ,  $60^\circ$ ) of novic acid (V) gives a *hydroxyketo-acid* (VI),  $\text{C}_{30}\text{H}_{42}\text{O}_6$ , m.p.  $237$ — $238^\circ$  ( $\text{Me}_1$  ester, m.p.  $198^\circ$ ), and a little of an *isomeride*, m.p.  $262^\circ$  [also formed in small yield by oxidation of (V) with  $\text{CrO}_3$  in  $\text{AcOH}$ ]. (VI) is oxidised ( $\text{CrO}_3$ ,  $\text{AcOH}$ ) to novicquinone (A., 1930, 600) (structure suggested), which is further oxidised (30%  $\text{H}_2\text{O}_2$ ,  $\text{AcOH}$ ) to a dilactonic dicarboxylic acid,  $\text{C}_{30}\text{H}_{42}\text{O}_8$ , m.p.  $287$ — $288^\circ$  (decomp.) ( $\text{Me}_2$  ester, m.p.  $242^\circ$ ). Thermal decomp. of (VI) at  $260^\circ$  affords a 3:2 mixture of two isomeric neutral substances,  $\text{C}_{29}\text{H}_{40}\text{O}_3$ , m.p.  $218^\circ$  and  $242$ — $243^\circ$ . Oxidation ( $\text{CrO}_3$ ,  $\text{AcOH}$ ) of diacetylpyroquinovic acid is now considered (cf. *loc. cit.*) to give the  $\text{Ac}_1$  derivative, m.p.  $289^\circ$  ( $\text{Me}$  ester, m.p.  $220^\circ$ ), of a  $\text{OH}$ -acid,  $\text{C}_{29}\text{H}_{42}\text{O}_5$ ; the latter is then similarly oxidised to a  $\text{CO}$ -acid (VII),  $\text{C}_{29}\text{H}_{40}\text{O}_5$ , m.p.  $290^\circ$  (decomp.) [ $\text{Me}_1$  ester, m.p.  $219^\circ$ ;  $\text{Br}$ -derivative, m.p.  $192$ — $194^\circ$  (decomp.)]. (II), which gives a violet colour with  $\text{Ac}_2\text{O}$ -conc.  $\text{H}_2\text{SO}_4$ , is similarly oxidised at  $20^\circ$  or  $60^\circ$  to (VII), an acid,  $\text{C}_{29}\text{H}_{42}\text{O}_6$ , m.p.  $318^\circ$  (decomp.) ( $\text{Me}_1$  ester, m.p.  $195^\circ$ ), and (VIII) (below); oxidation at  $100^\circ$  affords a non-cryst. product which when distilled in a high vac. yields a neutral substance,  $\text{C}_{29}\text{H}_{36}\text{O}_5$ , m.p.  $273$ — $274^\circ$ . (II) absorbs 1 O when treated with  $\text{BzO}_2\text{H}$  in  $\text{CHCl}_3$ , but the *dihydroxylactone* (C), m.p.  $267^\circ$  (decomp.) [ $\text{Ac}_1$  derivative, m.p.  $298$ — $300^\circ$  (decomp.)], is produced; this is identical with the compound previously obtained (A., 1931, 1158) by ozonolysis of (II) and it is oxidised ( $\text{CrO}_3$ ,  $\text{AcOH}$ ) to the *hydroxyketolactone* (VIII), m.p.  $286$ — $288^\circ$  (cf. *loc. cit.*).

Anhydroquinovic acid (simplified prep.) loses  $\text{CO}_2$  at  $245^\circ$  to give pyroanhydroquinovic acid, m.p.  $188$ — $189^\circ$ , which is converted by  $\text{ZnCl}_2$  in  $\text{AcOH}$  into the same lactone as is similarly obtained (A., 1932, 954) from (II). (I) and cold conc.  $\text{H}_2\text{SO}_4$  give (cf. A., 1927, 562) quinochromin (IX), m.p.  $249^\circ$ , and isoquinochromin,  $\text{C}_{29}\text{H}_{42}\text{O}_2$ , m.p.  $205$ — $206^\circ$ . (IX) is unsaturated (catalytic reduction; Br in  $\text{AcOH}$ - $\text{NaOAc}$ ;

cryst. products not isolable) and is reduced (Na, EtOH) to a *dihydro*-derivative, m.p. 177—178°. H. B.

**Syntheses in the thujane group. II. Synthesis of northujone-2:6-dicarboxylic esters.** P. C. GUHA and N. K. SESHADRIENGAR (Ber., 1936, 69, [B], 1212—1218).—Addition of  $\text{COBr}_2$  in  $\text{Et}_2\text{O}$  to the Na derivative of  $\text{Et}_4$  pentane- $\alpha\alpha\alpha\epsilon$ -tetracarboxylate (I) [prep. from  $\text{CH}_2(\text{CO}_2\text{Et})_2$  and  $\text{CH}_2(\text{CH}_2\text{Br})_2$  described] yields  $\text{Et}_4$  cyclohexanone-2:2:6:6-tetracarboxylate, b.p. 177°/1 mm. (corresponding *tetranilide*, m.p. 305°), hydrolysed and decarboxylated by  $\text{H}_2\text{SO}_4$  to cyclohexanone and by cold, 10% KOH-EtOH to the tetracarboxylic acid, m.p. 246° (decomp.). Similarly  $\text{Et}_4$  butane- $\alpha\alpha\delta\delta$ -tetracarboxylate (II) yields  $\text{Et}_4$  cyclopentanone-2:2:5:5-tetracarboxylate, which could not be distilled without decomp. and is hydrolysed to cyclopentanone. (I) is transformed by NaOEt in boiling EtOH into  $\text{Et}_2$  cyclohexanone-2:6-dicarboxylate (III), b.p. 140—142°/1.3 mm., from which the *phenylpyrazolone* derivative,  $\text{C}_{16}\text{H}_{18}\text{O}_3\text{N}_2$ , m.p. 150°, *pyrazolone* derivative,  $\text{C}_{10}\text{H}_{14}\text{O}_3\text{N}_2$ , m.p. 156—157°, the corresponding *dianilide*, m.p. 259—260°, and the *amide*, m.p. 225°, are obtained. The successive action of Na and Br on (III) in  $\text{Et}_2\text{O}$  leads to  $\text{Et}_2$  dicyclo-[0:1:3]-hexan-1-one-2:6-dicarboxylate, which could not be distilled without decomp.; its structure is established by its oxidation to cyclopentane-1:2-dicarboxylic acid. (II) and NaOEt in boiling EtOH afford  $\text{Et}_2$  cyclopentanone-2:5-dicarboxylate, b.p. 143°/3 mm. (Cu derivative, m.p. 200°), and a substance, m.p. 82°, which does not form a Cu compound. H. W.

**Lichen substances. LXVI. Constitution of lobaric acid. II.** Y. ASAHINA and M. YASUE (Ber., 1936, 69, [B], 643—649; cf. A., 1935, 1366).—Thermal decomp. of lobaric acid (I) at 200—300°/1 mm. affords *lobaritonide* (II), m.p. 127—128°, *n*-amylquinol (III), m.p. 87°, and an impure material, m.p. 70—75°, which resembles 2:3:5-trihydroxy-1-methyl- or -1:4-dimethyl-benzene in its behaviour towards  $\text{NH}_3$  and  $\text{CaOCl}_2$  in EtOH. (II) gives a *Me* ether, m.p. 99°, oxidised by  $\text{KMnO}_4$  in  $\text{COMe}_2$  to 3:5-dimethoxyphthalic anhydride and  $\text{Pr}^+\text{CO}_2\text{H}$ . Hydrolysis of (II) by conc. HCl in  $\text{COMe}_2$  at 50° gives *lobaritononic acid*,  $\text{C}_{13}\text{H}_{16}\text{O}_5$ , m.p. 120°, converted by  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  or  $\text{NH}_2\cdot\text{CO}\cdot\text{NH}\cdot\text{NH}_2$  in EtOH into the *hydrazine anhydride*,  $\text{C}_{13}\text{H}_{16}\text{O}_3\text{N}_2$ , m.p. 151°; the corresponding *Me* ether, m.p. 134°, is decarboxylated in quinoline containing Cu-bronze at 215° to 3:5-dimethoxyvalerophenone, m.p. 42—43°. (II) has therefore the constitution shown. (III) is oxidised by  $\text{HNO}_3$  in AcOH to *n*-amyl-*p*-benzoquinone, m.p. 22°, and is obtained synthetically by reducing (Zn-Hg and HCl) 2:5-dihydroxyvalerophenone, b.p. 161—163°/4 mm. (semicarbazone, m.p. 189—190°), obtained from

and subsequent acidification into *lobariolide* (V),  $\text{C}_{24}\text{H}_{30}\text{O}_6$ , m.p. 87° after softening at 83°, or (+ $\text{1H}_2\text{O}$ ), m.p. (indef.) about 75°. *Lobariol Me* ether, m.p. about 138°, from (IV),  $\text{Me}_2\text{SO}_4$ , and NaOH, is reduced by Na-Hg to *lobariolide Me* ether, also obtained from (V) and  $\text{CH}_2\text{N}_2$ , which is oxidised by  $\text{Na}_2\text{Cr}_2\text{O}_7$  in AcOH to the quinone (VI),  $\text{C}_{25}\text{H}_{30}\text{O}_7$ , m.p. 139°, obtained previously (*loc. cit.*) from permethylated norlobariolide; 6-methoxy-2-*n*-amyl-*p*-benzoquinone, b.p. 163°/3 mm., m.p. 1.3°, is also obtained. Reduction of (VI) with  $\text{H}_2\text{SO}_3$  affords the colourless *quinol*, m.p. 151—152° (*diacetate*, m.p. about 100° after softening at 80°). The structure A is assigned to (I). H. W.

**Oxidation of acetaldehyde and benzaldehyde by hydrogen peroxide in presence of selenium oxychloride.** J. B. FIRTH and H. H. GETHING (J.C.S., 1936, 633—634).—Oxidation of MeCHO or PhCHO to the acids by  $\text{H}_2\text{O}_2$  is greatly accelerated by addition of  $\text{SeOCl}_2$  (max. at 0.1—0.2 c.c. per 0.5 g. MeCHO) and by rise of temp. HCl alone does not catalyse the oxidation. J. W. B.

**Catalytic hydrogenation of nitriles with nickel. Hydrogenation of hydroxybenzonitriles and their methyl ethers.** H. RUPE and W. BRENTANO (Helv. Chim. Acta, 1936, 19, 588—596).—The yield of aldehyde obtained in the hydrogenation (Ni) of nitriles in  $\text{EtOAc-EtOH-H}_2\text{O}$  is increased by the presence of  $\text{NHPh}\cdot\text{NH}_2$ , although the rate of reaction is greatly reduced. Some of the aldehyde is obtained free and some as phenylhydrazone; much  $\text{NH}_2\text{Ph}$  is formed. *p*- and *o*-OH- $\text{C}_6\text{H}_4\cdot\text{CN}$  (I) and *p*- and *o*-OMe- $\text{C}_6\text{H}_4\cdot\text{CN}$  give 40–66, 40, 14–66, and 40–5%, respectively, of aldehyde without and 54–25, 50, 27–33, and 66%, respectively with  $\text{NHPh}\cdot\text{NH}_2$ . *Di-p*- and *o*-methoxybenzylamine have m.p. 35–37°, b.p. 225–230°/10 mm., and b.p. 200–210°/10 mm., respectively. *o*-Methoxybenzylamine has b.p. 120–125°/10 mm. The prep. of (I) from *o*-OH- $\text{C}_6\text{H}_4\cdot\text{NO}_2$  by way of the *p*- $\text{C}_6\text{H}_4\cdot\text{Me}\cdot\text{SO}_2$  derivative, reduction by Fe-AcOH, hydrolysis, and Sandmeyer reaction is impracticable owing to poor yields in the last reaction. R. S. C.

**Conversion of acids into aldehydes.** J. S. McFADYEN and T. S. STEVENS (J.C.S., 1936, 584—587).—Benzenesulphonylacylhydrazides are prepared thus: (a)  $\text{R}\cdot\text{CO}_2\text{H} \rightarrow \text{R}\cdot\text{CO}_2\text{Et} \rightarrow \text{R}\cdot\text{CO}\cdot\text{NH}\cdot\text{NH}_2 + \text{PhSO}_2\text{Cl} + \text{C}_5\text{H}_5\text{N} \rightarrow \text{R}\cdot\text{CO}\cdot\text{NH}\cdot\text{NH}\cdot\text{SO}_2\text{Ph}$  (I) or (b)  $\text{R}\cdot\text{COCl} + \text{PhSO}_2\cdot\text{NH}\cdot\text{NH}_2 + \text{C}_5\text{H}_5\text{N} \rightarrow$  (I): (a) is better since (b) favours diacylation and thus *benzenesulphondibenzoylhydrazide*, m.p. 198—200° (decomp.), is obtained. The following are prepared usually by method (a): *benzenesulphonyl-benzoyl*, m.p. 192—194° (decomp.), *-o-hydroxy-*, m.p. 161—162°, *-p-methoxy-*, m.p. 187—189° (decomp.), *-3:4-methylene-dioxy-*, m.p. 166—168°, *-m*, m.p. 222—223° (decomp.), and *-p-nitro-benzoyl*, m.p. 197—199° (decomp.), *-isobutyl-*, m.p. 156—158°, and *-diphenylacetyl-*, m.p. 191—193°, *-hydrazide*; 2:*o*-dichlorobenzenesulphonyl-benzoyl, m.p. 186—188° (decomp.), *-p-chlorobenzoyl*, m.p. 235—237° (decomp.), and *-o-hydroxybenzoyl*, m.p. 229—230° (decomp.), *-hydrazide*. Cinnamoylhydrazide and  $\text{PhSO}_2\text{Cl}$  give a compound, m.p. 169—171° (decomp.). Addition of alkali to a solution of (I) in hot glycol affords good

$\text{Bu}^+\text{CO}_2\text{H}$  and *m*- $\text{C}_6\text{H}_4(\text{OH})_2$  in presence of  $\text{ZnCl}_2$ . Lobariol (IV) is converted by reduction with Na-Hg

yields (42–87%) of aromatic aldehydes: (I)  $\rightarrow$   $\text{PhSO}_2\text{K} + (\text{R}\cdot\text{CO}\cdot\text{N}\cdot\text{NH}) \rightarrow \text{R}\cdot\text{CHO} + \text{N}_2$ , but fails in the aliphatic series. The yield is best when a considerable excess of alkali (best  $\text{Na}_2\text{CO}_3$ ) at  $160^\circ$  is used, and is unaffected by the quantity of solvent: prolonged heating ( $>75$  sec.) gives poor results. The reaction can be applied to the replacement of reactive halogen in the benzene ring by H; thus picryl chloride and  $\text{PhSO}_2\cdot\text{NH}\cdot\text{NH}_2$  afford *benzenesulphon-2':4':6'-trinitrophenylhydrazide*, m.p.  $210\text{--}220^\circ$  (decomp.), which gives  $1:3:5\text{-C}_6\text{H}_3(\text{NO}_2)_3$ , and the  $2':4'\text{-dinitrophenylhydrazide}$ , dimorphous, laminæ and needles, both m.p.  $196\text{--}198^\circ$  (decomp.), gives  $m\text{-C}_6\text{H}_4(\text{NO}_2)_2$ . *Piperonylhydrazide* has m.p.  $171\text{--}172^\circ$ . J. W. B.

**Derivatives of *p*-homosalicylaldehyde.** K. CHANG and P. P. T. SAH (J. Chinese Chem. Soc., 1936, 4, 80–83).—*p*-Homosalicylaldehyde (5-methyl-2-hydroxybenzaldehyde; cf. A., 1878, 875) with hydrazines, or semicarbazides in boiling 95% EtOH affords cryst. derivatives. The following are prepared: *phenyl*-, m.p.  $148.5\text{--}149.5^\circ$ , *o*-, m.p.  $149\text{--}150^\circ$  and *p*-tolyl-, m.p.  $153.5\text{--}155.5^\circ$ , and  $\beta$ -naphthylhydrazone, m.p.  $201.5\text{--}202.5^\circ$ ; *o*-nitro-, m.p.  $232\text{--}233^\circ$ , and 2-bromo-4-methyl-phenylhydrazone, m.p.  $128\text{--}129^\circ$ ; 3-, m.p.  $253\text{--}254^\circ$  (uncorr.), 4-nitro-, m.p.  $269\text{--}270^\circ$ , 3:5-dinitro-, m.p.  $259.5\text{--}260.5^\circ$ ; *p*-chloro-, m.p.  $247\text{--}248^\circ$  (decomp.), and *p*-bromobenzoylhydrazone, m.p.  $246.5\text{--}247.5^\circ$ ; *o*-, m.p.  $208\text{--}209^\circ$ , and *p*-tolylsemicarbazone, m.p.  $212\text{--}213^\circ$ . J. L. D.

**Theory and practice of the halogenation of active methyl and methylene groups.** F. KROHNKE (Ber., 1936, 69, [B], 921–935; cf. this vol., 592).—When Br (1 mol.) acts on  $\text{COPhMe}$  in 15 different media and the action is interrupted immediately after disappearance of the colour of the halogen the proportions of  $\text{COPh}\cdot\text{CH}_2\text{Br}$ ,  $\text{COPh}\cdot\text{CHBr}_2$ , and  $\text{COPhMe}$  in the product vary with the solvent; if the reaction is interrupted after a further 1.5–2 hr. the ratio  $\text{COPh}\cdot\text{CH}_2\text{Br}:\text{COPh}\cdot\text{CHBr}_2$  (80:20) is independent of the medium. Similar observations are recorded for other Me ketones, the constitution of which controls the position of equilibrium. For max. utilisation of Br in production of monobromo-ketones it is necessary to use an excess of ketone;  $\text{AcOH}$ ,  $\text{CCl}_4$ , and  $\text{CS}_2$  are unsuitable as media since in them the “time equilibrium” is very rapidly established whereas  $\text{CHCl}_3$  and  $\text{EtBr}$  are well adapted to the purpose. HBr activates the Me and  $\text{CH}_2\text{Br}$  ketone and also has a dehalogenating action, thus:

$\cdot\text{CO}\cdot\text{CHBr}_2$ . There is no apparent relationship between the effect of medium and its physical nature. Since further bromination of  $\text{CHBr}$  ketones is difficult, equilibrium is generally in favour of the  $\text{Br}_1$  compound. The  $\text{CBr}_2$  ketones in presence of HBr readily and almost completely undergo the change, e.g.,  $\text{COPh}\cdot\text{CMeBr}_2 + \text{COPhEt} \rightleftharpoons 2\text{COPh}\cdot\text{CHMeBr}$  and analogously the  $\text{CBr}$  compounds give the reaction  $\text{COPh}\cdot\text{CBr}_3 + 2\text{COPhMe} \rightarrow 3\text{COPh}\cdot\text{CH}_2\text{Br}$ . Unexpectedly bromination of  $\text{COPhMe}$  in presence of

$\text{KOAc}$  (as catchment for HBr) is accompanied by production of more  $\text{COPh}\cdot\text{CHBr}_2$  than in its absence; owing to non-activation of  $\text{COPhMe}$  by acid the reaction necessitates a higher temp. whilst  $\text{COPh}\cdot\text{CH}_2\text{Br}$  is regarded as activated by HBr in its immediate vicinity previous to the reaction with  $\text{KOAc}$ .  $\text{CaCO}_3$  behaves similarly. Bromination is preceded by the formation of red additive compounds, e.g.,  $\text{CORMe}\cdot\text{Br}_2$ . The separation of mono- and di-bromoketones is effected by  $\text{C}_5\text{H}_5\text{N}$  in hot EtOH in which the former rapidly produce salts,  $\text{COR}\cdot\text{CH}_2\cdot\text{N}(\text{C}_5\text{H}_5)\text{Br}$  whereas the latter react only after expulsion of EtOH at  $100^\circ$  thus:  $\text{COR}\cdot\text{CHBr}_2 + 2\text{C}_5\text{H}_5\text{N} + \text{H}_2\text{O} = \text{R}\cdot\text{CO}_2\text{H} + \text{CH}_2(\text{NC}_5\text{H}_5\text{Br})_2$ . The following appear new:  $\omega$ -tribromoacetophenone, m.p.  $65\text{--}66^\circ$ , b.p.  $176^\circ/16$  mm.; *pinacolynilpyridinium bromide*, m.p.  $203\text{--}204^\circ$ ; 3-phenanthracylpyridinium bromide, m.p.  $233^\circ$  (decomp.); 4-*p*-chlorophenacylpyridinium bromide, m.p.  $206^\circ$  (decomp.) after softening at  $203^\circ$ , and the corresponding *enolbetaine*  $\text{C}_{13}\text{H}_{10}\text{ONCl}$ , m.p.  $135\text{--}136^\circ$  (decomp.) after becoming discoloured at  $132^\circ$ ; 3:4-dichlorophenacylpyridinium bromide, m.p.  $222^\circ$  (decomp. commencing at  $220^\circ$ ), and the *enolbetaine*  $\text{C}_{13}\text{H}_9\text{ONCl}_2$ , m.p.  $130\text{--}135^\circ$  (decomp.); *p*-iodophenacylpyridinium bromide, m.p.  $252\text{--}253^\circ$  (decomp. beginning at  $248^\circ$ ), and the *enolbetaine*  $\text{C}_{13}\text{H}_{10}\text{ONI}$ , m.p.  $147^\circ$  (decomp.) after becoming discoloured at  $140^\circ$ ; *m*-nitrophenacylpyridinium bromide, m.p.  $244\text{--}245^\circ$  (decomp.), and the corresponding *picrate*. H. W.

**Halogen analogues of adrenaline and ephedrine. II. Derivatives of acetophenone.** R. P. EDKINS and W. H. LINNELL (Quart. J. Pharm., 1936, 9, 75–109; cf. A., 1932, 1245).—3-Amino-4-hydroxyacetophenone (an oil) obtained by reduction of the 3- $\text{NO}_2$ -derivative gave 3-bromo-4-hydroxyacetophenone (I), m.p.  $112^\circ$ , by the Sandmeyer method. (I) in  $\text{Et}_2\text{O}$  saturated with HCl gave with  $\text{BuNO}_2$  the *oximino*-derivative, and reduction *in situ* with  $\text{SnCl}_2$  gave 3-bromo- $\omega$ -amino-4-hydroxyacetophenone hydrochloride, m.p.  $236^\circ$ . In a similar way the hydrochloride, m.p.  $235^\circ$ , of the 3-Cl-derivative was obtained. 3-Chloro-5-nitroso-4-hydroxyacetophenone, m.p.  $110^\circ$ , was obtained from the chlorohydroxyketone and  $\text{BuNO}_2$  in  $\text{AcOH}$ . The hydrochlorides of 3-chloro-, 3-bromo-, 4-chloro-, and 4-bromo- $\omega$ -aminoacetophenones, m.p.  $222^\circ$ ,  $236^\circ$ ,  $290^\circ$ , and  $306^\circ$ , respectively, were obtained by reduction of the corresponding *oximino*-compounds with  $\text{SnCl}_2$  in  $\text{Et}_2\text{O}$  saturated with HCl. Reduction of these halogenated  $\omega$ -aminoacetophenones in aq. solution with  $\text{H}_2$  (Pd) gave excellent yields of  $\text{OH}\cdot\text{CHPh}\cdot\text{CH}_2\cdot\text{NH}_2\cdot\text{HCl}$ , halogen being eliminated, whilst in EtOH with or without  $\text{H}_2$ , but in presence of Pd, hydrolysis occurred, and theoretical yields of the halogenobenzoic acids were obtained. J. N. A.

**4-Chloroacetophenone. Catalytic oxidation in the liquid phase.** J. J. STUBBS and C. E. SENSEMAN (Ind. Eng. Chem., 1936, 28, 559–560).—4-Chloroacetophenone with  $\text{O}_2$  in  $\text{AcOH}$  containing  $\text{MnO}_2$  at  $110\text{--}112^\circ$  during 3 hr. affords 91%  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{CO}_2\text{H}$  (I). In the absence of  $\text{MnO}_2$  no (I) is formed. J. L. D.

**Organo-magnesium derivative of pentamethylbenzene.** H. CLÉMENT (Compt. rend., 1936, 202, 425—427; cf. A., 1934, 526).—Xylene and MeCl in presence of  $\text{AlCl}_3$  (24 hr.) afford an easily separable mixture of  $\text{C}_6\text{HMe}_5$  and  $\text{C}_6\text{Me}_6$ .  $\text{C}_6\text{Me}_5\cdot\text{MgBr}$  (I), prepared in presence of EtBr (*loc. cit.*), and AcCl yield *pentamethylacetophenone*, m.p.  $110^\circ$  (oxime; semicarbazone), and some *pentamethylphenylmethylethylcarbinol*, m.p.  $52^\circ$ . Similarly (I) (containing EtBr) with BzCl or EtOBz affords *pentamethylbenzophenone*, m.p.  $125^\circ$  (oxime; semicarbazone), and some *pentamethylphenylphenylethylcarbinol*, m.p.  $49^\circ$ , and with  $\text{HCO}_2\text{Et}$  affords *pentamethylbenzaldehyde*, m.p.  $130.5^\circ$  (oxime; semicarbazone). H. G. M.

**ar-Turmerone from curcuma oil.** H. RUPE and A. GASSMANN [with (in part) R. HAECKER] (Helv. Chim. Acta, 1936, 19, 569—581).—*ar*-Turmerone (I),  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{CHMe}\cdot\text{CH}\cdot\text{CO}\cdot\text{CH}\cdot\text{CMe}_2$ , and *dl*-*dihydroar-turmerone* (II) are synthesised. Crude curcuma oils had  $[\alpha]_D -9^\circ$  to  $+7.54^\circ$ , but various samples of rhizome gave to  $\text{C}_6\text{H}_6$  only dextrorotatory mixtures,  $[\alpha]_D +0.82^\circ$  to  $+20.48^\circ$ . The oil gave crystalline compounds with  $\text{H}_4\text{Fe}(\text{CN})_6$  and  $\text{H}_3\text{Fe}(\text{CN})_6$ , but treatment with these reagents does not give pure products. Oxidation of the oil with Pd-C, Se,  $\text{SeO}_2$ ,  $\text{FeCl}_3$ , and  $\text{O}_2\text{-FeCl}_3$  gives oils enriched in (I), but pure (I), b.p.  $159\text{--}160^\circ/10\text{ mm.}$ ,  $[\alpha]_D^{20} +82.21^\circ$ ,  $[\alpha]_{3461}^{20} +101.06^\circ$ , is best obtained by controlled oxidation with  $\text{CrO}_3$ , prep. of the *dinitrophenylhydrazones* (III), m.p.  $133\text{--}134^\circ$ , and hydrolysis thereof with hot HCl-EtOH. When pure, (I) gives a *semicarbazone*, m.p.  $108\text{--}109^\circ$ , an *oxime*, b.p.  $179\text{--}180^\circ/10\text{ mm.}$ , and *hydroxylamino*-compound, m.p.  $112^\circ$  (stable to acid). (III), but not (I), with conc. acid may give *d-curcuminone* (IV) (*dinitrophenylhydrazone*, m.p.  $89.5^\circ$ ). Hydrogenation (Ni) of (I) in 70% EtOH gives *dihydroar-turmerone*, b.p.  $146\text{--}147^\circ/10\text{ mm.}$ ,  $[\alpha]_D^{20} +44.25^\circ$ ,  $[\alpha]_{3461}^{20} +54.3^\circ$  (*dinitrophenylhydrazone*, m.p.  $121\text{--}122^\circ$ ; *oxime*, b.p.  $169\text{--}170^\circ/10\text{ mm.}$ ). (II), b.p.  $145\text{--}155^\circ/10\text{ mm.}$  (*dinitrophenylhydrazone*, m.p.  $127\text{--}128^\circ$ , not depressed by admixture with the *d*-compound; *oxime*, b.p.  $169\text{--}170^\circ/10\text{ mm.}$ ), is best obtained from  $\beta$ -*p*-tolylpropionpiperidide, b.p.  $205\text{--}208^\circ/10\text{ mm.}$ , and  $\text{MgBu}^{\text{I}}$ , and, less well, from  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{CHMe}\cdot\text{CH}_2\cdot\text{COCl}$  and  $\text{ZnBu}^{\text{I}}$  or  $\text{CPr}^{\text{II}}\text{Na}(\text{CO}_2\text{Et})_2$ . (IV) and  $\text{COMe}_2$  with cold NaOEt (not other reagents) gives (I). R. S. C.

**Beckmann change. IV. Effects of substitution on the rate of rearrangement of ketoxime picryl ethers. Suggested mechanism of the transformation.** A. W. CHAPMAN and F. A. FIDLER (J.C.S., 1936, 448—453; cf. A., 1935, 1498).—Velocities of Beckmann rearrangement of *p*-substituted benzophenoneoxime picryl ethers (I) ( $\text{X} = \text{picryl}$ ) into the corresponding amides (III):

are measured in  $\text{CCl}_4$  for compounds in which A and B = Ph, in which  $\text{A} = p\text{-Y}\cdot\text{C}_6\text{H}_4$  ( $\text{Y} = \text{Cl}$ ,  $\text{NO}_2$ , or Me) and B = Ph, and vice versa, and in which A and B =  $p\text{-Y}\cdot\text{C}_6\text{H}_4$  ( $\text{Y} = \text{Cl}$ ,  $\text{NO}_2$ , Me, or OMe). It is suggested that the activity of reagents promoting the Beckmann

rearrangement of ketoximes depends on the formation of ethers of type (I) ( $\text{X} = \text{acyl etc.}$ ), in which the change is spontaneous, its velocity depending on the polar character of the solvent. There is no evidence that ions are formed. The attraction for electrons exerted by  $\cdot\text{OX}$  creates a dipole at  $\text{N}\cdot\text{O}$ , its positive end being at N. If the mol. acquires sufficient energy, N becomes attached to A and OX migrates. The process is facilitated by electron-repelling groups on A or B. The following are prepared. *Ph p-tolyl  $\alpha$ - and  $\beta$ -ketoxime picryl ethers*, m.p.  $103^\circ$  and  $83^\circ$ , converted respectively into *p-toluoyl-N-picrylanilide*, m.p.  $209^\circ$  [also obtained from *p*-toluanilide-imidochloride and  $\text{C}_6\text{H}_2(\text{NO}_2)_2\text{ONa}$ ], and *benz-N-picryl-p-toluidide*, m.p.  $180\text{--}185^\circ$  (also obtained from *benz-p-toluidideimidochloride*). *p-Nitrobenzophenone- $\alpha$ -oxime picryl ether*, m.p.  $134^\circ$ , when heated in  $(\text{CH}_2\text{Cl})_2$  for 5 hr. at  $100^\circ$  gives *p-nitrobenz-N-picrylanilide*, m.p.  $214\text{--}215^\circ$ ; the  $\beta$ -oxime picryl ether, m.p.  $154\text{--}155^\circ$ , is unchanged under the same conditions. The picryl ether, m.p.  $189^\circ$ , of *pp'*-*dipitrobenzophenoneoxime*, m.p.  $195^\circ$  (decomp.), is similarly unchanged, as is *benzophenoneoxime 2:4-dinitrophenyl ether*, m.p.  $173\text{--}174^\circ$ ; the isomeric *benz-N-2:4-dinitrophenylanilide*, m.p.  $155\text{--}156^\circ$ , is obtained from *benzanilideimidochloride* and Na 2:4-dinitrophenoxide. *p*-Chlorobenzophenone- $\beta$ -oxime picryl ether has m.p.  $116\text{--}118^\circ$  (cf. A., 1933, 952). Attempts to prepare di-*p*-anisylketoxime picryl ether, even in a freezing mixture, give *p*-anisoyl-*p*-aniside. Improved methods of separating isomeric *p*-chloro- and *m*-methyl-benzophenoneoximes are described.

E. W. W.

**Action of alkalis on aromatic ketones.** N. S. KOZLOV, P. N. FEDOSEEV, and L. E. OLIFSON (J. Gen. Chem. Russ., 1936, 6, 259—264).—Ketones of the type  $\text{C}_6\text{H}_4\text{R}\cdot\text{COPh}$  decompose when heated at  $250\text{--}300^\circ$  for 50 min. with KOH, to yield  $\text{C}_6\text{H}_4\text{R}\cdot\text{CO}_2\text{H} + \text{C}_6\text{H}_6$ , whilst with  $\text{C}_6\text{H}_5\text{R}_2\cdot\text{COPh}$  the products are  $\text{C}_6\text{H}_5\text{R}_2$  and BzOH. Thus *o*- and *p*- $\text{C}_6\text{H}_4\text{Et}\cdot\text{COPh}$  yield *o*- and *p*- $\text{C}_6\text{H}_4\text{Et}\cdot\text{CO}_2\text{H}$  and  $\text{C}_6\text{H}_6$ , *p*- $\text{C}_6\text{H}_4\text{Pr}^{\text{II}}\cdot\text{COPh}$  affords *p*- $\text{C}_6\text{H}_4\text{Pr}^{\text{II}}\cdot\text{CO}_2\text{H}$  (I) and  $\text{C}_6\text{H}_6$ , 4:4'-*diisopropylbenzophenone*, b.p.  $195\text{--}196^\circ/1\text{ mm.}$  (from  $\text{PhPr}^{\text{II}}$  and  $\text{COCl}_2$  in presence of  $\text{AlCl}_3$ ), gives (I) and  $\text{PhPr}^{\text{II}}$ , and 4:4'-*diethylbenzophenone*, b.p.  $344^\circ$  (from  $\text{PhEt}$ ,  $\text{COCl}_2$ , and  $\text{AlCl}_3$ ), yields *p*- $\text{C}_6\text{H}_4\text{Et}\cdot\text{CO}_2\text{H}$  and  $\text{PhEt}$ , whilst 2:4'-*diisopropylbenzophenone*, b.p.  $334\text{--}335^\circ$  [from *m*- $\text{C}_6\text{H}_4\text{Pr}^{\text{II}}$  (II) and BzCl, in presence of  $\text{AlCl}_3$ ], gives (II) and BzOH, and  $\text{C}_6\text{H}_3\text{MePr}^{\text{II}}\cdot\text{COPh}$  yields  $\text{C}_6\text{H}_3\text{MePr}^{\text{II}}\cdot\text{CO}_2\text{H}$ , BzOH,  $\text{C}_6\text{H}_6$ , and *p*-cymene. R. T.

**Synthetical experiments with benzhydrylsodium.** E. BERGMANN (J.C.S., 1936, 412—413; cf. A., 1930, 1585).— $\text{CHPh}_2\text{Na}$  usually undergoes 1:4-addition to  $\Delta^{\alpha}$ -unsaturated CO-compounds.  $\text{CPh}_2\cdot\text{C}\cdot\text{CO}_2\text{Et}$ , however, gives a carbinol,  $\gamma$ -phenyl- $\alpha$ -bis(diphenylmethyl)propargyl alcohol, m.p.  $178\text{--}179^\circ$ .  $\text{CHPh}_2\text{Na}$  reacts with enolisable esters partly in the normal way, and partly is converted into  $\text{CH}_2\text{Ph}_2$  by the enolic form. Acyl chlorides of corresponding type react exclusively in the enolic form.  $\text{CHMeBr}\cdot\text{CO}_2\text{Et}$  condenses normally, forming  $\alpha\alpha\delta\delta$ -tetraphenyl- $\gamma$ -methylbutan-3-one, m.p.  $130\text{--}131^\circ$  (hydrolysed to  $\beta\beta$ -diphenylisobutyric acid, m.p.  $160\text{--}$

161°). With Et fluorene-9-carboxylate, the enolic reaction prevails, giving  $\text{CH}_2\text{Ph}_2$ . The condensation product with  $\text{CPh}_2\cdot\text{COPh}$  decomposes spontaneously into  $\text{CHPh}_3$  and  $\text{COPh}\cdot\text{CHPh}_2$ . The following are also prepared. From  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\text{Cl}$ ,  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CHPh}_2$ ; from  $\text{CHPhMeCl}$ ,  $\text{CHPhMe}\cdot\text{CHPh}_2$ ; from  $\text{CH}_2\text{Cl}\cdot\text{OMe}$ ,  $\text{CHPh}_2\cdot\text{CH}_2\cdot\text{OMe}$ ; from  $\text{CH}_2\text{PhO}$ ,  $\text{CHPh}_2\cdot\text{CH}_2\cdot\text{OH}$ ; from  $\text{COMe}_2$  or  $\text{CO}(\text{CH}_2\text{Ph})_2$ ,  $\text{CH}_2\text{Ph}_2$ ; from  $(\text{COPh})_2$ ,  $(\text{CHPh}_2)_2$  and  $\text{COPh}\cdot\text{CHPh}\cdot\text{OH}$ ; from  $\text{COPh}\cdot\text{CHPh}\cdot\text{OEt}$ ,  $\alpha$ -ethoxy- $\alpha\beta\gamma\gamma$ -tetraphenylpropan- $\beta$ -ol, m.p. 140°; from benzylideneacetophenone oxide,  $\gamma\delta$ -epoxy- $\alpha\alpha\beta\delta$ -tetraphenylbutan- $\beta$ -ol, m.p. 179—180°; from  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{COMe}$ ,  $\beta\beta$ -diphenyl- $\alpha$ - $p$ -chlorophenylethanol, m.p. 176—178°, dehydrated (AcCl) to  $p$ -chlorotetraphenylethylene, m.p. 166—167° (cf. Norris and Tibbetts, A., 1920, i, 831); from  $(p\text{-C}_6\text{H}_4\text{Cl})_2\text{CO}$ ,  $\beta\beta$ -diphenyl- $\alpha$ -bis-( $p$ -chlorophenyl)ethanol, m.p. 183—184°, dehydrated (AcCl) to an anomalous product,  $\text{C}_6\text{H}_5\text{O}_3\text{Cl}_2$ , m.p. 185—186°; from  $(p\text{-C}_6\text{H}_4\text{Br})_2\text{CO}$ ,  $\beta\beta$ -diphenyl- $\alpha$ -bis-( $p$ -bromophenyl)ethanol, m.p. 197°, dehydrated to  $pp'$ -dibromotetraphenylethylene, m.p. 205°; from  $p\text{-OMe}\cdot\text{C}_6\text{H}_4\cdot\text{COPh}$ ,  $\alpha\beta\beta$ -triphenyl- $\alpha$ - $p$ -anisylethanol, dehydrated to  $p$ -methoxytetraphenylethylene, m.p. 131—132°; from  $\text{CHPh}\cdot\text{CH}\cdot\text{COMe}$ ,  $\text{CH}_2\text{Ph}_2$  and  $Me\ \beta\gamma\gamma$ -triphenyl- $n$ -propyl ketone, m.p. 137°; from  $\text{CHPh}\cdot\text{CH}\cdot\text{COPh}$ ,  $Ph\ \beta\gamma\gamma$ -triphenyl- $n$ -propyl ketone, m.p. 182—184°; from  $p\text{-OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CH}\cdot\text{CH}\cdot\text{COPh}$ ,  $Ph\ \gamma\gamma$ -diphenyl- $\beta$ - $p$ -anisyl- $n$ -propyl ketone, m.p. 146—148°; from  $\text{CHPh}\cdot\text{CH}\cdot\text{CH}\cdot\text{COPh}$ ,  $Ph\ \delta$ -phenyl- $\beta$ -benzyl- $\Delta^2$ -butenyl ketone, m.p. 151—152°; from  $\text{CPh}_2\cdot\text{N}\cdot\text{NPhMe}$ ,  $N$ -phenyl- $N'$ - $\alpha\alpha\beta\beta$ -tetraphenylethyl- $N$ -methylhydrazine, m.p. 149—151°, with some  $(\text{CHPh}_2)_2$ ; from  $\text{CH}_2\text{Ph}\cdot\text{OBz}$  or  $\text{PhCN}$ ,  $\text{CHPh}_2\cdot\text{COPh}$ ; from  $o\text{-OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{Et}$ ,  $o$ -anisyl benzhydryl ketone, m.p. 86—87°; from  $o\text{-C}_6\text{H}_4\text{F}\cdot\text{CO}_2\text{Me}$ ,  $o$ -fluorophenyl benzhydryl ketone, m.p. 84—85°; from AcCl or  $\text{CH}_2\text{Ph}\cdot\text{COCl}$ ,  $\text{CH}_2\text{Ph}_2$ ; from  $\text{Pr}^i\text{CO}_2\text{Et}$ ,  $\text{CH}_2\text{Ph}_2$  and benzhydryl isopropyl ketone, m.p. 75—76°; from  $\text{CH}_2\text{Ph}\cdot\text{CHMe}\cdot\text{CO}_2\text{Et}$ ,  $\text{CH}_2\text{Ph}_2$  and benzhydryl  $\beta$ -phenylisopropyl ketone, b.p. 250—252°/16 mm.; from  $(\text{CH}_2\text{Ph})_2\text{CH}\cdot\text{CO}_2\text{Et}$ ,  $\text{CH}_2\text{Ph}_2$  and benzhydryl  $\beta$ -phenyl- $\alpha$ -benzylethyl ketone, m.p. 107—108°; and from  $\text{CHPh}\cdot\text{CH}\cdot\text{CO}_2\text{Me}$ ,  $Me\ \beta\gamma\gamma$ -triphenylbutyrate, m.p. 126—127°.

E. W. W.

**Action of amines on indandione derivatives.** G. WANAG and V. WALBE (Ber., 1936, 69, [B], 1054—1060).—2-Phenylindan-1:3-dione (I) and  $\text{NH}_2\text{Ph}$  in boiling EtOH give 1-anilo-2-phenylindan-3-one, m.p. 212—213°, hydrolysed by boiling 2N-HCl to (I) and  $\text{NH}_2\text{Ph}\cdot\text{HCl}$ . The following 2-phenylindan-3-ones are obtained similarly: -1- $p$ -tolylimino-, m.p. 242°, identical with the "phenylindandione-toluidide" of Liebermann; -1- $p$ -anisylimino-, m.p. 239—240°; -1-2'-naphthylimino- (II), m.p. 274—275° (block). 2-Methylindan-1:3-dione and  $\text{NH}_2\text{Ph}$  afford 1-anilo-2-methylindan-3-one (III), m.p. 153°. The compounds are generally stable towards  $\text{H}_2\text{O}_2$  in boiling EtOH with the exception of (III), which is slowly transformed into phthalanil. 2-Bromo-2-phenylindan-1:3-dione and  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  in boiling EtOH yield 2- $p$ -toluidino-2-phenylindan-1:3-dione, m.p. 187°.  $p\text{-OMe}\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$  similarly affords 2- $p$ -anisidino-2-phenylindan-1:3-dione, m.p. 165°.

whereas  $\beta\text{-C}_{10}\text{H}_7\cdot\text{NH}_2$  affords 2-2'-naphthylimino-2-phenylindan-1:3-dione, m.p. 201—203°, and some (II). 2-Anilino-2-phenylindan-1:3-dione is converted by  $\text{NaNO}_2$  and HCl into nitroso-2-anilino-2-phenylindan-1:3-dione, m.p. 187°. 2-Methylanilino-2-phenylindan-1:3-dione has m.p. 119°. Condensation with aliphatic amines is effected in  $\text{Et}_2\text{O}$ . Thus are obtained 2-isobutylamino-, m.p. 95°; 2-propylamino-(hydrochloride, decomp. 239°; nitroso-2-propylamino-2-phenylindan-1:3-dione, m.p. 139—140°; propylammonium bromide, m.p. 182°); 2-ethylamino- [hydrochloride, m.p. 237° (decomp.)]; 2-methylamino- (hydrochloride, decomp. 235°), 2-phenylindan-1:3-dione. 2-Anilino-2-methylindan-1:3-dione has m.p. 190°.

H. W.

**2-Nitroindan-1:3-dione and its salts.** G. WANAG (Ber., 1936, 69, [B], 1066—1074).—Indan-1:3-dione is transformed by fuming  $\text{HNO}_3$  in AcOH into  $o\text{-C}_6\text{H}_4(\text{CO}_2\text{H})_2$  (I). If the experiment is performed with efficient cooling 2-nitroindan-1:3-dione (II), m.p. 110°, or (+2H<sub>2</sub>O), m.p. 113° (decomp.), is obtained in 78% yield. It is converted by conc. NaOH or conc.  $\text{H}_2\text{SO}_4$  into (I) and  $\text{NH}_3$  (derived from  $\text{MeNO}_2$ ). (II) and  $\text{Br}\cdot\text{H}_2\text{O}$  afford 2-bromo-2-nitroindan-1:3-dione, m.p. 115—116°. (II) is about as strong as HCl and hence in solution exists in the form,  $\text{C}_6\text{H}_4\langle\begin{smallmatrix} \text{C}(\text{OH}) \\ \text{CO} \end{smallmatrix}\rangle\text{C}\cdot\text{NO}_2$  or  $\text{C}_6\text{H}_4\langle\begin{smallmatrix} \text{CO} \\ \text{CO} \end{smallmatrix}\rangle\text{C}\cdot\text{NO}\cdot\text{OH}$ . The  $\text{NH}_4$ , m.p. 222°, Na, K, Ba, Sr, Ca, Mg, Ag, Pb, Hg<sup>I</sup>, Cd, and Cu salts are described. The dark violet  $\text{Fe}^{II}$  salt (+4H<sub>2</sub>O and +2H<sub>2</sub>O) is very characteristic. Salts from the following org. bases are described:  $\text{NH}_2\text{Ph}$ , m.p. 209° after softening at 203°;  $o$ -,  $m$ -, and  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$ , m.p. 197—198°, 193—194°, and 192—193°, respectively;  $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\text{Ph}$ , m.p. 199°;  $\text{NPhMe}$ , m.p. 186°;  $\text{NPhMe}_2$ , m.p. 133°. (II) appears suitable for the isolation and characterization of org. bases, thus resembling picric, picrolonic, and styphnic acid; the group  $\text{OH}\cdot\text{C}\cdot\text{C}\cdot\text{NO}_2$  or  $\text{O}\cdot\text{C}\cdot\text{C}\cdot\text{NO}\cdot\text{OH}$ , which readily forms an internal complex, is common to all.

H. W.

**Condensation of indan-1:3-dione with acetone.** A. CIRULIS (Annalen, 1936, 522, 278—284).—Indan-1:3-dione (I) and  $\text{COMe}_2$ +piperidine give resinous products, di-indone, and  $s$ -di-(3-indenonyl)acetone (II),  $(\text{CO}\langle\begin{smallmatrix} \text{C}_6\text{H}_4 \\ \text{CH} \end{smallmatrix}\rangle\text{C}\cdot\text{CH}_2)_2\text{CO}$ , m.p. 199—200° [Na, Ag, and Ba salts;  $\text{Me}_2$ , m.p. 251° (from MeI and  $\text{MeOH}\cdot\text{NaOMe}$ ), and  $\text{Br}_2$ , m.p. 195°, derivatives; monoxime, m.p. 216° (decomp.); tri(phenylhydrazine), m.p. 248—249° (decomp.); nitrate, m.p. 233—235° (decomp.; evolution of NO), converted by  $\text{MeOH}\cdot\text{NaOMe}$  into (II)]. (II) contains 2 active  $\text{CH}_2$  groups and 2 enolisable H; it exists in yellow (keto) and bluish-green (enol) forms. (II) is produced by elimination of 2H<sub>2</sub>O from 2 mols. of the enolic form of (I) and 1 mol. of  $\text{COMe}_2$ . The di-indandionylpropane of Radulescu and Georgescu (A., 1925, i, 1285) is impure (II). The presence of a little  $\text{COMe}_2$  in  $\text{COMeEt}$  is demonstrated by treatment with (I) (as above); (II) is isolable.

H. B.

**Dimesityl diketones and their derivatives.** III.  $\alpha\eta$ -Dimesitylheptane- $\alpha\eta$ -dione and  $\beta\zeta$ -dibromo- $\alpha\eta$ -dimesitylheptane- $\alpha\eta$ -dione. T. Y. KAO

and C. K. CHANG (J. Chinese Chem. Soc., 1936, 4, 103—104).— $\alpha\eta$ -Dimesitylheptane- $\alpha\eta$ -dione, m.p. 72—73.5° ( $\beta\zeta$ -Br<sub>2</sub>-derivative, m.p. 132—134°), is synthesised from pimelic acid (cf. A., 1935, 862). J. L. D.

**Constituents of the adrenal gland. IV. T. REICHSTEIN** (Helv. Chim. Acta, 1936, 19, 402—412; cf. this vol., 704).—Substances A, C, and D with CrO<sub>3</sub> give a diketone (I), C<sub>19</sub>H<sub>28</sub>(O<sub>2</sub>)<sub>3</sub>, m.p. 178—180° (corr.), sublimes at 165°/0.1 mm. [dioxime, m.p. 274—276° (corr.; decomp.), sublimes at about 220—250°/high vac.], and are thus closely related. Substance E is probably of a different type, since with CrO<sub>3</sub> it gives a substance (possibly impure), m.p. 211—216° (corr.), sublimes at 180°/0.1 mm. Substance A absorbs 2.5 O from Pb(OAc)<sub>4</sub>, giving a ketone (II), C<sub>19</sub>H<sub>28</sub>(O<sub>2</sub>)<sub>3</sub>, m.p. 235—238° (corr.),  $[\alpha]_D^{20} + 84.5 \pm 3^\circ$  in dry EtOH [semicarbazone, m.p. 317—322° (corr.; decomp.), hygroscopic], and an acid, C<sub>18</sub>H<sub>30</sub>O<sub>2</sub>(CO<sub>2</sub>H)<sub>2</sub>, m.p. 256—258° (corr.; decomp.); it absorbs 2 O from KIO<sub>3</sub> to give (II) only. (II) with a little CrO<sub>3</sub> gives a substance (possibly impure) (III), C<sub>19</sub>H<sub>28</sub>O<sub>3</sub>, m.p. 156.5—158° (corr.), sublimes at 180—190°/0.02 mm. [dioxime, m.p. 262—273° (decomp. from 230°)], oxidised by CrO<sub>3</sub> to (I), which is also obtained directly from (II) by more CrO<sub>3</sub>. (II) is pptd. by digitonin in 90% EtOH, confirming its relation to *trans*-androsterone. These results lead to the provisional formulæ shown, substance A being (IV) [R=CH(OH)·CH<sub>2</sub>·OH] and

substances C and D stereoisomerides of (IV) (R=CO·CH<sub>2</sub>·OH) with respect to C<sub>17</sub>. These relations are strengthened by the fact that (II), (I), and (III) have one thirtieth, third, and seventh, respectively, of the activity of androsterone by the capon test. The sensitivity of the digitonin test is greater in 50% MeOH than in 90% EtOH; in 50% MeOH androstanedione, but not 3-epihydroxyætiocolan-17-one, gives a ppt. The O in the formulæ given may be a *tert*.-OH or ethereal. R. S. C.

**Synthesis of  $\Delta^4$ -dehydroandrosterone (3-hydroxy- $\Delta^4$ -ætiocolan-17-one) directly from cholesterol. I. A. REMESOV** (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 261—263).—Cholesteryl acetate dibromide is converted by oxidation with CrO<sub>3</sub> and subsequent reduction and hydrolysis into  $\Delta^4$ -dehydroandrosterone, m.p. 144—146°, which exhibits high biological activity (cocks). J. W. B.

**$\Delta^1$ -Androstene-3 : 17-dione. A. BUTENANDT** and H. DANNENBERG (Ber., 1936, 69, [B], 1158—1162).—Androstanedione is transformed by Br in AcOH-HBr into 2-bromoandrostanedione, m.p. 213—214° (decomp.), converted by KOAc in AcOH at 200° into  $\Delta^1$ -androstene-3 : 17-dione (I), m.p. 139—140°,  $[\alpha]_D^{20} + 6.8^\circ$  in EtOH [dioxime, gradual decomp. 225—252°]. The absorption spectrum of (I) proves

the double linking to be in conjugation with CO, and further evidence in favour of the assigned constitution is obtained as follows. *iso*Androstanediol diacetate is partly hydrolysed to the 17-monoacetate, m.p. 147—148°, oxidised by CrO<sub>3</sub> in AcOH to androstan-17-ol-3-one acetate, m.p. 156—157°. This is hydrolysed to androstan-17-ol-3-one, m.p. 178°, transformed by Br in AcOH into 2-bromoandrostan-17-ol-3-one, m.p. 180—181° (decomp.), oxidised to (I). (I) has physiological activity similar to that of the follicular hormone. H. W.

**Peculiar mode of formation of  $\Delta^4$ ·5-cholestene-3 : 6-dione ethyl ether. H. H. INHOFFEN** (Ber., 1936, 69, [B], 1134—1139).—Treatment of cholesterol with Br followed by oxidation of the product with CrO<sub>3</sub> in AcOH gives the ketone dibromide (I), decomp. 68—69°, debrominated to cholestenone. (I) and Br in Et<sub>2</sub>O-AcOH at 20° afford the bromoketone dibromide, C<sub>27</sub>H<sub>43</sub>OBr<sub>3</sub>, decomp. 137—138°, which when boiled with abs. EtOH under defined conditions passes into  $\Delta^4$ ·5-cholestene-3 : 6-dione Et ether (II), m.p. 164—165°, hydrolysed by boiling AcOH containing Zn(OAc)<sub>2</sub> to cholestenedione. (II) and Br in CHCl<sub>3</sub>-

AcOH yield cholestenedione tribromide, m.p. 192—193° (decomp.). The mode of formation and inability of (II) to react with maleic anhydride at 140° suggest the annexed formula for it. H. W.

**Absorption spectra of œstrone and related compounds.**—See this vol., 776.

**6-Ketotestosterone and related compounds. A. BUTENANDT and B. RIEGEL** (Ber., 1936, 69, [B], 1163—1168).—Oxidation of androstanediol monoacetate with CrO<sub>3</sub> (= 6 O) in AcOH yields 6-ketotestosterone acetate (I), m.p. 198—201°,  $[\alpha]_D^{25} + 47.2 \pm 1.4^\circ$  in COMe<sub>2</sub>, and (?) androstane-5 : 17-diol-3 : 6-dione 17-monoacetate, m.p. 239—241° after softening at 229—231°,  $[\alpha]_D^{25} - 29.9 \pm 1.3^\circ$  in COMe<sub>2</sub>. Cautious treatment of (I) with HCl-MeOH affords 6-ketotestosterone (II), m.p. 203—205°,  $[\alpha]_D^{25} - 58^\circ$  in COMe<sub>2</sub>. Dehydroandrosterone is oxidised to  $\Delta^4$ -androstene-3 : 6 : 17-trione (III), m.p. 216—217°,  $[\alpha]_D^{25} + 42.1 \pm 1.4^\circ$  in COMe<sub>2</sub> [trioxime, m.p. 235—237° (decomp.) after softening at 188°], an acid, m.p. 239—241°,  $[\alpha]_D^{25} - 12.5^\circ$

in COMe<sub>2</sub>, and (?) androstan-5-ol-3 : 6 : 17-trione, m.p. 248—249° after becoming discoloured at 225°,  $[\alpha]_D^{25} + 54.6^\circ$  in COMe<sub>2</sub>. The physiological activity of the original materials is so changed by the introduction of a further CO in conjugation with the double linking that (II) and (III) resemble the members of the œstrone group. H. W.

**Action of acetic anhydride on 2-acetylresorcinol. Synthesis of  $\gamma$ -resorcylic acid. D. B. LIMAYE and G. R. KELKAR** (J. Indian Chem. Soc., 1935, 12, 788—790).—2-Acetylresorcinol (cf. A., 1934,

298) with  $\text{Ac}_2\text{O}$  at 140—150° (3 hr.) gives the *diacetate*, b.p. 175—180°/10 mm., but with  $\text{Ac}_2\text{O}$ - $\text{NaOAc}$  at 160° (5 hr.) gives 5-hydroxy-3-acetyl-2-methylchromone (I), m.p. 122° (*Ac* derivative, m.p. 109°), together with a trace of a compound, m.p. 261—262°, probably the corresponding coumarin.  $\gamma$ -Resorcylic acid is obtained in good yield by hydrolysis of (I) with 0.5*N*- $\text{NaOH}$  for 0.5 hr.

H. G. M.

**Glycerol ethers of resacetophenone.** D. R. NADKARNI and T. S. WHEELER (J.C.S., 1936, 589—591).—Resacetophenone (I) and glycerol  $\alpha$ -chlorohydrin with aq.  $\text{KOH}$  at 100° afford 2-hydroxy-4-( $\beta$ -dihydroxypropoxy)acetophenone [A; R=

$\text{OH}\cdot\text{CH}_2\cdot\text{CH}(\text{OH})\cdot\text{CH}_2$ ], m.p. 88° (*hydrazone*, m.p. 98°; *azine*, m.p. 292—294°; *phenylhydrazone*, m.p. 119—120°), and glycerol  $\alpha$ -bis-(3-hydroxy-4-acetylphenyl) ether, m.p. 161° (*hydrazone*, m.p. 184°;

*azine*, m.p. > 300°; *phenylhydrazone*, m.p. 206°), the proportion of which is increased by use of higher [ $\text{KOH}$ ]. (I) and epichlorohydrin with aq.  $\text{NaOH}$  at room temp. give 2-hydroxy-4- $\beta$ -epoxypropoxyacetophenone (II) (A; R= $\text{O}-\text{CH}_2-\text{CH}(\text{OH})-\text{CH}_2$ ), m.p. 78° (*Ac* derivative, m.p. 198—200°), and (?) 2:4-bis-( $\beta$ -epoxypropoxy)acetophenone (*azine*, m.p. > 300°) which could not be purified. When only a trace of 10%  $\text{NaOH}$  is used as a catalyst 2-hydroxy-4- $\gamma$ -chloro- $\beta$ -hydroxypropoxyacetophenone, + $\text{H}_2\text{O}$ , (III), m.p. 68° (softens 58°), is formed, converted by aq.  $\text{NaOH}$  and reacidification with  $\text{AcOH}$  into (II), which with hot conc.  $\text{HCl}$  gives (III).

J. W. B.

**Synthesis of 2:5-dibenzoylquinol; 2:5-dibenzoylbenzoquinone.** R. PUMMERER and E. BUCHTA (Ber., 1936, 69, [B], 1018—1021).—Quinol-2:5-dicarboxylic acid is converted by  $\text{Ac}_2\text{O}$  containing conc.  $\text{H}_2\text{SO}_4$  at 100° into the  $\text{Ac}_2$  derivative and thence by  $\text{PCl}_5$  in boiling  $\text{C}_6\text{H}_6$  into the corresponding *dichloride*, m.p. 149° after slight softening, which with  $\text{AlCl}_3$  and  $\text{C}_6\text{H}_6$  affords 2:5-dibenzoylquinol (I), m.p. 199°. (I) is not dehydrogenated by  $\text{CrO}_3$  in boiling  $\text{AcOH}$ , alkaline  $\text{K}_3\text{Fe}(\text{CN})_6$ , or  $\text{PbO}_2$  in boiling  $\text{o}-\text{C}_6\text{H}_4\text{Cl}_2$  but is transformed by  $\text{Ag}_2\text{O}$  in boiling  $\text{C}_6\text{H}_6$  into 2:5-dibenzoyl-p-benzoquinone (II), m.p. 228° when placed in bath preheated to 227°. (II) differs entirely from Pechmann's dye.

H. W.

**Hydrolysis of 2-hydroxyanthraquinone- $\beta$ -d-glucoside.** J. H. GARDNER and W. H. DEMAREE (J. Amer. Chem. Soc., 1936, 58, 757—758).—2-Hydroxyanthraquinone- $\beta$ -d-glucoside (+ $\text{H}_2\text{O}$ ) (I), m.p. (anhyd.) 244.4—244.7° (corr.), obtained by hydrolysis (method: Robertson, A., 1930, 895) of its  $\text{Ac}_4$  derivative, m.p. 170—170.3° (corr.) (prep.: Müller, *ibid.*, 71), is hydrolysed (in suspension under identical conditions) by 0.05*N*- $\text{KOH}$ , 0.05*N*- $\text{HCl}$ , and approx. 10% borax at 100° with decreasing ease in the order quoted. Hydrolysis occurs less readily than with 1-hydroxyanthraquinone- $\beta$ -d-glucoside and -arabinoside (A. 1935, 983). The rate of hydrolysis of (I) by emulsin at 37° is in accordance with the  $\beta$ -glucoside formulation.

H. B.

**Additive product of carotene with maleic anhydride.** Z. NAKAMIYA (Bull. Inst. Phys. Chem.

Res. Japan, 1936, 15, 286—287).—Carotene and maleic anhydride give in  $\text{C}_6\text{H}_6$  an *anhydride*,  $\text{C}_{40}\text{H}_{56}(\text{C}_4\text{H}_2\text{O}_3)_5$ , m.p. 285—286°, of which the absorption spectrum shows no remaining double linkings. The corresponding *acid* (*Ba* and *Ag* salts), and a compound  $\text{C}_{40}\text{H}_{56}(\text{C}_4\text{H}_2\text{O}_3)\text{Br}_{10}$ , decomp. 250—260°, are prepared.

E. W. W.

**Catalytic reduction of pulegone.** B. N. RUTOVSKI, T. A. KOLOBLOTZKAJA, and Z. A. JAROSLAVTZEVA (J. Appl. Chem. Russ., 1936, 9, 684—689).—Pulegone (I) is converted into menthol (90% yield) by hydrogenation at 180°, in presence of a catalyst prepared by washing 27:73  $\text{Ni-Al}$  with aq.  $\text{NaOH}$  for 25—45 min., and then with  $\text{H}_2\text{O}$ , and drying the product in a stream of  $\text{H}_2$ . Impure (I), from the essential oil of *Ziziphora clinopodioides*, L., may be used for the process.

R. T.

**Optically active 2-deuteroamphane.** E. BILLMANN, K. A. JENSEN, and E. KNUTH (Ber., 1936, 69, [B], 1031—1035).—Treatment of *l*-bornyl chloride with  $\text{Mg}$  and then with  $\text{H}_2\text{O}$  gives a mixture of camphane (I), *l*-camphene, and *d*-dihydrocamphene from which the last-named is removed by distillation; crystallisation of the residue from  $\text{MeOH-Et}_2\text{O}$  affords (I), m.p. 153—154°,  $[\alpha]_D^{20} \pm 0^\circ$ . If  $\text{D}_2\text{O}$  is used in place of  $\text{H}_2\text{O}$ , 2-deuteroamphane (II), m.p. 153.5—154°,  $[\alpha]_D^{20} +0.40 \pm 0.05^\circ$  in  $\text{Et}_2\text{O}$ , is obtained which does not depress the m.p. of (I). Treatment of (II) with  $\text{H}(\text{Pt-C})$  causes inactivation whereas (I) remains unchanged.

H. W.

**Pinane group. I. Synthesis of pinononic acid and "ketonopinone" [4:6-diketopinane].** P. C. GUHA and K. GANAPATHI (Ber., 1936, 69, [B], 1185—1194; cf. A., 1935, 975; this vol., 206).—*trans*-Norpinic acid is converted by  $\text{Ac}_2\text{O}$  into *cis*-norpinic anhydride (I) (corresponding *anilic acid*, m.p. 218—219°, and *monoamide*, m.p. 197—198°), (I) and  $\text{NaOMe}$  in  $\text{MeOH}$  at 0° afford *Me H cis-norpinate*, m.p. 69—71°, converted by the successive action of  $\text{SOCl}_2$  and  $\text{NH}_2\text{Ph}$  into the corresponding *anilide*, m.p. 174°, and by  $\text{SOCl}_2$  followed by  $\text{ZnMeI}$  into *Me<sub>2</sub> pinononate*, b.p. 127°/13 mm. (*semicarbazone*, m.p. 177—178°), hydrolysed to *cis-pinononic acid*, m.p. 129° [*semicarbazone*, m.p. 208° (decomp.)]; *oxime*, m.p. 175—176°]. The synthesis of 4:6-diketopinane (*loc. cit.*) is described in greater detail. *cis-Norpinyl dichloride*, m.p. about 80° (corresponding *dianilide*, m.p. 269—270°), gives a neutral product with terpene-like odour with  $\text{MgMeI}$  and a mixture of compounds with  $\text{ZnMeI}$ .

H. W.

**Syntheses in the camphane group. I. Attempted synthesis of apocamphorquinone.** P. C. GUHA and S. K. RANGANATHAN (Ber., 1936, 69, [B], 1195—1198).—Condensation of  $\text{Me}_2$  diketapocamphorate with  $\text{Na}$  and  $\text{C}_2\text{H}_4\text{Br}_2$  in  $\text{C}_6\text{H}_6$  or  $\text{MeOH}$  affords the substance

164—165°, which does not react with ketonic reagents or give a coloration with  $\text{FeCl}_3$ . It is hydrolysed by  $\text{KOH-MeOH}$  to the corresponding dicarboxylic acid, m.p. 274—275° (decomp.), and hydrolysed and decarboxylated by boiling dil.  $\text{H}_2\text{SO}_4$  (1:3) to 3:4-diketo-1:1-dimethylcyclopentane. The latter

substance could not be condensed with  $\text{NaNH}_2$  and  $\text{C}_2\text{H}_4\text{Br}_2$  in  $\text{Et}_2\text{O}$ . H. W.

**Camphor series. Structure of camphene-lauroic acid.** O. ASCHAN (Soc. Sci. Fenn., Comment. phys.-math., 1935, 8, No. 1, 13 pp.; Chem. Zentr., 1935, ii, 1555—1556; cf. A., 1916, i, 53).—Distillation of camphenic acid in a stream of  $\text{CO}_2$  at atm. pressure affords camphenic acid and camphene-lauroic acid (I),  $\text{C}_{15}\text{H}_{14}\text{O}_2$ , b.p.  $129^\circ/7$  mm.,  $[\alpha]_D^{25} +2.51^\circ$  (Na, Ba, and Ca salts; amide, m.p.  $139^\circ$ ,  $142$ — $143^\circ$ ). (I) does not add  $\text{N}_2\text{O}_3$ , is not hydrolysed by 95%  $\text{HCO}_2\text{H}$  at  $160$ — $170^\circ$ , it yields a readily decomposed Br additive product, and, on oxidation ( $\text{KMnO}_4$ ), cyclopentanone-3-carboxylic acid and  $\text{COMe}_2$  are not formed. It is concluded that (I) is

H. N. R.

**Optical activity and chemical constitution. Optically active acids and bases. II.** MAHAN SINGH and MANOHAR SINGH (J. Indian Chem. Soc., 1935, 12, 768—770; cf. A., 1935, 1127).— $[\alpha]_D^{25}$ ,  $[\alpha]_{5780}$ , and  $[\alpha]_{491}$  of *p*-diethylaminoanilcamphor (I), m.p.  $102.5^\circ$ , prepared by heating camphorquinone with *p*- $\text{NH}_2\text{C}_6\text{H}_4\text{NET}_3$ ,  $\text{EtOH}$ , and anhyd.  $\text{Na}_2\text{SO}_4$ , have been determined in several solvents. (I) and the corresponding  $\text{Me}_2$  compound (*loc. cit.*) are both photo- and thermo-tropic. The two forms of these compounds have different  $[\alpha]_D^{25}$ . The changes in  $[\alpha]_D^{25}$  of the two forms of (I) in  $\text{EtOH}$  solution indicate an equilibrium. H. G. M.

**Salts of camphor-10-sulphonic acid (Reychler's acid).** S. BERLINGOZZI and R. LENOCI (Boll. Chim. farm., 1936, 75, 270, 273—276).—Hexamethylenetetramine, m.p.  $165$ — $166^\circ$ ,  $[\alpha]_D^{20} +13.2^\circ$  (in  $\text{H}_2\text{O}$ ), piperazine, decomp. about  $250^\circ$ ,  $[\alpha]_D^{25} +17.5^\circ$ , antipyrine, m.p.  $164^\circ$ ,  $[\alpha]_D^{25} +11.9^\circ$ , and pyridone, m.p. about  $180^\circ$  (decomp.),  $[\alpha]_D^{25} +10.4^\circ$ , camphor-10-sulphonates are prepared. E. W. W.

**Camphor series. II. Synthesis of oximinothiocamphor and its application as an indicator in acidimetry and alkalimetry.** D. C. SEN (J. Indian Chem. Soc., 1935, 12, 751—755).—Thiocamphor, isomyl nitrite,  $\text{Et}_2\text{O}$ , and  $\text{NaNH}_2$  give oximinothiocamphor, m.p.  $148^\circ$  (Ni and Co salts), suitable as an indicator in acid- and alkalimetry. ( $p_K=8.8$ ;  $p_H$  range  $8.6$ — $9.0$ .) It is a sensitive reagent for Co, detecting 1 part in 50,000 of  $\text{H}_2\text{O}$ . H. G. M.

**Syntheses in the camphane group. II. Synthesis of ketohomonorcamphor [dicyclo-[1:2:3]-octane-2:4-dione].** P. C. GUHA and S. K. RANGANATHAN (Ber., 1936, 69, [B], 1199—1206).—Mainly an extended account of work already reported (A., 1935, 1245). The following appears new. Acetylcyclopentane-3-carboxylic acid is oxidised by  $\text{KOBBr}$  to *cis*-cyclopentane-1:3-dicarboxylic acid. Condensation of methylenedimalonic ester with  $\text{C}_2\text{H}_4\text{Br}_2$  and  $\text{NaOEt}$  gives after hydrolysis and decarboxylation of the product, glutaric anhydride. *cis*-cyclopentane-1:3-dicarboxylic anhydride and  $\text{MgMeI}$  in  $\text{Et}_2\text{O}$  do not appear to yield the ketonic acid. *Me*, *cis*-cyclopentane-1:3-dicarboxylate,  $\text{Me}_2\text{C}_4\text{O}_4$ , and  $\text{NaOMe}$  give unchanged material and *trans*-cyclopentane-1:3-dicarboxylic acid.

*Et*, 1:3-dibromocis-cyclopentane-1:3-dicarboxylate and  $\text{C}_2\text{Na}_2(\text{CO}_2\text{Et})_4$  do not react in boiling  $\text{C}_6\text{H}_6$ . H. W.

**The santene inversion of fenchyl alcohol and its conditions.** N. J. TOIVONEN (Suomen Kem., 1936, 9, B, 15—16).—Al salts and other catalysts are divided into those which catalyse the conversion of fenchyl alcohol (I) into 1-methylsantene (II) and into fenchenes, respectively (cf. this vol., 338). The santene inversion seems to be favoured by influences which increase the ionisation of esters of (I), e.g., cresol,  $\beta\text{-C}_{10}\text{H}_7\text{OH}$ . Using  $\text{AlPO}_4$ ,  $\alpha$ -,  $\beta$ -,  $\gamma$ -, and cyclofenchene are obtained. Fenchenes are more readily polymerised than (II); polymerising catalysts therefore give terpene mixtures richer in (II). Catalysts which yield (II) also give monocyclic terpenes. *iso*Fenchyl alcohol and kaolin give mainly polymerides, but also (II). *cuclo*Fenchene is very readily polymerised. E. W. W.

**$\alpha$ -Cyperone, a sesquiterpene ketone from the oil of *Cyperus rotundus*.** A. E. BRADFELD, B. H. HEGDE, B. S. RAO, J. L. SIMONSEN, and (in part) A. E. GILLAM (J.C.S., 1936, 667—677).—The higher-boiling fractions of the oil, treated with semicarbazide acetate, give  $\alpha$ -cyperonesemicarbazone (I), m.p.  $216^\circ$ ,  $[\alpha]_{5461}^{25} +178^\circ$  in  $\text{CHCl}_3$ , hydrolysed to  $\alpha$ -cyperone,  $\text{C}_{15}\text{H}_{22}\text{O}$  (II), b.p.  $177^\circ/20$  mm.,  $[\alpha]_{5461}^{25} +138^\circ$  (oxime, m.p.  $150.5^\circ$ ,  $[\alpha]_{5461}^{25} +134^\circ$  in  $\text{EtOH}$ ; 2:4-dinitrophenylhydrazones, m.p.  $209$ — $210^\circ$ ; nitroguanyldiazones, decomp.  $203$ — $204^\circ$ ,  $[\alpha]_D^{25} +196^\circ$ ). (II) with Na and amyl formate yields hydroxymethylene- $\alpha$ -cyperone (2:4-dinitrophenylhydrazones, m.p.  $159$ — $160^\circ$ ). Reduction of (II) with  $\text{Pd-H}_2$  affords tetrahydro- $\alpha$ -cyperone (III), b.p.  $151$ — $152^\circ/14$  mm.,  $[\alpha]_{5461}^{25} +14.8^\circ$  (semicarbazones, decomp.  $173$ — $175^\circ$ ; oxime, m.p.  $116$ — $117.5^\circ$ ; 2:4-dinitrophenylhydrazones, m.p.  $151$ — $152^\circ$ ), and with Na-EtOH gives dihydro- $\alpha$ -cyperol (IV), b.p.  $167$ — $168^\circ/15$  mm.,  $[\alpha]_{5461}^{25} +17.7^\circ$  in  $\text{EtOH}$  (3:5-dinitrobenzoate, m.p.  $157$ — $158^\circ$ ), dehydrogenated (Se) to eudalene. Hydroxymethylenetetrahydro- $\alpha$ -cyperone forms a 2:4-dinitrophenylhydrazones, m.p.  $182$ — $183^\circ$ . Oxidation of (II) with  $\text{O}_3$  gives  $\text{CH}_2\text{O}$ , and a dibasic keto-acid,  $\text{C}_{13}\text{H}_{20}\text{O}_5$  ( $\text{Me}_2$  ester, b.p.  $190$ — $197^\circ/11$  mm., and its semicarbazones, decomp.  $245$ — $246^\circ$ ), and with  $\text{H}_2\text{O}_2$ -NaOH yields 6-acetyl-1-methyl-4-isopropenylcyclohexane-1-carboxylic acid, m.p.  $112^\circ$ ,  $[\alpha]_{5461}^{25} +62.6^\circ$  in  $\text{MeOH}$  (semicarbazones, decomp.  $180$ — $181^\circ$ ; phenylsemicarbazones, decomp.  $200^\circ$ ). Ozonisation of (I) leads to a semicarbazones, decomp.  $185$ — $187^\circ$ . (IV) is ozonised to a neutral oil, which is oxidised ( $\text{H}_2\text{CrO}_4$ ) to a diketone (dioxime, decomp.  $258$ — $259^\circ$ ; disemicarbazones, decomp.  $251$ — $252^\circ$ ) (using an impure specimen containing  $\alpha$ -cyperol, a substance forming a di- or tri-phenylsemicarbazones, decomp.  $222$ — $223^\circ$ , has been obtained). Ozonolysis of dihydro- $\alpha$ -cyperyl 3:5-dinitrobenzoate gives  $\text{CH}_2\text{O}$  and a ketone,  $\text{C}_{21}\text{H}_{26}\text{O}_7\text{N}_2$ , m.p.  $148$ — $149^\circ$ , from which  $\text{CHI}_3$  is derived by oxidation with Fuson's reagent. (III) and  $\text{MgMeI}$  afford a mixture, which is dehydrogenated (Se) to 1:2-dimethyl-7-isopropyl-naphthalene (V), b.p.  $149$ — $151^\circ/9$  mm. (picrate, m.p.  $92$ — $93^\circ$ ; *s*- $\text{C}_6\text{H}_3(\text{NO}_2)_3$  derivative, m.p.  $107$ — $109^\circ$ ). Reduction of hydroxymethylene- $\alpha$ -cyperone with  $\text{Pd-H}_2$  followed by Na-EtOH leads to an oil,

dehydrogenated (Se) to a hydrocarbon,  $C_{15}H_{18}$  (picrate, m.p. 102–5–104°;  $s\text{-C}_6\text{H}_5(\text{NO}_2)_3$  derivative, m.p. 116–118°). (I) with  $\text{NaOEt}$  affords  $\alpha\text{-cyperene}$ , b.p. 132–133°/15 mm., which could not be reduced by  $\text{Na}$ . (III) is 1:10-dimethyl-7-isopropyldecal-2-one and (II) is represented as

$\text{CH}_2\text{:CH}_2\text{:CH}\text{---}\text{CH}\text{:CH}$   
 $\text{CH}_2\text{:CMe}\text{---}\text{CH}_2\text{:CH}\text{---}\text{CHMe}\text{:CO}$  (II) is isomerised by  $\text{H}_2\text{C}_2\text{O}_4$ , aq. or  $\text{MeOH}\text{---}\text{KOH}$  to  $\beta\text{-cyperone}$ , b.p. 175–176°/16 mm.  $[\alpha]_{5461}^{20} + 239^\circ$  (semicarbazone, decomp. 207°; oxime, m.p. 138°,  $[\alpha]_{5461}^{20} + 217^\circ$  in  $\text{EtOH}$ ; 2:4-dinitrophenylhydrazine, decomp. 218–219°; nitroquanylhydrazine, m.p. 197°,  $[\alpha]_{\text{D}}^{20} + 220^\circ$  in  $\text{CHCl}_3$ ), which must differ only stereochemically from (II). Homocuminy alcohol, b.p. 129°/10 mm. (p-xenylcarbamate, m.p. 144–145°), obtained from the corresponding Et ester, is converted into the bromide, b.p. 136°/14 mm., which with Et methylpotassium malonate forms Et homocuminy methylmalonate, b.p. 200°/13 mm. The ester with  $\text{H}_2\text{SO}_4$  yields 2-methyl-7-isopropyl-1:2:3:4-tetral-1-one, b.p. 155–160°/12 mm. (phenylsemicarbazone, m.p. 180–181°; 2:4-dinitrophenylhydrazine, m.p. 177–178°), which with  $\text{MgMeI}$  forms an oil, dehydrogenated (Se) to (V). Tetrahydroeremophilone and  $\text{MgMeI}$  give a substance, dehydrogenated (Se) to 1:3:7- $\text{C}_{10}\text{H}_5\text{Me}_2\text{Pr}^8$  (picrate, m.p. 113–114.5°;  $s\text{-C}_6\text{H}_5(\text{NO}_2)_3$  derivative, m.p. 141–142°).

$\alpha\text{-Methylbenzyl Pr}^8$  ketone, b.p. 125–126° (semicarbazone, m.p. 128–129°; phenylsemicarbazone, m.p. 183°), with  $\text{CHMeBr}\cdot\text{CO}_2\text{Et}$  and  $\text{Zn}$  affords Et  $\gamma\text{-o-tolyl-}\alpha\text{-methyl-}\beta\text{-isopropylbutyrate}$ , b.p. 165°/13 mm., which with  $\text{H}_2\text{SO}_4$  gives 2:5-dimethyl-3-isopropyl-1:2:3:4-tetral-1-one, b.p. 185–190°/22 mm. (phenylsemicarbazone, m.p. 222–223°). The ketone is reduced and dehydrogenated to 1:6-dimethyl-7-isopropyl-naphthalene, b.p. 154–158°/13 mm. (picrate, m.p. 124–126°; styphnate, m.p. 141–142°). Et homocuminy malonate, b.p. 198°/13 mm., is converted with  $\text{H}_2\text{SO}_4$  into 7-isopropyl-1:2:3:4-tetral-1-one, b.p. 158–160°/17 mm. (2:4-dinitrophenylhydrazine, m.p. 223–224°), which with  $\text{MgEtI}$  followed by dehydrogenation affords 1:7- $\text{C}_{10}\text{H}_6\text{EtPr}^8$  (picrate, m.p. 65–67°;  $s\text{-C}_6\text{H}_5(\text{NO}_2)_3$  derivative, m.p. 79–81°). The absorption spectrum of (II) indicates an  $\alpha\beta$ -unsaturated ketone.

F. R. S.

**Colouring matter in the wood of "Hinoki" tree.** I. Hinokitin and hinokitiol. T. HOZOE (Bull. Chem. Soc. Japan, 1936, 11, 295–298).—Discrepancies in earlier work by Hirao (J. Chem. Soc. Japan, 1926, 47, 666, 743) and Tsuchihashi *et al.* (Rep. Gov. Res. Inst. Formosa, 1920, 1) are investigated. From the ethereal oil of the wood of the "Hinoki" tree (*Chamaecyparis obtusa*, Lieb. and Zucc.) are isolated l-rhodinic acid,  $\text{C}_{10}\text{H}_{18}\text{O}_2$ , and a phenolic substance hinokitiol,  $\text{C}_{10}\text{H}_{12}\text{O}_2$  (I) (no OMe; gives liquid products with CO reagents), converted by  $\text{FeCl}_3$  into hinokitin,  $\text{C}_{10}\text{H}_{33}\text{O}_6\text{Fe}$ , m.p. 251° (absorption max. 584, 540  $\mu$ ) (II) (A;  $\text{M}=\text{Fe}$ ,  $n=3$ ), an Fe complex salt of (I). The interconversion  $3(\text{I}) + \text{FeX}_3 \rightleftharpoons (\text{II}) + 3\text{HX}$  is realised. (I) also forms complex salts (all of type A) with  $\text{Cr}^{+++}$ , m.p. 230°,  $\text{Co}^{+++}$ , m.p. 208°,  $\text{Cu}^{++}$ , m.p. 177°,  $\text{Ni}^{++}$ , m.p. 242°,  $\text{Co}^{++}$ , m.p. 210°,  $\text{Mn}^{+}$ , m.p. > 300°,  $\text{Cd}^{++}$ , m.p. > 300°,  $\text{Zn}^{++}$ ,

and  $\text{Mg}^{++}$ , m.p. > 300° those with bivalent metals form cryst. compounds with 2 mols. of org. bases. By catalytic reduction (I) absorbs 3–4  $\text{H}_2$ , and the product no longer forms complex salts.

J. W. B.

**Limonin, the bitter principle of orange kernels.** G. KOLLER and H. CZERNY [with K. LOCKER and W. MAAS] (Monatsh., 1936, 67, 248–268).—The air-dried material is extracted successively with light petroleum and EtOH. The syrupy residue is treated with  $\text{H}_2\text{O}$  and much  $\text{Et}_2\text{O}$ , which induces crystallisation of a mixture of bitter principles. Limonin (I) is isolated therefrom by dissolution in dil. NaOH or KOH, acidification of the solution at 0°, and suspension of the pptd. OH-acids in EtOH, when (I) slowly crystallises. Alternatively the mixture is treated with  $\text{Ac}_2\text{O}$  in  $\text{C}_6\text{H}_6\text{-N}$ , whereby (I) remains unchanged whereas isolimonin (II) is transformed into a more freely sol. Ac derivative. (II) is best isolated by regulated extraction of the mixture with boiling  $\text{C}_6\text{H}_6$ , which removes more freely sol. (I). (I), m.p. 280° (vac.; decomp.), is probably  $\text{C}_{23}\text{H}_{36}\text{O}_7$ . The presence of CO could not be established. Under drastic conditions acetylation occurs to only a slight extent. With cold  $\text{MgMeI}$  little  $\text{CH}_4$  is evolved, but in boiling solution the vol. of gas is equiv. to about 1 OH. One lactone group is certainly, a second probably present. Catalytic hydrogenation (Pd-C) of (I) in abs. EtOH leads to absorption of 3  $\text{H}_2$  and production of an amorphous product which passes on contact with  $\text{H}_2\text{O}$  into the cryst. hexahydrolimonin acid (III),  $\text{C}_{23}\text{H}_{34}\text{O}_8$ , decomp. 175–178° (vac.). When kept over  $\text{P}_2\text{O}_5$  at 140°/vac. (III) loses  $\text{H}_2\text{O}$  with apparent formation of polymerised material. It is unchanged by  $\text{CaCl}_2$  in  $\text{C}_6\text{H}_6$ .  $\text{Ac}_2\text{O}$  transforms it into a non-cryst. Ac derivative from which it is regenerated by EtOH- $\text{H}_2\text{O}$ . Its non-cryst. Me ester appears to be  $\text{C}_{24}\text{H}_{34}\text{O}_8$ . During hydrogenation small amounts of tetrahydrolimonin,  $\text{C}_{23}\text{H}_{30}\text{O}_7$ , m.p. 282° (vac.), appear to be produced. Treatment of (I) with molten KOH affords partly hydrogenated alkyl-naphthalenes from which by treatment with Se at 300° 1:2:5- $\text{C}_{10}\text{H}_5\text{Me}_3$  and possibly a  $\text{C}_{10}\text{H}_6\text{Me}_2$  are isolated; the acidic products contain  $m\text{-C}_6\text{H}_4(\text{CO}_2\text{H})_2$ . Oxidation of (I) with  $\text{KMnO}_4$ ,  $\text{HNO}_3$ , or  $\text{H}_2\text{O}_2$  gives ill-defined products whereas  $\text{MnO}_2$  and boiling 57%  $\text{H}_2\text{SO}_4$  give  $\text{C}_6\text{H}(\text{CO}_2\text{H})_5$ . (II), probably  $\text{C}_{23}\text{H}_{32}\text{O}_7$ , m.p. 264° (vac.; decomp.), contains 2 OH (Zerevitinov) and appears to give a diacetate.

H. W.

**Capsanthol, a reduction product of capsanthin.** P. KARRER and H. HÜBNER (Helv. Chim. Acta, 1936, 19, 474–479).—Capsanthin (I) and  $\text{Al}(\text{OPr}^8)_3$  in  $\text{Pr}^8\text{OH}\text{---}\text{C}_6\text{H}_6$  gives capsanthol (II),  $\text{C}_{40}\text{H}_{57}(\text{OH})_3$ , m.p. 175–176° (photomicrograph), isolated by adsorption on  $\text{CaO}$ . (II) absorbs 10  $\text{H}_2$  on micro-hydrogenation and its adsorption spectrum (max. at 5080 and 4770 Å. in  $\text{CS}_2$ ) closely resembles that of (I), confirming the presence of a CO in (I) at the end of a series of 10 ethylenic linkings.

R. S. C.

**Formation of lignin in wood.** P. KLASON (Ber., 1936, 69, [B], 676–678).—For the determination of lignin in wood the finely-divided sample is extracted

with  $\text{Et}_2\text{O}$  and dried at  $100^\circ$ . 1—1.3 g. is kept in contact with 50 c.c. of 65—66%  $\text{H}_2\text{SO}_4$  with occasional shaking at room temp. for 24 hr. After dilution the ppt. is heated with 50 c.c. of 0.1N-HCl at  $100^\circ$  for about 12 hr. The residue is washed free from mineral acid, dried at  $75^\circ$  and then at  $100^\circ$ , weighed, and incinerated. The possible formation of lignin in plants from  $\text{CO}_2$  and  $\text{H}_2\text{O}$  through  $\text{CH}_2\text{O}$  is discussed. The part played by  $\text{H}_3\text{PO}_4$  is considered. The "lignin fermentation" appears invariably associated with the production of pentoses. H. W.

**Dioxan-lignin and the pigment of ebony wood.** R. S. HILPERT and S. WISSELINCK (Ber., 1936, 69, [B], 680—684).—Xylose is transformed by HCl-dioxan into a pitch-like mass converted by  $\text{H}_2\text{O}$  into a black powder. Under like conditions, fructose gives a brown solution from which  $\text{H}_2\text{O}$  ppts. a similar material. Glucose does not become discoloured but its chemical properties are altered. In composition, which varies somewhat with the [HCl] used, the solid products are closely allied to the lignins, from which they differ mainly in the absence of OMe. The assumption that HCl-dioxan simply removes lignin and incrustations from wood and leaves cellulose is of doubtful validity. Wedekind's method (this vol. 207) for the isolation of the pigment of ebony wood is criticised. H. W.

**Further resinol from matai (*Podocarpus spicatus*).** L. H. BRIGGS and D. A. PEAK (J.C.S., 1936, 724).—From the mother-liquors of matai-resinol, condendrin, m.p.  $254\text{--}255^\circ$ , has been isolated (cf. Haworth *et al.*, this vol., 80). F. R. S.

**Pigments of *Lactarius deliciosus*, L. II.** H. WILLSTAEDT (Ber., 1936, 69, [B], 997—1001; cf. A., 1935, 495).—The material is extracted with  $\text{EtOH}$  and then with  $\text{COMe}_2$ . The  $\text{COMe}_2$  extract is treated with  $\text{H}_2\text{O}$  and light petroleum. The latter extract is chromatographed with  $\text{Al}_2\text{O}_3$  thus giving *lactarazulene* (I), b.p.  $155\text{--}160^\circ/2.5\text{--}3$  mm. [additive compound,  $\text{C}_{21}\text{H}_{21}\text{O}_6\text{N}_3$ , m.p.  $122\text{--}123^\circ$ , with 1 : 3 : 5- $\text{C}_6\text{H}_3(\text{NO}_2)_2$ ]. (I) is closely similar to but not identical with the azulene from camomile oil. Both sources contain a second azulene and also a green product. H. W.

**Red gossypol.**—See this vol., 912.

**Catalytic transformations of heterocyclic compounds. II. Conversion of 2-methylfuran into 2-methylpyrrole and 2-methylthiophen. III. Reciprocal transformations of the simplest five-membered heterocyclic compounds.** J. K. JURIEV (Ber., 1936, 69, [B], 1002—1004; cf. this vol., 481).—2-Methylfuran gives 2-methylpyrrole when passed with  $\text{NH}_3$  over  $\text{Al}_2\text{O}_3$  at  $450^\circ$  and 2-methylthiophen when passed with  $\text{H}_2\text{S}$  over the catalyst at  $350^\circ$ . The conversion of furan (I) into pyrrole (II) and thiophen (III) takes place with good yields, but yields are poor in the changes (II)  $\rightarrow$  (III), (III)  $\rightarrow$  (II), (II)  $\rightarrow$  (I), and (III)  $\rightarrow$  (I). H. W.

**Resolution of  $\alpha$ -furylmethylcarbinol.** D. I. DUVEEN and J. KENYON (J.C.S., 1936, 621—623).—dl- $\alpha$ -Furylmethylcarbinol (p-xenylurethane, m.p.  $114^\circ$ ; acetate, b.p.  $177^\circ/760$  mm.) with o- $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$  gives dl- $\alpha$ -furylmethylcarbinyl H phthalate, m.p.  $80^\circ$ , which

is resolved through the quinidine salts, m.p.  $81^\circ$ ,  $[\alpha]_{\text{D}}^{20} +76.8^\circ$ , and  $[\alpha]_{\text{D}}^{20} +13.4^\circ$  in  $\text{CHCl}_3$ , into d- and l- $\alpha$ -furylmethylcarbinyl H phthalate, m.p.  $61^\circ$ ,  $[\alpha]_{\text{D}}^{20} +39.6^\circ$  and  $-39.3^\circ$  in  $\text{CHCl}_3$ . d- and l-Furylmethylcarbinol have b.p.  $70^\circ/15$  mm.,  $\alpha_{\text{D}}^{20} +10.29^\circ$  and  $-40.07^\circ$ , and are obtained by hydrolysis of the H phthalates with NaOH; hydrolysis with  $\text{Na}_2\text{CO}_3$  or steam leads to inactive alcohols. F. R. S.

**Condensation of acetone and mesityl oxide with furfuraldehyde.** P. P. SURMIN (J. Gen. Chem. Russ., 1935, 5, 1642—1644).— $\text{COMe}_2$  and furfuraldehyde (I) in presence of 3% of NaOH at  $0^\circ$  yield mono- and di-furfurylideneacetone (phenylhydrazones, m.p. respectively  $123^\circ$  and  $121\text{--}122^\circ$ ). Mesityl oxide and (I) in presence of 50% of NaOH afford furfurylidene-mesityl oxide, m.p.  $140\text{--}145^\circ$ , not yielding a phenylhydrazone. R. T.

**Identity of isopsoralene, a component of the seeds of *Psoralea corylifolia*, L., with angelicin from the roots of *Archangelica*, L.** H. S. JOIS and B. L. MANJUNATH (Ber., 1936, 69, [B], 964—967).—The solid which crystallises from the oil from the seeds of *P. corylifolia*, L., is separated by  $\text{EtOH}$  into psoralene and isopsoralene (I), m.p.  $142^\circ$ , identical with angelicin (Spath, A., 1934, 779, 899). (I) is oxidised by alkaline  $\text{H}_2\text{O}_2$  to furan-2 : 3-dicarboxylic acid. Reduction of (I) by Na-Hg in alkaline solution affords 3-hydroxy-4- $\beta$ -carboxyethylcoumarone (II), m.p.  $124.5^\circ$ , which passes at  $155^\circ$  vac. into the corresponding lactone, m.p.  $74.5^\circ$ . Methylation ( $\text{Me}_2\text{SO}_4$ ) and subsequent hydrolysis of (I) gives 3-methoxy-4- $\beta$ -carboxyvinylcoumarone (III), m.p.  $142\text{--}144^\circ$ , converted into an isomeride, m.p.  $214^\circ$ , by repeated sublimation in high vac., and reduced to the corresponding saturated acid, m.p.  $77^\circ$ , also obtained by methylation of (II). Oxidation of (III) by  $\text{KMnO}_4$  yields an acid,  $\text{C}_9\text{H}_8\text{O}_4$ , m.p.  $107^\circ$ . H. W.

**6-Methylcoumarin and its methylation products.** K. CHANG and P. P. T. SAH (J. Chinese Chem. Soc., 1936, 4, 84—88).—5-Methylsalicylaldehyde with anhyd. NaOAc and  $\text{Ac}_2\text{O}$  containing some I at  $180\text{--}190^\circ$  affords 6-methylcoumarin, m.p.  $76.5\text{--}77.5^\circ$  (lit.,  $74.5^\circ$ ), which with MeI in  $\text{EtOH}$ -NaOEt at room temp. affords Me cis-5-methyl-o-methoxycinnamate (cf. A., 1908, i, 441), whereas with NaOH- $\text{Me}_2\text{SO}_4$ , the trans-isomeride (cf. A., 1911, i, 295) is formed. J. L. D.

**Relation between odour and constitution of alkoxy coumarins. New product with a celery odour.** A. S. PFAU (Riechstoffind., 1935, 10, 57—58; Chem. Zentr., 1935, ii, 1457).—The odours of the following are described: 6-methoxy- (odourless), 6-, m.p.  $106\text{--}107^\circ$ , and 7-ethoxy-coumarin, m.p.  $89^\circ$ ; 6-methoxy-, m.p.  $163\text{--}164^\circ$ , 6-ethoxy-, m.p.  $113\text{--}114^\circ$ , 7-methoxy-, 7-ethoxy-, m.p.  $114.5^\circ$  (strong celery odour), 7-n-propoxy-, m.p.  $72\text{--}73^\circ$ , 7-isobutoxy-, m.p.  $55\text{--}56^\circ$ , and 7-allyloxy-, m.p.  $103^\circ$  (odourless), 4-methylcoumarin; 7-ethoxy-4-methyldihydrocoumarin, m.p.  $30^\circ$ . H. N. R.

**Synthesis of coumarins from phenols and  $\beta$ -ketonic esters. V. Constitution of chlororesorcinol and chlororesorcylaldehyde.** D. CHAK-

RAVARTI and B. GHOSH (J. Indian Chem. Soc., 1935, 12, 791—797).—The diazo-anhydride of 8-amino-7-hydroxy-4-methylcoumarin is converted (Sandmeyer) into 8-chloro-7-hydroxy-4-methylcoumarin, m.p. 267° (*Ac* derivative, m.p. 188—189°), which is different from the condensation product of  $\text{CH}_3\text{Ac} \cdot \text{CO}_2\text{Et}$  and 4-chlororesorcinol (I), (cf. A., 1935, 1503). Nitration of 7-hydroxy-3:4-dimethylcoumarin gives the 8- $\text{NO}_2$ -derivative (*loc. cit.*), reduced by  $\text{SnCl}_2\text{--HCl--EtOH}$  to the corresponding 8- $\text{NH}_2$ -derivative, m.p. 272°. This is converted into the corresponding diazo-anhydride, m.p. 172°, and then (Sandmeyer) into 8-chloro-7-hydroxy-3:4-dimethylcoumarin, m.p. 272°, which is different from the condensation product of (I) and  $\text{CHMeAc} \cdot \text{CO}_2\text{Et}$  (cf. *loc. cit.*). These comparisons confirm the constitution of (I) (cf. A., 1933, 270). Nitration of umbelliferone yields its 6-, m.p. 220° (*Ac* derivative, m.p. 180°), and 8-, m.p. 245° (*Ac* derivative, m.p. 185°)- $\text{NO}_2$ -derivatives (cf. J.C.S., 1910, 97, 1400). The constitution of the latter is confirmed by reduction to 8-amino-7-hydroxycoumarin, converted (Sandmeyer) into 8-chloro-7-hydroxycoumarin, m.p. 263°, which is different from the condensation product (II) of (I) and malic acid (*loc. cit.*). (I) with anhyd.  $\text{Zn}(\text{CN})_2$  and dry  $\text{HCl}$  in  $\text{Et}_2\text{O}$  gives 5-chlororesorcyaldehyde (III), which with  $\text{NaOH--ClCO}_2\text{Me}$  gives chlorodicarbomethoxyresorcyaldehyde, m.p. 58°, this with  $\text{CH}_2(\text{CO}_2\text{H})_2\text{--AcOH}$  yields chlorocarbomethoxy-7-hydroxycoumarincarboxylic acid and a trace of 2:4-dicarbomethoxycinnamic acid (cf. A., 1934, 775). The former when boiled with  $\text{Na}_2\text{CO}_3$  gives 6-chloro-7-hydroxycoumarin-3-carboxylic acid, m.p. 284°, decomposed by heat into 6-chloro-7-hydroxycoumarin, identical with (II). H. G. M.

[Attempted] synthesis of furocoumarins from 4-hydroxy-5-methoxyisophthaldialdehyde. K. W. MERZ and J. HOTZEL (Arch. Pharm., 1936, 274, 292—310).—Attempts to prepare xanthotoxin or an isomeride thereof failed. Guaiacol-4:6-dialdehyde (I) with  $\text{Ac}_2\text{O--C}_5\text{H}_5\text{N}$  gives the *Ac* derivative, m.p. 145—146°, and with  $\text{P}_2\text{O}_5\text{--Ac}_2\text{O}$  at 100° gives acetylguaiacol-4:6-dialdehyde tetra-acetate, m.p. 136.5°. With  $\text{NH}_2\text{OH}$  these give the dioxime of (I), which with  $\text{Ac}_2\text{O--C}_5\text{H}_5\text{N}$  gives acetylguaiacol-4:6-dialdoxime diacetate (II), m.p. 148—149°, but with hot  $\text{Ac}_2\text{O}$  yields acetylguaiacol-4:6-dinitrile, m.p. 143°. 4-Aldehydoacetylguaiacol-6-aldoxime with  $\text{Ac}_2\text{O--C}_5\text{H}_5\text{N}$  gives the acetate (III), m.p. 134—135°, and with hot  $\text{Ac}_2\text{O}$  affords 4-aldehydoacetylguaiacol-6-nitrile, m.p. 117°. Attempts to hydrolyse the nitriles gave resins. (I) with  $\text{NH}_3\text{--EtOH}$  or  $\text{NH}_2\text{Ph--EtOH}$  yields 4-aldehydoguaiacol-6-aldimine, m.p. 211°, or 6-aldehydeimine (IV), m.p. 132°, respectively, and attempts to induce both  $\text{CHO}$  to react failed. (IV) with  $\text{Ac}_2\text{O--C}_5\text{H}_5\text{N}$  gives the *Ac* derivative, m.p. 170°, hydrolysed by aq.  $\text{EtOH}$ . Attempts to nitrate (I) failed; fuming  $\text{HNO}_3$  in  $\text{EtOH}$  gives 4:6-dinitroguaiacol, m.p. 121—122°. (I), piperidine, and  $\text{CH}_2(\text{CO}_2\text{Et})_2$  give a mixture, m.p. 189°, of nitrogenous substances, which with hot  $\text{AcOH}$  yields *Et* 6-aldehydo-8-methoxycoumarin-3-carboxylate (V), m.p. 209—210° (*phenylhydrazone*, m.p. 215°), and a little *Et* 8-methoxycoumarin-3-carboxylate-6-methylenemalonate (VI), m.p. 148—149°. Hydrolysis of (V) and (VI) by 5%  $\text{NaOH}$  gives the corre-

sponding acids (VII), m.p. 243° (decomp.) [*phenylhydrazone*, m.p. 250° (decomp.)], and (VIII), m.p. 265°, respectively. Hydrogenation ( $\text{PtO}_2$ ) of (VI) in  $\text{AcOH}$  at room temp. or, better, at 60° gives *Et* 3- $\beta$ -8-methoxydihydrocoumarin-3-carboxylate-6-propionate- $\alpha$ -carboxylate, m.p. 84°, but that of (V) proceeds only at 90° and yields *Et* 8-methoxy-6-hydroxymethylcoumarin-3-carboxylate (IX), m.p. 171—172° (*benzoate*, m.p. 155°). (V),  $\text{Ac}_2\text{O}$ , and  $\text{P}_2\text{O}_5$  at 100° afford the diacetate, m.p. 127—129°, hydrogenation ( $\text{PtO}_2$ ) of which in  $\text{AcOH}$  gives the *Ac* derivative, m.p. 139°, of (IX). (VI),  $\text{H}_2\text{SO}_4$ , and  $\text{KNO}_3$  at  $\approx -5^\circ$  give a poor yield of 5- or 7- $\text{NO}_2$ -derivative, m.p. 152—154°, which could not be hydrolysed to the acid and gave amorphous products when hydrogenated; the  $\text{NO}_2$ -acid could also not be obtained directly from (VIII). Similar nitration of (V) affords the 5- and 7- $\text{NO}_2$ -esters, m.p. 185—186° [*phenylhydrazone*, m.p. 256° (decomp.)] and 124° [*phenylhydrazone*, m.p. 227.5° (decomp.)], respectively, or vice versa, which decompose when hydrolysed, but with  $\text{H}_2\text{--Pt}$  or  $\text{H}_2\text{--Pd--BaSO}_4$  in  $\text{AcOH}$  absorb 2  $\text{H}_2$  to yield benzisooxazoles, m.p. 208—210° and 246° (decomp.), respectively, both resistant to further reduction. (VII) with 65%  $\text{HNO}_3$  in conc.  $\text{H}_2\text{SO}_4$  at 0° gives the 5- and 7- $\text{NO}_2$ -acids, m.p. 145° [*phenylhydrazone*, m.p. 236° (decomp.)] and 178° [*phenylhydrazone*, m.p. 269° (decomp.)], respectively, or vice versa. The  $\text{NO}_2$ -esters with  $\text{Ac}_2\text{O--P}_2\text{O}_5$  afford the diacetates, m.p. 197° and 131—132°, respectively, which are hydrogenated ( $\text{Pd}$  or  $\text{PtO}_2$ ) in  $\text{AcOH}$  to *Et* 5- and 7-hydroxylamino-8-methoxy-6-acetoxymethylcoumarin-3-carboxylate, m.p. 164—165° and 116°, respectively, or vice versa. Attempts to decarboxylate (VII) failed. R. S. C.

Constituents of the bark of *Zanthoxylum Americanum* (Mill). I. Xanthoxyletin. (MISS) J. C. BELL, A. ROBERTSON, and T. S. SUBRAMANIAM (J.C.S., 1936, 627—633).—Xanthoxyletin,  $\text{C}_{14}\text{H}_{11}\text{O}_3 \cdot \text{OMe}$  (I), m.p. 133°, has been isolated and is the same compound as xanthoxylin *N* (cf. Gordin, A., 1907, i, 68). (I) is hydrolysed ( $\text{NaOH}$ ) to phloroglucinol *Me* ether (*di-p-nitrobenzoate*, m.p. 199—200°) and  $\text{COMe}_2$ , and oxidation with  $\text{KMnO}_4\text{--NaOH}$  leads to  $\alpha$ -hydroxyisobutyric acid. With  $\text{NaOH--Me}_2\text{SO}_4$ , (I) is converted into *O*-methylxanthoxyletinic acid (II), m.p. 179.9—180.5° (*Me* ester, m.p. 78.5—79.5°), an unsaturated acid. Hydrogenation ( $\text{Pd--H}_2$ ) of (I) gives dihydroxanthoxyletin, m.p. 144.5—145.5°, which with  $\text{NaOH--Me}_2\text{SO}_4$  forms *O*-methyl-dihydroxanthoxyletinic acid, m.p. 171—172°, reduced to the tetrahydro-acid, m.p. 150.5—151.5°, also obtained from (II). Ozonisation of (I) affords apoxanthoxyletin, m.p. 217—218° [*phenylhydrazone*, m.p. 251° (decomp.)]; *Ac* derivative, m.p. 151—152°, reduced ( $\text{Pd--H}_2$ ) to deoxyapoxanthoxyletin (III), m.p. 197—198°, the *Me* ether, m.p. 138—139°, of which with  $\text{Me}_2\text{SO}_4$  gives 2:4:6-trimethoxy-3-methylcinnamic acid (IV), m.p. 163—164°, reduced ( $\text{Pd--H}_2$ ) to 2:4:6-trimethoxy-3-methyldihydrocinnamic acid, m.p. 139—140°. 2-Hydroxy-4:6-dimethoxy-3-methylbenzaldehyde,  $\text{CN} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$ , and  $\text{NaOH}$  yield 4:6-dimethoxy-3-methylsalicylideneacyanoacetic acid, hydrolysed and cyclised to 5:7-dimethoxy-8-methylcoumarin-3-carboxylic acid, which is decarboxylated to 5:7-

*dimethoxy-8-methylcoumarin*, m.p. 187—188°. Hydrolysis and methylation of this coumarin give (IV).

Hence (III) must be either 7-hydroxy-5-methoxy- or 5-hydroxy-7-methoxy-6-methylcoumarin and (I) has the structure of type (a) or (b). F. R. S.

**Natural coumarins. XVI. Coumarins of the root of *Heracleum sphondylium*, L.** E. SPATH and A. F. J. SIMON (Monatsh., 1936, 67, 344—351).—The dried material is extracted with Et<sub>2</sub>O and the extract is washed with dil. alkali. The neutral portion remaining in the Et<sub>2</sub>O is hydrolysed, the unsaponifiable matter is removed, and ring-closure of the lactones is effected by addition of acid. The lactone mixture is separated into its components by fractional distillation in high vac. combined with suitable crystallisation. Thus are isolated *isopimpinellin*, m.p. 147—149°, *pimpinellin*, m.p. 117—119°, *isobergaptin*, m.p. 217—219°, *sphondylin* (I), C<sub>12</sub>H<sub>8</sub>O<sub>4</sub>, m.p. 161—163°, and *sphondin* (II), C<sub>12</sub>H<sub>8</sub>O<sub>4</sub>, m.p. 189—191°. (I) and (II) contain 1 OMe and are isomeric with *bergapten*; when oxidised with H<sub>2</sub>O<sub>2</sub> they give furan-2:3-dicarboxylic acid. H. W.

**Antiseptics and anthelmintics. II. Synthesis of 7-hydroxy-6-benzyl- and -6-*n*-hexyl-flavone.** D. R. DHINGRA, H. L. UPPAL, and K. VENKATARAMAN (Proc. Indian Acad. Sci., 1936, 3, A, 206—210).—2:4-Dihydroxydiphenylmethane (Klarman, A., 1926, 515) is converted (Hoesch) into 5-benzylresacetophenone (I), m.p. 153° (*dinitrophenylhydrazone*, m.p. 221°), benzylated to the 4-O-CH<sub>2</sub>Ph derivative, m.p. 111°, converted by PhCHO-50% NaOH into 2-hydroxy-4-benzyl-5-benzylchalcone, oxidised (SeO<sub>2</sub>-C<sub>5</sub>H<sub>11</sub>OH at 150°) to 7-benzyl-6-benzylflavone, m.p. 222°, debenzylated by HBr-AcOH to 7-hydroxy-6-benzylflavone, m.p. 267° (*Ac* derivative, m.p. 191°), also obtained together with its 3-Bz derivative, m.p. 229°, from (I) and Bz<sub>2</sub>O-NaOBz and subsequent hydrolysis with 10% KOH-EtOH. By similar reactions from α-2:4-dihydroxyphenyl-*n*-hexane are obtained 5-*n*-hexylresacetophenone, m.p. 85°, b.p. 195—200°/3—4 mm. (*dinitrophenylhydrazone*, m.p. 183—184°); 2-hydroxy-4-benzyl-5-*n*-hexylacetophenone, m.p. 94°; 2-hydroxy-4-benzyl-5-*n*-hexylchalcone, m.p. 92°; 7-benzyl-5-*n*-hexylflavone, m.p. 120°, and 7-hydroxy-6-*n*-hexylflavone, m.p. 191—192° (*Ac* derivative, m.p. 104°). J. W. B.

**Constitution of oroxylin-A, a yellow colouring matter from the root-bark of *Oroxylum indicum*, Vent.** R. C. SHAH, C. R. MEHTA, and T. S. WHEELER (J.C.S., 1936, 591—593).—Oroxvlin-A (probably identical with oroxylin; cf. Naylor and Dyer, J.C.S., 1901, 79, 954) has been isolated in 0.86% yield, and from its reactions appears to be 6-*O*-methylbaicalein (5:7-dihydroxy-6-methoxyflavone). It forms 5:7-diacetoxy-, m.p. 131—132°, and 5-hydroxy-7-benzoyloxy-6-methoxyflavone, m.p. 211°; hydrolysis with KOH gives BzOH and demethylation gives baicalein.

Monomethyloroxvlin-A corresponds in properties with 5-hydroxy-6:7-dimethoxyflavone [*platinichloride*, m.p. 185—187° (decomp.); 5-*Ac* derivative, m.p. 130—131°; 5-*Bz* derivative, m.p. 206—207°].

F. R. S.

**Fukugenetin, a rearrangement product of fukugetin.** M. MURAKAMI and T. IRIE (Bull. Chem. Soc. Japan, 1936, 11, 288—292).—Fukugetin and hot 30% aq. KOH in H<sub>2</sub> give a mixture (I) of fukugetin (II) and isofukugetin (III), m.p. > 380°, which are *cis-trans* isomerides with the formula shown. (II) and

(III) cannot be separated directly from (I), but methylation gives the *Me*<sub>6</sub> ethers, m.p. 204—206°, and (IV), m.p. 199—200°, of (II) and (III), respectively, separable by fractionation from EtOH; (IV) shows only 5 OMe by a Zeisel determination, but a sixth under the conditions used for NMe and is obtained from the *Me*<sub>5</sub> ether (V) described below by further methylation. Further, (I) and H<sub>2</sub>SO<sub>4</sub>-EtOH give (II), which is unaffected, and *anhydroisofukugetin* (VI), C<sub>24</sub>H<sub>14</sub>O<sub>8</sub>, m.p. > 380°, also obtained from pure (III); the *Ac*<sub>3</sub> derivative, m.p. 267°, is obtained from (VI) or from (I) by hot Ac<sub>2</sub>O-NaOAc, and, since (II) is isomerised to (III) by this reagent, the yield from (I) is excellent. Hydrolysis of (VI) by 10% KOH at room temp. gives (III). Methylation of (VI) gives (V), m.p. 178.5—179° (1 active H); (IV) and 10% KOH give an acid, C<sub>28</sub>H<sub>21</sub>O<sub>9</sub>, m.p. 258—260°, which proves the presence of CO<sub>2</sub>H in (II) and (III). The loss of one active H (*Ac*<sub>3</sub> derivative only) in the formation of (VI) is noted. R. S. C.

**Chromone group. XIX. Synthesis of genkwanin.** H. S. MAHAL and K. VENKATARAMAN (J.C.S., 1936, 569—570).—Condensation of 2:4:6-trimethoxyacetophenone and *p*-CH<sub>2</sub>Ph·O·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>Me with Na at 120° affords ω-4'-benzyl-2:4:6-trimethoxyacetophenone, m.p. 101—102°, which with AlCl<sub>3</sub>-PhNO<sub>2</sub> gives only a poor yield of (I) (below). 2-Hydroxy-4:6-dimethoxyacetophenone with *p*-CH<sub>2</sub>Ph·O·C<sub>6</sub>H<sub>4</sub>·CHO and NaOH-EtOH affords 2-hydroxy-4'-benzyl-4:6-dimethoxychalcone, m.p. 159°, oxidised by SeO<sub>2</sub> in boiling C<sub>5</sub>H<sub>11</sub>OH to 4'-benzyl-5:7-dimethoxyflavone (I), m.p. 178°, converted by HCl-AcOH into genkwanin 5-*Me* ether, m.p. 298° (*Ac* derivative, m.p. 220°), partly demethylated by AlCl<sub>3</sub>-PhNO<sub>2</sub> to genkwanin (5:4'-dihydroxy-7-methoxyflavone) identical with the natural product (cf. Tseng, J. Pharm. Soc. Japan, 1935, No. 636, 30).

J. W. B.

**Constitution of awobanin and awobanol, the colouring matter of awobana and its co-pigment.** (Miss) C. KURODA (Bull. Chem. Soc. Japan, 1936, 11, 265—271).—Details are given for the isolation of awobanin chloride (I), +5H<sub>2</sub>O, and picrate, +5H<sub>2</sub>O (cf. A., 1935, 1290), its decomp. by cold NaOH to give *p*-coumaric acid (II), its hydrolysis by cold 20% aq. HCl to glucose and awobanin-A (III) chloride, +3H<sub>2</sub>O, and by hot acid to delphinidin chloride, and its fusion with NaOH to gallic acid

and phloroglucinol. (III) is shown to be delphinidin-3:5-diglucoside and (I) a compound of this glucoside and (II). A co-pigment, *awobanol*, isolated as *chloride*, m.p. 216° (*Ac* derivative, m.p. 148—156°), is obtained, which on NaOH fusion gives *p*-C<sub>6</sub>H<sub>4</sub>·Ac·OH and *p*-OH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H. R. S. C.

**Constitution of natural colouring matters, kuromanin, shisonin, and nasunin.** (Miss) C. KURODA and M. WADA (Bull. Chem. Soc. Japan, 1936, 11, 272—287).—Details are given of the isolation of kuromanin from the H<sub>2</sub>O-sol. and -insol. portions of "kuromane" from 4 sources and of the proof of its identity with chrysanthemin (cf. A., 1935, 1040). Details are given of the isolation from the leaves of "shiso" (cf. A., 1935, 674) of *shisonin-A* (I) and -B (II); (I) is proved to be a cyanin and (II) a compound thereof with *p*-coumaric acid (III). "Nasu," the fruit of *Solanum melongena*, L., var. *erculentum*, Ness, yields to MeOH-HCl *nasunin chloride* (IV), +10H<sub>2</sub>O (*picrate*, +4H<sub>2</sub>O), purified by Pb(OAc)<sub>2</sub> etc., which with cold aq. HCl gives *nasunin-A chloride* (V), decomp. 197°, and yields delphinidin chloride; these pigments are probably not identical with the awobana pigments. Probably (V) is delphinidin-3-disaccharide and (IV) contains (III) attached to the sugar nucleus. R. S. C.

**Synthesis and constitution of psoralene.** E. SPATH, B. L. MANJUNATH, M. PAILER, and H. S. JOIS (Ber., 1936, 69, [B], 1087—1090).—6-Hydroxycoumarone is hydrogenated (Pd-C in AcOH) to 6-hydroxycoumarone, m.p. 61°, which is condensed with malic acid and conc. H<sub>2</sub>SO<sub>4</sub> at 120° to *dihydropsoalene*

(I), m.p. 204°. Dehydrogenation of (I) with Pd-sponge at 170° gives psoralene (II), m.p. 171°, identical with the natural substance. Methylation, oxidation, and renewed methylation of (II) gives Me<sub>2</sub> 2:4-dimethoxybenzene-1:5-dicarboxylate, m.p. 147—148°, thus confirming the assigned structure. H. W.

**Partial oxidation of metathioxen.** I. J. RINKES (Rec. trav. chim., 1935, 54, 940—942).—The conclusion of Steinkopf *et al.* (A., 1935, 354) that partial oxidation of metathioxen (I) gives 2-thiotolen-4-carboxylic acid is criticised. Repetition of the prep. of the acid there described as 4-bromo-3-methylthiophen-5-carboxylic acid, m.p. 195°, gave 4-bromo-3-methylthiophen-*x*-carboxylic acid, m.p. 219—220° (*Me* ester, m.p. 76°, which regenerates the acid on hydrolysis), reduced by Na-Hg to 3-methyldihydrothiophen-*x*-carboxylic acid, m.p. 79° (cf. *loc. cit.*). The author maintains that the *α*-Me is converted into CO<sub>2</sub>H in the partial oxidation of (I) (cf. A., 1934, 81). H. G. M.

**Dyes derived from acenaphthenequinone.** 5-Methyl-1:8'-thionaphthenacenaphthenyl-indigos. S. K. GUHA (J. Indian Chem. Soc., 1936, 14, 94—97).—2-Hydroxy-5-methylthionaphthen with acenaphthenequinone and its derivatives in AcOH-

conc. HCl gives 5-methyl-1:8'-thionaphthenacenaphthenylindigo (I), m.p. 305°, and its 3'-Cl-, m.p. 297°, 3'-Br-, m.p. 302°, and 1'-OMe-, m.p. 300° (softens at 298°), derivatives. These dye wool (from acid bath) and cotton (from Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> vat) with lighter shades (of red) than the isomeric 4-Me compounds (A., 1934, 534). H. B.

**Bimolecular reduction of thioindigotindisulphonate.**—See this vol., 800.

**Phenoxthionine. I. Comparison of directive influences of oxygen and sulphur.** C. M. SUTER, J. P. MCKENZIE, and C. E. MAXWELL (J. Amer. Chem. Soc., 1936, 58, 717—720).—Phenoxthionine (I), m.p. 57.5—58°, obtained (cf. Ferrario, A., 1911, i, 555) from Ph<sub>2</sub>O (10.4 mols.), S (8 mols.), and AlCl<sub>3</sub> (3.84 mols.) at 100° in 67—72% yield, with Br in CCl<sub>4</sub> gives the 2-Br-derivative (II), m.p. 59—60° (which could not be prepared from *p*-C<sub>6</sub>H<sub>4</sub>Br·OPh and S), and then the 2:8-Br<sub>2</sub>-derivative, m.p. 92—93° [oxidised (30% H<sub>2</sub>O<sub>2</sub>, AcOH) to the 10:10-dioxide (III), m.p. 185—186°]. 4:4'-Dibromodiphenyl ether (IV) and ClSO<sub>3</sub>H (1 mol.) in CCl<sub>4</sub> followed by H<sub>2</sub>O give the 2-sulphonic acid (*Na* salt), the *chloride*, m.p. 128—129°, of which with AlCl<sub>3</sub> in *s*-C<sub>2</sub>H<sub>5</sub>Cl<sub>4</sub> affords (III). (IV) and an excess of ClSO<sub>3</sub>H give the 2:2'-disulphonyl chloride, m.p. 241—243°, hydrolysed to the disulphonic acid (*Na* salt). (I), AcCl, and AlCl<sub>3</sub> in CS<sub>2</sub> afford 2-acetylphenoxthionine, m.p. 111—112° (phenylhydrazone, m.p. 93.5—94.5°; oxime, m.p. 142—143°), oxidised (CaOCl<sub>2</sub>, dil. NaOH) to phenoxthionine-2-carboxylic acid, m.p. 260—262°, which was also obtained (in 8% yield) from the Grignard reagent (prepared only once) from (II) and CO<sub>2</sub>. 2-Benzoyl-, m.p. 96—97°, and 2:8-dibenzoyl-, m.p. 197°, -phenoxthionines are prepared from (I), BzCl (1 mol.), and AlCl<sub>3</sub> in CS<sub>2</sub>. (I) with 1 and 4 mols. of ClSO<sub>3</sub>H in CCl<sub>4</sub> gives phenoxthionine-2-sulphonic acid (*Na* salt; *chloride*, m.p. 127—128°; *amide*, m.p. 177—178°) and -2:8-disulphonic acid [*Na* and *Ag* salts; *chloride* (V), m.p. 142—143°, also obtained directly from (I) and ClSO<sub>3</sub>H], respectively. (V) heated with PCl<sub>5</sub> affords a little of (probably) 2:8-dichlorophenoxthionine, m.p. 134—135° (Hilditch and Smiles, J.C.S., 1911, 99, 408). In all the above reactions with (I), O has a greater directive influence than S. Contrary to Ferrario (*loc. cit.*), (I) could not be converted into diphenylene oxide by Cu at 250° or 285—290°. H. B.

**Reactions of hydrogen with derivatives of pyrrole.** F. K. SIGNAIGO and H. ADKINS (J. Amer. Chem. Soc., 1936, 58, 709—716).—Pyrroles are more resistant to hydrogenation [H<sub>2</sub> (usually 200—300 atm.); Raney Ni or Cu-Cr oxide; EtOH, dioxan, methylcyclohexane, or no solvent] than any of the unsaturated ring compounds hitherto examined; reduction is, however, facilitated by an *N*-substituent (*e.g.*, Ph, CO<sub>2</sub>Et). The following reductions are done with Ni: pyrrole to pyrrolidine (47% yield) at 180°; 3:5-dimethyl-2:4-diethylpyrrole to 3:5-dimethyl-2:4-diethylpyrrolidine, b.p. 186—188°, (70%) at 180°; 1-phenylpyrrole to 1-phenyl- (63%) and 1-cyclohexyl-

pyrrolidine (30%) at 135° (0 and 84%, respectively, at 180°); Et pyrrole-1-carboxylate to Et pyrrolidine-1-carboxylate, b.p. 98—99°/20 mm., (77%) at 160°; Et pyrrole-1:2-dicarboxylate (I), b.p. 132—134°/8 mm., to Et pyrrolidine-1:2-dicarboxylate, b.p. 133—134°/7.5 mm., (97—98%) at 50—85°. Acylpyrroles are converted (65—95% yield) into alkylpyrroles using Ni or (usually) Cu—Cr oxide at 135—175°. Thus, Et 4-acetyl-3:5-dimethylpyrrole-2-carboxylate gives Et 3:5-dimethyl-4-ethylpyrrole-2-carboxylate; Et and Bu<sup>r</sup>, m.p. 154—155° (prep. as A., 1933, 1303). *o*-acetyl-2:4-dimethylpyrrole-3-carboxylate afford Et and Bu<sup>r</sup> (II), m.p. 128—129°, 2:4-dimethyl-5-ethylpyrrole-3-carboxylate, respectively; Et 5-benzoyl-2:4-dimethylpyrrole-3-carboxylate furnishes Et 5-benzyl-2:4-dimethylpyrrole-3-carboxylate (III), m.p. 119—121°; 2:4-diacetyl-3:5-dimethylpyrrole (IV) (prep. as *loc. cit.*) yields 3-acetyl-2:4-dimethyl-*o*-ethylpyrrole, m.p. 157—158°, which then gives 3:4-dimethyl-2:4-diethylpyrrole. *C*-Carbomethoxypyrroles undergo hydrogenolysis to the methylpyrroles with Cu—Cr oxide at 210—225°; further reduction to the methylpyrrolidines may then occur (with 3-CO<sub>2</sub>Et, but not 2-CO<sub>2</sub>Et, reduction precedes hydrogenolysis). Thus, Et 3:5-dimethyl-4-ethylpyrrole-2-carboxylate (V) gives 2:4:5-trimethyl-3-ethylpyrrole (VI) (30%) and -pyrrolidine (VII) (15%); Et 3:5-dimethylpyrrole-2:4-dicarboxylate (VIII) affords (according to H<sub>2</sub> absorbed) Et 2:4:5-trimethylpyrrole-3-carboxylate (IX) (33—55%) and 2:3:4:5-tetramethylpyrrole (X) (trace—13%) and -pyrrolidine (XI) (5—25%); (IX) furnishes (X) (2%) and (XI) (33%); Et 2:4-dimethyl-5-ethylpyrrole-3-carboxylate (XII) yields 3:4:5-trimethyl-2-ethylpyrrolidine (XIII), b.p. 147—151° (30%); Et 4-acetyl-3:5-dimethylpyrrole-2-carboxylate gives (V) (36%), (VI) (23%), and (VII) (29%); (I) affords 2-methylpyrrole (42%). Reduction of the above esters is also accompanied by *N*-ethylation (with EtOH produced during hydrogenolysis); this is better accomplished by reduction at (usually) 250° with Ni or Cu—Cr oxide in EtOH. Thus, Et pyrrole-2-carboxylate furnishes 1-ethyl- (10%; Ni) or 2-methyl-1-ethylpyrrolidine, b.p. 119—120° (90%; Cu); (XII) yields (XIII) (0—35%) and 3:4:5-trimethyl-1:2-diethylpyrrolidine, b.p. 183—184° (35—88%); (V) gives (according to H<sub>2</sub> consumed and catalyst) (VII) (0—8%), 4:5-dimethyl-1:3-diethyl- (37%), and 2:4:5-trimethyl-1:3-diethylpyrrolidine, b.p. 184—185° (37—80%); (VIII) affords 2:3:4:5-tetramethyl-1-ethylpyrrolidine, b.p. 163—165° (70%); (III) furnishes 3:4:5-trimethyl-1-ethyl-, b.p. 52—55°/23 mm. (17%) (hydrochloride), and 2-benzyl-3:4:5-trimethyl-1-ethylpyrrolidine, b.p. 139—141°/12 mm. (52%); (II) yields (XIII) (80%) (*N*-ethylation does not occur); (IV) gives 3:5-dimethyl-1:2:4-triethylpyrrolidine, b.p. 200—201° (50%); Et pyrrole-1-carboxylate affords 1-methyl- (27%) and 1-ethyl- (37%) -pyrrolidines. Further reduction [Cu—Cr oxide, EtOH, 200—250°, H<sub>2</sub> (varying amounts)] of Et pyrrolidine-1:2-dicarboxylate gives 2-methyl-1-ethyl- (XIV) (2—27%) and 1-ethyl-2-hydroxymethylpyrrolidine (XV), b.p. 82—84°/24 mm. (23—34%), and Et 2-hydroxymethylpyrrolidine-1-carboxylate, b.p. 134—135°/8 mm. (0—62%) [also reduced further to

(XIV) (7%) and (XV) (32%)]. Much better yields of many of the above compounds are obtained by hydrogenolysis than by other methods. H. B.

**Interaction of alkyl chlorosulphates and pyridine in ethereal solution.** W. GERRARD (J.C.S., 1936, 688—691).—When an alkyl chlorosulphate, RO·SOCl, is mixed with C<sub>5</sub>H<sub>5</sub>N in Et<sub>2</sub>O, an oily mixture of 1-alkylpyridinium chloride and 1-alkylpyridinium chlorosulphate separates in quantity, leaving in the Et<sub>2</sub>O about a 40% yield of alkyl chloride. With 1 mol. of chlorosulphate per mol. of C<sub>5</sub>H<sub>5</sub>N, nearly one third of the base remained in the Et<sub>2</sub>O, but with 0.5 mol. of the base, no C<sub>5</sub>H<sub>5</sub>N remained in the Et<sub>2</sub>O, and the yield of alkyl chloride was somewhat larger. Two mechanisms for the reaction are suggested. The isolation and identification of the alkylpyridinium compounds have been effected through the ferrocyanides, (C<sub>5</sub>H<sub>5</sub>NR)<sub>2</sub>H·Fe(CN)<sub>6</sub>·2H<sub>2</sub>O: ferrocyanide; R=Me; Et m.p. 150—151° (decomp.); Pr, m.p. 143° (decomp.); Bu, decomp. 165°; isoamyl; Pr<sup>β</sup>, decomp. 145°; Bu<sup>β</sup>, decomp. 150°; derivatives of C<sub>5</sub>H<sub>5</sub>NR: R=Me, picrate, m.p. 109°, aurichloride, m.p. 247°; Et, picrate, m.p. 89°, aurichloride, m.p. 141—142°, platinichloride, m.p. 201°; Pr, aurichloride, m.p. 128°; Bu, platinichloride, m.p. 202°, aurichloride, m.p. 117°; isoamyl, platinichloride, m.p. 203°, aurichloride, m.p. 139°; Pr<sup>β</sup>, aurichloride, m.p. 144°; and Bu<sup>β</sup>, aurichloride, m.p. 139—140°.

F. R. S.

***N*-Methylpyridinethiouram disulphide.** K. S. TOPTSCHIEV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 115—118).—Oxidation of the methylpyridoneimide salt of its dithiocarbamic acid (A., 1935, 995) either with 10% I-EtOH at 0° or 3% H<sub>2</sub>O<sub>2</sub> in aq. EtOH affords the disulphide (I), m.p. 142°, hydrolysed by boiling KOH-EtOH to *N*-methylpyridone, K<sub>2</sub>S, and KCNS [from (NH<sub>2</sub>·CS·S)<sub>2</sub>].

J. W. B.

**Nicotinamide methiodide.** P. KARRER and O. WARBURG (Biochem. Z., 1936, 285, 297—298).—The hydrochloride, m.p. 233°, of the iminoethyl ether, the methylamide, m.p. 100°, the *N*-methylamidine, decomp. 235°, and the methoxymethochloride of the amide of nicotinic acid do not react (at *p*<sub>H</sub> 8 and room temp.) with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>; glucosido-1-pyridinium iodide reacts slowly yielding a substance not identical with reduced H-transporting co-enzyme (I). The methiodide of nicotinamide (II) reacts as quickly as does (I) yielding a substance identical with reduced (I). (I) contains 13.3% of (II).

W. McC.

**Synthesis in the indole group.** XV. **Synthesis of bufotenin methyl ether (5-methoxy-*NN*-dimethyltryptamine) and bufotenin.** T. HOSHINO and K. SHIMODAIRA (Bull. Chem. Soc. Japan, 1936, 11, 221—224).—Bufotenin Me ether (I) is synthesised in a manner similar to that used for its Et ether (A., 1935, 1378). 5-Methoxy-3-indolylacetic acid, m.p. 146—147° (from the nitrile), gives its Et ester, b.p. 202—203°/4 mm., m.p. 97—98°, reduced to 5-methoxytryptophol, b.p. 194°/4 mm. (picrate, m.p. 117—118°), from which are obtained 5-methoxy-3-β-bromoethylindole and 5-methoxy-*NN*-dimethyltryptamine (I), m.p. 66—67° [picrate, m.p. 176—177°; mono-,

m.p. 170—171°, and *di-picrate*, m.p. 103—104° (lit. m.p. 84°), of the methiodide], demethylated by  $\text{AlCl}_3$  to bufotenin. When heated with  $\text{MeI-EtOH}$ -anhyd.  $\text{Na}_2\text{CO}_3$  5-methoxytryptamine affords the methiodide of (I), converted by  $\text{AgCl}$  into the *methochloride*, m.p. 144°, which gives (I) when heated at 240—250°.

J. W. B.

**Stereoisomerism of 6-methyldecahydroquinoline.** S. FUJISE and M. IWAKIRI (Bull. Chem. Soc. Japan, 1936, 11, 293—294).—Reduction of 6-methylquinoline ( $\text{PtO}_2\text{-H}_2$  in  $\text{AcOH}$ , 50°) affords *trans*-(I), m.p. 68—69°, b.p. 211.5—212° (*hydrochloride*, m.p. 265°; *hydrobromide*, m.p. 244—245°; *aurichloride*, m.p. 117—119°; *platinichloride*, m.p. 171.5—172.5°; *Bz*, m.p. 95—99°, and *p-nitrobenzoyl*, m.p. 124.5—125°, derivatives), and *cis*-6-methyldecahydroquinoline, b.p. 212—212.5° [*hydrochloride*, m.p. 263—264°; *hydrobromide*, m.p. 252—253°; *aurichloride*, m.p. 152—153°; *platinichloride*, m.p. 230° (decomp.); *p-nitrobenzoyl*, m.p. 138—139°, and liquid *Bz* derivative]. Resolution of (I) with *d*-bromocamphorsulphonic acid gives the *d-trans*-form, m.p. 92—93°,  $[\alpha]_D^{25} +4.8^\circ$  in  $\text{EtOH}$ . The reduced 6-methylquinoline, m.p. 44° (Finger *et al.*, A., 1909, i, 512), must be impure (I).

J. W. B.

**4-Hydroxyquinoline-3-aldehyde.** Preparation of 4-hydroxyquinoline (*kynurine*). B. BOBRANSKI (Ber., 1936, 69, [B], 1113—1117).—4-Hydroxyquinoline (prep. from quinoline through the oxide and 4-chloroquinoline described) is converted by  $\text{NaOH}$  and  $\text{CHCl}_3$  into 4-hydroxyquinoline-3-aldehyde, m.p. 273° (decomp.), in about 10% yield. It is a very weak base which does not reduce  $\text{NH}_3\text{-Ag}_2\text{O}$  or Fehling's solution. The *phenylhydrazone*, m.p. 244—245° (decomp.), and *oxime*, m.p. 222—223° (decomp.) when rapidly heated and m.p. 241° after re-solidification, are described.

H. W.

**2-Phenylquinoline series.** K. FEIST and M. KUKLINSKI (Arch. Pharm., 1936, 274, 310—315; cf. this vol., 735).—The  $\text{NH}_2$  of 4-amino-2-phenylquinoline (I) is relatively unreactive. (I) and  $\text{NH}_4\text{CNS}$  in very dil.  $\text{HCl}$  give the *thiocarbamide*, m.p. 277°, but  $\text{C}_3\text{H}_5\text{-CNS}$  and  $\text{PhCNS}$  give only poor yields of *allyl*-, m.p. 279°, and *phenyl-carbamide*, derivatives, m.p. 150°. (I),  $\text{S}$ , and  $\text{NaOH}$  in hot  $\text{CS}_2\text{-EtOH}$  give only a little 2-phenylquinolyl-4-thiourethane, m.p. 151°, and probably  $\text{H}_2\text{S}$ ; 6-amino-2-methylpyridine gives mainly *thiocarbamide* with a little thiourethane. (I) and the aldehyde, when melted together, afford the *o-methoxybenzylidene*, m.p. 136° and *salicylidene* derivative (II), m.p. 138°, but *o*- (III) and *p*- $\text{NO}_2\text{-C}_6\text{H}_4\text{-CHO}$  (IV) and *p*- $\text{NMe}_2\text{-C}_6\text{H}_4\text{-CHO}$  do not react. (II) yields ( $\text{H}_2\text{-Pd-black}$  in  $\text{Et}_2\text{O}$ ) 4-benzylamino-2-phenylquinoline, m.p. 204°. (I) also does not react with (III), (IV),  $\text{PhCHO}$ ,  $\text{o-OH-C}_6\text{H}_4\text{-CHO}$ , or piperonal in anhyd.  $\text{HCO}_2\text{H}$ .

R. S. C.

**Catalytic dehydrogenation of 3-phenyltetrahydroisoquinolines.** B. REICHERT and W. HOFFMANN (Arch. Pharm., 1936, 274, 281—283).—6:8-Methylenedioxy-3-phenyl- and -3:4':5'-methylenedioxyphenyl-, 6-methoxy- and 6:7-dimethoxy-3-phenyl-1:2:3:4-tetrahydroisoquinoline are quantitatively dehydrogenated by 10—25% of  $\text{Pd-black}$

at 170—210°, the reaction being favoured by the 3-Ph. 6:7-Dimethoxy-, m.p. 128°, and 6-methoxy-3-phenylisoquinoline, m.p. 101°, are described.

R. S. C.

**Synthesis of alkoxy- and hydroxy-carbazoles.** T. HOSHINO and K. TAKIURA (Bull. Chem. Soc. Japan, 1936, 11, 218—220).—Dehydrogenation of tetrahydrocarbazoles, prepared by Borsche's method (A., 1908, i, 365), is best effected with  $\text{Pd-black-CHPh:CH-CO}_2\text{H}$  at 150—200°, and thus are obtained carbazole, 3-ethoxy-, m.p. 106—107° (converted by  $\text{NH}_2\text{Ph.HCl}$  at 220° in  $\text{CO}_2$  into 3-hydroxy-, m.p. 256—257°), 7-ethoxy-1:2:3:4-tetrahydro-, m.p. 120°, 2-ethoxy-, m.p. 216—217°, converted into 2-hydroxy-, m.p. 273—274°, -carbazole. *cycloHexanone-p*-phenetylhydrazine has m.p. 77° and 6-ethoxy-1:2:3:4-tetrahydrocarbazole, m.p. 105—106° (*loc. cit.*, m.p. 87—88°).

J. W. B.

**4:5-Di-m-aminophenylcarbazole.** S. SAKO (Bull. Chem. Soc. Japan, 1936, 11, 144—157).—3-Nitro-2-acetamidodiphenyl with  $\text{H}_2\text{SO}_4\text{-HNO}_3$  (*d* 1.52)  $< 2^\circ$  gives its 4'- $\text{NO}_2$ -derivative, m.p. 207.5°, hydrolysed (boiling  $\text{EtOH-conc. HCl}$ ) to 3:4'-dinitro-2-amino-, m.p. 196—197° (oxidised to *p*- $\text{CO}_2\text{H-C}_6\text{H}_4\text{-NO}_2$ ), converted through its diazo-compound into 2-iodo-3:4'-dinitro-, m.p. 139—140°, and reduced by  $\text{Na}_2\text{S-aq. EtOH}$  to 3-nitro-2:4'-diamino-diphenyl, m.p. 156—157°, converted by  $\text{Ac}_2\text{O-C}_6\text{H}_6$  into its 4'-*Ac* derivative, m.p. 174—175°, converted (Sandmeyer) into the 4'-*Ac* derivative, m.p. 239°, of 2-iodo-3-nitro-4'-aminodiphenyl (I), m.p. 126—127° [*hydrochloride*; *p*-toluenesulphonyl derivative (II), m.p. 136—137°], which is obtained by hydrolysis with  $\text{EtOH-conc. HCl}$ . Addition of (I) to  $\text{HNO}_3$  (*d* 1.456, essential) at 0° affords 2-iodo-3:3':5'-dinitro-4'-acetamidodiphenyl, m.p. 196—197°, hydrolysed to the 4'- $\text{NH}_2$ -compound (III), m.p. 178—178.5°. (I) with  $\text{HNO}_3$  (*d* 1.52) gives the 3:3':5'-( $\text{NO}_2$ )<sub>3</sub> derivative, m.p. 263—264°, hydrolysed to 2-iodo-3:3':5'-trinitro-4'-aminodiphenyl, m.p. 220—221°, also obtained by nitration of (II) and subsequent hydrolysis. Deamination of (III) by the diazo-reaction affords 2-iodo-3:3'-dinitrodiphenyl, m.p. 130—131°, b.p. 239°/6 mm., converted by  $\text{Cu}$  powder at 190—195° into 2:2'-dinitro-6:6'-di-m-nitrophenyl-, m.p. 259.5—260°, reduced ( $\text{SnCl}_2\text{-AcOH-HCl}$ ) to 2:2'-diamino-6:6'-di-m-aminophenyl-diphenyl, m.p. 169—170°, converted by 0.5*N*- $\text{HCl}$  ( $\text{N}_2$  atm.) at 200—205° into 4:5-di-m-aminophenylcarbazole (IV), softens 175°, m.p. 180—182° [*dihydrochloride*,  $+2\text{H}_2\text{O}$ ;  $\text{Ac}_2$ , m.p. 257—258°, and *di-l-menthoxyacetyl* derivative (V), m.p. 190—191°,  $[\alpha]_D^{25} -22.27^\circ$  in  $\text{EtOH}$ ,  $+14.2^\circ$  in  $\text{C}_6\text{H}_6$ ]. Spatial considerations suggest that (IV) should exist in *cis*- and *trans*-forms, the latter being resolvable, but attempts to resolve (IV) with *d*-camphorsulphonic acid or *d*-tartaric acid failed, and hydrolysis of the *l*-menthoxyacetyl group from (V) was unsuccessful.

J

**Acridine. XIII. *ms*-Acridine derivatives.** IV. "Acridol" and the tautomerism, *N*-hydroxyacridone-5-hydroxyacridine 10-oxide. K. LEHMSTEDT and H. KLEE (Ber., 1936, 69, [B], 1155—1158; cf. A., 1935, 1251).—Acridine *N*-oxide identical

with "acridol" is converted by  $\text{NaHSO}_3$  and  $\text{HCN}$  into acridine (I) and 5-cyanoacridine, respectively; since in these reactions it behaves similarly to (I) it must be formulated  $\text{C}_6\text{H}_4\langle\text{CH}\rangle\text{C}_6\text{H}_4$  not

In agreement with Kliegl and Brosamle (this vol., 343) the hydroxyacridone of Kliegl and Fehrle (A., 1914, i, 867) is regarded as  $\text{C}_6\text{H}_4\langle\text{CO}\rangle\text{C}_6\text{H}_4$  which can become tautomerised

H. W.

**Synthesis of substituted acridines as possible antimalarials.** G. R. CLEMO and W. HOOK (J.C.S., 1936, 608—609).—The *p*-toluenesulphonamide of 1-methylamino-5:10-dihydroacridine, m.p. 170°, is hydrolysed ( $\text{H}_2\text{SO}_4$ ) to 1-methylaminoacridine, m.p. 75°. 1-( $\beta$ -Diethylaminoethyl)aminoacridine, b.p. 180°/1 mm. [dipicrate, m.p. 192°; monopicrate, m.p. 151°; dihydrochloride (+2 $\text{H}_2\text{O}$ ), m.p. 104°], is obtained from 1-aminoacridine,  $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{N}(\text{Et})_2\cdot\text{HCl}$ , and  $\text{NaOAc}$ , and also by hydrolysing the *p*-toluenesulphonamide of 1-( $\beta$ -diethylaminoethyl)amino-5:10-dihydroacridine, m.p. 88°.  $\alpha$ -Diethylamino- $\delta$ -hydroxypentane and  $\text{SOCl}_2$ , followed by  $\text{NaOH}$  give  $\delta$ -chloro- $\alpha$ -diethylaminopentane (methiodide, m.p. 116°), which is isomerised to a solid [picrate, m.p. 270° (decomp.)]. 1-Aminoacridine (monopicrate, m.p. 220°), *p*-nitrobenzyl bromide, and  $\text{NaOAc}$  give 1-(*p*-nitrobenzyl)-aminoacridine, m.p. 170°, reduced to the 1-*p*- $\text{NH}_2$ -compound [dihydrochloride (+2 $\text{H}_2\text{O}$ ), m.p. 168°; dipicrate, m.p. 178° (decomp.)]. F. R. S.

**Manufacture of acridine derivatives [pharmaceuticals].**—See B., 1936, 524.

**Creatinine derivatives.** II. W. R. CORNTHWAITE, S. LAZARUS, R. H. SNELLINGS, jun., and C. E. DENOON, jun. (J. Amer. Chem. Soc., 1936, 58, 628—629; cf. A., 1935, 352).—Creatinine and the appropriate  $\text{RCHO}$  at 150—180° give 5-*o*- (I), m.p. 241°, and -*p*-, m.p. 248—249° (decomp.), -*anisylidene*-, 5-*o*-ethoxybenzylidene- (II), m.p. 236° (decomp.), 5-*p*-hydroxybenzylidene-, m.p. 289° (cf. Deulofeu and Mendivelzua, A., 1935, 850), 5-*p*-tolylidene- (III), m.p. 285° (decomp.), 5-*o*-chlorobenzylidene- (IV), m.p. 242° (decomp.; sealed tube), 5-*p*-piperonylidene- (V), m.p. 274° (decomp.; sealed tube), and 5- $\gamma$ -phenylpropylidene-, m.p. 225—230°, -*creatinine*. (I)—(V) are accompanied by products, m.p. 292°, 297°, 309°, 270°, and 327°, respectively, which are (probably) triarylidenecreatinines; that from *o*- $\text{OEt}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$  is also produced from (II) and an excess of the aldehyde at 175°. H. B.

**Tertiary alkylbarbituric acids.** A. W. DOX and W. G. BYWATER (J. Amer. Chem. Soc., 1936, 58, 731—732).— $\text{CHBu}^t(\text{CO}_2\text{Et})_2$ , b.p. 205—210°/750 mm. [obtained in 6.4% yield from  $\text{CHNa}(\text{CO}_2\text{Et})_2$  and  $\text{Bu}^t\text{Br}$  in  $\text{EtOH}$  at 5°—room temp.], and  $\text{CEtBu}^t(\text{CO}_2\text{Et})_2$ , b.p. 244—248° [formed in 3.8% yield from  $\text{CHEt}(\text{CO}_2\text{Et})_2$  (I),  $\text{Bu}^t\text{Br}$ , and  $\text{Na}$  powder in dry  $\text{PhMe}$ ], with  $\text{CO}(\text{NH}_2)_2$  in  $\text{EtOH}\text{--NaOEt}$  give 5-*tert*-butyl- (II), m.p. 230—231°, and impure

5-ethyl-5-*tert*-butyl- (III), m.p. 191.5—192.5°, -*barbituric acid*, respectively. 5-Ethyl-5-*tert*-amylbarbituric acid (IV), m.p. 196.5—197.5°, is similarly prepared from  $\text{Et}$  ethyl-*tert*-amylmalonate, b.p. 93—96°/1.5 mm. [formed in 4.6% yield from (I), *tert*-amyl bromide, and  $\text{EtOH}\text{--NaOEt}$  at room temp.]. Contrary to expectation, (III) and (IV) are not more active than the isomeric 5-*sec*-alkyl derivatives. (II) is inactive. H. B.

**Nitrogen-substituted barbituric acids.** D. NIGHTINGALE and C. H. ALEXANDER (J. Amer. Chem. Soc., 1936, 58, 794—796).—1-Aryl- and 1:3-diarylbarbituric acids are prepared from  $\text{CH}_2(\text{COCl})_2$  and  $\text{NH}_2\cdot\text{CO}\cdot\text{NHar}$  or  $\text{CO}(\text{NHar})_2$  (Whiteley, J.C.S., 1907, 91, 1330); their 5:5-di-*p*-nitrobenzyl derivatives are obtained by Lyons and Dox's method (A., 1929, 453), whilst the 5-anilinomethylene derivatives, which are recommended for identification, are formed from the acids and  $\text{NHPh}\cdot\text{CH}\cdot\text{NPh}$  in  $\text{EtOH}$ . The following are described: 1-phenyl- (5-cinnamylidene, decomp. 271°, 5:5-di-*p*-nitrobenzyl, m.p. > 295°, and 5-anilinomethylene, m.p. 271°, derivatives); 1-*p*-tolyl-, m.p. 244° (5-cinnamylidene, decomp. 275°, 5:5-di-*p*-nitrobenzyl, m.p. 245°, and *o*-anilinomethylene, m.p. 290°, derivatives); 1-*p*-phenetyl-, m.p. 211° (5-cinnamylidene, decomp. 258°, 5:5-di-*p*-nitrobenzyl, m.p. 240°, and 5-anilinomethylene, m.p. 248°, derivatives); 1:3-diphenyl- (5:5-di-*p*-nitrobenzyl, m.p. > 300°, and 5-anilinomethylene, m.p. 228°, derivatives); 1:3-di-*o*-tolyl-, m.p. 171° (5-cinnamylidene, decomp. 223°, 5:5-di-*p*-nitrobenzyl, m.p. > 300°, and *o*-anilinomethylene, m.p. 198°, derivatives); 1:3-di-*p*-tolyl-, m.p. 213° (5-cinnamylidene, decomp. 260°, 5:5-di-*p*-nitrobenzyl, m.p. > 300°, and 5-anilinomethylene, m.p. 258°, derivatives); 1:3-di-*p*-phenetyl-, m.p. 167° (5-anilinomethylene derivative, m.p. 207°); 1:3-diphenyl-2-thio- (5-anilinomethylene derivative, m.p. > 300°), and 1:3-di-*o*-tolyl-2-thio-barbituric acid, m.p. 217° (5-cinnamylidene, decomp. 248°, and 5-anilinomethylene, m.p. 237°, derivative). H. B.

**Synthesis of glyoxaline derivatives from  $\alpha$ -amino-acids.** III. Synthesis of two homologues of histamine. S. AKABORI and T. KANEKO. IV. Synthesis of histamine. S. AKABORI and S. NUMANO (Bull. Chem. Soc. Japan, 1936, 11, 208—213, 214—217).—III. Reduction of arginine  $\text{Et}$  ester dihydrochloride with  $\text{Na}\text{--Hg}\text{--EtOH}\text{--}5N\text{--HCl}$  at  $-12^\circ$  to  $-17^\circ$  and treatment of the product with  $\text{NH}_4\text{SCN}$  affords 2-thiol-5- $\gamma$ -guanidinopropylglyoxaline hydrochloride (I), m.p. 236.5—237.5° (decomp.), converted by aq.  $\text{FeCl}_3$ -phosphotungstic acid into 5- $\gamma$ -guanidinopropylglyoxaline [picrate, m.p. 258° (decomp.); flavianate, m.p. 248° (decomp.)], isolated as its dinitrate (II), m.p. 183.5—184° (decomp.). Hydrolysis of (I) with  $\text{Ba}(\text{OH})_2$  gives 2-thiol-5- $\gamma$ -aminopropylglyoxaline (not isolated), converted by  $\text{FeCl}_3$ -phosphotungstic acid into 5- $\gamma$ -aminopropylglyoxaline (III), isolated as its picrate, m.p. 244—244.5° (decomp.), also obtained by hydrolysis of (II). Similarly lysine  $\text{Et}$  ester dihydrochloride is converted successively into 2-thiol-5- $\delta$ -amino-*n*-butyl-, m.p. 220.5—221.5° (decomp.) [hydrochloride, m.p. 212—214° (decomp.)]; picrate, m.p. 154—155° (decomp.)], and 5- $\gamma$ -amino-*n*-butyl-glyoxaline (IV), b.p. 204°/6 mm.,

m.p. 51—53° [oxalate, m.p. 168.5—170° (decomp.); picrate, m.p. 197.5—198.5° (decomp.)]. The physiological action (non-pregnant dogs) of (III) is <, and that of (IV), that of histamine (V).

IV. *Et hydantoinpropionate*, m.p. 78—82°, is converted through the *hydrazide*, m.p. 164—167°, *azide*, decomp. 69—70°, into *Et β-hydantoinylethylcarbamate*, m.p. 82—88°, hydrolysed by Ba(OH)<sub>2</sub> to α-diaminobutyric acid hydrochloride, the *Et* ester, m.p. 173—175° (decomp.), of which is converted as above into 2-thiolhistamine hydrochloride, m.p. 245.5—247°, and (V).  
J. W. B.

**Ethylene oxamide (2 : 3-diketopiperazine).** J. VAN ALPHEN (Rec. trav. chim., 1935, 54, 937—939).—2 : 3-Diketopiperazine (I), m.p. 285°, is obtained when Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub> and ethylenediamino hydrate [corresponding dioxalate, m.p. 207° (decomp.)] are added very gradually to much abs. EtOH (cf. lit.). In H<sub>2</sub>O they give β-aminoethyloxamic acid, m.p. about 320° (decomp.). (I) forms the 1 : 4-(NO<sub>2</sub>)<sub>2</sub>-derivative, m.p. about 150° (decomp.).  
H. G. M.

**Pyrimidines.** (A) Molecular rearrangement of 2-ethylthiol-6-thiocyano-4 : 5-dimethylpyrimidine. (B) Synthesis of 4 : 5-dimethylcytosine. Y. F. CHI and Y. S. KAO. (C) Molecular rearrangement of 2-ethylthiol-6-thiocyano-4-phenylpyrimidine. Y. F. CHI, Y. S. KAO, and Y. T. HUANG (J. Amer. Chem. Soc., 1936, 58, 769—771, 772, 773—774; cf. A., 1934, 85).—(A) 6-Hydroxy-4 : 5-dimethyl-2-thiopyrimidine (I), m.p. 279—280° [from CS(NH<sub>2</sub>)<sub>2</sub> and CHMeAc·CO<sub>2</sub>Et in EtOH-NaOEt], with EtI, MeI, and CH<sub>2</sub>Cl·CO<sub>2</sub>Et in EtOH-NaOEt gives 2-ethylthiol- (II), m.p. 155—156°, 2-methylthiol-, m.p. 225—227°, and 2-carbethoxymethylthiol-, m.p. 132—133° [and thence 2-carboxymethylthiol- (+H<sub>2</sub>O), m.p. 128—129°], 4 : 5-dimethyluracil, respectively. 4 : 5-Dimethyluracil, m.p. 294—296°, is obtained from (I) and aq. CH<sub>2</sub>Cl·CO<sub>2</sub>H or from (II) and aq. HBr. (II) and POCl<sub>3</sub> give 6-chloro-2-ethylthiol-4 : 5-dimethylpyrimidine (III), b.p. 142—144°/10 mm., which with KCNS in EtOH affords 2-ethylthiol-6-thiocyano-4 : 5-dimethylpyrimidine (IV), b.p. 160°/1.5 mm., m.p. 64.5—65.5°, converted by SH·CH<sub>2</sub>·CO<sub>2</sub>H into 2-ethylthiol-4 : 5-dimethyl-6-thiopyrimidine, m.p. 187—188° [also formed from (III) and NaHS]. (IV) heated in xylene for 20 hr. at the b.p. rearranges partly into 2-ethylthiol-6-thiocarbimido-4 : 5-dimethylpyrimidine (V), b.p. 150—152°/1.5 mm., m.p. 29.5—30°, which with NH<sub>2</sub>Ph and conc. aq. NH<sub>3</sub> in light petroleum gives the 6-phenylthiocarbimido-, m.p. 139—141°, and 6-thiocarbamido-, m.p. 209—210°, derivatives, respectively. (V) with MeOH, EtOH, and Pr<sup>o</sup>OH affords the corresponding thiourethanes, m.p. 75—76°, 129—130°, and 61—63°, respectively.

(B) 6-Amino-2-ethylthiol-4 : 5-dimethylpyrimidine, m.p. 92—93° [from (III) (above) and conc. EtOH-NH<sub>3</sub> at 140—150°], is hydrolysed (48% HBr) to 4 : 5-dimethylcytosine (+H<sub>2</sub>O), m.p. >300° [hydrobromide, m.p. 291° (decomp.) (sinters at 278°)].

(C) 2-Ethylthiol-6-thiocyano-4-phenylpyrimidine (VI), b.p. 204°/1.5 mm., m.p. 88—89° [from the 6-Cl-derivative (VII) and KCNS in EtOH], is converted by SH·CH<sub>2</sub>·CO<sub>2</sub>H into 2-ethylthiol-4-phenyl-6-thiopyrimidine, m.p. 206—207°, also prepared from (VII)

and EtOH-NaHS. (VI) heated in PhMe at 160—170° (sealed tube) for 10 hr. rearranges to 2-ethylthiol-6-thiocarbimido-4-phenylpyrimidine (VIII), b.p. 215—218°/2 mm., which with NH<sub>2</sub>Ph and NH<sub>3</sub> (as above) gives the 6-phenylthiocarbimido-, m.p. 215—216°, and 6-thiocarbamido-, m.p. 212—213°, derivatives, respectively. (VIII) with MeOH, EtOH, Pr<sup>o</sup>OH, and Bu<sup>o</sup>OH affords the corresponding thiourethanes, m.p. 130—131°, 115—116°, 97—98°, and 89—90°, respectively. (IV) and (VI) do not react with NH<sub>3</sub>, NH<sub>2</sub>Ph, or alcohols.  
H. B.

**1-Arylindazoles.** II. W. BORSCHKE and L. BUTSCHLI (Annalen, 1936, 522, 285—298).—The p-tolylhydrazone, m.p. 178—179°, p-acetylphenylhydrazone, m.p. 163—164°, p-carboxyphenylhydrazone, m.p. 262° (decomp.), 2 : 4-dichlorophenylhydrazone, m.p. 204°, 2 : 4 : 6-trichlorophenylhydrazone, m.p. 173—174°, and mesitylhydrazone, m.p. 137—138°, of Me 2 : 4-dinitrophenylglyoxylate are prepared (method : A., 1934, 784) from ArN<sub>2</sub>Cl and 2 : 4-(NO<sub>2</sub>)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·CH<sub>2</sub>·CO<sub>2</sub>Me and converted (*loc. cit.*) into 6-nitro-1-p-tolyl-, m.p. 268° (decomp.) (*Me* ester, m.p. 191—192°), -1-p-acetylphenyl-, m.p. 233° (decomp.), -1-p-carboxyphenyl-, m.p. 300° (decomp.), -1-2' : 4'-dichlorophenyl-, m.p. 262° (decomp.), -1-2' : 4' : 6'-trichlorophenyl-, decomp. 236° (*Me* ester, m.p. 190°), and -1-mesityl- (*Me* ester, m.p. 164°) -indazole-3-carboxylic acids, respectively. 6-Nitro-1-p-tolyl- (I), m.p. 134—135°, and -1-mesityl-, m.p. 109—110°, -indazoles are described. PhN<sub>2</sub>Cl and 2 : 4-(NO<sub>2</sub>)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·CH<sub>2</sub>·COPh (A., 1909, i, 232) in MeOH-C<sub>5</sub>H<sub>5</sub>N give α-Ph β-2 : 4-dinitrophenyl diketone-β-phenylhydrazone, m.p. 209° (decomp.) [corresponding anisylhydrazone, m.p. 175—176° (decomp.)], convertible into 6-nitro-3-benzoyl-1-phenylindazole, m.p. 212—214° (1-4'-OMe-derivative, m.p. 199—200°), also obtained from the chloride, m.p. 191°, of 6-nitro-1-phenylindazole-3-carboxylic acid (*anilide*, m.p. 220—221°), C<sub>6</sub>H<sub>6</sub>, and AlCl<sub>3</sub>. A phenylhydrazone could not be prepared from 2 : 4-dinitrobenzophenone, m.p. 172° [from 2 : 4-(NO<sub>2</sub>)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·COCl, C<sub>6</sub>H<sub>6</sub>, and AlCl<sub>3</sub>]. 2 : 4-(NO<sub>2</sub>)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·CO<sub>2</sub>H could not be prepared by oxidation (CrO<sub>3</sub>, H<sub>2</sub>SO<sub>4</sub>) of 2 : 4-C<sub>6</sub>H<sub>3</sub>Me(NO<sub>2</sub>)<sub>2</sub>; in one case, some 2 : 4-dinitrophenyl 2 : 4-dinitrobenzyl ketone (?) was obtained. Reduction (H<sub>2</sub>, Pd-C, MeOH) of (I) gives 6-amino-1-p-tolylindazole (hydrochloride, decomp. 255—257°; *Bz* derivative, m.p. 213—214°) [converted by diazotisation and subsequent treatment with H<sub>3</sub>PO<sub>2</sub> into 1-p-tolylindazole (II), m.p. 70°] and some of the azoxy-derivative, m.p. 200°. 6-Amino-3-acetyl-1-phenylindazole, m.p. 226—228° (*Bz* derivative, m.p. 192°), prepared from the 6-NO<sub>2</sub>-compound, is similarly converted into 3-acetyl-1-phenylindazole, m.p. 84—85° (*oxime*, m.p. 137°; 2 : 4-dinitrophenylhydrazone, m.p. 263°), which with PhCHO in MeOH-NaOH gives 3-cinnamoyl-1-phenylindazole, m.p. 149—150°. *Me* 6-nitro-1-phenylindazole-3-carboxylate (III) (modified prep.) is similarly reduced to the NH<sub>2</sub>-ester, m.p. 115° (*Bz* derivative, m.p. 201°), deaminated (as above) to the *Me* ester (IV), m.p. 81°, of 1-phenylindazole-3-carboxylic acid, m.p. 181° (*anilide*, m.p. 127—128°); the chloride, m.p. 147—148°, of this with C<sub>6</sub>H<sub>6</sub> and AlCl<sub>3</sub> affords 3-benzoyl-1-phenylindazole, m.p. 148—149° (2 : 4-dinitrophenyl-

hydrazone, m.p. 215°). 1-Phenylindazole (V) and 86%  $\text{HNO}_3$  give  $(\text{NO}_2)_4$ -derivatives, m.p. 226—228° and 238—241°; with  $\text{KNO}_3$ +conc.  $\text{H}_2\text{SO}_4$  (method a) a  $(\text{NO}_2)_2$ -derivative, m.p. 253°, results. (II) affords (a) a  $(\text{NO}_2)_2$ -derivative, m.p. 215°. 6-Nitro-1-phenylindazole and fuming  $\text{HNO}_3$  give a  $(\text{NO}_2)_4$ -compound, m.p. 220—223°; (a) leads to 6:4'-dinitro-1-phenylindazole, m.p. 265° [also obtained by decarboxylation of (VI) (below)], which is reduced (as above) to the  $(\text{NH}_2)_2$ -derivative, m.p. 207—209° (becoming red). Contrary to Strassmann (A., 1890, 781), a  $(\text{NO}_2)_4$ -compound, m.p. 225—226°, is formed from (III) and fuming  $\text{HNO}_3$ ; (a) affords the Me ester, m.p. 269—270°, of 6:4'-dinitro-1-phenylindazole-3-carboxylic acid (VI), m.p. 275° (decomp.). (V) and Br in AcOH at room temp. give (probably) the 3:5:4'- $\text{Br}_3$ -derivative, m.p. 181°; (II) and (IV) similarly yield the 3:5- $\text{Br}_2$ -, m.p. 132—134°, and 5:4'- $\text{Br}_2$ -, m.p. 182—183°, derivatives, respectively. Reduction ( $\text{SnCl}_2$ , AcOH-HCl) of (III) affords some 6-amino-1-phenylindazole-3-carboxylic acid (cf. Schulhofer, A., 1891, 1231), also obtained from the 6- $\text{NO}_2$ -acid and alkaline  $\text{Na}_2\text{S}_2\text{O}_4$ . An  $\alpha$ -oxy-compound, m.p. 243—244° (decomp.), is formed by reduction ( $\text{H}_2$ , Pd-C, MeOH) of Me 2:4-dinitrophenylglyoxylate phenylhydrazone. H. B.

**Pyrogenic rearrangement of 3-2-pyridylpyrrole.** A. G. OOSTERHUIS and J. P. WIBAUT (Rec. trav. chim., 1936, 55, 348—349).—Under the conditions of pyrolysis of N-2-pyridylpyrrole (I) to 2- (II) and 3-2-pyridylpyrrole (III) (A., 1926, 1260; Tschitschibabin *et al.*, A., 1925, i, 1174), (III) is converted into (II) but not (II) into (III). Hence no (III) is found in the products if the vapour of (I) is passed too slowly through the reaction tube.

J. W. B.

**Quinoxaline colours.** K. YAMADA, T. NOGUCHI, and K. OTWA (Bull. Chem. Soc. Japan, 1936, 11, 225—231).—The solubility, colour reactions, and dyeing properties of the quinoxaline dyes obtained by condensation (in AcOH) of phenanthraquinone with *o*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{NHPh}$  (I) (chloride, +0.5 $\text{ZnCl}_2$ , bromide, and iodide, all m.p. > 285°) and *o*- $\text{NH}_2\cdot\text{C}_6\text{H}_3\cdot\text{NHMe}$  (chloride, +0.5 $\text{ZnCl}_2$ , decomp. 200—205°; bromide, decomp. 216—217°; iodide, decomp. 195—200°), and of naphthoquinone with (I) (chloride, +0.5 $\text{ZnCl}_2$ , decomp. 278—279°; bromide, decomp. 281—282°; iodide, decomp. 220—221°) are tabulated.

J. W. B.

**Synthesis of  $\alpha$ -picolylisoquinolines as possible antimalarials.** I. G. R. CLEMO, H. MCLWAIN, and W. MCG. MORGAN (J.C.S., 1936, 610—611).—Et pyridyl-2-acetate and 3:4-methylenedioxy- $\beta$ -phenylethylamine condense to pyridyl-2-aceto-3':4'-methylenedioxy- $\beta$ -phenylethylamide, m.p. 89°, which with  $\text{POCl}_3$  forms 6:7-methylenedioxy-1- $\alpha$ -picolyl-3:4-dihydroisoquinoline, m.p. 105° [dihydrochloride (+EtOH), m.p. 210°; picrate, m.p. 210°]. This compound is reduced with  $\text{Zn-H}_2\text{SO}_4$  to 6:7-methylenedioxy-1- $\alpha$ -picolyl-1:2:3:4-tetrahydroisoquinoline (I), b.p. 215°/1 mm. [picrate, m.p. 175°; hydrochloride (+ $\text{H}_2\text{O}$ ), m.p. 205°], and with  $\text{PtO}_2\text{-H}_2$  to the  $\alpha$ -pipecolyl compound, b.p. 210°/1 mm. (picrate, m.p. 236°; hydrochloride, m.p. 293°). (I) is dehydrogen-

ated (Pd-C) to  $\alpha$ -picoline and 6:7-methylenedioxyisoquinoline, isolated as the picrate, m.p. 206°.

F. R. S.

**Nitrogenous heterocyclic rings. XXIII. Reduced *lm-m*-benzodipyridine.** P. RUGGLI and A. STAUB (Helv. Chim. Acta, 1936, 19, 439—448; cf. this vol., 614).— $\text{m-C}_6\text{H}_4(\text{CH}_2\text{CH}\cdot\text{CO}_2\text{H})_2$  (I) and  $\text{HNO}_3$  1:51 at 0° give only 4-nitrophenylene-1:3-diacrylic acid (II), m.p. 268—269° (decomp.), reduced by  $\text{FeSO}_4\text{-aq. NH}_3$  or, better,  $\text{H}_2\text{-Ni}$  in AcOH at 40—50° to the 4- $\text{NH}_2$ -acid, decomp. > 300°. Absence of ring-closure proves the *trans*-nature of the ethylenic linking. The Me<sub>2</sub> ester (III) of (I) with  $\text{HNO}_3$  at -5° to 0° gives the Me<sub>2</sub> ester, m.p. 162° (Ac derivative, m.p. 215°), of (II), hydrogenation (Ni; aq. EtOH; 75°) of which gives 70% of Me 3-dihydrocarbostyryl-6-propionate, m.p. 134°, hydrolysed by acid or alkali to the corresponding acid, m.p. 234°. Hydrogenation (Ni; EtOH-EtOAc- $\text{H}_2\text{O}$ ) of (III) gives 95% of Me<sub>2</sub> *m*-phenylenedipropionate, m.p. 50—52°, converted by  $\text{HNO}_3$  (d 1:52) at > 0° into the 4:6- $(\text{NO}_2)_2$ -ester, m.p. 71°, which with  $\text{H}_2\text{-Ni}$  in EtOH-EtOAc- $\text{H}_2\text{O}$  gives by partial ring-closure Me 3-7-aminodihydrocarbostyryl-6-propionate, cryst. (Ac derivative, m.p. 245—246°). When heated at 250—270° or, better (90—100%), with conc. HCl, this gives 2:7-diketo-1:2:3:4:5:6:7:8-octahydro-*lm-m*-benzodipyridine [1':2':3':4'-tetrahydro-2'-pyridono-5':6'-6:7-dihydrocarbostyryl], sublimes at about 300°, which with HI-red P (not other reagents) at 185° yields 1:2:3:4:5:6:7:8-octahydro-*lm-m*-benzodipyridine [1':2':3':4'-tetrahydropyridino-5':6'-6:7-ar-tetrahydroquinoline] (IV), m.p. 114°, b.p. 210°/vac. [hydriodide, m.p. 307°; hydrochloride; Ac., m.p. 143°; Bz<sub>2</sub>, m.p. 209°, and  $(\text{NO}_2)_2$ -derivative, m.p. 187°; picrate, m.p. 210—215° (decomp. from 164—170°)], or, if less P is used, mainly the 2-keto-derivative of (I) [1':2':3':4'-tetrahydropyridino-5':6'-6:7-dihydrocarbostyryl], m.p. 234—235°.

R. S. C.

**Formation of heterocyclic compounds from thioacetocarbamic acid derivatives.** I. T. N. GHOSH (J. Indian Chem. Soc., 1936, 13, 86—93).—Dicarbethoxythioacetocarbamic acid (I) (A., 1934, 400) and  $\text{NHPh}\cdot\text{NH}_2$  (II) in EtOH give Et 3-keto-2-phenyl-2:3-dihydro-1:2:4-triazolyl-5-malonate, m.p. 203°, hydrolysed by 15% EtOH-KOH to the 5-acetic acid, m.p. > 300° (darkens at 280°), and thence by aq. 20% KOH to 3-keto-2-phenyl-5-methyl-2:3-dihydro-1:2:4-triazole, m.p. 210—212° (decomp.). (I) and  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  afford Et 3-carboxylimino-5-pyrazolone-4-carboxylate (+1.5 $\text{H}_2\text{O}$ ), m.p. 181°, hydrolysed (10% EtOH-KOH) to 3-carboxylimino-5-pyrazolone (+2 $\text{H}_2\text{O}$ ), m.p. > 300° (darkens at 250°) [4-CHPh derivative (+2 $\text{H}_2\text{O}$ ), resinifies slowly at > 280° (softens at 180°)], whilst acetylcarbethoxythioacetocarbamic acid (*loc. cit.*) and (II) give the pyrazolone,  $\text{NPh}\langle\text{NH}\cdot\text{C}\cdot\text{N}\cdot\text{CO}_2\text{H}$  185 186° (decomp.). Diacetylthioacetocarbamic acid (III) (*loc. cit.*) and  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  yield 3-keto-5-diacetylmethyl-

m.p. 70—71°, and thence (hydrolysis with 15% EtOH-KOH) 3-keto-5-acetylmethyl-, m.p. 228—230°, -2:3-dihydro-1:2:4-triazole. 4-Phenylthiosemicarbazide and (I) give the thioheptadiazine (IV),

m.p. 183° (decomp.), which with  $\text{Ac}_2\text{O}$  affords  $\text{PhNCS}$  and tar; S is not removed from (IV) by yellow  $\text{HgO}$ .  $\text{o-C}_6\text{H}_4(\text{NH}_2)_2$  and (I) in  $\text{AcOH}$  give *Et* 2-benziminazolylmalonate, m.p. 218°, hydrolysed (15% EtOH-KOH) to 2-methylbenziminazole; (III) similarly affords 2-diacetylmethylbenziminazole, m.p. 138—139° [hydrochloride, m.p. 243—244° (decomp.; turning green)], whilst (I) and  $\text{C}_2\text{H}_4(\text{NH}_2)_2$  yield *Et* 4:5-dihydro-2-glyoxalinylmalonate, m.p. 100—101°. H. B.

**Synthesis of glyoxaline derivatives from  $\alpha$ -oximinoketones.** 4-3'-Piperidylglyoxaline. E. OCHIAI and S. IKUMA (Ber., 1936, 69, [B], 1147—1151).—Production of glyoxaline derivatives by reduction of oximinoketones (I) in presence of KCNS is not practicable, since the catalyst becomes poisoned, but addition of KCNS to the reduced solution of (I) effects the desired change. Thus  $\text{OH}\cdot\text{N}\cdot\text{CAc}\cdot\text{CO}_2\text{Et}$  affords *Et* 2-thiol-4-methylglyoxaline-5-carboxylate, decomp. 229°, whilst  $\text{CMeAc}\cdot\text{N}\cdot\text{OH}$  gives 2-thiol-4:5-dimethylglyoxaline, m.p. about 270°. Replacement of  $\text{CNS}'$  by  $\text{CNO}'$  gives, respectively, *Et* 4-methylglyoxal-2-one-5-carboxylate, m.p. 220°, and 4:5-dimethylglyoxal-2-one, darkens at about 210°. *Et* oximinonicotylacetate yields *Et* 2-thiol-4-3'-pyridylglyoxaline-5-carboxylate (II), decomp. 230—231° (picrate, decomp. 192°; hydrochloride, decomp. 116°). *Et* 4-3'-pyridylglyoxal-2-one-5-carboxylate, decomp. 258°, is described. (II) is converted by 3%  $\text{H}_2\text{O}_2$  in presence of dil.  $\text{H}_2\text{SO}_4$  at 40° into *Et* 4-3'-pyridylglyoxaline-5-carboxylate, m.p. 198°; the corresponding acid, decomp. 248°, is decarboxylated at 260° to 4-3'-pyridylglyoxaline, m.p. 40—41° (hydrobromide, decomp. > 320°), the hydrochloride of which is hydrogenated (Pt) under pressure to non-cryst. 4-3'-piperidylglyoxaline, b.p. 200—250° (bath)/0.001 mm. (platinichloride, decomp. > 330°; monobenzoate, m.p. 192°). H. W.

**[Relation between] constitution and fluorescence of flavins.** P. KARRER and H. FRITZSCHE (Helv. Chim. Acta, 1936, 19, 481—483).—8-Methyl- and 6:8-dimethyl-9- $\beta$ -hydroxyethylisalloxazine (I) in  $\text{H}_2\text{O}$  or  $\text{COMe}_2$  show brownish-yellow fluorescence in ultra-violet light, but none in daylight, and thus differ markedly from the alloxazines, although Me next to the N-ring has the same qual. effect in both series. Diazotisation of 5-nitro-*m*-4-xylylidine at 0° and treatment with Cu first at room temp. and then at 100° gives 67.8% of 4-chloro-5-nitro-*m*-xylene, m.p. 51°, which with  $\text{NH}_2\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$  in hot  $\text{C}_5\text{H}_5\text{N}$  gives 5-nitro-N- $\beta$ -hydroxyethyl-1:3:4-xylylidine, m.p. 51°. Reduction with  $\text{Na}_2\text{S}_2\text{O}_4$  in aq. EtOH, followed by reaction with alloxan, affords (I), m.p. 268° (uncorr.; decomp.) after sintering from 258°. R. S. C.

**Syntheses in the flavin series.** P. KARRER and F. M. STRONG (Helv. Chim. Acta, 1936, 19, 483—493).—Attempts to synthesise flavins with 2 Me in positions other than 6 and 7 failed. 4-Nitro-N-carb-

ethoxy-1:2:3-xylylidine (prep. by  $\text{ClCO}_2\text{Et}$  in  $\text{CHCl}_3$ ), m.p. 115°, with  $\text{H}_2$ -Pt-black in EtOH gives 3-carb-ethoxyamino-1:2:4-xylylidine, m.p. 127—129°, which by condensation with *l*-arabinose (I) in dry MeOH, followed by hydrogenation (Ni; 80°/25 atm.) gives 4-1-1'-arabamino-N-carboethoxy-1:2:3-xylylidine, m.p. 182°. With 2.5*N*-KOH at 70° this gives nearly quantitatively 2-hydroxy-1-*l*-arabityl-4:5-dimethylbenziminazole, m.p. 247—248°. 5-Nitro-*m*-xylene (modified prep.) with  $\text{H}_2$ -PtO<sub>2</sub> in EtOH gives *s*-m-xylylidine, b.p. 97—98°/12 mm., converted by conc.  $\text{HNO}_3$ - $\text{H}_2\text{SO}_4$  at 0—5° into 6- (II), m.p. about 45° (lit. 54°; converted by reduction and condensation with alloxan into a fluorescent solution of an alloxazine), and 4-nitro-*s*-m-xylylidine, m.p. 136° (gives no alloxazine). The  $\text{CO}_2\text{Et}$ -derivative, m.p. 61.5°, of (II) is hydrogenated ( $\text{PtO}_2$ ; EtOH) to 5-carboethoxy-amino-1:3:4-xylylidine, m.p. 116°, which gives only a trace of N-*d*-ribityl derivative, m.p. 164°, whence no flavin could be obtained. N-*d*-1'-Arabityl-1:3:4-xylylidine, m.p. 145°, and  $\text{PhN}_2\text{Cl}$  give the phenyldiazamino-compound, decomp. 150°. (I) and (II) in MeOH at 105—115° give the Schiff's base, m.p. 165—166°, which by hydrogenation (Ni; 60°; MeOH) and condensation with alloxan and  $\text{H}_3\text{BO}_3$  gives only a trace of flavin. R. S. C.

**Photochemical bleaching of chlorophyll.** K. WEBER (Ber., 1936, 69, [B], 1026—1031).—Diethyl-allyl- and diallyl-thiocarbamide are powerful acceptors in the photochemical bleaching of chlorophyll (I) in presence of air; phenylallylthiocarbamide and allylthiosemicarbazide are about as efficient as thiosinamine, whereas hydrazine-*NN'*-dithiocarbonyl-amine is less powerful.  $\text{FeSO}_4$  is active in neutral or feebly acid solution. In absence of acceptor the rate of bleaching is slow; it increases rapidly in the presence of small amounts of acceptor, attains a max., and then diminishes approx. logarithmically with increasing acceptor concn. In all cases there is a marked induction period. The rate depends little on temp. Bleaching is greatly inhibited by quinol, toluquinol, *p*-benzoquinone, toluquinone, thymoquinone, *p*- $\text{C}_6\text{H}_4(\text{OMe})_2$ ,  $\text{PhOH}$ , *m*- $\text{C}_6\text{H}_4(\text{OH})_2$ , *o*- $\text{C}_6\text{H}_4(\text{OH})_2$ , *s*- $\text{C}_6\text{H}_3(\text{OH})_3$ , thymol, *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$ ,  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{OH}$ ,  $\text{NHPh}_2$ ,  $\text{NH}_2\text{Ph}$ , and KI. Acceptors and inhibitors, except KI, do not extinguish fluorescence. The phenomena are explained by the hypothesis that the mol. of (I) activated by a light quantum brings the acceptor into an active state in which it combined with a mol. of  $\text{O}_2$  giving a peroxide which then oxidises (I). Induction and photochemical after-effect are due to the long life-period of the intermediate peroxide. With high concn. of acceptor (I) is stabilised by the reaction  $\text{AO}_2 + \text{A} \rightarrow 2\text{AO}$ . H. W.

**Magnetic properties and structure of hæmoglobin, oxyhæmoglobin, and carboxyhæmoglobin.** L. PAULING and C. D. CORYELL (Proc. Nat. Acad. Sci., 1936, 22, 210—216; cf. this vol., 616).—Magnetic measurements show that the two last-named contain no unpaired electrons; thus the  $\text{O}_2$  mol., with two unpaired electrons, undergoes a profound change in electronic structure on attachment to hæmoglobin (I). The magnetic susceptibility of (I) corresponds

with an effective magnetic moment of 5.46 Bohr magnetons per heme (Fe-porphyrin complex). This shows the presence of 4 unpaired electrons per heme, and indicates that the heme-heme interaction tends to stabilise the parallel configuration of the moments of the 4 hemes in the mol. The linkings from Fe to surrounding atoms are ionic in (I), and covalent in the other two compounds. N. M. B.

**Nucleic acids. V. Hydrolytic fissions of yeast nucleic acid.** H. BREDERECK and G. RICHTER (Ber., 1936, 69, [B], 1129—1133).—Hydrolysis of yeast nucleic acid with boiling  $H_2O$  gives *guanine-uridylic acid* (I),  $C_{14}H_{16}O_8N_4P$ , the individuality of which is established by analysis, production essentially of guanine (II) when treated with HCl in MeOH, hydrolysis by 3.8%  $H_2SO_4$  to guanine sulphate and uridylic acid (III) (isolated as the brucine salt) and by 3% NaOH to (II) and (III), and separation of (II) under the action of almond emulsin at  $pH$  4.9. The possibility of the presence of a mixture of (II) and (III) is excluded, since the material is relatively freely sol. in  $H_2O$  and the solution does not yield guanine

picrate or brucine uridylylate. Since (I) is monobasic acid (phenolphthalein) the union of (II) and (III) must occur through the  $PO_4$  group. Further, since de-amination of (I) and subsequent hydrolysis with dil.  $H_2SO_4$  affords (II) and (III), the  $NH_2$  of (II) is not free, but linked to the  $PO_4$  of (III). Hence (I) has the above constitution. Examination of the filtrate from (I) shows the presence of (II), adenine, (III), cytidylic acid, ribose, and  $H_3PO_4$ . H. W.

**Carbamide-formaldehyde condensation products.** H. KADOWAKI (Bull. Chem. Soc. Japan, 1936, 11, 248—261).—Many cryst. condensation products are isolated.  $CH_2O$  (1 mol.) and  $CO(NH_2)_2$  (8 mols.) in dil. HCl under defined conditions give *methylenebiscarbamide* (I),  $CH_2(NH-CO-NH_2)_2$ , m.p. 218° (decomp.) (Ac. derivative, m.p. 156°), which with a trace of HCl in  $H_2O$  gives *trimethylenetetra-*, m.p. 230° (decomp.), and *pentamethylenehexa-carbamide*, m.p. 236° (decomp.),  $NH_2-CO-NH-[CH_2-NH-CO-NH]_x-H$  ( $x=3$  and 5, respectively). (I) and  $CH_2O$  with a trace of  $Ba(OH)_2$  give, according to the conditions,  $\omega$ -*hydroxymethyl-* ("methylolmethylenedicarbamide"), solid, and  $\omega\omega'$ -*di(hydroxymethyl)-methylenedicarbamide* ("methylenebismethylolcarbamide") (II), m.p. 228° (decomp.),  $OH-CH_2-NH-CO-NH-CH_2-NH-CO-NHR$  ( $R=H$  and  $-CH_2-OH$ , respectively). Methylcarbamide,  $CH_2O$ , and HCl give similarly the  $\omega\omega'$ - $Me_2$  derivative, m.p. 184° of (I) ("methylenebismethylcarbamide"). *N*-Hydroxymethylcarbamide ("methylolcarbamide") (III) with MeOH or EtOH and a trace of HCl gives the *Me*, m.p. 91°, and *Et ether*, m.p. 111°. *NN'*-*Di*(hydroxymethyl)carbamide ("dimethylolcarbamide") (IV) gives similarly the *Me*., m.p. 101°, *Et*., m.p. 124°, *Pr*., m.p. 95°, *Bu*.,

m.p. 93°, *di-n-amyl*, m.p. 84°, and *dibenzyl ether*, m.p. 112°, and with SHEt and a little HCl *NN'*-*di*(ethylthiolmethyl)carbamide, m.p. 108.5°. (II) gives similarly the *Me\_2 ether*, m.p. 240° (decomp.).  $CH_2O$  (1 mol.) and carbamide (8 mols.) in dil. HCl at about  $-5^\circ$  give  $\omega\omega'$ -*di*(methoxymethyl)trimethylenetetra-carbamide,  $OMe-CH_2-[NH-CO-NH-CH_2]_3-OMe$ , solid. (III) and acid  $H_2O_2$  give a *peroxide*, m.p. 163°. (IV) with neutral  $H_2O_2$  gives a liquid *peroxide*, with  $H_2O_2$  and acid a cryst. *peroxide*, but with slightly acid  $H_2O_2$  a polymeric, amorphous *peroxide*,  $CO(NH-CH_2-O_2-CH_2-NH-CO-NH-CH_2-O_2H)_2$ . When  $CH_2O$  (4 mols.) and carbamide (1 mol.) are condensed in aq.  $Ba(OH)_2$  and then treated with MeOH and HCl, there is obtained 3 : 5-*di*(methoxymethyl)urone [4-*keto*-3 : 5-*di*(methoxymethyl)tetrahydro-1 : 3 : 5-oxadiazine] (V), b.p. 82—83°/0.1 mm. (the hypothetical 4-*keto*-tetrahydro-1 : 3 : 5-oxadiazine,  $O<\begin{smallmatrix} CH_2-NH \\ CH-NH \end{smallmatrix}>CO$ , is termed "urone"), which with SHEt and a little HCl gives 3 : 5-*di*(ethylthiolmethyl)urone [4-*keto*-3 : 5-*di*(ethylthiolmethyl)tetrahydro-1 : 3 : 5-oxadiazine], m.p. 59°. *N*-Methyl- and -ethyl-carbamide lead similarly to 3-methyl-5-methoxymethyl-, b.p. 89—90°/0.2 mm., and -5-ethylthiolmethyl-, b.p. 122—125°/1 mm., 3-ethyl-5-methoxymethyl-, b.p. 91—93°/1 mm., and -5-ethylthiolmethyl-urone, m.p. 15.5°, b.p. 110—113°/1 mm. [4-*keto*-3-methyl-5-methoxymethyltetrahydro-1 : 3 : 5-oxadiazine etc.];  $CO(NHMe)_2$  gives 3 : 5-*dimethyl*-urone [4-*keto*-3 : 5-*dimethyl*tetrahydro-1 : 3 : 5-oxadiazine], m.p. 38.5°, and tetramethyldimethylenediureide,  $CO<\begin{smallmatrix} NMe-CH_2-NMe \\ NMe-CH_2-NMe \end{smallmatrix}>CO$ , m.p. 258° (also obtained in acid solution);  $NH_2-CO-NMe_2$  gives *N,N*-dimethyl-*N'*-methoxymethylcarbamide, m.p. 65°; (I) gives 3 : 3'-methylenebis-5 : 5'-dimethoxymethylurone [*bis*-4-*keto*-5 : 5'-*di*(methoxytetrahydro-1 : 3 : 5-oxadiazine)],

$CH_2\left[N<\begin{smallmatrix} CH_2-O \\ CO-N-CH_2-OMe \end{smallmatrix}>CH_2\right]$ , a gum. (II), its  $Bu_n$ , diamyl, and  $(CH_2Ph)_2$  ethers, when heated, give transparent resins with great resistance to  $H_2O$ . 20 photomicrographs are given. R. S. C.

**Thiazolinephenols. Synthesis and proof of structure.** J. B. NIEDERL, W. F. HART, and J. V. SCUDI (J. Amer. Chem. Soc., 1936, 58, 707—708).—Allylthiocarbimide (0.5 mol.), PhOH (1 mol.), and conc.  $H_2SO_4$  (1 mol.) at 0—5° (24 hr.) and then at room temp. (3 days) give 2-*p*-hydroxyphenyl-5-methylthiazoline, m.p. 166—168° (hydrochloride, m.p. 187°; picrate, m.p. 178°), oxidised ( $KClO_3$ , dil. HCl) to *p*-OH-C<sub>6</sub>H<sub>4</sub>-CO<sub>2</sub>H and  $NH_2-CH_2-CHMe-SO_3H$ . 2-4'-Hydroxy-2'-methylphenyl-, m.p. 131° (hydrochloride, m.p. 175°; picrate, m.p. 154°), 2-4'-hydroxy-3'-methoxyphenyl-, m.p. 142° (hydrochloride, m.p. 187°; picrate, m.p. 159—160°), and 2-2' : 4'-dihydroxyphenyl-, m.p. 184° (hydrochloride, m.p. 251°; picrate, m.p. 190°), -5-methylthiazolines are similarly prepared from *m*-cresol, guaiacol, and *m*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub>, respectively. H. B.

**Thiazoles. XXII. Synthesis of some 6-methoxy- and 5:6-dimethoxy-benzthiazoles and of certain dyes obtainable therefrom.** M. G. ASF and M. T. BOGERT (Rec. trav. chim., 1935, 54, 917—930).—*p*-OMe·C<sub>6</sub>H<sub>4</sub>·NH<sub>2</sub>·HCl and S<sub>2</sub>Cl<sub>2</sub> give a condensation product, m.p. 168—168.5° (corr.) (decomp.), hydrolysed by NaHCO<sub>3</sub>·Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> to 2-amino-5-methoxythiophenol, m.p. 110° [Na and Zn (I) salt; Bz<sub>2</sub> derivative, m.p. 162—162.5° (corr.)], yields 1-phenyl-5-methoxybenzthiazole, m.p. 114—114.5° (cf. lit.). (I) with AcOH and *p*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·COCl (II) gives 1-*p*-nitrophenyl-5-methoxybenzthiazole (III), m.p. 215—216.5° (corr.). The corresponding *m*-NO<sub>2</sub>-compound, m.p. 161.5—162.5° (corr.), similarly prepared, was obtained together with a trace of 1-*m*-nitrophenyl-5-methoxychlorobenzthiazole, m.p. 199.5—200.5° (corr.). (I) and *o*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CHO give a compound, m.p. 123.5—124.5° (corr.), reduced by SnCl<sub>2</sub> to a compound, m.p. 108.5—109.5° (corr.); these were not investigated further. (III) when refluxed with SnCl<sub>2</sub>·AcOH·HCl yields 1-*p*-aminophenyl-5-methoxybenzthiazole, m.p. 195—196° [corresponding *m*-NH<sub>2</sub>-derivative, m.p. 128.5—129.5° (corr.)]. (I) with *p*-NMe<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CHO·AcOH affords 1-*p*-dimethylaminophenyl-5-methoxybenzthiazole (III), m.p. 181.5—182.5° (corr.). 6:6'-Dinitro-3:4:3':4'-tetramethoxydiphenyl disulphide (V), m.p. 232—232.5° (corr.) (cf. lit.), prepared from 4:5-dinitroveratrole, Na<sub>2</sub>S, S, and MeOH, when treated with Zn·AcOH gives a solution of Zn 2-amino-4:5-dimethoxyphenyl mercaptide (VI), which with (II) gives an amorphous product (VII), m.p. 238.5—239.5° (corr.), reduced by SnCl<sub>2</sub>·HCl·AcOH to 1-*p*-amino-4:5-dimethoxybenzthiazole, m.p. 224.5—225.5° (corr.) [the corresponding *o*-, m.p. 196.5—197.5° (corr.), and *m*-amino-compound, m.p. 206—206.5° (corr.)]. (VI) and (II) with anhyd. NaOAc gives a cryst. product, which on heating to 190—195° or attempted crystallisation is converted into (VII). (V) when boiled with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>, NaOH, and H<sub>2</sub>O and then treated with BzCl at room temp. gives dibenzoyl-2-amino-4:5-dimethoxythiophenol, m.p. 149.5—150° (corr.), converted by hot AcOH·NaOAc into 1-phenyl-4:5-dimethoxybenzthiazole, m.p. 149—150°; 1-*o*-, m.p. 162—163.5° (corr.), and 1-*m*-, m.p. 186—187° (corr.), -nitrophenyl-4:5-dimethoxybenzthiazole were similarly prepared. (VI) and *p*-NMe<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CHO give 1-*p*-dimethylaminophenyl-4:5-dimethoxybenzthiazole, m.p. 231—232°. This and (IV) when methylated yield 1-*p*-dimethylamino-4:5-dimethoxy-, m.p. 221—224° (corr.), and -5-methoxy-, m.p. 217.5—218.5° (corr.), -benzthiazole methiodide, respectively, which are thioflavine dyes, unstable to light or washing. Chloramine-yellows were obtained by treating the aminobenzthiazoles described with H<sub>2</sub>SO<sub>4</sub>·SO<sub>3</sub> and the resulting sulphonic acid with NaOCl. The tinctorial properties of the dyes are described. H. G. M.

**Cyanine dyes. VIII. Synthesis of 8-methyltrimethinethiocyanine derivatives and the reactivity of the 8-methyl group.** T. OGATA (Bull. Chem. Soc. Japan, 1936, 11, 262—264).—The following are prepared from the appropriate 2-methylbenzthiazole ethiodide and Ac<sub>2</sub>O·HCO<sub>2</sub>K (A) or Ac<sub>2</sub>O·KOAc (B) at 150—165°, the data in parentheses being,

respectively, method, yield, and sensitisation max. in mμ: 1:1'-diethyl- (A, 1934, 422) (A), 1:1'-diethyl-8-methyl- (B, 30%), m.p. 286° (decomp.) (580), 1:1':4:4':8-pentamethyl- (B, 20%), m.p. 279° (decomp.) (580), and 8-methyl-1:1'-diethyl-3:4:3':4'-dibenzo- (B, 70%), m.p. 293° (decomp.) (600), -trimethinethiazolocyanine iodide [all as (C)]. The 8-Me

derivatives condense with aldehydes and piperidine to give the corresponding 8-2-substituted vinyl compound, and thus are obtained: 1:1'-diethyl-8-β-furylvinyl-, m.p. 277° (decomp.) (C, R'=CH:CH·C<sub>4</sub>H<sub>3</sub>O), -8-styryl- (R'=CH:CHPh), m.p. 266° (decomp.) (600), and -8-*p*-dimethylaminostyryl-, m.p. 252° (decomp.) (600), -trimethinethiazolocyanine iodide; 1:1'-diethyl-8-styryl-, m.p. 265° (decomp.), and -8-*p*-dimethylaminostyryl-, m.p. 288°, -3:4:3':4'-dibenzotrimethinethiazolocyanine iodide, and 1:1':4:4'-tetramethyl-8-*p*-dimethylaminostyryltrimethinethiazolocyanine iodide, m.p. 292° (decomp.). J. W. B.

**Alkaloids of Heliotropium lasiocarpum. V. Lasiocarpine.** G. MENSCHIKOV and J. SCHDANOVITSCH (Ber., 1936, 69, [B], 1110—1113; cf. A., 1932, 865).—Lasiocarpine (I) is hydrolysed by boiling 2% NaOH to heliotridine and angelic acid. Hydrogenation (PtO<sub>2</sub> in 0.5*N*-HCl) of (I) affords lasiocarpic acid, C<sub>8</sub>H<sub>16</sub>O<sub>5</sub>, m.p. 95—97°, [α]<sub>D</sub>+10.6° in EtOH, which contains 2 OH (Zerevitinov) and 1 OMe, and a non-cryst. base, C<sub>13</sub>H<sub>23</sub>O<sub>2</sub>N, b.p. 123—125°/8 mm., [α]<sub>D</sub>+3.8° in EtOH (picrate, m.p. 157—159°), hydrolysed by KOH·EtOH to hydroxyheliotridane and CHMeEt·CO<sub>2</sub>H. H. W.

**Electrolytic reduction of vasicine.** K. S. NARANG and J. N. RAY (J.C.S., 1936, 686—688).—In reply to Spath and Platzer (this vol., 489), the reduction of *B* (cf. A., 1935, 765) for 5 hr. gives a base, C<sub>11</sub>H<sub>12</sub>ON<sub>2</sub>, m.p. 115°, whilst similar reduction of vasicine (I) gives a base, C<sub>11</sub>H<sub>14</sub>ON<sub>2</sub> [picrolonate, m.p. 165—168° (decomp.)], the first addition of H taking place at N:C in the middle ring. Reduction of (I) for a longer period yields a base, C<sub>11</sub>H<sub>12</sub>N<sub>2</sub>, m.p. 92° [picrolonate, m.p. 224—228° (decomp.)]. The constitution of the various reduction products of (I) is discussed, and the structure assigned previously to (I) is confirmed. F. R. S.

**Identity of tazettine from Narcissus tazetta, L., with "base VIII," from Lycoris radiata, Herb.** E. SPATH, H. KONDO, and F. KUFFNER (Ber., 1936, 69, [B], 1086—1087).—Tazettine is identical with Kondo's "base VIII" (J. Pharm. Soc. Japan, 1932, 52, 51) which is therefore, C<sub>18</sub>H<sub>21</sub>O<sub>5</sub>N; it has [α]<sub>D</sub><sup>18</sup>+165.1° in CHCl<sub>3</sub>. Their identity with unergine (Norkina et al., this vol., 618) is probable. H. W.

**Tobacco alkaloids. VII. New synthesis of di-anabasine.** E. SPATH and L. MAMELI (Ber., 1936, 69, [B], 1082—1085).—1-Benzoylpiperidone, m.p. 110—112°, from piperidone and Bz<sub>2</sub>O at 180°, is condensed with Et nicotinate by NaOEt in C<sub>6</sub>H<sub>6</sub> at 110—115° to anabaseine, C<sub>10</sub>H<sub>12</sub>N<sub>2</sub>, b.p. 110—120°

(bath)/1 mm. [*dipicrate*, m.p. 174° (vac.; slight decomp.)], which is reduced (Pd-C in 3% AcOH) to *dl*-anabasine, identical with that obtained by racemisation of the natural base. The *dipicolonate* has m.p. 258—259°. H. W.

**Lupin alkaloids. IX. Synthesis of 5:5'-dimethylidi(1:2)pyrrolidine.** G. R. CLEMO and T. P. METCALFE (J.C.S., 1936, 606—607).—*Et* 2-methylpyrrole-5-acetate, b.p. 129—130°/12 mm., obtained from 2-methylpyrrole and  $\text{CHN}_2 \cdot \text{CO}_2\text{Et}$ , is reduced ( $\text{PtO}_2\text{--H}_2$ ) to the *-pyrrolidine* compound, b.p. 98°/12 mm. (*picrate*, m.p. 112°; *picolonate*, m.p. 194°), which condenses with  $\text{CHMeBr} \cdot \text{CO}_2\text{Et}$  to *Et* 2-methylpyrrolidine-5-acetate-1- $\alpha$ -propionate, b.p. 150—151°/12 mm. This ester with K forms 4-keto-5:5'-dimethylidi(1:2)pyrrolidine, b.p. 65°/1 mm. (*picrate*, m.p. 186°; *picolonate*, m.p. 217°), which is reduced (Zn-HCl) to the 4-hydroxy-compound, b.p. 68—70°/1 mm. (*picolonate*, m.p. 205°) but with  $\text{N}_2\text{H}_4$  affords 5:5'-dimethylidi(1:2)pyrrolidine, b.p. 25°/1 mm. (*picrate*, m.p. 249°; *picolonate*, m.p. 180°).

F. R. S.

**Hydrobromoquinine.** J. K. PODLEWSKI and J. SUSZKO (Rec. trav. chim., 1936, 55, 392—400; cf. this vol., 490).—Quinine hydrochloride with 38% HBr-AcOH at 80° affords a partly racemised mixture of *hydrobromoquinine dihydrobromide* (A), m.p. 223—225° (decomp.),  $[\alpha]_D^{20}$  -140° to -150° in  $\text{H}_2\text{O}$  (*dinitrate*, decomp. 180—210°,  $[\alpha]_D^{20}$  -150° to -170° in  $\text{H}_2\text{O}$ ). With 48% aq. HBr-10%  $\text{NaNO}_2$  or 10%  $\text{NaOAc}$  (A) gives the *monohydrobromide*, m.p. 200—210° (decomp.). Crystallisation from  $\text{C}_6\text{H}_6$  of the bases liberated by the action of aq.  $\text{NH}_3$  on (A) affords plates of  $\text{C}_{20}\text{H}_{25}\text{O}_2\text{N}_2\text{Br}$ ,  $+\text{C}_6\text{H}_6$ , m.p. 103°, resolidifying and decomp. at 140°,  $[\alpha]_D^{20}$  -130° to -150°, and needles, decomp. 140°,  $[\alpha]_D^{20}$  -115° to -140°, of the solvent-free base. Both cryst. forms give a mixture of  $\beta$ -isoquinine and niquine when hydrolysed with KOH-EtOH. Separation of the stereoisomerides is effected by fractional crystallisation of the  $\text{Et}_2\text{O}$  extract of (A) basified with 10% NaOH, which affords *hydrobromoquinine-II*, m.p. 166—167° (decomp.),  $[\alpha]_D$  -200° in EtOH- $\text{CHCl}_3$  [*metho-p-toluenesulphonate*, m.p. 145—155° (decomp.),  $[\alpha]_D^{20}$  -114° in EtOH, and  $\text{CH}_3\text{PhBr}$  additive salt, m.p. 185—190° (decomp.),  $[\alpha]_D$  -142° in EtOH], and, from the  $\text{Et}_2\text{O}$  mother-liquor, *hydrobromoquinine-I*, solvent-free, m.p. 160—162° (decomp.),  $[\alpha]_D^{20}$  -182° to -186°, and  $+\text{C}_6\text{H}_6$ ,  $[\alpha]_D^{20}$  -50° in EtOH- $\text{CHCl}_3$  [*metho-p-toluenesulphonate*,  $+\text{H}_2\text{O}$  and anhyd., m.p. 193—194° (decomp.),  $[\alpha]_D^{20}$  -59° in EtOH, and  $\text{CH}_3\text{PhBr}$  additive salt, m.p. 185—190° (decomp.),  $[\alpha]_D^{20}$  -95° in EtOH]. When heated with 3% KOH-EtOH, base-I gives only  $\beta$ -isoquinine, and base-II gives only niquine. Base-I and -II are stereoisomeric *tert.* bases. J. W. B.

**Alkaloids of white hellebore. II. Isolation of alkaloids from the so-called resinous matters.** K. SAITO and H. SUGINOME. **III. Constitution of jervine.** K. SAITO and M. TAKAOKA (Bull. Chem. Soc. Japan, 1936, 11, 168—171, 172—176).—II. Extraction of the resin remaining after EtOH-extraction of the roots (A., 1934, 422) with dil. AcOH affords a sol. portion from which jervine (I) is isolated,

and an insol. portion (2.5% of roots). Prolonged  $\text{Et}_2\text{O}$ -extraction of the latter removes 18%, from which ligroin (b.p. 40—60°) dissolves 19% of fats leaving an insol. *substance*, m.p. 262° (decomp.). From the  $\text{Et}_2\text{O}$ -insol. residue are isolated phenolic substances, sol. acids including angelic and an *acid*, m.p. 102°, and alkaloids from which more (I) (total yield 0.6% of roots) is obtained.

III. Pure (I), m.p. 243.5—244.5° (bath preheated to 180°),  $[\alpha]_D^{20}$  -150° in EtOH, with  $\text{CH}_2\text{N}_2$  or MeI-KOH-EtOH gives its N-Me derivative,  $+\text{H}_2\text{O}$  and anhyd., m.p. 201—202° [*methiodide*, m.p. about 247°, by MeI at 100°; *methochloride*, m.p. 252° (decomp.); Ac derivative, m.p. 186—187°, and with  $\text{NaNO}_2$ -AcOH a NO-derivative, m.p. 251—252° (decomp.). (I) with  $\text{Ac}_2\text{O}$  at room temp. affords its N-Ac derivative,  $+\text{H}_2\text{O}$  and anhyd. (II), m.p. 161—162° (decomp.), and with boiling  $\text{Ac}_2\text{O}$  an ON-Ac<sub>2</sub> derivative, m.p. 176—177°, hydrolysed by 0.1N-NaOH-EtOH to (II). In agreement with these data (I) contains 2 active H (Zerevitinov) and is represented by the partial formula (A).

**Alkaloids of *Holarrhena antidysenterica*. IV. Occurrence of two further new bases in the bark of Indian *Holarrhena* and their relationship to conessine and holarrhimine.** S. SIDDIQUI. **V. Holarrhimine.** S. SIDDIQUI and R. H. SIDDIQUI (Proc. Indian Acad. Sci., 1936, 3, A, 249—266; 257—260).—IV. From the mother-liquor of holarrhimine sulphate (A., 1933, 289) are isolated (insolubility of their hydrochlorides in 10% HCl and fractional crystallisation from ligroin) *conamine* (I),  $\text{C}_{22}\text{H}_{36}\text{N}_2$ , probably  $\text{C}_{21}\text{H}_{31}(\text{NMe})\text{NH}_2$ , m.p. 130°,  $[\alpha]_D^{20}$  -19° in EtOH, converted by heating to dryness into a *substance*, m.p. 220—240°, and *conarrhimine* (II), (?)  $\text{C}_{21}\text{H}_{31}(\text{NH})\text{NH}_2$ . The latter was not obtained pure since it forms eutectic mixtures, of sharp m.p. 160° and m.p. 175°, with holarrhimine (III), into which they are converted completely by heating with moist EtOAc. These observations may explain the isolation of kurchicine (Ghosh *et al.*, A., 1928, 1265). The presence of (II) was established by the isolation of *nitrosohydroxyapoconarrhimine*,  $\text{C}_{21}\text{H}_{31}(\text{N}\cdot\text{NO})\cdot\text{OH}$ , sinters 145°, m.p. 160—163° [together with  $\text{C}_{21}\text{H}_{31}(\text{OH})\text{NMe}$  from (I) and  $\text{C}_{21}\text{H}_{31}(\text{OH})_3$  from (III)], by the action of  $\text{HNO}_2$  on the mother-liquor from (I). Contrary to earlier statements (*loc. cit.*) (III) contains 5 active H atoms,  $\text{C}_{22}\text{H}_{31}(\text{NH}_2)_2(\text{OH})$ , and is converted by 40%  $\text{CH}_3\text{O}\cdot\text{HCO}_2\text{H}$  into *tetra-N-methylholarrhimine*, m.p. 233—235°,  $[\alpha]_D^{20}$  -45.5° in EtOH (also obtained by direct methylation of the total bases from *Holarrhena* bark) [*hydrochloride*, m.p. 315—316° (decomp.); *hydriodide*, m.p. 302—303° (decomp.); *hydrobromide*, m.p. 306—307°; *picrate*, sinters 225°, m.p. 272—275°; *platinichloride*, m.p. 251—252°; *monomethiodide*, m.p. 286—287° (decomp.); Bz, m.p. 176° [*hydrochloride*, shrinks 163°, m.p. 237—238° (decomp.); *picrate*, evolves  $\text{H}_2\text{O}$  at 105—160°, decomp. 205—210°], and Ac derivative, softens 134°, m.p. 139—140° [*hydrochloride*, decomp. 230—273°; *picrate*, evolves  $\text{H}_2\text{O}$  at 105°, m.p. 160°, decomp. 202—205°]]. (II) is pro-

bably the parent of the alkaloid constituents of *H. antidyenterica*.

V. With  $\text{BzCl}$  (4 mols.)- $\text{C}_5\text{H}_5\text{N}$  (III) gives a  $\text{Bz}_3$  derivative, m.p. 269—270°, and, from the mother-liquor, a  $\text{Bz}_2$  derivative, decomp. 115°, and with  $\text{Ac}_2\text{O}$ - $\text{NaOAc}$ , a  $\text{Ac}_3$  derivative,  $+\text{H}_2\text{O}$  and anhyd., m.p. 249—250°. (III) contains 1 double linking and with  $\text{Br}-\text{CHCl}_3$  a dibromide, m.p. 290—295° [m.p. 226—228° (decomp.) after liberation from its solution in  $\text{AcOH}$  by  $\text{NaOH}$ ], is obtained. With  $\text{MeI}-\text{CHCl}_3$  (III) gives a dimethiodide, m.p. 279°, converted (loss of  $\text{HI}$  and  $\text{MeOH}$ ) by aq.  $\text{NH}_3$ ,  $\text{NaOH}$ , or  $\text{AgOH}$  into methylholarrhimine, m.p. 170° [hydrochloride, m.p. 266° (decomp.)]; platinichloride, m.p. 245° (decomp.); picrate, m.p. 205°]. J. W. B.

**Structure of strychnine. III. Strychninolone and its derivatives.** M. KOTAKE and T. MITSUWA (Bull. Chem. Soc. Japan, 1936, 11, 231—238).—Oxidation of strychnine ( $\text{KMnO}_4$ - $\text{COMe}_3$ ) affords dihydrostrychnine,  $+\text{MeOH}$ ,  $+2.5\text{H}_2\text{O}$ , and solvent-free, decomp. 100°, resolidifies, shrinks at 155°, m.p. 240° (hydrochloride, decomp. 212°; methiodide, m.p. 322°). Fractional crystallisation of Leuchs' strychninolone- $\alpha$  (I), m.p. 228—230°, from  $\text{MeOH}$  separates it into strychninolone- $\alpha$  (II), m.p. 224° ( $\text{Ac}$  derivative, m.p. 240—243°), and - $\beta$ , m.p. 240° (less sol.) ( $\text{Ac}$  derivative, m.p. 253°), both  $\text{C}_{19}\text{H}_{18}\text{O}_3\text{N}_2$  (different positions of double linking) and both reduced by  $\text{Pd}-\text{H}_2$  to the same  $\text{H}_2$ -derivative m.p. 274°. (II) with 10%  $\text{KOH}$  gives isomeric strychninolone- $\gamma$  (III), m.p. 254° ( $\text{Ac}$  derivative, m.p. 260°), which gives a different  $\text{H}_2$ -derivative, and is probably formed by  $\text{OH}$ -migration. (I) with  $\text{NaOEt}-\text{EtOH}$  gives strychninolone- $\delta$  (IV),  $+3\text{H}_2\text{O}$ , and anhyd., m.p. 285—286° (decomp.) ( $\text{Ac}$  derivative,  $+\text{H}_2\text{O}$ , m.p.  $>340^\circ$ ; not reduced by  $\text{Pd}-\text{H}_2$ ), and (I) with  $\text{NH}_3$ - $\text{MeOH}$  gives, by fractional crystallisation of the product from  $\text{H}_2\text{O}$ , (III) and strychninolone- $\epsilon$  (V),  $+\text{H}_2\text{O}$  and anhyd., m.p. 240—243° ( $\text{Ac}$  derivative, m.p. 214—215°;  $\text{H}_2$ -derivative,

m.p. 257°). Oxidation of (I) with  $\text{CrO}_3$ - $\text{AcOH}$  gives strychninone, m.p. 273° (yellow solution in alkali, repptd. by  $\text{CO}_2$ ), and dihydrostrychninolone- $\alpha$  similarly gives dihydrostrychninone, m.p. 314° (colourless solution in alkali, not repptd. by  $\text{CO}_2$ ). The structural implications of these results are discussed, the partial formulæ above being suggested. J. W. B.

**Iodo-derivatives of brucine.** G. SOLLAZZO (Boll. Chim. farm., 1936, 75, 213—219).—The compounds  $\text{C}_{23}\text{H}_{27}\text{O}_4\text{N}_2\text{I}_3$ , new m.p. 239—241°, and  $\text{C}_{23}\text{H}_{27}\text{O}_4\text{N}_2\text{I}_4$ , and the compound  $\text{C}_{23}\text{H}_{27}\text{O}_4\text{N}_2\text{I}_3 \cdot 3\text{H}_2\text{O}$ , are prepared from brucine and I in  $\text{EtOH}$  under varying conditions. E. W. W.

**Organic compounds of germanium.** K. BURSCHKIES (Ber., 1936, 69, [B], 1143—1146).—Sulphides,  $\text{S}(\text{GeR}_3)_2$ , are obtained by heating the appropriate bromide with  $\text{Na}_2\text{S}$  alone or in  $\text{EtOH}$ ;

$\text{R}=\text{Ph}$ , m.p. 138°; *tolyl*, m.p. 156—157°;  $\text{CH}_2\text{Ph}$ , m.p. 124°;  $\text{C}_6\text{H}_4\text{Ph}$ , m.p. 238°, cyclohexyl, m.p. 87—88°; *Et*, b.p. 148—150°/12 mm. They are well-cryst. compounds with sharp m.p. and completely insol. in alkali. *Ge tetra- $\beta$ -phenylethyl*, m.p. 56—57°, is obtained from  $\text{CH}_2\text{Ph}-\text{CH}_2-\text{MgBr}$  and  $\text{GeCl}_4$  in  $\text{Et}_2\text{O}$ .  $\text{Ge}(\text{CH}_2\text{Ph})_4$  is unattacked by  $\text{HNO}_3$  (*d* 1.52) in  $\text{AcOH}$  at 15—20° or 50—60° and decomposed at the b.p. into  $\text{Ge}$  and  $\text{NO}_2\text{-C}_6\text{H}_4\text{-CHO}$ . Di-*p*-dimethylamino-phenylgermanic anhydride is transformed by  $\text{HNO}_3$  (*d* 1.52)-conc.  $\text{H}_2\text{SO}_4$  at room temp. into the 3- $\text{NO}_2$ -derivative. Tolylgermanic anhydride is oxidised by  $\text{KMnO}_4$  in boiling  $\text{H}_2\text{O}$  to di-*p*-carboxyphenylgermanic anhydride. H. W.

**Mercury acetamide as a mercurating agent. II. Mercuration of phenols.** K. G. NAIK and B. V. MEHTA (J. Indian Chem. Soc., 1935, 12, 783—787).— $\text{Hg}$  acetamide when heated with the appropriate phenol in  $\text{EtOH}$  gives rise to  $\text{OH-Hg}$ -derivatives, the constitution of which was established by conversion by means of  $\text{Br}$  into the corresponding Br-derivatives. The following have been prepared: 2-nitro-4-hydroxymercuriphenol, m.p.  $>285^\circ$ , unaffected by dil.  $\text{HCl}$ ,  $\text{KI}$ ,  $\text{H}_2\text{S}$ , or  $(\text{NH}_4)_2\text{S}$ , but when heated with conc.  $\text{HCl}$  gives  $\text{o-NO}_2\text{-C}_6\text{H}_4\text{-OH}$ ; 4-nitro-2-hydroxymercuriphenol, m.p.  $>285^\circ$ , converted by hot  $\text{AcOH}$  into 4-nitro-2-acetoxymercuriphenol, m.p.  $>285^\circ$ , which with  $\text{Na}_2\text{S}_2\text{O}_3\text{-H}_2\text{O}$  gives 2 : 2'-mercuribis-4-nitrophenol, m.p.  $>285^\circ$ ; 1-hydroxymercuri- $\beta$ -naphthol (I), m.p. 210° (decomp.), which with hot dil.  $\text{HCl}$  gives  $\beta\text{-C}_{10}\text{H}_7\text{-OH}$ , with  $\text{H}_2\text{S-H}_2\text{O}$  gives  $\text{HgS}$ , and with  $\text{KI}$  gives  $2\text{KOH}$  quantitatively, and is converted by hot  $\text{AcOH}$  into 1-acetoxymercuri- $\beta$ -naphthol, m.p. 185°; 4-hydroxymercuri- $\alpha$ -naphthol, m.p.  $>285^\circ$ ; trihydroxymercuriphenol, m.p.  $>285^\circ$ . (I) with dil.  $\text{NaOH}$  and  $\text{CS}_2$  gives 1-thiolmercuri- $\beta$ -naphthol, m.p.  $>285^\circ$ ; *o*-, m.p.  $>285^\circ$ , and thiolmercuriphenol were similarly prepared from the appropriate chloromercuriphenol. H. G. M.

**Manufacture of heterocyclic mercury compounds.**—See B., 1936, 572.

**Quinonephosphines. I. Benzoquinone-triphenylphosphine.** A. SCHONBERG and R. MICHAELIS (Ber., 1936, 69, [B], 1080—1082).—*p*-Benzoquinone and  $\text{PPh}_3$  in  $\text{C}_6\text{H}_6$  afford *p*-benzoquinone-triphenylphosphine (I) decomp.  $>270^\circ$ , hydrolysed by boiling 50%  $\text{KOH}$  to  $\text{PPh}_3\text{O}$  and quinol. (I) is converted by boiling  $2\text{N-HCl}$  into the hydrochloride (II), decomp. (indef.) 290—300°, and by  $\text{EtI}$  in  $\text{EtOH}$  into the ethiodide [(II) with  $\text{OEt}$  for  $\text{OH}$  and  $\text{I}$  for  $\text{Cl}$ ], m.p. about 235° (decomp.). H. W.

**Synthesis of selenophen derivatives. I. Action of chlorine and bromine on selenophen.** H. SUGINOME and S. UMEZAWA (Bull. Chem. Soc. Japan, 1936, 11, 157—167).—Selenophen (I) with  $\text{Cl}_2$  at 50—60° gives its 2-*Cl*-, b.p. 42°/12.5 mm., and 2 : 5-*Cl*\_- (II) -derivative, b.p. 67°/12 mm., and (best with excess of  $\text{Cl}_2$ ) 2 : 2 : 3 : 4 : 5 : 5-hexachlorotetrahydroselenophen, m.p. 55°, oxidised by fuming  $\text{HNO}_3$

at  $-21^{\circ}$  to  $15^{\circ}$  to its 1-oxide, m.p.  $172-172.5^{\circ}$  (decomp.). (I) with  $\text{Cl}_2\text{-CS}_2$  at  $-15^{\circ}$  gives 2 : 3 : 4 : 5-tetrachlorotetrahydroselenophen, m.p.  $97^{\circ}$  (decomp.), decomposed at  $95^{\circ}$  to (II) and 2 : 2 : 5 : 5-tetrachlorotetrahydroselenophen, m.p.  $96-98^{\circ}$  [oxidised to its 1-oxide, m.p.  $149-150^{\circ}$  (decomp.)]. (I) with 20%  $\text{Br-CS}_2$  at  $-15^{\circ}$  gives the 1 : 1-dibromide (III), m.p.  $152^{\circ}$  (decomp.), of 2 : 2 : 5 : 5-tetrabromotetrahydroselenophen (IV), m.p.  $97^{\circ}$ , which is obtained, together with its 1-oxide (V), m.p.  $128.5-130^{\circ}$  (decomp.), by decomp. with  $\text{H}_2\text{O}$ , and is reconverted into (III) by  $\text{Br-CS}_2$  at room temp. (V) is also obtained by oxidation of (IV) with fuming  $\text{HNO}_3$ , and is reconverted into (IV) by either hot cyclohexanol or hot  $\text{PhMe}$ . A 10% solution of (I) in  $\text{CS}_2$  with cold 10%  $\text{Br-CS}_2$  gives 2-bromoselenophen, b.p.  $59^{\circ}/13\text{ mm.}$ , the 2 : 5- $\text{Br}_2$  (VI), b.p.  $42^{\circ}/0.02\text{ mm.}$ , and 2 : 3 : 5- $\text{Br}_3$ -derivative, b.p.  $94^{\circ}/0.12\text{ mm.}$ , m.p.  $38^{\circ}$ , being obtained when excess of Br is used. Excess of Br and (I) without solvent give tetrabromoselenophen, m.p.  $102^{\circ}$ , oxidised by fuming  $\text{HNO}_3$  to  $(\text{CBr-CO}_2\text{H})_2$ . Excess of  $\text{Cl}_2$  and a  $\text{CS}_2$  solution of (VI) give 2 : 5-dibromo-2 : 3 : 4 : 5-tetrachlorotetrahydroselenophen, m.p.  $70-72^{\circ}$ . J. W. B.

Preparation of dibenzanthronyl, mixed benzanthrone-anthraquinone, dianthraquinonyl, and benzanthrone selenoethers.—See B., 1936, 489.

X-Ray studies of protein structure. W. T. ASTBURY (Nature, 1936, 137, 803-805).—A summary of three lectures. L. S. T.

Nature of ostacin-ovo-ester from lobsters. P. KARRER and H. HUBNER (Helv. Chim. Acta, 1936, 19, 479-480).—In spite of its hypophasic behaviour on partition, the ostacin ester from lobster eggs ("ovo-ester") (prop. detailed) is shown by analysis to be  $\text{C}_{40}\text{H}_{47}\text{O}_4\cdot\text{CO}\cdot\text{C}_{5-7}\text{H}_{11-15}$  or an ester of a similar, but unsaturated, acid. R. S. C.

Separation of amino-acids. III. Adsorption of amino-acids by Japanese clay from protein hydrolysate. IV. Dissolving out of amino-acids adsorbed by Japanese clay. M. MASHINO and N. SHIKAZONO (J. Soc. Chem. Ind. Japan, 1936, 39, 88B).—III. Of the various forms of N in the hydrolysate of soya-bean protein after removal of glutamic acid. Japanese clay adsorbs total N 45.14,  $\text{NH}_3\text{-N}$  21.77, humin-N 63.11, diamino-N 86.21, and monoamino-N 20.16%.

IV. The adsorbed  $\text{NH}_4$ -acids are best extracted with alkaline-earth hydroxides, especially  $\text{Ca(OH)}_2$ ; its dissolving power is < that of  $\text{Na}_2\text{CO}_3$ ,  $\text{NaOH}$ , or aq.  $\text{NH}_3$ , but the latter group also extract more colouring matter and render the clay colloidal, unless  $\text{Ca(OH)}_2$  or  $\text{EtOH}$  is also added. J. W. B.

Constituents of acid globulins. Protein-C.—See this vol., 875.

Apparatus for drying organic compounds decomposed by heat. J. BOUILLLOT (J. Pharm. Chim., 1936, [viii], 23, 605-607).—Apparatus for drying under reduced pressure at  $30-60^{\circ}$  is described. J. L. D.

Ashing of organic matter with nitric acid. H. KAUNITZ (Mikrochem., 1936, 20, 104-106).—Vessels are described for avoiding loss of material

by spurting during ashing with  $\text{HNO}_3$ , which can be done in 3 hr. J. W. S.

Pregl's absorption apparatus for micro-determination of carbon and hydrogen.—See this vol., 815.

Structure in relation to chromic oxidation of nitrogenous substances. C. N. ACHARYA (Biochem. J., 1936, 30, 1026-1032; cf. this vol. 352).—In the determination of N by the  $\text{K}_2\text{CrO}_4\text{-H}_2\text{SO}_4$  oxidation method with substances containing C-2N and C-3N linkings and  $\text{NH}_2\text{OH}$  derivatives the low vals. obtained are due to the formation of  $\text{N}_2\text{O}$ ; with  $\text{N}_2\text{H}_4$  and azo-derivatives, to the formation of  $\text{N}_2$ . The method is modified by collecting the gases evolved after absorption of  $\text{CO}_2$  and determining the  $\text{O}_2$  by pyrogallol absorption and the  $\text{N}_2\text{O}$  by explosion with  $\text{H}_2$ . H. D.

Determination of nitrogen by the Kjeldahl method.—See this vol., 811.

Micro-analytical determination of active hydrogen by the Tschugaev and Zerevitinov method. Simultaneous determination of the active hydrogen atom and of the Grignard reagent consumed. A. SOLTYS (Mikrochem., 1936, 20, 107-125).—Sufficient material to yield about 1 c.c. of  $\text{CH}_4$  is weighed, 0.5 c.c. of anethole added, and introduced into a micro-gas-evolution apparatus in which the air is displaced by  $\text{N}_2$ . A known vol. of Grignard reagent is introduced and the  $\text{CH}_4$  evolved is measured. Excess of  $\text{NH}_2\text{Ph}$  is then added and the amount of  $\text{CH}_4$  now produced indicates the amount of reagent unconsumed. Details of apparatus and procedure are described. J. W. S.

Micro-analytical determination of oxygen in organic substances. H. HENNIG (Chem. Fabr., 1936, 9, 239-241).—The material is hydrogenated by combustion in  $\text{H}_2$ , freed from  $\text{O}_2$  by hot Cu, in presence of a Ni catalyst carried on pumice at  $400-420^{\circ}$ . J. S. A.

Determination of small quantities of an organic substance in the air. T. BREHMER (Suomen Kem., 1936, 9, B, 14).—The author's method (A., 1935, 876) is used to determine the v.p. of  $\text{C}_{10}\text{H}_8$  at  $15^{\circ}$  to  $40.5^{\circ}$ ; results are in agreement with the literature. Org. halogen compounds are determined by making the compound react with a metal or metallic oxide (of which the corresponding carbonate has low  $\text{CO}_2$  pressure), or with a metallic carbonate (of high  $\text{CO}_2$  pressure). On applying the necessary corrections, the vals. of the v.p. of  $p\text{-C}_6\text{H}_4\text{Br}_2$  at  $17.8^{\circ}$  to  $23^{\circ}$  given by the two methods are concordant. E. W. W.

Coloured crystalline precipitates.—See this vol., 812.

Determination of citric acid in presence of certain organic substances. A. I. KOGAN and S. D. SCHTEIPELMAN (J. Appl. Chem. Russ., 1936, 9, 568-571).—3-4 ml. of buffer solution (49 g. of  $\text{H}_3\text{PO}_4$  and 68 g. of  $\text{KH}_2\text{PO}_4$  per litre) are added to 100 ml. of solution in a flask fitted with a condenser, and 0.05%  $\text{KMnO}_4$  is added drop by drop to the boiling solution to the appearance of a permanent coloration.  $\text{MeCHO}$  (from lactic or tartaric acid, glucose, or tannins)

is removed from the distillate by adding 5 ml. of 25%  $\text{H}_2\text{SO}_4$  and 5 ml. of 5%  $\text{KMnO}_4$ , excess of which is eliminated by adding  $\text{FeSO}_4$ , excess of  $\text{NaOH}$  is added, the vol. is made up to 300 ml., and the solution is filtered. Excess of 0.1N-I in KI is added to 100 ml. of filtrate, the solution is shaken for 15 min., made acid with  $\text{H}_2\text{SO}_4$ , and excess of I is titrated. The method depends on the reactions: citric acid  $\rightarrow \text{COMe}_2$ ;  $6\text{NaOH} + 6\text{I} \rightarrow 3\text{NaI} + 3\text{NaOI}$ ;  $\text{COMe}_2 + 3\text{NaOI} \rightarrow \text{CHI}_3 + \text{NaOAc} + 2\text{NaOH}$ . R. T.

$\beta$ -Naphthoylhydrazine as a reagent for the identification of aldehydes and ketones. H. CHEN and P. P. T. SAH (J. Chinese Chem. Soc., 1936, 4, 62—68).— $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{CO}_2\text{Et}$  with  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  in boiling EtOH affords  $\beta$ -naphthoylhydrazine (cf. A., 1932, 847) which with the theoretical amount of aldehyde or ketone in 95% EtOH containing a little AcOH gives the hydrazone.  $\beta$ -Naphthoylhydrazones (m.p. in parenthesis) of the following are prepared: MeCHO (109—110°); EtCHO (165—166°); PrCHO (187—188°);  $\text{Pr}^i\text{CHO}$  (146—147°); BuCHO (158—159°) *n*-hex- (96—97°) and *n*-heptaldehyde (114—115°); PhCHO (213—214°); *m*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$  (234—235°); 5-methylsalicylaldehyde (196—197°); furfuraldehyde (199—200°);  $\text{COMe}_2$  (145—146°); Me hexyl ketone (84—85°); COPhMe (201—202°); *p*-bromo- (219—220°), *p*-methyl- (181—182°), and *p*-methoxy-acetophenone (210—211°); Et (135—136°) and benzyl laevulate (111—112°), and laevulic acid (142—143°). Primary and *sec.* alcohols are identified after oxidation. J. L. D.

*m*-Bromobenzhydrazide as a reagent for the identification of aldehydes and ketones. CHUNG-HSI KAO, T. TAO, CHENG-HENG KAO, and P. P. T. SAH (J. Chinese Chem. Soc., 1936, 4, 69—74; cf. A., 1934, 790).—*m*-Bromobenzhydrazide (A., 1899, i, 136) with aldehydes or ketones in boiling 95% EtOH gives *m*-bromobenzoylhydrazones. Derivatives (m.p. in parenthesis) are prepared from: MeCHO (160—161°); EtCHO (135—136°); PrCHO (97—98°); BuCHO (88—89°); *n*-hept- (71—72°), *m*-nitrobenz- (217—218°), and *p*-nitrobenz-aldehyde (240—241°); furfuraldehyde (197—198°); 5-methylsalicylaldehyde (222—223°); cinnamaldehyde (210—211°);  $\text{CH}_3\text{Ac}_2$  (126—127°); COPhMe (162—163°); *p*-methyl- (188—189°) and *p*-methoxy-acetophenone (163—164°); COPh<sub>2</sub> (128—129°); laevulic acid (155—156°); benzyl laevulate (102—103°). J. L. D.

Reduction of silver nitrate by cuprous oxide applied to the determination of reducing sugars. V. HARLAY (J. Pharm. Chim., 1936, [viii], 23, 589—594).—Glucose with an alkaline Cu salt ppts.  $\text{Cu}_2\text{O}$  which is determined with  $\text{AgNO}_3$ . J. L. D.

Analytical uses of Nessler's reagent. M. GOSWAMI and B. C. DAS-PURKAYASTHA (J. Indian Chem. Soc., 1936, 13, 73).—Fructose and sucrose have been determined by the method previously described (this vol., 745). E. E. A.

Azides. V. 3-Nitrobenzazide as a reagent for the identification of amines. K. MENG and P. P. T. SAH (J. Chinese Chem. Soc., 1936, 4, 75—79; cf. A., 1934, 997; 1935, 207).—3-Nitrobenzazide with an amine in dry hot PhMe gives a carbamide.

Carbamides are prepared (m.p. in parenthesis) from the following: *o*- (227—228°) and *p*-nitro- (270—271°), *p*-chloro- (212—213°), and *p*-bromo-anilino (257°); NHPPhEt (104—105°); *o*- (214—215°), *m*- (191—192°), and *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  (202—203°); *m*-nitro-*p*-toluidine (213—214°);  $\alpha$ - (238—239°) and  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{NH}_2$  (245—246°); NHPPhAc (135—136°); *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{NHAc}$  (152°); acet-*o*- (233—234°) and *p*-toluidide (241—242°); *m*-bromo-*p*-toluidine (192—193°). J. L. D.

Reactions of cystine and materials containing cystine. A. STEIGMANN (Phot. Ind., 1935, 33, 445—446; Chem. Zentr., 1935, ii, 1486).—A reaction is given, in conjunction with the Feigl and albumin reactions, for the sp. identification of cystine, keratoses, albumins, and albumoses. J. S. A.

Precipitation of cystine.—See this vol., 881.

Separation of amino-acids. V. Recovery of Japanese acid clay [after use for adsorption of] amino-acids. M. MASHIMO and N. SHIKAZONO (J. Soc. Chem. Ind. Japan, 1936, 39, 136B; cf. this vol., 561).—The  $\text{NH}_3$ -acid is removed with CaO and the clay washed with the theoretical amount of HCl and then with  $\text{H}_2\text{O}$ . The total N, but not the protein-N, adsorbed decreases with repeated use of the clay. Recovery of the protein by CaO is complete after the first adsorption. R. S. C.

Determination of camphor as 2:4-dinitrophenylhydrazone in concentrated and dilute alcoholic solutions of camphor. M. M. JANOT and M. MOUTON (J. Pharm. Chim., 1936, [viii], 23, 547—549).—The method of Hampshire and Page (B., 1935, 253) is examined and modified, and is compared with that of Bougault and Leroy (B., 1928, 690). E. W. W.

Micro-determination of uric acid. N. L. EDSON and H. A. KREBS (Biochem. J., 1936, 30, 732—735).—A method for conversion of uric acid (I) by way of allantoin and allantoic acid into a mixture of  $\text{CO}(\text{NH}_2)_2$  (II) and  $\text{CHO}\cdot\text{CO}_2\text{H}$  (III) is described. Either end product can then be determined, (III) either colorimetrically or by  $\text{HSO}_3^-$ -titration and (II) by various methods. In determinations of 0.1—2.0 mg. of (I), (II) is determined manometrically using urease, the method being sp. and having a const. error of  $8 \pm 3\%$  which is corr. for. The method is particularly suitable for use in conjunction with tissue slice work but is not suitable for blood analysis or for solutions containing  $< 0.1$  mg. of (I) per 5 ml. of fluid. P. W. C.

The Vitali reaction: new technique permitting micro-determination of substances giving the reaction. C. MORIN (J. Pharm. Chim., 1936, [viii], 23, 545—547).—When atropine or hyoscyamine is evaporated with fuming  $\text{HNO}_3$  and the residue dissolved in anhyd.  $\text{COMe}_2$  and treated with 10% MeOH-KOH, an intense and comparatively stable violet coloration results, by means of which small quantities of the alkaloid may be determined colorimetrically. E. W. W.

Determination of the number of replaceable hydrogen atoms in strychnine, vomicine, and phloroglucinol. H. ERLNMEYER, A. EPPRECHT,

and H. LOBECK (Helv. Chim. Acta, 1936, 19, 543—545).—Strychnine nitrate, vomicine nitrate, and phloroglucinol exchange 1, 3, and 6 H, respectively, for D, when cryst. from 99.6% D<sub>2</sub>O. R. S. C.

Determination of total basic amino-acids in gelatin by titration in glacial acetic acid. J.

RUSSELL and A. E. CAMERON (J. Amer. Chem. Soc., 1936, 58, 774—775).—Titration of a gelatin (dissolved in a little H<sub>2</sub>O and then diluted with AcOH) with 0.0119N-HClO<sub>4</sub> using a H electrode indicates the presence of  $9.6 \times 10^{-4}$  equiv. of dibasic NH<sub>2</sub>-acids per g. Titration curves for lysine and arginine in AcOH are given. H. B.

## Biochemistry.

Relations between oxygen consumption, carbon dioxide production, and expired air during respiration in man. J. JOANID and F. NEPVEUX (Compt. rend. Soc. Biol., 1936, 121, 1618—1620).—CO<sub>2</sub> production  $\propto$  ventilation, but O<sub>2</sub> consumption is const. R. N. C.

Determination of basal metabolism in the adult pigeon during nutritional studies. R. LECOQ and J. M. JOLY (Compt. rend. Soc. Biol., 1936, 122, 193—195).—The R.Q. can be determined by direct measurement of O<sub>2</sub> consumed and CO<sub>2</sub> produced. A coeff. is given to determine the surface area of the body. R. N. C.

Absorption of dust through respiration. II. Absorption of pyrolusite dust. O. EHRSIMANN (Z. Hyg., 1935, 117, 662—678).—MnO<sub>2</sub> is adsorbed by rabbits and cats exposed to pyrolusite dust, but there is no essential increase of Mn in the organs, particularly the lungs. R. N. C.

Permeability of the mammalian erythrocyte to deuterium oxide (heavy water). A. K. PARPART (J. Cell. Comp. Physiol., 1935, 7, 153—162).—The rate of penetration of ox and rat erythrocytes by 99.5% D<sub>2</sub>O is about 44% < that by H<sub>2</sub>O; the permeability is apparently uninjured by D<sub>2</sub>O. R. N. C.

Permeability of erythrocytes to deuterium oxide (heavy water). S. C. BROOKS (J. Cell. Comp. Physiol., 1935, 7, 163—171).—The rate of hæmolysis of sheep erythrocytes by solutions containing D<sub>2</sub>O is < that by H<sub>2</sub>O alone, given equal concn. gradients. This is due largely to differences in fugacity. R. N. C.

Osmotic properties of the erythrocyte. VII. Temperature coefficients of certain hæmolytic processes. M. H. JACOBS, H. N. GLASSMAN, and A. K. PARPART (J. Cell. Comp. Physiol., 1935, 7, 197—225).—The temp. coeff. of hæmolysis of human, rat, mouse, rabbit, and guinea-pig erythrocytes in isotonic glycerol solution is low. Hæmolysis is rapid, and is retarded by CO<sub>2</sub>, acids, and traces of Cu, the temp. coeff. being increased. Ox, sheep, swine, horse, dog, and cat erythrocytes show slow hæmolysis, high temp. coeff., and often acceleration of hæmolysis by acids and Cu. R. N. C.

Permeability of red blood corpuscles to organic anions. R. HÖBER (J. Cell. Comp. Physiol., 1936, 7, 367—391).—Penetration of anions across a collodion membrane is > that expected from the migration velocity, due to surface activity in the case of fatty acids, and the hydrotropic properties in the case of sulphonates and aromatic anions. Anions of

OH- and polybasic acids lack these properties and are rather inactive. The permeability of the red cell membrane is similar, but the presence of lipins facilitates the entrance of fatty and aromatic anions, particularly with sheep and ox corpuscles. R. N. C.

Magnetic properties and structure of hæmoglobin, oxyhæmoglobin, and carboxyhæmoglobin.—See this vol., 867.

Hæmocuprin from hæmocyanins. J. ROCHE and P. DUBOULOZ (Compt. rend. Soc. Biol., 1936, 122, 234—236).—Hæmocuprin is a polypeptide containing tyrosine, arginine, and leucine. R. N. C.

Isoelectric point of fibrinogen. E. KYLIN and F. PAULSEN (Biochem. Z., 1936, 285, 159—174).—Fibrinogen (I) yields an acid and two basic fractions on subjection to cataphoresis. One basic fraction (min. stability at  $p_H$  7.3 and < 12.4) is colourless, is coagulated by heat at 55°, and is pptd. on 28% saturation with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, saturation with MgSO<sub>4</sub>, and half saturation with NaCl. The other (min. stability at  $p_H$  7.3) is white, is coagulated by heat at 37°, and is pptd. on 16% saturation with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, half saturation with MgSO<sub>4</sub>, and 33% saturation with NaCl. The isoelectric points are: acid fraction  $p_H$  5.4, basic fractions 12.4 and 8.5, respectively. The theory of ideal ampholytes does not hold for (I). (I) of exudates consists entirely of the second basic fraction. W. McC.

Viscosity of fibrinogen. E. WOHLISCH and A. KIESGEN (Biochem. Z., 1936, 285, 200—206; cf. this vol., 562).—Fibrinogen (I) (from horse plasma) exhibits anomalous  $\eta$ , the deviation from normal decreasing with rising temp. High concns. of urea reversibly inhibit coagulation of (I) solutions by heat, EtOH, and thrombin (II) and increase  $\eta$ , greatly reducing the abnormality. After extraction with Et<sub>2</sub>O the temp. of denaturation of (I) is raised; denaturation with EtOH and heat and coagulation with (II) are more difficult, and  $\eta$  is normal. These results confirm the view that (I) has a fibrous mol. structure. W. McC.

Protein equilibrium of serum during sensitisation and serum shock. AUBRY, THIODET, and RIBERE (Compt. rend. Soc. Biol., 1936, 122, 209—212).—The albumin/globulin ratio increases during sensitisation, falls rapidly at the crisis, and rises again at the end of the reaction. R. N. C.

Precipitation of serum-proteins by ammonium sulphate: arterial hypertension. A. ROCHE, M. DORIER, and L. SAMUEL (Compt. rend. Soc. Biol.,

1936, 122, 231—233).—In cases of hypertension, pptn. does not separate albumin (I) and globulin (II), and the (I)/(II) ratio has no significance. The modifications are associated with the nature of the proteins rather than with the (I) and (II) contents of the serum. R. N. C.

**Constituents of acid globulins. Protein C.** M. DOLADILHE (Compt. rend., 1936, 202, 1385—1387).—The serum of human, ox, or sheep blood is aged under sterile conditions for 4—5 days at 0°; the acid globulins therefrom are dissolved in physiological aq. NaCl (1/10 vol. of the serum); CO<sub>2</sub> then ppts. protein *B* and a new protein *C*. The mixed ppt. is redissolved in aq. NaCl and centrifuged at 45° for 15 min., whereby protein *A* is pptd.; *C* separates on cooling. *C* dissolves in H<sub>2</sub>O at higher temp. and is repptd. on cooling, unless the solution has been heated above a certain temp. This crit. temp. is usually 55°, but is higher if the ageing of the serum has been prolonged (e.g., 8—15 days) or slightly less if *B* has been heated at too high a temp. (which also decreases the pptn. of *C* by CO<sub>2</sub>). *C* is a constituent of group *B* and a probable factor of complement. Ageing and heat diminish the physiological effects of the latter in serum at the same time as affecting the physical properties of the former. R. S. C.

**Biochemistry of choline and its derivatives. I. Acetylcholine in blood.** E. KAHANE. II. Biological determination of acetylcholine. J. LÉVY and L. OLSZYCKA. III. Determination of acetylcholine in biological material. IV. Action of blood on esters of quaternary ammonium compounds. E. KAHANE and J. LÉVY (Bull. Soc. Chim. biol., 1936, 18, 479—489, 490—504, 505—528, 529—555).—I. Introductory.

II. The method makes use of the fact that 0.03—0.2 × 10<sup>-6</sup> g. of acetylcholine (I) may be detected by the fall in blood pressure produced on intravenous injection into chloralised dogs. The effect of the material to be determined is compared with that produced by (I) chloride. Eserine sulphate (II) may be used to increase the reaction of the animals.

III. The above method is applied to the determination of (I) added to serum and blood. The technique of chemical methods of determining (I) involving hydrolysis and pptn. as phosphotungstate, silicotungstate, Reineckate, and periodate is described. The pharmacological method may also be applied to these ppts.

IV. Propionyl-, formyl-, and acetyl-choline are rapidly hydrolysed by serum; betaine Et ester, acetyl-β-methylcholine, and benzoylcholine are slowly attacked, and bromocholine and the nitric and carbamic esters of choline are not hydrolysed. Injections of (II) only increase the hypotensive action of those esters which are rapidly hydrolysed. A. L.

**Acetylcholine-like substance dissimulated in normal blood.** E. KAHANE and J. LEVY (Compt. rend., 1936, 202, 1210—1212).—The fluid obtained when blood is treated with boiling H<sub>2</sub>O and then EtOH contains an acetylcholine-like substance (0.01—1.5 × 10<sup>-5</sup> g. per c.c.) which is not ultrafilterable and may be the precursor of acetylcholine. J. L. D.

**Blood-glutathione and pulmonary respiration.** L. BINET and S. BARRET (Compt. rend. Soc. Biol., 1936, 122, 16—18).—Perfusion of a dog's lung ventilated with O<sub>2</sub> diminishes the reduced glutathione (I) content of the blood. In N<sub>2</sub> (I) increases, subsequent ventilation with O<sub>2</sub> decreasing it again. R. N. C.

**Determination of indole in blood.** P. MAZZOCCO (Rev. soc. argentina biol., 1935, 11, 31—37).—Oxalated blood (1 c.c.) is extracted successively with 3, 2, 2, and 1 c.c. of Et<sub>2</sub>O and the combined extract is diluted to 12 c.c. with EtOH. *p*-NMe<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>-CHO (10 drops of 5% EtOH solution) followed by 2 c.c. of conc. HCl are added and the colour is matched against a standard. Blood-urobilinogen interferes since it gives a red colour.

CH. ABS. (p)

**Extraction of blood-lipins.** E. M. BORD (J. Biol. Chem., 1936, 114, 223—234).—The limitations of the Bloor lipin extractions (A., 1915, ii, 805) are investigated. For aliquots > 3 c.c. 20 vols. of EtOH-Et<sub>2</sub>O for plasma and 30 vols. for whole blood are required; warming and variation of the EtOH : Et<sub>2</sub>O ratio were without influence. Oxalated plasma had higher vals. than defibrinated serum. H. D.

**Relationship between total and free cholesterol in human blood-serum.** W. M. SPERRY (J. Biol. Chem., 1936, 114, 125—133).—In 126 samples of serum from 91 healthy adults, the min. amount of free in total cholesterol (I) was 24.3% (max. 30.1%; average 26.9%). Most samples taken after sudden death gave vals. within the same range. Similar results were obtained in healthy children and in 80% of diseased children. The % of free (I) in total (I) may be of val. in the study of (I) metabolism and in pathology. J. N. A.

**Blood-cholesterol in rabbits painted or injected with benzopyrene.** Y. POURBAIX and N. DENISOFF (Compt. rend. Soc. Biol., 1936, 122, 128—130).—There is no appreciable variation. R. N. C.

**Normal blood-sugar in domestic animals.** A. S. CAMPORI (Rev. Med. vet. Buenos Aires, 1935, 17, 47—75).—The vals. were: cows 40—70, horses 50—100, asses 40—100, cats 50—120, dogs 50—100, poultry 100—214 mg. per 100 ml. NUTR. ABS. (m)

**Fasting blood-sugar in rats.** E. M. GREISHEIMER, E. GEORGE, and L. GILMAN (Proc. Soc. Exp. Biol. Med., 1935, 32, 1669).—The rate of decrease of blood-sugar in females is > in males, and is greatest in both sexes between 12 and 24 hr. R. N. C.

**Rapid methods of blood-sugar determination with potassium ferricyanide.** C. H. HAGEDORN, F. HALSTRÖM, and N. JENSEN (Hospitalstidende, 1935, 78, 1193—1202).—To 0.1 or 0.05 ml. of blood are added 1 ml. of 0.1N-NaOH and 5 ml. of 0.45% aq. ZnSO<sub>4</sub>, the mixture is heated at 100° for 4 min., and after cooling, filtered through purified cotton wool. Then 2 ml. of alkaline 0.005N-K<sub>3</sub>Fe(CN)<sub>6</sub> are added and the mixture is heated for 5 min. at 100°. When cold, KI is added, then 1 ml. of citric acid and ZnSO<sub>4</sub> reagent, and the I liberated titrated with 0.005N-Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. Rapidity is increased by heating in an open flask and using tablet reagents.

NUTR. ABS. (m)

**Widmark's method of blood-alcohol determination.** H. ELBEL (Deut. Z. ges. gerichtl. Med., 1935, 25, 124—129; Chem. Zentr., 1935, ii, 1585).—Methods for increasing the accuracy are described.

H. N. R.

**Variations of blood-copper in normal children at different ages.** F. LESNÉ, P. ZIZINE, and S. B. BRISHKAS (Compt. rend. Soc. Biol., 1936, 121, 1582—1583).—Blood-Cu falls after birth, fluctuates at < 1 mg. per litre in the first 10 days, and then increases to a steady val. of 1.35 mg. per litre in the first or second month.

R. N. C.

**Determination of total iron in blood.** F. B. SHORLAND and E. M. WALL (Biochem. J., 1936, 30, 1047—1048).—The blood (0.5 ml.) is digested with  $\text{H}_2\text{SO}_4$ - $\text{HNO}_3$  and the Fe determined by a modification of the 2:2'-dipyridyl method.

J. N. A.

**Action of certain reagents on the "loosely bound" iron in blood.** F. B. SHORLAND and E. M. WALL (Biochem. J., 1936, 30, 1049—1052).—Thioacetic acid has a definite action on haemoglobin-Fe (I) and cannot be used for determination of non-haemoglobin-Fe (II).  $\text{Na}_4\text{P}_2\text{O}_7$  does not attack (I) and gives a good recovery of inorg. Fe added to blood. The vals. obtained for (II) by use of  $\text{Na}_4\text{P}_2\text{O}_7$  are much lower than those obtained by Starkenstein and Weden's method (A., 1928, 1275).

J. N. A.

**Iron content and oxygen capacity of blood.** M. JOHNSON and M. E. HANKE (J. Biol. Chem., 1936, 114, 157—170).—An iodometric method by which the Fe in blood may be determined to  $10^{-6}$  g. per litre of blood is described. To obtain this accuracy, complete oxidation of the blood, removal of  $\text{SO}_4^{2-}$  and  $\text{PO}_4^{3-}$ , and control of the concn. of acid and salts for the  $\text{Na}_2\text{S}_2\text{O}_3$  titration are essential. The conversion factor for  $\text{Na}_2\text{S}_2\text{O}_3$  must be determined with standard  $\text{FeCl}_3$ , as it varies with the amount of Fe. The end-point must be determined under standardised conditions as regards amounts of KI and time intervals. The Fe content and  $\text{O}_2$  capacity of blood agreed within 1%.

J. N. A.

**Determination of lead in blood.** AXON. (Chem. Ztg., 1936, 60, 368).—Various methods are described.

F. O. H.

**Iodometric determination of chloride in small amounts of blood.** A. D. HASLEWOOD and E. J. KING (Biochem. J., 1936, 30, 902—905).—The method uses the fact that on adding  $\text{AsIO}_3$  in aq.  $\text{NH}_3$  solution to solutions containing  $\text{Cl}^-$  an amount of  $\text{IO}_3^-$  equiv. to the  $\text{Cl}^-$  passes into solution, which on determination iodometrically liberates 6I for each  $\text{Cl}^-$  originally present. The method is used for determinations of pure  $\text{NaCl}$  and of  $\text{Cl}^-$  in  $\text{Zn}(\text{OH})_2$  nitrates of 0.2 ml. of blood or plasma, the results in the latter case agreeing within 1% amongst themselves and with gravimetric analyses.

P. W. C.

**Effect of diet on blood-phosphorus partition of rats with or without insulin.** N. VAN CLEVE and A. F. MORGAN. Proc. Soc. Exp. Biol. Med., 1935, 32, 1636—1641).—Insulin evokes a decrease of inorg. P only in animals on a high-fat diet. Other determined P fractions vary only slightly: total P is unchanged and org. P tends to increase.

R. N. C.

**Distribution of phosphorus compounds in human and animal blood.** H. NISSEN (Z. Kinderheilk., 1935, 57, 289—320; Chem. Zentr., 1935, ii, 1571).—Analytical vals. are given for the different P fractions in the blood of man and a no. of animals.

R. N. C.

**Acid-base condition of blood.** V. Influence of protein concentration on the colorimetric  $p_{\text{H}}$  determination of blood-serum. H. W. ROBINSON, J. W. PRICE, and G. E. CULLEN (J. Biol. Chem., 1936, 114, 321—340).—The influence of the protein concn. on the correction to be applied to the determined val. of serum- $p_{\text{H}}$  by Cullen's method (A., 1922, ii, 672) is studied by comparing the  $p_{\text{H}}$  vals. of sera conc. by ultrafiltration and diluted with the ultrafiltrate. The correction  $\propto$  log protein concn.

H. D.

**Determination of the  $p_{\text{H}}$  of blood with the glass electrode.** G. HAUGAARD and E. LUNDSTEEN (Biochem. Z., 1936, 285, 270—281).—Methods of determining the  $p_{\text{H}}$  of venous and capillary blood are described. Determinations must be made  $> 5$  min. after drawing the blood. Part of the titration curve of venous blood has been plotted.

W. McC.

**Anion and cation contents of normal and anæmic blood.** M. MAIZELS (Biochem. J., 1936, 30, 821—830).—The concn. of anions and cations ( $\text{K}^+$ ,  $\text{Na}^+$ ,  $\text{HCO}_3^-$ , and  $\text{Cl}^-$ ) in erythrocytes is < that in plasma, the resulting deficiency in cellular osmotic pressure indicating binding of approx. 8% of the cell- $\text{H}_2\text{O}$ . The excess of base over  $\text{Cl}^- + \text{HCO}_3^- + \text{Hb}^+$  in the cells indicates the presence of another anion which is increased in anæmia but not in acholuric jaundice. Concn. of cell-cation is relatively const. despite wide variations in cell-Hb and in blood regeneration and destruction. Cellular changes in acholuric jaundice are discussed.

F. O. H.

**Ionisation and buffers of the internal medium of the parasitised sacculenised crab (*Carcinus maenas*).** A. DRILHON and E. A. PORA (Compt. rend., 1936, 202, 1309—1311).—The parasite causes a disappearance of the buffering substances of the serum, whereas the presence of the large amount of  $\text{CO}_2$  in the hæmolymph maintains a high alkaline reserve and lowers the  $p_{\text{H}}$ .

H. G. R.

**Composition of arterial blood after ingestion of saline solution.** P. CAMBIER and G. BARDOS (Compt. rend. Soc. Biol., 1936, 122, 130—132).—Ingestion of Priestley's solution causes dilution of the blood with only feeble diuresis compared with that from ingestion of  $\text{H}_2\text{O}$ .

R. N. C.

**Water content of the blood of the normal human adult.** Correlation between the water content of blood from the ear lobe and that from the median vein. T. RYÖ (Keijo J. Med., 1935, 6, 9—22).—Average vals. were 79.25% for the ear and 79.74% for the median vein.

CH. ABS. (p)

**Water content of the blood of chicken during the course of development.** K. KURODA (Keijo J. Med., 1935, 6, 23—29).—Max. vals. were observed at hatching; a min. at 2 weeks was followed by a second max. and a subsequent decline to a const. level.

CH. ABS. (p)

**Lipin films in relation to the structure of the plasma membrane.** J. F. DANIELLI (J. Cell. Comp. Physiol., 1936, 7, 393—407).—Continuous lipin and mosaic films are all metastable, the lipin films being the more stable. The prep. of shell-lipin films is described. R. N. C.

**Spontaneous reversibility of the gelation of serum.** I. KOPACZEWSKA, W. KOPACZEWSKI, and S. MARCZEWSKI (Compt. rend., 1936, 202, 1212—1214).—Normal human serum in  $H_2O$  gels in presence of 0.1—0.3*N*-NaOH. The optimum rate of gelation for any concn. of serum occurs with only one [NaOH]. The gel liquefies, the rate being greatest when [NaOH] is high and the serum is very dil. J. L. D.

**Gelation of human serum by bases.** S. MARCZEWSKI (Compt. rend., 1936, 202, 510—511; cf. A., 1935, 374).—The period of gelation by NaOH and various org. bases decreases with rising temp. Certain bases (toluidine, PhOH) have no direct action, but accelerate gelation by other bases. Still other bases, even at high concns., are ineffective. Factors other than  $[OH^-]$  are concerned in gelation. A. G. P.

**Relations between electric charge and hydration of flocculation of blood-serum.** R. JONNARD (Compt. rend. Soc. Biol., 1936, 122, 48—50).—The curve of the EtOH/acid ratio for flocculation to begin and the acid concn. is almost a rectangular hyperbola. The ratio at any given acid concn. is const. and independent of the serum concn. R. N. C.

**Nature of agglutinogens.** G. BRUYNOGHE (Compt. rend. Soc. Biol., 1936, 122, 94—95).—The A and B isoagglutinogens are proteins, whilst the M and N supplementary agglutinogens are lipins. R. N. C.

**Mode of formation of aggregates in bacterial agglutination.** W. W. C. TOPLEY, J. WILSON, and J. T. DUNCAN (Brit. J. Exp. Path., 1935, 16, 116—120).—Experimental data throw doubt on the view that flocculation occurs in two stages, one sp. and one non-sp., but accord well with Marrack's lattice theory. CH. ABS. (p)

**Relation between the complement and opsonin of normal serum.** J. GORDON and F. C. THOMPSON (Brit. J. Exp. Path., 1935, 16, 101—108).—Treatment of serum with  $NH_3$ , Congo-red, acid, alkali, or with hypertonic solutions of certain Na or K salts, or long storage at room temp. may inactivate the complement without affecting the concn. of opsonin. The latter is non-sp. and thermolabile, and resembles the complement in many respects, but is probably an independent system. Modified complement may possibly function as an opsonin. CH. ABS. (p)

**Specificity of hybrid proteins.** A. G. ZOET (Proc. Soc. Exp. Biol. Med., 1935, 32, 1469—1470).—Hybridised protein from horse and swine serum is serologically different from the serum-proteins of both species. R. N. C.

**Reactivation of ammonia-inactivated complement by leucocytes.** E. MALTANER (Proc. Soc. Exp. Biol. Med., 1935, 32, 1555—1558). R. N. C.

**Nature of tuberculous antibodies: some properties peculiar to the guinea-pig.** K. MEYER

(Compt. rend. Soc. Biol., 1936, 122, 26—28).—The production of lipin (I) and protein antibodies (II) in normal guinea-pigs by the Besredka antigen (III) or extracts of tubercle bacilli is similar to that in rabbits, but in tuberculous animals (I) are often absent, whilst (II) react only feebly with the protein antigens, although strongly with (III). R. N. C.

**Mechanism of immunity to filterable viruses.** I. Does the virus combine with the protective substance in immune serum in the absence of tissue? II. Fate of the virus in a system consisting of susceptible tissue, immune serum, and virus and the role of tissue in the mechanism of immunity. A. B. SABIN (Brit. J. Exp. Path., 1935, 16, 70—84, 84—100).—I. There is no apparent union between the virus and the protective substance *in vitro*.

II. Immunity to virus intimately concerns the cell. Both protective substance and virus are fixed by the tissue. If fixation of the virus precedes that of protective substance infection is not prevented. Fixation in the reverse order or simultaneously prevents infection. CH. ABS. (p)

**Diffusion potentials in scallop muscles.** H. B. STEINBACH (J. Cell. Comp. Physiol., 1935, 7, 271—289).—The concn.  $E$  is the same at the injured and uninjured surfaces, the more dil. solution being positive for KCl but negative for NaCl,  $MgCl_2$ , or  $CaCl_2$ .  $Ca^{++}$  increases the  $[KCl]$   $E$  at the injured, but not the uninjured surface.  $E$  may be termed a diffusion concn. if the tissue is considered as a solution of a colloidal electrolyte. R. N. C.

**Nature and permeability of the grasshopper egg membrane.** I. E.m.f. across membranes during early diapause. T. L. JAHN (J. Cell. Comp. Physiol., 1935, 7, 23—46).—The apparent relative ionic mobilities of univalent cations across membranes increase in the same order as  $\Lambda_r$  in solution, but the differences are less. Those of bivalent cations fall very rapidly as concn. increases. The concn. effect is reversed by conc. solutions of bivalent ions ( $-\log c = 1.3$  approx.), and by HCl solutions at  $p_H < 2.1$ ; the membrane can recover from reversal by  $Ca^{++}$ , but only incompletely from reversal by HCl. The anion does not influence the concn. effect.  $E$  across the membrane in  $M$ - and  $0.1M$ -KCl is not affected by  $p_H$  between 4 and 6, but below  $p_H$  4 it falls rapidly, reaching zero at  $p_H$  2.2 and then becoming negative; equilibrium is established only slowly below  $p_H$  3. The exochorion and one of the cuticle layers of the egg are semipermeable, the former probably being responsible for  $E$  changes.  $E$  shows a definite correlation with the expected changes in potential for a protein surface. R. N. C.

**Electrical conductivity of yolk, albumin, and allantoic and amniotic fluids of developing birds' eggs.** A. L. ROMANOFF and H. J. GROVER (J. Cell. Comp. Physiol., 1936, 7, 425—431). R. N. C.

**Behaviour of the electrical conductivity of the yolk of the hen's egg with change of temperature.** A. ORRU (Atti R. Accad. Lincei, 1935, [vi], 22, 458—463).—Egg-yolk does not exhibit the hysteresis of  $\kappa$  at rising and falling temp. observed

with gelatin (A., 1930, 993). At 16—18° to 60° a straight-line graph of  $\kappa$  against temp. is obtained on heating the uncoagulated or coagulated yolk. At higher temp., changes of  $\kappa$  indicate a max. (72—76°) due to the coagulation of lecitho-vitellin, a second due to that of livetin, whilst a third is ascribed to a third protein, as suggested by Jukes and Kay (A., 1932, 957). E. W. W.

**Relation between acids and bases in the human brain cortex.** A. PETRUNKINA and M. PETRUNKIN (J. Physiol. Path. gén., 1935, 33, 1102—1113).—Grey matter of human brain cortex contains a large excess of base combined with the  $\text{CO}_2$  and colloids. The isoelectric point of the colloids is at  $p_H$  4.35. NUTR. ABS. (m)

**Calcium and phosphorus content of the body of the brook trout in relation to age, growth, and food.** C. M. McCAY, A. V. TUNISON, M. CROWELL, and H. PAUL (J. Biol. Chem., 1936, 114, 259—263).—The increases of body-Ca are chiefly due to absorption from  $\text{H}_2\text{O}$ . In the eggs and fry  $[\text{P}]$  is  $> [\text{Ca}]$ ; as soon as the fry start to feed the  $[\text{Ca}]$  increases rapidly. H. D.

**Primary calculi of the smaller intestine.** G. BLIX (Acta chirurg. Scand., 1935, 76, 25—34; Chem. Zentr., 1935, ii, 1391).—The calculi contain 58% of  $\text{CaC}_2\text{O}_4$ , 11% of choleic acid, and 1.4% of  $\text{ZnS}$ . The  $\text{ZnS}$  is formed from sol. Zn compounds by bacterial action. A. G. P.

**Histo-chemical detection of lead in bones.** E. SIEBER (Arch. exp. Path. Pharm., 1936, 181, 273—280).—Fixation by 70%  $\text{EtOH}$  or aq.  $\text{CH}_2\text{O}$  and decalcification by 30%  $\text{HCO}_2\text{H}$  (both saturated with  $\text{H}_2\text{S}$ ) indicates the distribution of Pb in bone-tissue of Pb-poisoned guinea-pigs. Variations of Pb distribution with age of Pb-poisoned animals are described. F. O. H.

**Chemical composition of the minerals of bone.** J. MAREK, O. WELLMANN, and L. URBANYI (Mezőg. kutat., 1935, 8, 217—225).— $\text{H}_2\text{O}$ , glycerol (I), aq.  $\text{KOH}$ ,  $\text{KOH}$  in (I), and aq.  $\text{K}_2\text{CO}_3$  hydrolyse the Ca-P compound of bones in the same way as they hydrolyse  $\text{Ca}_3(\text{PO}_4)_3$ . Hence bone-phosphate must be composed chiefly of  $\text{Ca}_3(\text{PO}_4)_2$  and  $\text{CaCO}_3$  with small amounts of  $\text{Mg}_3(\text{PO}_4)_2$  and Ca alkali phosphates. NUTR. ABS. (m)

**Chemical determination of the age of fossilised bones.** J. GANGL (Oesterr. Chem.-Ztg., 1936, 39, 79—82).—Examination by ultra-violet light does not differentiate between fresh and 2000-year-old bones. The nature of the fats (as with "bog-butter") indicates, however, that with increasing age (2500—5500 years) the m.p., sap. val., and, more especially, the acid val. increase, whilst the I val. and glycerol content decrease. These changes are due to initial enzymic action and, to a greater extent, subsequent oxidation. F. O. H.

**X-Ray examination of tooth structure.** J. TREWLIS (Nature, 1936, 137, 828).—Enamel which is smooth and free from pigmentation contains much preferentially oriented apatite. A tooth is entirely enclosed by a thin layer of hypercalcified tissue which may act as a protecting layer against caries.

The arrangement of crystallites at the surface of the enamel generally differs from that of the interior.

L. S. T.

**Teeth. III. Variations in chemical composition in relation to dental structure.** J. H. BOWES and M. M. MURRAY (Biochem. J., 1936, 30, 977—984).—With increased hyperplasia the apatite content of the enamel decreased from 92 to 86% with a corresponding increase in some other P compound; in the dentine the val. decreased from 53 to 49%, but the variations were less regular. H. G. R.

**Copper content of the embryonic calf liver.** Z. GRUZEWSKA and G. ROUSSEL (Compt. rend. Soc. Biol., 1936, 122, 13—14).—Cu is equally distributed between the sol. and insol. ash, but is apparently contained in a complex which is decomposed only by inorg. acids. The liver-Cu curve is analogous to the Fe curve throughout embryonic development. The Fe/Cu ratio increases with the age of the embryo. R. N. C.

**Fatty acids of chrysalis oil.** W. BERGMANN (J. Biol. Chem., 1936, 114, 27—38).—Commercial chrysalis oil of *Bombyx mori* slowly deposits glyceryl  $\alpha$ -dipalmitate, which is, however, not formed from the oil from living chrysalides. The acids from both oils contain palmitic 20, stearic 4, palmitoleic 2, oleic 35, linoleic 12, and linolenic acid 28%, with  $< 1\%$  of other saturated and 1—2% of unsaturated acids with  $> 18^\circ\text{C}$ . The oils contain  $< 1\%$  of  $\text{COMe}_2$ -insol. matter. Chrysalis oil from *Malacosoma americana* has a similar composition but contains 7.1% of  $\text{COMe}_2$ -insol. phosphatide. R. S. C.

**Lipins of retina, brain, and blood.** P. J. LEINFELDER and P. W. SALIT (Amer. J. Ophthalm., 1934, 17, 619—624).—Methods of sampling and analysis are described. The lipin content of the retina is  $<$  of brain but  $>$  that of blood. Retinal tissue contains more  $\text{H}_2\text{O}$  and lecithin (%) but less protein and cholesterol than the other two tissues. Glycolipins have equal concn. in retina and brain. The I vals. of extracts of brain and of retina are similar, suggesting a similar rate of metabolism. CH. ABS. (p)

**Application of Fujita's method of blood-sugar determination to tissue-sugar.** R. WETZEL (Arch. exp. Path. Pharm., 1936, 181, 259—264).—The method (A., 1932, 75) is modified so as to be applicable to 0.05—1.50 mg. of glucose. Deproteinisation of tissue hydrolysates by phosphotungstic acid is permissible when excess of reagent is pptd. (as  $\text{K}_2\text{WO}_4$ ) by  $\text{KCl}$ . F. O. H.

**Production of glycogen in the liver from sugars.** Y. OTOMO (Tohoku J. Exp. Med., 1935, 27, 420—433).—In rabbits all sugars caused an increase in liver-glycogen as follows: glucose  $>$  fructose  $>$  galactose  $>$  sucrose  $>$  maltose  $>$  lactose. Intravenous injection gave in most cases higher vals. than did oral administration. NUTR. ABS. (m)

**Osmotic pressure of glycogen solutions.** H. B. OAKLEY and F. G. YOUNG (Biochem. J., 1936, 30, 868—876; cf. A., 1935, 297).—Solutions of glycogen from rabbit liver and muscle and methylated rabbit-liver glycogen in 0.1N- $\text{CaCl}_2$  gave osmotic pressures

indicating a mean particle wt. of the order of  $2 \times 10^6$ . A solution of methylglycogen in  $C_6H_6$  contained particles of the same order of magnitude ( $3.4 \times 10^6$ ). The significance of these results is discussed.

J. N. A.

**Determination of muscle-glycogen.** H. BERRY, B. GOUZON, and C. MAGNAN (Compt. rend. Soc. Biol., 1936, 122, 4—6).—The tissue is dissolved in 30% KOH by autoclaving at  $110^\circ$ , and glycogen (I) is pptd. with hot EtOH and removed by centrifuge. (I) is then hydrolysed with HCl at  $120^\circ$ , the solution is neutralised and deproteinised with  $Hg(NO_3)_2$ , excess of Hg being removed with Cu, and glucose determined by the micro-Bertrand method.

R. N. C.

**Carbohydrate groups of submaxillary mucin.** G. BLIX (Z. physiol. Chem., 1936, 240, 43—54).—The mucin (I) yields only traces of  $H_2SO_4$  on hydrolysis, indicating absence of mucoitinsulphuric acid as prosthetic group. Digestion of EtOH-dried (I) with boiling  $H_2O$ , extraction of the  $H_2O$ -sol. fraction with MeOH, and fractionation of the extract with  $Et_2O$  and light petroleum affords two carbohydrates. One [cryst. and forming 20—25% of (I)] contains hexosamine (1 mol.), an acidic (not hexuronic) group, and two Ac groups and gives a positive Ehrlich reaction; the other [forming 5% of (I)] is neutral, contains hexosamine (1 mol.) and hexose (2 mols.; probably mannose), and is probably of the same type as that from ovo- and serum-mucin.

F. O. H.

**Carbohydrate groups of some glucoproteins.** O. KARLBERG (Z. physiol. Chem., 1936, 240, 55—58).—Mucins from umbilical cord, cornea, and vitreous humour yield only traces of  $H_2SO_4$  on hydrolysis (indicating a low content of mucoitinsulphuric acid) and contain hexose and glucosamine approx. 1:1 (mol.).

F. O. H.

**Amino-acids in human skin.** H. C. ECKSTEIN (Proc. Soc. Exp. Biol. Med., 1935, 32, 1573—1574).—Analytical vals. are given.

R. N. C.

**Basic amino-acids of human skin.** R. J. BLOCK (Proc. Soc. Exp. Biol. Med., 1935, 32, 1574—1575).—The analytical results agree closely with those of Eckstein (see preceding abstract).

R. N. C.

**Amino-acid content of cod muscle-protein.** E. ABDERHALDEN, E. BAERTICH, and W. ZIESECKE (Z. physiol. Chem., 1936, 240, 152—162).—All known  $NH_2$ -acids (including alanine 5.7, valine 3.7, leucine 7.5, glutamic acid 7.5, arginine 6.8, lysine 8.0, histidine 4.8%) are obtained on hydrolysis of the protein. Glycine (I) [but not other  $NH_2$ -acids or polypeptides containing (I)] gives a bluish-violet colour with pyrocatechol.

W. McC.

**Separation of amino-acids. III—V.**—See this vol., 872, 873.

**Choline in the animal organism.** J. GAUTRELET (Bull. Soc. Chim. biol., 1936, 18, 449—478).—A review of published work.

A. L.

**Composition of muscle of normal adult pigeons at rest.** R. LECOQ and R. DUFFAU (Compt. rend. Soc. Biol., 1936, 122, 180—182).— $H_3PO_4$ , total acid-sol. P, and adenyolphosphoric acid show const.

vals. for all the birds tested. Lactic acid and total reducing substances vary over a small range, whilst the readily hydrolysed phosphoric esters, particularly creatinephosphoric acid, vary considerably.

R. N. C.

**Bence-Jones proteinuria.** L. MEYLER (Arch. Int. Med., 1936, 57, 708—713).—Bence-Jones protein is present in normal bone-marrow probably in the lymphocytes and other leucocytes.

H. G. R.

**Crystalloids of the mammary gland.** J. GRYNFELT (Compt. rend., 1936, 202, 1300—1302).—These are present in the gland when colostrum is secreted and appear to be due to pptn. of protein.

H. G. R.

**Determination of particle weight and shape from diffusion and viscosity data.** A. POLSON (Nature, 1936, 137, 740).—Mol. wt. and shape of proteins have been determined from the diffusion const. and  $\eta$  by the formulæ given. For ovalbumin, lactoglobulin, serum-albumin, amandin, thyroglobulin, and octopus haemocyanin the particle wts. are approx. 0.71 of those obtained from sedimentation data.

L. S. T.

**Carotenoids of human serum and liver. I.** H. WILLSTAEDT and T. LINDQVIST (Z. physiol. Chem., 1936, 240, 10—18).—Chromatographic separation of serum-carotenoids indicated, in addition to that of  $\beta$ -carotene, the occasional presence of lycopene, zeaxanthin, and xanthophyll; these and, in one case, violaxanthin also occurred in the liver. Two unknown pigments with absorption max. at respectively 498, 468, 422, and 478, 559 in light petroleum, and 512 (?), 498, 470, and 493, 472 m $\mu$  in  $CS_2$  occurred in serum and liver; their probable nature is discussed.

F. O. H.

**Colouring matter of the shell of the cassowary's egg.** D. DYNELI (Atti R. Accad. Lincei, 1936, [vi], 22, 464—467).—The residue after treating the powdered shells with 5% HCl is extracted by MeOH, and the solution treated with MeOH-HCl. The green pigment obtained on evaporation is taken up in  $Et_2O$  and extracted with 0.5% aq. HCl. The neutralised product yields a mixture, decomp. 90—100°, which gives an absorption band at 650 m $\mu$ , but does not fluoresce after treatment with  $NH_3$  and  $Zn(OAc)_2$  (cf. A., 1931, 1066). The residue after the original MeOH extraction is also green: treated with 10% NaOH and acidified, it evolves  $H_2S$  and yields a green chromoprotein (N 14.3%).

E. W. W.

**Cytochrome-c. II. Preparation and properties.** H. THEORELL (Biochem. Z., 1936, 285, 207—218; cf. A., 1935, 1277).—Simplified methods of purification involving pptn. with  $(NH_4)_2SO_4$  and adsorption on  $BaSO_4$  and Cellophane followed by elution with HCl and pptn. with  $COMe_2$  are described. Purest cytochrome-c (I), mol. wt. 16,500, contains C 49.18, H 7.73, O 27.5, N 14.4, S 1.18, Fe 0.34%, and has isoelectric point  $p_H$  9.82 (borate buffer) and 9.86 (glycine-NaOH). At  $p_H$  7.0—9.3 the ionic mobility is independent of  $[H^+]$ . Dried (I) does not deteriorate on keeping and is not destroyed by N-HCl and N-NaOH. Reduced (I) exhibits absorption max. at 550, 540, 520, 470, and 415 m $\mu$  and bands at 345 (weak), 316 (strong), and 275 m $\mu$ , whilst

oxidised (I) exhibits bands at 520—550, 407, 364, and 276  $\mu$ . In  $H_2O$  at  $p_H < 2.5$  oxidised (I) exhibits one band only at 515—545  $\mu$  and at  $p_H > 13$  it exhibits bands at 570—580, 525—545  $\mu$ , the changes which produce these spectroscopically different forms of (I) being reversible. The change to the acid form is accompanied by a red-brown colour change. W. McC.

Constituents of the adrenal gland. III, IV.—See this vol., 704, 854.

Ostacin-ovo-ester from lobsters.—See this vol., 872.

Substance P, the atropine-resistant, intestine-stimulating, and vaso-dilating substance from intestine and brain. U. S. VON EULER (Arch. exp. Path. Pharm., 1936, 181, 181—197).—The active principle (cf. Gaddum and Schild, A., 1935, 780), extracted from tissues by  $EtOH-H_2SO_4$  and purified by half-saturation with  $(NH_4)_2SO_4$  and fractional pptn. from  $EtOH$  solution with  $COMe_2$  until active in dilutions of  $1:3 \times 10^6$  on the isolated rabbit's intestine, is unstable to  $0.1N-NaOH$  at  $100^\circ$  and tryptic hydrolysis, but relatively stable to acids. Electrodialysis etc. indicate an albumose nature. Its physiological activity and reactions to base-precipitants are discussed. F. O. H.

"Methæmoglobin-production" test for assaying antianæmic potencies of liver extracts. W. DEUTSCH and J. F. WILKINSON (Brit. J. Exp. Path., 1935, 16, 33—39).—No correlation exists between results of clinical tests of hæmopoietic potency and ability to form methæmoglobin as determined spectroscopically or by the respirometer. The antianæmic principle of liver is not identical with, and occurs independently of, the methæmoglobin-producing factor. CH. ABS. (p)

Action of ultra-violet light on villikinin. G. VON LUDANY (Biochem. Z., 1936, 285, 192—194; of this vol., 518).—Secretin (I) and villikinin (II) are not identical, since (I) but not (II) is destroyed by ultra-violet light. W. McC.

Physiology of milk and butter-fat secretion. I. Milk pressure in the udder. II. Development and evolution of milk secretion. J. HAMMOND (Vet. Rec., 1936, 16, 519—527, 528—535).—II. During the development of milk secretion the composition of the milk changes. Globulin (I) and albumin (II) appear first, but decrease as the rate of secretion increases; at the same time  $H_2O$ , lactose (III), casein (IV), and ash increase. (III) increases faster than (IV). The milks of different species generally show the same proportional composition as that of cow's milk in course of development at similar (I) and (II) levels. A parallel can be drawn between changes in the development of constitution of milk in the individual and the changes that have occurred during the course of evolution in different species. R. N. C.

Electrical resistance of milk and its constituents. B. LUYET (Compt. rend. Soc. Biol., 1936, 122, 64—65).— $R$  is a property of the whey, cream or casein increasing it without altering it essentially. R. N. C.

Ultracentrifugal and electrophoretic studies on the milk-proteins. I. Preliminary results with fractions from skim-milk. II. Lactoglobulin of Palmer. K. O. PEDERSEN (Biochem. J., 1936, 30, 948—960, 961—970).—I. A method for calculating sedimentation equilibrium concn. from  $n$  data by the method of Lamm (A., 1929, 129, 1234) is described. In milk-plasma, the caseinogen (I) is present as a coarse polydisperse system, and the degree of dispersity in solution in  $PO_4'''$  buffer depends on the concn. of (I). Milk-serum contains the low-mol. wt. protein of Kekwick, Palmer's lactoglobulin (II) (A., 1924, 434), and lactoglobulin.

II. (II) is homogeneous, mol. wt. about 39,000 and isoelectric point in OAc' buffer  $p_H$  5.19. The mol. wt. is const. between  $p_H$  1 and 9, but the sedimentation const. indicated a change in the mol. frictional const. at  $p_H$  5 and 7.5. H. G. R.

Variations in lactose content of milk. W. R. BROWN, W. E. PETERSEN, and R. A. GORTNER (J. Dairy Sci., 1936, 19, 81—92).—Hourly samples show considerable variations in blood-sugar and in lactose contents of milk. Correlation between sugar vals. of blood and milk is highest when milk samples taken 1 hr. after blood samples are considered. A. G. P.

Thiol compounds of milk. C. J. JACKSON (J. Dairy Res., 1936, 7, 29—30).—No sol.  $-SH$  compounds occur in cow's milk. The positive nitroprusside test is attributed to cystine in the protein complex. A. G. P.

Iron and copper content of milk throughout the season, as related to anæmia development in rats. W. E. KRAUSS and R. G. WASHBURN (J. Biol. Chem., 1936, 114, 247—252).—Nutritional anæmia was produced in rats fed exclusively on milk obtained from cows fed on a variety of diets, indicating that the variation of the cow's diet was insufficient to cause profound modifications in the Fe and Cu contents of its milk. H. D.

Alleged occurrence of acetylcholine and adrenaline in cat's saliva. J. SECKER (J. Pharm. Exp. Ther., 1936, 56, 464—465).—Polemical against Larson (A., 1935, 1146). H. D.

Hormone content of saliva. A. I. WEISMAN and C. C. YERBURY (Endocrinol., 1936, 20, 103—104).—Anterior pituitary-like and œstrogenic hormones are not present in saliva. R. N. C.

Diastatic activity of rat saliva. E. W. COHN and M. H. BROOKES (J. Biol. Chem., 1936, 114, 139—145).—Rat saliva contains an enzyme capable of hydrolysing starch to reducing sugars. The amount of these produced was determined in terms of  $Cu_2O$  by a photo-electric method. J. N. A.

Determination of bile salts in human bile. R. GOIFFON, F. NEPVEUX, and CHALEIL (J. Pharm. Chim., 1936, [viii], 23, 499—513).—After removal of protein with the Folin-Wu reagent, decolorisation with  $FeCl_3$ , and subsequent purification, the determination is carried out nephelometrically in  $(NH_4)_2SO_4$  suspension. H. G. R.

Differential quantitative analysis of bile acids in bile and in duodenal drainage. H. DOUBILET

(J. Biol. Chem., 1936, **114**, 289—308).—The bile acids conjugated with taurine and glycine are determined by the Schmidt-Dart method (A., 1921, ii, 284), the cholic acid by the Gregory-Pascoe reaction (A., 1929, 1114) modified by addition of EtOH to the coloured solutions before comparison, and the total bile acids by pptn. with  $\text{FeCl}_3$  and determination of the pptd. Fe. From these vals. the concns. of deoxycholic and total free bile acids may be calc.

H. D.

**Gastric secretion of infants with special reference to pepsin and rennin.** B. ANDERSEN (Diss., Copenhagen, 1935, 94 pp.).—Methods of distinguishing between rennin (I) and pepsin (II) and possible sources of error are discussed. (I) is not present in the gastric juice of infants and coagulation of milk is due to (I) alone.

NUTR. ABS. (m)

**Gastric secretion. V. Achlorhydria following partial gastrectomy for ulcer: histamine and the transplanted gastric pouch.** E. KLEIN (Arch. Surg., 1935, **30**, 162—170; cf. this vol., 99).—Phases of gastric secretion are discussed. Partial gastrectomy eliminates the secondary phaso due to chemical stimulation of the antrum. In some cases there is true anacidity which does not disappear with histamine, as well as a pseudoanacidity.

CH. ABS. (p)

**Demonstration of adrenaline in the amniotic liquid and extract of the amniotic membrane in different periods of pregnancy.** O. MACCHIARULO (Arch. Gynakol., 1935, **159**, 355—359; Chem. Zentr., 1935, ii, 1570).—Adrenaline cannot be detected in human amniotic extract or fluid or Wharton's gelatin. Traces occur after the 9th month of pregnancy. The hyperglycaemic action of amniotic fluid and extract is due to other active principles.

R. N. C.

**Micro-test for acetone in urine.** J. F. BARRETT (Biochem. J., 1936, **30**, 888—889).—About 0.2 ml. of urine (or 2 ml. of blood-filtrate after pptn. with tungstic acid) mixed with 3 ml. of sulphosalicylic acid (5% in 1% aq.  $\text{Na}_2\text{SO}_4$ ) is boiled and the vapour passed into dil. Nessler's reagent.  $\text{COMe}_2$  in concns.  $\leq 0.01$  mg. per ml. produces a creamy ppt. Volatile reducing substances (e.g.,  $\text{CH}_2\text{O}$ ) interfere, and when such are present 1 drop of 1% aq.  $\text{NaOCl}$  is added to the reagent, the test being then less sensitive.

W. McC.

**Experimental variations of sulphur elimination in dogs.** J. GOSSET and S. DELAUNEY (Compt. rend. Soc. Biol., 1936, **121**, 1616—1617).—The post-operative increase in urinary S excretion is due to muscular trauma; anaesthesia and hyperthermia are without influence.

R. N. C.

**Canine cystinuria. II. Analysis of cystine calculi and sulphur distribution in the urine.**

F. GREEN, M. L. MORRIS, G. F. CAHILL, and E. BRAND (J. Biol. Chem., **114**, 91—94).—The calculi contained 0.14—0.26% of allantoin and approx. 0.5% of unidentified N. Only 30% of the neutral present in the urine was cystine-S.

H. G. R.

**Sulphur metabolism. I. Precipitation of cystine from solutions by mercuric and cuprous chlorides and its recovery, as preliminary to its**

**quantitative determination in urine.** G. MEDES and K. E. PADIS (Biochem. J., 1936, **30**, 941—947).—Recovery of cystine (I) from  $\text{HgCl}_2$  and  $\text{Cu}_2\text{Cl}_2$  pptn. by decomp. with  $\text{H}_2\text{S}$  yields 69 and 95%, respectively. If the Cu is pptd with  $\text{KSCN}$  and  $\text{C}_5\text{H}_5\text{N}$  the val. is raised to 100%, but the filtrate is not suitable for determination of (I) with Folin's reagent. Using 8 ml. of solution, 0.24 mg. of (I) may be determined by this method.

H. G. R.

**Composition of urine in the seal.** H. W. SMITH (J. Cell. Comp. Physiol., 1936, **7**, 465—473).—Urea is the principal N compound, but  $\text{NH}_3$ , creatinine (I), and creatine (II) are present, (II) being apparently of exogenous origin, since the quantity after a meal of herring is  $>$  after a meal of clams. There is no evidence that the seal swallows much sea- $\text{H}_2\text{O}$ . Simultaneous inulin and (I) clearances are essentially identical, showing the absence of renal (I) secretion.

R. N. C.

**Determination of creatine in urine.** W. D. LANGLEY, M. ROSENBAUM, and M. G. ROSENBAUM (J. Lab. Clin. Med., 1935, **20**, 972—974).—To the urine (1—2 c.c.) is added 1 c.c. of  $\text{H}_2\text{SO}_4$  (dropwise with mixing) and the mixture left 2—5 hr. at room temp. A standard solution of creatinine (1 mg. per c.c.) is treated similarly. Subsequently, 20 c.c. of saturated picric acid and sufficient 10% aq.  $\text{NaOH}$  to neutralise the acid with 1.5 c.c. excess are added. The solutions are compared colorimetrically after dilution to 100 c.c. The method is not applicable to diabetic urines.

CH. ABS. (p)

**Histidine in human urine.** (A) F. FOLDES. (B) R. KAPPELLER-ADLER (Biochem. Z., 1936, **285**, 294—296, 296; cf. this vol., 362).—(A) Polemical.

(B) A reply. Foldes' method is based on the detection of a substance other than histidine itself and hence is untrustworthy.

W. McC.

**Metabolism of guanyltaurine. Occurrence of glycocyamine in urine.** D. ACKERMANN (Z. physiol. Chem., 1936, **239**, 231—235).—When guanyltaurine (I) is fed to dogs about 8% is recovered unchanged in the urine but no asterubin is produced. The glycocyamine (II) in the urine occurs preformed and is not derived from (I). Allantoin (III) is adsorbed by Lloyd's reagent, but gives no red colour with  $\text{NaOBr}$  in Sakaguchi's test. Hence (III) can be distinguished from (II).

W. McC.

**Determination of morphine in urine of opium and morphine addicts: practical applications of the reaction.** S. To (Japan. J. Med. Sci., IV, 1935, **8**, 93—115).—The min. intake of morphine (I) which gives a positive Frohde test was 0.01 g. in normal cases and 0.017 g. in addicts. Use of (I) or smoking of opium is readily detected by testing the urine.

CH. ABS. (p)

**Presence of anti-pernicious anaemia principle in normal human urine.** G. E. WAKERLIN (Proc. Soc. Exp. Biol. Med., 1935, **32**, 1607—1610).

R. N. C.

**Occurrence of a new breakdown product of blood pigments (pentdyopent) in the urine.** F. WIMPLINGER (Deut. med. Woch., 1935, **61**, 1072—1074).—Pentdyopent appears regularly in the urine

in conditions that lead to elimination of bile pigments. It can appear independently from bilirubin and urobilin. Its absence is diagnostically important, as it indicates absence of liver disease. R. N. C.

**Origin of natural crystalline urobilin (stercobilin).** C. J. WATSON (J. Biol. Chem., 1936, 114, 47—57).—A cryst. urobilin, not identical with stercobilin, has been obtained from mesobilirubinogen *in vitro*, and the existence of a second urobilinogen in excreta is indicated. H. G. R.

**Uropterin**, a yellow pigment from human urine. W. KOSCHARA (Z. physiol. Chem., 1936, 240, 127—151; cf. A., 1935, 774; Schopf *et al.*, A., 1933, 1311).—The "purine fraction" of normal human urine contains uropterin (I) (concn. 1 : 10<sup>6</sup>), which is probably identical with the xanthopterin of the wings of the brimstone butterfly (*Gonepteryx rhamni*). (I) is isolated by adsorption on fuller's earth and elution with aq. C<sub>5</sub>H<sub>5</sub>N with const. observation of the fluorescence in ultra-violet light. H<sub>2</sub>S reduces (I), the leuco-compound produced being re-oxidised by atm. O<sub>2</sub>. Xanthopterins occur also in the rabbit, horse, and ox and in hay. W. McC.

**Human foot perspiration; nature and inter-reactions with footwear.** A. COLIN-RUSS (J. Hyg., 1935, 35, 198—206). CH. ABS. (p)

**Cure of anaemia by ingestion of mammalian liver.** E. LEMAIRE (Bull. Soc. d'Encour., 1936, 135, 330—332).—A review. H. G. R.

**Anaemia in pregnancy.** J. A. BOYCOTT (Lancet, 1936, 230, 1165—1172).—The common anaemia of pregnancy is of the hypochromic type and is due apparently to Fe deficiency. It responds to Fe treatment. L. S. T.

**Hypochlorhydria in asthma with special reference to the age incidence.** M. GILLESPIE (Quart. J. Med., 1935, 4, 397—405).—Low free acidity of the gastric contents was present in 51% and low total acidity in 41% of 109 cases of asthma. Subacidity (74% of cases) was most marked in the age group under 15 years. After 6 months' treatment, 16 of 46 cases showed increased acid content of the juice. NUTR. ABS. (m)

**Treatment of Basedow's disease with large doses of vitamin-A (Vogan).** H. WENDT (Munch. med. Woch., 1935, 82, 1160—1162).—The body gains in wt. and basal metabolism falls almost to normal. R. N. C.

**Treatment of tuberculous lung-bleeding with vitamin-C (Cebion-Merck).** F. HASSELBACH (Fortschr. Therap., 1935, 11, 407—411; Chem. Zentr., 1935, ii, 1573). R. N. C.

**Treatment of gynaecological bleeding with vitamin-C.** E. JUNGHANS (Klin. Woch., 1935, 14, 899). R. N. C.

**Biochemical factors of cancer.** M. COPISAROW (Chem. and Ind., 1936, 422).—The metabolic significance of enzymes, vitamins, and hormones in cancer and the curative effect of methylene-blue, cystine disulphoxide, and vitamin-E treatments support the author's views on the aetiology of cancer (cf. B., 1934, 1032; 1935, 107). F. O. H.

**Cancer. I. Influence of parenteral administration of certain sugars on the  $p_H$  of malignant tumours.** C. VOEGTLIN, R. H. FITCH, H. KAHLER, J. M. JOHNSON, and J. W. THOMPSON. II. Influence of [H<sup>+</sup>] on the reversal of proteolysis in oxygenated extracts of normal and neoplastic tissues. M. E. MAVER, J. M. JOHNSON, and C. VOEGTLIN (Nat. Inst. Health Bull., 1935, No. 164, 1—14, 29—45).—I. Administration of *d*-glucose decreased the  $p_H$  of Jensen rat sarcoma, Walker rat sarcoma, Flexner-Jobling rat carcinoma, and a spontaneous adenocarcinoma in albino mice. *d*-Fructose, *d*-mannose, and maltose, and to a smaller extent *d*-xylose, affected Jensen sarcoma and Flexner-Jobling carcinoma tissue similarly whereas *l*-arabinose, *d*-galactose, lactose, and sucrose were ineffective. The active sugars increase lactic acid in the tumours.

II. Protein synthesis in digests of both tissues reached max. at neutrality under the high [O<sub>2</sub>] used. At  $p_H$  6.0—6.5 and 7.3—7.5 slight protein synthesis was followed by proteolysis. The cystine content of the protein increased during digestion and regained its original val. during oxidation. Protein synthesis is not due to non-enzymic oxidation of ·SH in protein cleavage products. Org. S has no sp. role in digestion and oxidation. CH. ABS. (p)

**Chemotherapy of cancer. I. Lead.** J. A. BARGEN, B. T. HORTON, and A. E. OSTERBERG (Amer. J. Cancer, 1935, 23, 762—770).—Use of colloidal Pb phosphate is described. CH. ABS. (p)

**Therapy of enzymes in experimental rat tumours.** B. OTTENSTEIN and S. VON PASTINSZKY (Z. Krebsforsch., 1935, 42, 1—8; Chem. Zentr., 1935, ii, 1563). R. N. C.

**Relation of glycaemia to adrenal capsules and growth of tumours.** A. H. ROFFO and L. M. CORREA (Bol. inst. med. exp., 1931, 8, 132—146).—Adrenaline regulates glycaemia and stimulates growth of tumours. CH. ABS. (p)

**Oestrogenic hormones and mammary adenocarcinoma of the mouse.** A. LACASSAGNE (Compt. rend. Soc. Biol., 1936, 122, 183—184). R. N. C.

**Independence of malignant growths and type of metabolism.** A. REIS and L. KLUGE (Arch. exp. Path. Pharm., 1936, 181, 281—284).—Data of metabolic processes in rat sarcomata before and after general and local (growth-inhibiting) X-irradiation indicate their independence of growth; this is exemplified by the increase (32—48%) in uric acid content. F. O. H.

**Chlorine and cholesterol metabolism of animals suffering from cancer.** Hepatorenal symptom complex. S. SUMEGI (Frankfurter Z. Path., 1935, 48, 386—397).—During the growth of a transplanted rat carcinoma, cholesteryl ester in blood was low and the rise and fall in blood-Cl' following NaCl administration was > normal. Later blood-Cl' was greatly increased and diuresis and Cl' excretion were reduced. These changes were accompanied by a rise in total blood-cholesterol. They are ascribed to changes in liver and kidney due to toxic degradation products of tumour-protein. NUTR. ABS. (m)

**Tobacco and cancer.** O. SCHURCH and A. WINTERSTEIN (Z. Krebsforsch., 1935, 42, 76—92; Chem. Zentr., 1935, ii, 1563).—Tobacco-tar obtained from burning cigars contains 9% of nicotine, > 5% of hentriacontane,  $C_{31}H_{64}$ , m.p. 66°, a higher (possibly dipalmityl) ketone, m.p. 79°, a phytosterol, m.p. 135°, and about 2% of a substance,  $C_{10}H_{14}O$ , b.p. 50—55°/1 mm., which is responsible for the odour of tobacco-smoke, and is possibly a furan derivative; the odour is destroyed by catalytic hydrogenation. No product of the tar exhibits carcinogenic activity.

R. N. C.

**Effect of interference with the vascular supply on the induction of dibenzanthracene tumours.** J. W. ORR (Brit. J. Exp. Path., 1935, 16, 121—126).—Fibrosis of subcutaneous tissue produced by insertion and removal of linen threads accelerated tumour induction in mice by 1:2:5:6-dibenzanthracene. Injection of adrenaline hydrochloride further accelerated the tumours. Ephedrine sulphate had no effect.

CH. ABS. (p)

**Effect of methylene-blue on oxygen consumption and respiratory quotient of normal and tumour tissue.** J. J. JARES (Amer. J. Cancer, 1935, 24, 80—89).—Addition of methylene-blue (I) in concns. of > 0.01% to normal and tumour tissues causes an initial increase followed by a decrease in  $O_2$  consumption. The R.Q. of spleen, kidney, liver, and cerebral cortex are increased and that of testis and tumour tissues are lowered by (I) in final concn. of 0.01%. Injection of (I) and  $CH_2Br\cdot CO_2H$  into rats bearing Jensen sarcoma does not affect the rate of tumour growth.

CH. ABS. (p)

**Purine-nitrogen content of the organs of rats on various diets and suffering from avitaminosis and Jensen sarcoma.** S. EDLBACHER and P. JUCKER (Z. physiol. Chem., 1936, 240, 78—98).—Purine-N/total N ratios are given for liver, kidney, muscle, and spleen. A-Avitaminosis does not affect the vals., whilst sarcomatous rats have a high liver-purine content.

F. O. H.

**Natural sources of fluorine and "mottled teeth" in Maldon, Essex.** J. H. BOWES and M. M. MURRAY (Nature, 1936, 137, 828).—Pond- $H_2O$ , well- $H_2O$ , grass, and rabbit's teeth from this "mottled teeth" area contain much more F than similar substances from other localities.

L. S. T.

**Possible role of the anterior pituitary in human diabetes.** O. L. V. DE WESSELOW and W. J. GRIFFITHS (Lancet, 1936, 230, 991—994).—Injection of the blood-plasma of elderly, obese, glycosuric patients into rabbits diminishes the hypoglycaemic action of insulin in a manner closely resembling that obtained with extracts of the anterior pituitary gland. The plasma of young diabetic and normal subjects produces no alteration in the blood-sugar response of the rabbit to insulin. These results are discussed in relation to the pathogenesis of human diabetes.

L. S. T.

**Influencing of diphtheric circulation weakness by cortical hormone and vitamin-C.** P. BAMBERGER and L. WENDT (Klin. Woch., 1935, 14, 846—847).

R. N. C.

**Pathogenesis of galactorrhoea: hormonal processes in physiological lactation.** E. J. KRAUS (Arch. Gynakol., 1935, 159, 380—394; Chem. Zentr., 1935, ii, 1568).

R. N. C.

**Treatment of gapeworm disease.** P. A. CHAPMAN (J. Helminthology, 1935, 13, 3—8).—The eggs and adults of the parasite were killed by allyl sulphate in linseed oil (0.33 minim, 3 times daily).

CH. ABS. (p)

**Ascorbic acid in paroxysmal hæmoglobinuria.** L. ARMENTANO (Nature, 1936, 137, 910).—Paroxysmal hæmoglobinuria is accompanied by a marked deficiency in ascorbic acid, administration of which causes it to disappear.

L. S. T.

**Chronic hypoglycæmia.** M. A. GOLDZIEHER (Endocrinol., 1936, 20, 86—92).

R. N. C.

**Biochemical aspects of canine hysteria treatment.** J. McGREE (Vet. Rec., 1936, 16, 416).—The condition is due to deficiency of blood-Mg rather than -Ca.

R. N. C.

**Relative values of urea-stibamine and neo-stibosan in treatment of kala-azar.** C. U. LEE and C. F. CHU (Chinese Med. J., 1935, 49, 328—329).—Urea-stibamine is the more potent and also the more toxic.

CH. ABS. (p)

**Iodine values and total lipins of leprous human blood-sera.** H. H. ANDERSON and J. VAN D. ANDERSON (Proc. Soc. Exp. Biol. Med., 1935, 32, 1470—1473).—The I val. is low and total lipins (I) are high in early cuta-neural leprosy. Chaulmoogra (II) therapy increases the I val. and lowers (I), but the large amount of (II) given may be responsible for this.

R. N. C.

**Fat metabolism in liver disease.** S. M. LEITES, L. S. LIFSCHITZ, and A. I. ODINOV (Méd. exp. Ukraine, 1935, No. 1, 44—54).—In patients suffering from affections of the liver the curve of the alimentary lipæmia following a meal of 75 g. of butter and 20 g. of bread did not differ greatly from normal, but the ketones in the blood were > normal. In very severe cases the amount of ketones was reduced.

NUTR. ABS. (m)

**Blood-purine derivatives in migraine.** J. BRAZELL and L. A. CRANDALL, jun. (Proc. Soc. Exp. Biol. Med., 1935, 32, 1450—1451).—Adeninonucleotide-N and purine-N show no deviation from the normal vals.

R. N. C.

**Chemistry of muscle in myopathy.** R. DEBRÉ, J. MARIE, and D. NACHMANSON (Compt. rend., 1936, 202, 520—522).—In myopathy the lactic acid and glycogen contents of muscle remain within normal ranges but the proportion of P compounds is much reduced.

A. G. P.

**Insulin hypoglycæmia in myxœdema.** A. BAUDOUIN, E. AZÉRAD, and J. LEWIN (Compt. rend. Soc. Biol., 1936, 122, 170—171).—The hypoglycæmia is abnormally prolonged, the abnormality disappearing on treatment with thyroid.

R. N. C.

**Nephritis in the dog: differential diagnosis with special reference to urine analysis.** N. S. KING (Vet. Rec., 1936, 16, 445—459).—A lecture and discussion.

R. N. C.

**Congo-red test in nephropathics.** I. E. E. FERNANDEZ (*Dia Méd.*, 1932, 4, 681).—Retention of dye is shown especially in renal disease.

CH. ABS. (p)

**Paget's disease. II. Effect of adreno-cortical extract treatment on blood-phosphatase in Paget's disease.** L. BERMAN (*Endocrinol.*, 1936, 20, 226—227).—The phosphatase is reduced.

R. N. C.

**Secondary pellagra.** S. L. SIMPSON (*Quart. J. Med.*, 1935, 4, 191—201).—Pellagra following gastrectomy was cured by vitamin-B<sub>3</sub>. Gastrectomy may deprive the patient of an essential dietary factor which is derived from or bound up with protein. Adrenal hypofunction and pellagra are related.

CH. ABS. (p)

**Copper content of blood in pregnancy.** S. L. THOMPSETT and D. F. ANDERSON (*Brit. J. Exp. Path.*, 1935, 16, 67—69).—Blood-Cu increases during the last 3 months of pregnancy and is not greatly affected by associated anaemias. Milk is deficient in Cu and Fe. In foetal life a reserve of these metals is laid down, notably in liver, to be utilised in the period between birth and weaning. Cu feeding during pregnancy lowers the Fe content of liver and tissues and increases that in blood. Cu is essential for blood formation even when excess of Fe is present.

CH. ABS. (p)

**Influence of pregnancy on histamine sensitivity.** I. KARÁDY and F. STRÓBL (*Orvosi Het.*, 1935, 79, 589—590).—Changes in sensitivity occur from the third or fourth month.

CH. ABS. (p)

**Streptococcal complement-fixing reaction in rheumatic diseases.** A. BECK and F. COSTE (*Brit. J. Exp. Path.*, 1935, 16, 20—25).—Tuberculous and pregnancy sera frequently react with streptococcal lipin antigens; positive reaction with these occurs only in cases of rheumatic disease in which, clinically, a connexion with streptococcal infection is probable.

CH. ABS. (p)

**Experimentally rachitic rats after injection of porphyrin.** E. EMMINGER and B. BÜCHELE (*Virchow's Archiv*, 1935, 295, 46—56; *Chem. Zentr.*, 1935, ii, 1395).—Porphyrin deposition in the bones is apparently unrelated to rickets.

R. N. C.

**Silicosis.** W. E. COOK (*J. Hyg.*, 1935, 35, 207—218).—A review.

CH. ABS. (p)

**Action of iodine-containing saline atmosphere on thyroid hyperplasia.** H. UFFENORDE (*Z. ges. exp. Med.*, 1934, 93, 547—569; *Chem. Zentr.*, 1935, ii, 1570).

R. N. C.

**Use of nitric acid in the serological diagnosis of cattle trypanosomiasis.** E. R. JONES (*Vet. Rec.*, 1936, 16, 602—605).—HNO<sub>3</sub> gives a sp. serological reaction for trypanosome infections, the reaction being a modification of the xanthoproteic reaction.

R. N. C.

**Cholesterolaemia and tuberculosis.** L. LLOPIS (*Cron. med. Valenciana*, 1934, 28, No. 809).—Blood-cholesterol is unrelated to the course of pulmonary tuberculosis.

CH. ABS. (p)

**Value of urine examination in disease of the urinary tract in the dog.** J. MCGHEE (*Vet. Rec.*, 1936, 16, 570—574).

R. N. C.

**Metabolism of cold-blooded animals in different latitudes.** H. M. FOX (*Nature*, 1936, 137, 903—904).—The O<sub>2</sub> consumption of English marine invertebrates is > that of related northern species each at the temp. of their habitat. Since locomotory activities are approx. equal, non-locomotory metabolism appears to be higher in the warmer-H<sub>2</sub>O species. Ciliary activity parallels O<sub>2</sub> consumption, but in crustaceans the respiratory movements of the warmer- and colder-H<sub>2</sub>O species are equal.

L. S. T.

**Effects of complete and incomplete hypophysectomy on basal metabolism of pigeons.** O. RIDDLE, G. C. SMITH, and C. S. MORAN (*Proc. Soc. Exp. Biol. Med.*, 1935, 32, 1614—1616).—Basal metabolism falls after both complete and incomplete hypophysectomy, to extents which are influenced by the temp. of measurement.

R. N. C.

**Respiratory metabolism of the seal and its adjustment to diving.** L. IRVING, O. M. SOLANDT, D. Y. SOLANDT, and K. C. FISHER (*J. Cell. Comp. Physiol.*, 1935, 7, 137—151).

R. N. C.

**Fumarate and tissue-respiration. I. Effect of dicarboxylic acids on oxygen consumption.** G. D. GREVILLE (*Biochem. J.*, 1936, 30, 877—887; cf. *Annau et al.*, A., 1935, 1406).—The effects of malonate (I) and fumarate (II) on the respiration of tissues (pigeon's breast-muscle, rat diaphragm) are the more pronounced the greater is the degree of damage which they have suffered. (I) inhibits carbohydrate respiration in rat's brain-cortex and retina and respiration, accelerated by dinitro-*o*-cresol, in brain-cortex and tumour. (II) partly counteracts the inhibition. (I) does not inhibit respiration, accelerated by brilliant-cresyl-blue, in tumour.

W. McC.

**Determination of the respiratory quotient of tissues in Ringer's solution containing phosphate.** E. CLARANFI (*Biochem. Z.*, 1936, 285, 238—240).—The amount of preformed CO<sub>2</sub> in tissues  $\propto$  their wt. if determined in unbuffered Ringer's solution after the const. of proportionality has been determined. The respiration of tissues is subsequently measured in a vessel described, the *p<sub>H</sub>* of the solution being adjusted as required.

W. McC.

**Metabolism of normal and tumour tissues. XVI. Action of some oxidation-reduction systems.** F. DICKENS (*Biochem. J.*, 1936, 30, 1064—1074; cf. this vol., 629).—Thionine (I) and brilliant-cresyl-blue (II) considerably increase rat kidney oxidation in HCO<sub>3</sub>' and PO<sub>4</sub>' media, whilst pyocyanine (III) produces an increase in PO<sub>4</sub>'—Ringer's solution. All three dyes increase the respiration of kidney in lactate medium, whilst methylene-blue has a progressive toxic action and gallocyanine is without effect. With tumour-tissue, the max. increase (200%) in respiration in glucose occurs with (I) and (II), and these also increase the oxidation of brain-tissue in glucose. Phenosafranine greatly increases aerobic glycolysis in both brain and tumour tissue. (III) increases respiration and decreases aerobic and

anaerobic glycolysis of tumour. Phenazine mothiodide and *NN'*-dimethyldihydrophenazine have similar but less marked actions. J. N. A.

Low-temperature blood meals as a source of essential amino-acids for nutritive purposes. W. C. MILLER (Vet. Rec., 1936, 16, 311—321).—A lecture and discussion. R. N. C.

Oxidative deamination of amino-acids. M. NEBER (Z. physiol. Chem., 1936, 240, 59—69).—The principal  $\text{NH}_2$ -acids are oxidatively deaminated (by the same enzyme; glycine most readily) to decreasing extents by liver, kidney, and intestinal mucosa. The isolated organs, unlike those *in situ* (as indicated by feeding experiments), deaminate the naturally-occurring optical forms more slowly than the corresponding non-natural isomerides. Deamination of tryptophan and *d*(+)-histidine by kidney occurs to only a small extent; that of alanine by liver is accompanied by disappearance of part of the resultant  $\text{NH}_3$  which is not converted into urea, but probably utilised for purine synthesis. F. O. H.

Nutritive value of canavanine (amino-acid). M. OGAWA (J. Agric. Chem. Soc. Japan, 1936, 12, 256—259; cf. A., 1935, 1407).—Canavanine is not essential for growth in the later part of the growing period of animals. J. N. A.

Conversion of histidine into histamine in the animal organism. W. BLOCH and H. PINOSCH (Z. physiol. Chem., 1936, 239, 236—240).—The histamine (I) content (0.0015—0.0025%) of the lungs of guinea-pigs is doubled following subcutaneous injection of histidine (II) (1.0 g. per kg of body-wt.). No increase follows injection of other  $\text{NH}_2$ -acids or of 0.9% aq. NaCl, or fasting. Organs other than the lungs contain very little (I) and no definite increase in their content of (I) follows injection of (II).

W. McC.

Inactivation of histamine *in vivo*. C. A. DRAGSTEDT and F. B. MEAD (Proc. Soc. Exp. Biol. Med., 1935, 32, 1435—1437).—Histamine injected in almost lethal doses in the dog disappears in 30—40 min.; in smaller doses the time is proportionately less.

R. N. C.

Metabolism of betaine and allied tertiary nitrogenous bases in the ruminant. W. L. DAVIES (J. Dairy Res., 1936, 7, 14—24).—The principal tertiary N metabolite of all *tert.* N bases examined is  $\text{NMe}_3\text{O}$  (I). Traces of  $\text{NMe}_3$ ,  $\text{NHMe}_2$ , and  $\text{NH}_2\text{Me}$  also occur in cow's urine. The N of simple bases [ $\text{NMe}_3$  and (I)] is rapidly and almost quantitatively excreted as (I). From 14 to 43% of the N of betaine (II), choline, and  $\text{NMe}_2\cdot\text{CH}_2\cdot\text{CO}_2\text{Me}$  is excreted as (I), the rate of excretion varying with the nature and amount of the bases fed. No unchanged (II) was found in the urine. A. G. P.

Fission of proline in the animal organism. M. NEBER (Z. physiol. Chem., 1936, 240, 70—77).—Decomp. of *l*(-)-proline and -hydroxyproline by liver and kidney tissue is accompanied by formation of  $\cdot\text{NH}_2$ , but not of  $\text{NH}_3$ . From the products of decomp. were isolated *l*(+)-glutamic (I) and  $\alpha$ -ketoglutaric acid (II). The decomp. of pyrrolidonecarboxylic (III) and  $\alpha$ -amino- $\delta$ -hydroxyvaleric acid (IV) (the latter

yielding  $\delta$ -hydroxy- $\alpha$ -ketovaleric acid) indicates that the route is proline  $\rightarrow$  (III) + (IV)  $\rightarrow$  (I)  $\rightarrow$  (II), (II) being further catabolised. F. O. H.

Tryptophan metabolism. VIII. Growth and kynurenic acid production on carboxylic acid derivatives of tryptophan. L. C. BAUGUENESS and C. P. BERG (J. Biol. Chem., 1936, 114, 253—257; cf. A., 1934, 1252).—*Me*, m.p. 149—150°, *Et*, m.p. 105—106°, *Pr*, m.p. 124—125°, *Ph*, m.p. 151° (decomp.), and  $\text{CH}_2\text{Ph}$  tryptophancarboxylate, m.p. 122—124°, were all inactive in promoting growth or kynurenic acid production in tryptophan-deficient rats.

Metabolism of sulphur. XXIII. Influence of ingestion of cystine, cysteine, and methionine on the excretion of cystine in cystinuria. H. B. LEWIS, B. H. BROWN, and F. R. WHITE (J. Biol. Chem., 1936, 114, 171—184; cf. A., 1935, 1008).—When cystine (I) isolated from urine or obtained from human hair was fed to a cystinuric, no extra (I) was excreted in the urine, but there was a large increase in urinary  $\text{SO}_4^{--}$ . When cysteine hydrochloride was fed, there was an increase in the amounts of (I) and  $\text{SO}_4^{--}$  excreted. When *dl*-methionine (II) was fed, extra (I) but not  $\text{SO}_4^{--}$  was excreted. If the cystinuric received a high-protein diet, the extra excretion of (I) after feeding (II) was < when a moderate protein diet was fed. There was no evidence of the presence in the urine of a readily decomposed complex containing (I). J. N. A.

Metabolism of argininic acid. K. FELIX and H. MÜLLER (Z. physiol. Chem., 1936, 240, 1—9).—Argininic acid (A., 1928, 744) is harmless to fed animals (e.g., 10—30 g., daily in man, the blood-sugar being unaffected), but doses of 0.5 g. per kg. are toxic and occasionally lethal to starved animals. In animals and men suffering from muscular dystrophy (but not from myasthenia), it increases excretion of (partly nowly formed) creatine, whilst in diabetics it is converted mainly into urea and sugar. F. O. H.

Comparative studies on the concentrating power of the liver and kidney with respect to cholalic acid. E. CHABROL, J. COTTET, and J. SALLET (Compt. rend. Soc. Biol., 1936, 122, 184—186).—Slow continuous intravenous injection of cholalic acid (I) in the dog does not increase blood-(I); most of the injected (I) is removed by the liver, very little being eliminated in the urine. Increase of the rate of injection causes a rise of blood-(I) through inability of the liver to remove the increased supply; renal elimination is not increased in this case, nor if the bile duct is ligatured. In dogs poisoned with tolylenediamine, (I) is removed during injection as in normal dogs, but blood-(I) rises after injection has ceased.

R. N. C.

Increase in cholalic acid in the liver and muscle during experimental cholalæmia. E. CHABROL, J. COTTET, and J. SALLET (Compt. rend. Soc. Biol., 1936, 122, 186—188).—Cholalic acid (I) injected into normal dogs is removed by the liver but not stored in the muscles. With the bile duct ligatured, (I) is stored in both liver and muscles, their content continuing to increase after injection has

coased. In dogs intoxicated by tolylenediamine, storage of (I) is reduced in both liver and muscles.

R. N. C.

**Origin and fate of urea in the developing hen's egg.** J. NEEDHAM, J. BRACHET, and R. K. BROWN (J. Exp. Biol., 1935, 12, 321—336).—The urea produced during development of the embryo is not derived from the  $\text{NH}_3$  of protein catabolism, or from uric acid (I) by means of uricase. Its source appears to be an arginine-arginase system present from the 2nd day of incubation onward. Arginase (II) activity falls very regularly as development proceeds, reaching a min. about the 12th day, but the quantity of activators present does not decrease. (II) occurs in the yolk sac, but in much smaller quantity than in the embryo. Results of injection of urea and tartronic acid show that Werner's urea conjugation hypothesis of (I) synthesis is untenable. Injection of  $(\text{NH}_4)_2\text{CO}_3$  markedly increases the (I) content of the embryo.

NUTR. ABS. (m)

**Pigment metabolism during and after a fifty-day period of starvation.** G. G. GASENKO and N. P. BLAGOVESTOVA (Folia Hæmatol., 1935, 53, 283—290).—Changes in the pigment of internal organs were slow. Urobilin excretion reached a min. normal. Decreased formation of red cells followed only at the end of the period and during recovery.

CH. ABS. (p)

**Biological degradation of chlorophyll. V. Dihydropyrophæophorbide-a and pyrophæophorbide-b from the fæces of sheep.** H. FISCHER and F. STADLER (Z. physiol. Chem., 1936, 239, 167—178; cf. A., 1933, 627, 1173; 1934, 317).—Probo-phorbide-a is a mixture of pyrophæophorbide-a. (I) and its  $\text{H}_2$ -derivative (II). (I) and (II) are partly separated by adsorption on talc. Probo-phorbide-b probably consists chiefly of methyl-phæophorbide-a or contains chlorin- $c_8$ . In the sheep, after the Mg of chlorophyll is eliminated in the stomach, part of the phæophytin produced passes through the intestine unchanged, but most is converted into (I) and small amounts of pyrophæophorbide-b, together with a little phæophorbide. Enzymic hydrogenation of (I) yields (II),  $\text{CH}:\text{CH}_2$  being reduced to Et. According to the conditions which prevail in the intestine (I) and (II) are excreted or converted into phylloerythrin.

W. McC.

**Cholesterol content of different organs during digestion and fasting.** K. YAMASAKI (Fukuoka Acta med., 1935, 28, 106—107).—During digestion of food the cholesterol (I) content of the adrenals was increased but that of other organs remained const. In fasting animals the (I) content of the adrenals was decreased and that of the liver increased. Increased liver-(I) was noted, together with hypercholesterolaemia, after oral administration of (I).

NUTR. ABS. (m)

**Cholesterol ratio in living and necrotic neoplastic tissue.** A. H. ROFFO (Bol. inst. med. exp., 1932, 9, 503—510).—Increased cholesterol occurs in neoplastic tissue.

CH. ABS. (p)

**Phosphorus metabolism. V. Relation between urinary phosphate and blood-phospholipin during absorption of fats.** G. E. YOUNG-

BURG (J. Lab. Clin. Med., 1935, 20, 920—922; cf. A., 1933, 178).—Increased blood-phospholipin (I) occurring after ingestion of a high-fat meal is not accompanied by a decrease in urinary  $\text{PO}_4'''$  (II). The P of (I) and (II) is not drawn from the same immediate source.

CH. ABS. (p)

**Fat metabolism. XVII. Biological degradation of hydrogen esters. I. Metabolism of ethyl hydrogen sebacate in dogs.** B. FLASCHENTRAGER and K. BERNHARD (Z. physiol. Chem., 1936, 240, 19—22).—Of 30 g. of Et H sebacate ingested, 91.8% is apparently metabolised and 5.2% is excreted unchanged, 2.1% as sebacic acid and 0.63% as Et H suberate. This confirms the enhanced catabolism of  $(\text{CO}_2\text{H})_2$ -acids by blocking a  $\cdot\text{CO}_2\text{H}$  (cf. A., 1935, 1015, 1151; Verkade and van der Lee, this vol., 234).

F. O. H.

**Influence of food-fat of varying degrees of unsaturation on blood-lipins and milk-fat.** L. A. MAYNARD, C. M. MCCAY, and L. L. MADSEN (J. Dairy Sci., 1936, 19, 49—53).—Changes in the I val. of milk-fat appear 18—24 hr. after changes in the ration and reach max. in 2—4 days. Similar though less marked changes occur in blood-lipins.

A. G. P.

**Effect of various fats in the production of dietary fatty livers.** H. J. CHANNON and H. WILKINSON (Biochem. J., 1936, 30, 1033—1039).—Rats fed on a diet containing 5% of protein supplemented with butter or beef fat or palm, coconut, or olive oil all developed fatty livers. The differences in accumulation were accounted for by the differences in the content of glycerides, and the degree of accumulation was inversely  $\propto$  the I val. of the dietary fat, and, except in the case of olive and cod-liver oils, ran parallel with the % of  $\text{C}_{14}$ — $\text{C}_{18}$  saturated acids. The data indicate that the nature of the stored fat depends, both in the glyceride and phosphatide fraction, on that of the dietary fat.

H. D.

**Effect of dietary caseinogen in the prevention of fatty livers.** A. W. BEESTON, H. J. CHANNON, J. V. LOACH, and H. WILKINSON (Biochem. J., 1936, 30, 1040—1046).—1 g. of caseinogen (I) is equiv. to 7—8 mg. of choline (II) in preventing liver-fat deposition in rats receiving diets containing 40% of fat. The presence of marmite in the diet has no further effect on liver-fat accumulation than that due to its (II) content. With diets containing 5% of (I) and 40% of fat, 3 mg. of (II) per day reduced the liver-fat from 20 to 10%, but amounts varying from 8.8 to 79.8 mg. did not prevent some fat accumulation. Edestin has lipotropic action.

J. N. A.

**Serum-lipin changes in relation to the intermediary metabolism of fat.** A. E. HANSEN, W. R. WILSON, and H. H. WILLIAMS (J. Biol. Chem., 1936, 114, 209—222).—Serum-lipins (I) were determined in dogs, which were fasted to deplete the fat depots, and then fed a complete diet, including linseed oil or coconut oil as sources of fat. After regaining wt., the dogs were fasted for 7 days and then fed a diet in which carbohydrate replaced the fat. This was followed by a fast of 4 days. The highest vals. for total lipins were found during the ingestion of fat, and the lowest during feeding of

carbohydrate, with approx. equal vals. at the end of the two fasts. The level of (I) varied with the intensity of fat metabolism. All the principal fractions of the total lipin were concerned with the transport and utilisation of fat. Dogs receiving coconut oil had higher (I) vals. than those receiving linseed oil. The difference was greatest in the neutral fat. The I vals. of the total fatty acids and, to a smaller extent, those of the phospholipin fatty acids reflected the characters of the diet during the feeding, and of the depot fat during fasting. J. N. A.

**Physiology of pyrimidines. VIII. Metabolism of isobarbituric acid in the rabbit.** W. J. CONWAY and L. R. CERECEDO (Proc. Soc. Exp. Biol. Med., 1935, 32, 1600—1601).—Feeding with isobarbituric acid (I) results in a decrease of inorg. S and increases in sulphuric esters and urea; hence (I) is metabolised as in the dog and man. R. N. C.

**Fate of phenol after intravenous injection in the dog.** G. BARAC (Compt. rend. Soc. Biol., 1936, 122, 74—75).—PhOH diffuses into the organs, the liver and kidneys taking up slightly > the remaining organs. R. N. C.

**Blood-sugar equilibrium in simultaneous portal and arterial perfusion of the liver.** N. FIESSINGER, H. BENARD, M. HERBAIN, and L. DERMER (Compt. rend. Soc. Biol., 1936, 122, 32—33).—Liver-glycogen (I) in the dog falls considerably, particularly if initially high, whilst blood-sugar rises proportionally, falling again when (I) is exhausted. R. N. C.

**Metabolism of the frog's egg in course of development. IV. Glycogen content of the egg from segmentation to hatching.** J. BRACHET and J. NEEDHAM (Arch. Biol., 1935, 46, 821—825).—Glycogen (I) is steady until gastrulation, afterwards falling progressively. The % of desmoglecogen also falls. (I) is reduced by anaerobiosis at segmentation, but not at neurulation. R. N. C.

**Digestion and utilisation of starch by the honey bee.** R. LOTMAR (Arch. Bienenk., 1935, 16, 195—204).—Starch (I) is digested by bees and utilised almost as well as sugar. Cooked (I) is less readily digested, but intact (I) grains are not digested, being protected by amylopectin against the action of bee-diastase (II). Pollen-(I) is not attacked by pollen-(II) but by bee-(II). NUTR. ABS. (m)

**Biochemistry and physiology of glycuronic acid. VI. Excretion of ethereal sulphate by the rabbit following administration of phenylglucosides. VII. Conjugation of borneol in man.** J. PRYDE and R. T. WILLIAMS (Biochem. J., 1936, 30, 794—798, 799—800; cf. A., 1934, 442).—VI. Phenyl- $\alpha$ - and - $\beta$ -glucosides, orally or subcutaneously administered to rabbits, are not excreted as glycuronides, but as (the equiv. amount of)  $\text{Ph}_2\text{SO}_4$ , indicating hydrolysis to PhOH and glucose.

VII. Following ingestion of borneol (2 g.), up to approx. 80% is excreted as glycuronide within 10—12 hr. F. O. H.

**Effect of low-carbohydrate diet on glucose tolerance in spontaneous hypoglycæmia.** B. B.

CLARK and J. A. GREENE (Proc. Soc. Exp. Biol. Med., 1935, 32, 1459—1462).—Glucose tolerance is increased. R. N. C.

**In-vitro studies on lactic acid metabolism in tissues from polyneuritic chicks.** W. C. SHERMAN and C. A. ELVEHJEM (Biochem. J., 1936, 30, 785—793).—Determinations of  $\text{O}_2$  uptake, lactic acid (I) removal, and reduction of methylene-blue by normal and polyneuritic chick tissues indicate that diminished  $\text{O}_2$  uptake and removal of (I) occur in heart- but not brain-tissue, the deficiency being remedied by addition of vitamin- $B_1$ . Inhibition of (I) dehydrogenase by  $\text{AcCO}_2\text{H}$  in avitaminous heart and kidney is > that in normal tissues. The influence of - $B_1$  on the dehydrogenation of (I) and the bearing of the data on those of Birch and Mann (A., 1934, 705) are discussed. F. O. H.

**Post-mortal formation of lactic acid in muscles of seals, ducks, and hens.** J. F. MANERY, M. S. WELCH, and L. IRVING (J. Cell. Comp. Physiol., 1935, 7, 131—135).—The anaerobic reserves of the skeletal muscle of the seal are not different from those of other animals, nor those of the duck from those of the hen. Post-mortal formation of lactic acid is the same in muscles of hens and ducks without buffers, and is high in the pectoral muscles. The  $\text{CO}_2$  contents of the muscles are also similar in the two species. R. N. C.

**Degradation of butyric acid by surviving liver.** E. CIARANFI (Biochem. Z., 1936, 285, 228—237).—The respiration and production of ketones by surviving guinea-pigs' liver in presence of  $\text{Pr}^c\text{CO}_2\text{Na}$  and the ratio  $\beta$ -hydroxybutyric acid (I) to  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{H}$  (II) produced are greater when the Ringer's solution employed contains  $\text{NaH}_2\text{PO}_4$  as buffer than when it contains  $\text{NaHCO}_3$ . The liver oxidises (I) slightly with production of (II), and partly reduces and partly oxidises (II), free  $\text{O}_2$  being consumed. In Ringer's solution the reaction (I)  $\rightarrow$  (II) proceeds equally rapidly in both directions when  $\text{NaHCO}_3$  is the buffer but (II) $\rightarrow$ (I) is more rapid when  $\text{NaH}_2\text{PO}_4$  is buffer. Consumption of  $\text{O}_2$  and production of  $\text{CO}_2$  by the liver are increased by addition of  $\text{Pr}^c\text{CO}_2\text{Na}$ , indicating that degradation proceeds beyond the stage of (I) and (II). W. McC.

**Variations in magnesium content of the normal white rat with growth and development.** D. M. GREENBERG and E. V. TUFTS (J. Biol. Chem., 1936, 114, 135—138; cf. A., 1927, 894).—The Mg content of normal rats is least in the foetus and increases rapidly to a max. val. of 40 mg. per 100 g. at 4 weeks of age. This is followed by a const. level for 11 weeks, and a subsequent reduction of about 20%. There is no significant difference in the Mg content of the two sexes. The  $\text{H}_2\text{O}$  content progressively decreases from birth. J. N. A.

**Sulphur and sulphate balance experiments with sheep.** F. J. WARTH and T. S. KRISHNAN (Indian J. Vet. Sci., 1935, 5, 319—331).—A loss (intake less that recovered in excreta and estimated to be present in live-wt. increase and wool) of total S and  $\text{SO}_4$  always occurred in sheep receiving a diet low in S and in those receiving the same diet supple-

mented with  $\text{SO}_4^{''}$ , but there was a gain in org. S. The org. S of the urine increased after feeding inorg.  $\text{SO}_4^{''}$ .  
NUTR. ABS. (m)

**Response of the kidney to an alkalosis during salt deficiency.** R. A. McCANCE and E. M. WIDDOWSON (Proc. Roy. Soc., 1936, 120, B, 228—239).—Overbreathing by normal persons produced alkaline urine with increased excretion of  $\text{Na}^+$  and  $\text{K}^+$  and diuresis. In salt-deficient cases, oliguria with no change in  $p_{\text{H}}$  or excretion of  $\text{Na}^+$  and  $\text{K}^+$ , but with a generalised lowering of functional renal activity, occurred, administration of  $\text{CO}_2$  preventing the latter.  
H. G. R.

**Physiology of digestion in ruminants. I. Acid and enzyme content of the abomasum of the sheep.** F. W. KRZYWANIEK and W. BUSS (Arch. wiss. pr. Tierheilk., 1935, 69, 321—328).—In the abomasum acidity and  $p_{\text{H}}$  were not closely correlated, the discrepancy being due to the presence of org. acids. In a pregnant sheep,  $\text{HCl}$  fell to a very low level 1 month before lambing and gradually rose to normal at lambing. Pepsin was the only enzyme of importance.  
NUTR. ABS. (m)

**Denaturation of proteins by sound waves of audible frequencies.** L. A. CHAMBERS and E. W. FLOSDORF (J. Biol. Chem., 1936, 114, 75—83).—Ovalbumin and plastein, but not horse serum-albumin, are denatured by intense sonic vibration sufficient to produce vigorous cavitation of the solutions, except in an atm. of  $\text{N}_2$  or  $\text{H}_2$  or in vac. The solubility of the products equals that of the heat-denatured products.  
H. G. R.

**Modifications of the state of oxidation-reduction of tissues *in vivo* during photo-sensitisation.** P. DUBOULOZ and J. ROCHETTE (Compt. rend. Soc. Biol., 1936, 122, 221—222).—Irradiation of the skin of the guinea-pig injected with methylene-blue decolorises it irreversibly. The skin of the frog similarly coloured is decolorised in darkness, but the colour is restored on irradiation.  
R. N. C.

**Determination of oxidation-reduction potentials [in biological media].** L. P. DUGAL (Natural. Canad., 1936, 63, 113—133).—Data are recorded for the survival of specimens of *Gammarus locusta* and of the larvæ of coastal plankton in media of varying  $p_{\text{H}}$  and  $r_{\text{H}}$ .  
H. J. E.

**Oxidation-reduction potential of  $\alpha$ -amino-ketobutyric ester and of reductone.** C. MARTIUS and F. KNOOP (Z. physiol. Chem., 1936, 240, 195—197).—The average potential,  $E_0$ , of the ester (I) at 25° and  $p_{\text{H}}$  4.53—8.68 is 0.077, whilst the vals. for reductone and ascorbic acid are approx. equal. (I) readily decolorises indigotindisulphonate, Janus-green, phenosafranin, safranin VE, and (chiefly irreversibly) neutral-red.  
W. McC.

**Effect of certain environmental conditions on skin and body temperatures and rate of oxygen consumption.** H. FREEMAN (Refrig. Eng., 1935, 30, 27—30).—Effects of temp. and R.H. are examined.  
CH. ABS. (p)

**Physiological basis of the sensation of cold. IV. Influence of temperature and of thyroid extract on oxygen consumption of the anæsthet-**

**ised rabbit. V. Relation between basal metabolism, regulation of temperature, and sensation of cold.** J. M. O'CONNOR (Proc. Roy. Irish Acad., 1936, 43, B, 23—33, 34—42).—IV. The influence of temp. on the basal metabolic rate in normal and in thyrotoxic rabbits is the same, the vals. at all temp. being raised 50% in the latter.

V. The onset of shivering between 22° and 38° corresponds with a change in the basal metabolic rate with temp.  
H. G. R.

**Effects of fractional doses of prolactin and X-rays in association on the morphology of the ovary of the adult rabbit.** P. DESAIVE (Arch. Biol., 1935, 46, 669—694).  
R. N. C.

**Interpretation of the action of X-rays and prolactin on the ovary of the adult rabbit.** P. DESAIVE (Arch. Biol., 1935, 46, 695—715).  
R. N. C.

**Exogastrulation in amphibia after X-ray exposure.** W. C. CURTIS, J. A. CAMERON, and K. O. MILLS (Science, 1936, 83, 354).  
L. S. T.

**Absorption of radium emanation by the human body through the skin.** R. WAGNER (Sitzungsber. Akad. Wiss. Wien, II, A, 1934, 143, 521—531).—Rn from radioactive baths is absorbed through the skin and lungs, the latter being the more important route. The permeability of the skin to Rn is about 0.01%, but is increased with large skin surface and excessive hypodermal fat tissue. Absorption in warm  $\text{H}_2\text{O}$  baths is > in ordinary air-baths.  
R. N. C.

**Electromotive force in biological systems. IV. Effect of various nitrogen-oxygen and carbon monoxide-oxygen mixtures on the electromotive force and oxygen consumption of frog skin.** A. B. TAYLOR (J. Cell. Comp. Physiol., 1935, 7, 1—21).— $[\text{O}_2]$  of < 20% in  $\text{N}_2$ - $\text{O}_2$  mixtures lower both  $E$  and  $\text{O}_2$  consumption, the fall of  $E$  being > that of  $\text{O}_2$  consumption, which  $\propto$  the  $[\text{O}_2]$ . Pure  $\text{O}_2$  stimulates  $E$  and increases  $\text{O}_2$  consumption slightly. The decline of  $E$  and of respiration in  $\text{CO}$ - $\text{O}_2$  mixtures depends partly on the  $[\text{CO}]$ , the fall of  $E$  being the greater in certain limits. Complete recovery after treatment with either mixture depends on the time of exposure and the composition of the mixture. The effect of  $\text{CO}$  is unaffected by light.  
R. N. C.

**Ionic antagonism in the water-permeability of sea-urchin eggs.** T. R. FUKUDA (J. Cell. Comp. Physiol., 1935, 7, 301—312).—The rate of swelling of the eggs in hypotonic solutions depends on the ionic composition of the solution. The permeability changes caused by two-salt mixtures containing chlorides of bivalent cations are simple if both cations are bivalent, but more complicated if one only is bivalent; the changes are characteristic of the mixed ratio.  $\text{Na}^+$ - $\text{Ca}^{++}$  mixtures show max. at 99.5% and 50%  $\text{Na}^+$ , and min. at 5% and 100%  $\text{Ca}^{++}$ ;  $\text{Na}^+$ - $\text{Mg}^{++}$  mixtures show max. at 30% and 75%  $\text{Na}^+$  and a min. at 100%  $\text{Mg}^{++}$ .  
R. N. C.

**Permeability of the egg of *Arbacia punctulata* to certain solutes and water.** D. R. STEWART and M. H. JACOBS (J. Cell. Comp. Physiol., 1936, 7, 333—350).—The permeability consts. for a no. of glycols and  $\text{H}_2\text{O}$  are given. They are doubled after

fertilisation of the egg.  $\text{CaCl}_2$  in the solution decreases the permeability of the cell to  $\text{H}_2\text{O}$ , but does not affect that to glycol. R. N. C.

**Distribution of penetrating ammonium salts between cells and their surroundings.** M. H. JACOBS and D. R. STEWART (J. Cell. Comp. Physiol., 1936, 7, 351—365).—The rate of penetration of cells by  $\text{NH}_4$  salts of weak acids is  $>$  that by salts of strong acids, the mechanism probably being by means of the hydrolysis products. The *Arbacia* egg does not swell in isotonic  $\text{NH}_4\text{Cl}$  or hypertonic  $\text{KCl-NH}_4\text{OAc}$  mixture, but ultimately swells in hypertonic  $\text{NH}_4\text{Cl-NH}_4\text{OAc}$  mixture; swelling is caused in  $\text{NH}_4\text{Cl}$  by addition of  $\text{NaOAc}$ , but not by  $\text{Na}_3\text{BO}_3$ , although the cell is apparently permeable to  $(\text{NH}_4)_3\text{BO}_3$ . This suggests that in a mixture of a penetrating and a non-penetrating  $\text{NH}_4$  salt the former may distribute itself so as to raise the internal concn. above the equilibrium concn., but that sufficiently weak acids may prevent this increase. R. N. C.

**Phosphocreatine and lactic acid changes in potassium chloride contractions of frog's muscle in acid solution.** S. R. TIPTON (J. Cell. Comp. Physiol., 1936, 7, 433—443).—Muscles in solution buffered at  $p_{\text{H}}$  6.0 are contracted by 0.04% of K. The contraction is accompanied by a sudden rise in  $\text{O}_2$  consumption, and by hydrolysis of phosphocreatine (I), but lactic acid (II) does not begin to accumulate until  $[\text{K}]$  reaches 0.08%. At this concn. (I) resynthesis is increased. Anaerobic (I) hydrolysis with high  $[\text{K}]$  is  $>$  aerobic hydrolysis. In presence of  $\text{O}_2$  (I) is resynthesised even if (II) formation is not increased. R. N. C.

**Effect of cations on the velocity of the extinguishing action of animal and vegetable organs.** G. RUSSO (Boll. Soc. ital. Biol. sperim., 1935, 10, 805—807).—The velocity of extinction in the presence of cations in the alkaline  $p_{\text{H}}$  zone decreases in the order  $\text{Li} > \text{K} > \text{Na} > \text{Sr} > \text{Mg}^{++}$ ,  $\text{Ba}^{++} > \text{Ca}^{++} > \text{NH}_4^+$ , whilst in the acid zone it increases in the order  $\text{K} < \text{Ba}^{++} < \text{Ca}^{++} < \text{Sr}^{++} < \text{Mg}^{++} < \text{Na}^+$ ,  $\text{NH}_4^+ < \text{Li}^+$ . R. N. C.

**Effect of inorganic salts on the diuretic action of salyrgan.** C. B. ETHRIDGE, D. W. MYERS, and M. N. FULTON (Arch. Int. Med., 1936, 57, 714—728).—Diuresis is increased by the addition of salts which produce acidosis and diminished by those producing alkalosis. H. G. R.

**Inorganic salts in nutrition. Changes in kidneys of rats fed a diet poor in inorganic constituents.** P. P. SWANSON, C. A. STORVICK, and A. H. SMITH (J. Biol. Chem., 1936, 114, 309—319).—Rats on a salt-deficient diet showed enlarged kidneys for 45 days, followed by a regression in kidney size. The proportions of ash, Ca, and P did not decrease, and at the end of 3 weeks the  $[\text{Ca}^{++}]$  was abnormally high. H. D.

**Influence of arsenic on basal metabolism, blood-residual nitrogen, and reticulocytes in man.** E. KNEEL (Arch. exp. Path. Pharm., 1936, 292—300).—Administration of single therapeutic doses of org. or inorg. As preps. lowers the basal metabolism and blood-residual N (I), the latter subsequently increasing and, with inorg. As, exceeding

normal vals. Prolonged dosage increases (I) and the reticulocyte count, the course of the latter together with those of haemoglobin and erythrocytes resembling (and hence indicating the non-specificity of) those due to anti-anæmic preps. F. O. H.

**Value of carbon dioxide in counteracting oxygen lack.** E. GELLHORN (Nature, 1936, 137, 700—701).—The presence of 3% of  $\text{CO}_2$  in the air prevents or alleviates the effect of a low  $[\text{O}_2]$  (8—9%) on brain-stem reflexes in the rabbit and on vision, muscular co-ordination, and mental processes in man. L. S. T.

**Mineral metabolism. XXXIII. Iodine in the nutrition of sheep.** II. A. I. MALAN, P. J. DU TOIT, and J. W. GROENEWALD (Onderstepoort J. Vet. Sci., 1935, 5, 189—200).—There was no significant difference in wt. or wool production between merino ewes receiving KI daily and those receiving none. NUTR. ABS. (*m*)

**Action of lithium on sea-urchin development.** J. RUNNSTRÖM (Biol. Bull., 1935, 68, 378—384).—Effects of  $\text{Li}^+$ , to which the eggs are very sensitive, are described. Pyocyanine counteracts the action of Li which affects the structure of the protoplasm and respiration. CH. ABS. (*p*)

**Effect of uranium nitrate on insulin hypoglycæmia and glycolysis in the blood.** R. WEEKERS (Compt. rend. Soc. Biol., 1936, 122, 78—80).— $\text{UO}_2(\text{NO}_3)_2$  does not appreciably modify the reduction of blood-sugar and  $-\text{PO}_4$  caused by insulin, but it slackens, without inhibiting, blood-glycolysis. R. N. C.

**Effect of sulphur on the bone-marrow.** A. H. MÜLLER (Klin. Woch., 1935, 14, 917—918).—Stimulation of the bone-marrow by thioalbumin (I) is not more productive than that by S-free proteins. Pure S and inorg. S compounds do not affect blood-formation. The action of (I) on the haemopoietic system is due probably to the presence of Fe and Cu as impurities. The effect of Cu on the marrow is not strengthened by S. R. N. C.

**Effect of dietary supplements of different forms of sulphur on the wool of merino sheep.** C. M. VAN WYK, M. L. BOTHA, and J. G. BEKKER (Onderstepoort J. Vet. Sci., 1935, 5, 177—188).—The daily supplements were: 0.45 g. of cystine, 0.7 g. of a mixture of sulphates, 0.36 g. of KCNS, 5.0 g. of S, and 0.12 g. of S. They had no effect on grease wt., clean wt. and % yield of fleece, mean length, thickness, and fibre wt. NUTR. ABS. (*m*)

**Dipolar theory of sense of odour.** A. MÜLLER (Perf. Essent. Oil Rec., 1936, 27, 202—205).—An attempt to explain the odour of organic compounds in relation to their structure by consideration of the theory of dipole moments. P. G. M.

(A) Second eclosion of the infective larvæ of certain *Trichostrongylidae* in solutions of sodium sulphide and of organic compounds containing sulphur. (B) Behaviour of sterilised exsheathed infective *Trichostrongylid* larvæ in sterile media resembling their environment in ovine hosts. G. LAPAGE (J. Helminthol., 1935, 13, 103—114,

115—128).—(A) Effects of garlic,  $\text{Na}_2\text{S}$ , cysteine, sulphonol, and  $\text{Na}_2\text{S}_2\text{O}_3$  are compared.  $\text{NaOCl}$  was more toxic than these.

(B) The larvæ had a wide  $p_{\text{H}}$  tolerance (3.6—9.6). In media containing sheep serum the longevity of the larvæ was not affected by lactose, fructose, glucose, vitamins, or  $\text{NH}_2$ -acids. Yeast and liver extracts were toxic. CH. ABS. (p)

**Blood-chloride and the renal secretion of urea in mice.** P. FEYEL (Compt. rend., 1936, 202, 507—509).—Increased secretion of urea (I) in the brush-bordered cells following intraperitoneal injection of (I) is accompanied by increased secretion of  $\text{Cl}'$ . Similarly, injection of  $\text{NaCl}$  leads to increased secretion of both (I) and  $\text{Cl}'$ . A. G. P.

**Influence of dietary factors on renal secretion of urea in mice.** P. FEYEL (Compt. rend., 1936, 202, 687—689).—Interrelationships between urea and  $\text{Cl}$  excretion are further examined (cf. preceding abstract). A. G. P.

**Influence of renal secretion of urea on the functioning of the chloride resorption mechanism in the mouse.** P. FEYEL (Compt. rend., 1936, 202, 871—874).—The special cells of the Schweigger-Seidel segment of the kidney of a mouse after a meat diet for 15 days contained more  $\text{Cl}'$  than those of a similar mouse which had received an injection of urea just before examination. The renal secretion of urea is accompanied both by secretion and resorption of  $\text{Cl}'$ . J. N. A.

**Physiological effects of certain aliphatic thiocyanates on the isolated heart preparation from the roach, *Blatta orientalis*.** J. F. YEAGER, A. HAGER, and J. M. STRALEY (Ann. Entom. Soc. Amer., 1935, 28, 256—264).—Thiocyanates are grouped in three classes according to their action in inhibiting the contraction rate of the heart prep.: (i) Me and Et, (ii)  $\text{Pr}^a$ ,  $\text{Pr}^b$ , and Bu, (iii) trimethylene, "butylcarbitol," and diethylene glycol thiocyanates,  $\beta\beta$ -dithiocyanodiethyl ether, and diethylene glycol dithiocyanacetate. Relative activity of the groups is (iii) > (ii) > (i). CH. ABS. (p)

**Pharmacological action and pathological effects of alkyl thiocyanates in relation to chemical constitution and physical-chemical properties.** W. F. VON OETTINGEN, W. C. HUEFER, and W. DEICHMANN-GRUEBLER (J. Ind. Hyg., 1936, 18, 310—336).—Of 8 alkyl thiocyanates studied the lower homologues (Me, Et, etc.) cause stimulation and subsequent paralysis of the medullary centres following subcutaneous injection, whilst octyl and decyl thiocyanate are active only in very large doses, and lauryl and myristyl thiocyanate are almost inactive. The higher homologues irritate the mucous membrane. P. G. M.

**Action of acetone and of ketones present in diabetic blood on the heart.** M. M. BAGOURY (Brit. J. Exp. Path., 1935, 16, 25—33).—Toxicity of  $\text{CH}_3\text{Ac}\cdot\text{CO}\cdot\text{H}$  is > that of  $\text{COMe}_2$ .  $\beta$ -Hydroxybutyric acid (> 1%) has no effect on the heart, its action being attributed to the changes in acid-base equilibrium in the blood. Administration of glucose

and of insulin does not modify the action of the three substances. CH. ABS. (p)

**Action of methylglyoxal on acetoacetic acid.** VI. Liver- and muscle-glycogen after feeding of the ketol and simultaneous injection of insulin. R. STÖHR (Z. physiol. Chem., 1936, 240, 23—25; cf. A., 1935, 1412).—Glycogen (I) formation from  $\text{CH}_3\text{Ac}\cdot\text{CO}\cdot\text{H}$  (II) in the liver of starving rats is inhibited by insulin (III). Compensatory (I) formation in muscle does not occur, the level being diminished. Parallel results with  $\text{AcCHO}$  indicate that (II) is degraded into two 3-C compounds ( $\text{AcCHO?}$ ). (II) does not inhibit (III)-hypoglycæmia. F. O. H.

**Physiological behaviour of trioses and related compounds.** VI. Liver- and muscle-glycogen after feeding of methylglyoxal and simultaneous injection of insulin. R. STÖHR (Z. physiol. Chem., 1936, 240, 26—28; cf. A., 1934, 919).—See preceding abstract. F. O. H.

**Fat and calcium metabolism.** II. Effect of tributyrin on the excretion of calcium by the intestine in the growing rat. A. WESTERLUND (Lantbruks-Högskolans Ann., 1933—1934, 4, 21—31; Chem. Zentr., 1935, ii, 1574).—Tributyrin does not affect Ca excretion. R. N. C.

**Increased cardiac output [after administration of dinitrophenol].** J. V. GALGANI and M. L. TAINTER (J. Pharm. Exp. Ther., 1936, 56, 451—463).—The increased  $\text{O}_2$  consumption of dogs injected with the drug is only partly due to increased cardiac output. H. D.

**Sensitising action of antioxygenic phenols after post-ganglionic enervation of the nictitating membrane.** Z. M. BACQ (Compt. rend. Soc. Biol., 1936, 122, 112—114).—The sensitising action is inhibited by antioxygenic phenols and aminophenols, but not by non-phenolic antioxygens or amines. The action takes place in the tissues. R. N. C.

**Characterisation of the sympathomimetic and parasympathomimetic substances in the blood by dialysis *in vivo*.** J. GAUTRELET, D. BROUN, H. SCHEINER, and E. CORTEGGIANI (Compt. rend., 1936, 202, 1302—1304).—The parasympathomimetic action of carotid or jugular blood is due to the presence of acetylcholine and the sympathomimetic action of the adrenal vein blood to adrenaline. H. G. R.

**Inhibition of autoxidation of adrenaline by the aqueous humour.** F. BONHOMME (Compt. rend. Soc. Biol., 1936, 122, 110—112).—The inhibition is feebler than that exerted by plasma; the inhibiting agents are proteins and ascorbic acid. R. N. C.

**Choline as a factor in the elaboration of adrenaline.** R. L. STEHLE, J. I. MELVILLE, and F. K. OLDHAM (J. Pharm. Exp. Ther., 1936, 56, 473—481).—A possible genetic relationship between choline (I) and adrenaline (II) is investigated by determining the effects on the blood pressure of possible intermediates in the synthesis of (II) from (I). Methyl- $\beta$ -acetoxyethylammonium chloride, m.p. 105°, and  $\beta$ -3 : 4-dihydroxyphenyldimethyl- $\beta$ -hydroxyethylammonium iodide, m.p. 186°, are described. H. D.

**Comparative action of sodium oleate and ricinoleate on lecithin.** G. VALLETTE (Compt. rend. Soc. Biol., 1936, 122, 150—152).—Na ricinoleate clarifies lecithin suspensions at  $p_H$  7.0—9.0, the clarifying power increasing with  $p_H$ . Na oleate only clarifies the suspension at  $p_H > 9.8$ . R. N. C.

**Dephosphorylation processes during phloridzin diabetes in the dog.** A. LAMBRECHTS (Compt. rend. Soc. Biol., 1936, 122, 72—73).—There is no evidence of inhibition by phloridzin of the action of phosphatases. R. N. C.

**Pharmacodynamics of dyes with distinct electrical charges.** A. H. ROFFO and R. L. RAMIREZ (Bol. inst. med. exp., 1931, 8, 99—104).—The action of electro-positive dyes (malachite-green, neutral-red, methylene-blue) on blood pressure and respiration is not appreciably modified by admixture with electro-negative dyes (acid-fuchsin, phenolsulphonephthalein). CH. ABS. (p)

**Toxic action of percutaneously-applied irradiated wool-fat preparations in the sense of hyper-*vitaminosis-D*.** M. SCHIEBLICH and G. PALLASKE (Deut. med. Woch., 1935, 61, 957—960).—Crude wool-fat, lanolin, and eucerin do not generate vitamin-D when irradiated with ultra-violet light, nor do they after irradiation cause calcification of the inner organs when rubbed on the dorsal skin of guinea-pigs. R. N. C.

**Methæmoglobin test for the determination of anti-anæmic efficiency of liver-extracts.** J. F. WILKINSON and W. DEUTSCH (Klin. Woch., 1935, 14, 926—928; Chem. Zentr., 1935, ii, 1586).—The methæmoglobin test is no real indication of the anti-anæmic efficiency and cannot replace clinical methods. H. N. R.

**Ornitho-callicrein.** I. E. WERLE and J. HURTER (Biochem. Z., 1936, 285, 175—191).—Callicrein (I), injected into birds (hen, goose, pigeon, duck), has no effect on the blood pressure, but the fæces and pancreas of birds contain *ornitho-callicrein* (II) which closely resembles (I), having a powerful reducing effect on the blood pressure of birds, but none on that of mammals. (II) is inactivated by heat, *N*-HCl, *N*-NaOH, I,  $H_2O_2$ , and the serum of birds and mammals. In the fæces of birds (II) is accompanied by small amounts of a substance, probably histamine. W. MCC.

**Effect of adrenal and splanchnic denervation on sugar tolerance of dogs.** G. DE TAKATS and F. P. CUTHBERT (Arch. Surg., 1935, 30, 150—161).—The sugar tolerance increased under both conditions. Dogs are more responsive to insulin and less to the hyperglycæmic action of adrenaline. Bilateral vagotomy does not diminish the increased sugar tolerance obtained in these operations. Interruption of the sympathico-adrenal mechanism may cause increased storage or fixation of glycogen in the liver. CH. ABS. (p)

**Fixation of alcohol on the encephalon of rats with experimental alkalosis.** J. LEVY (Compt. rend., 1936, 202, 440—441).—The min. anæsthetic dose of EtOH for normal rats is sufficient for rats with alkalosis produced by NaOH, but insufficient

for those with alkalosis produced by  $Na_2CO_3$ . The hyposensitivity to EtOH of the latter is discussed. H. G. M.

**Blood-alcohol and its relation to intoxication in man.** R. G. TURNER (Proc. Soc. Exp. Biol. Med., 1935, 32, 1548—1552).—Blood-EtOH must be  $> 0.2\%$  to cause noticeable intoxication;  $0.31$ — $0.4\%$  causes marked intoxication,  $0.41$ — $0.5\%$  stupor, and  $> 0.5\%$  coma or death. R. N. C.

**Specific dynamic action and toxicity of synthetic alcohol and fermentation alcohol.** J. KRIZENECKY and F. DIAKOV (Z. Unters. Lebensm., 1936, 71, 149—159).—No important difference was observed, but the synthetic EtOH appeared to contain an impurity with narcotic properties. E. C. S.

**Activity of anæsthetics and their partition in blood.** N. LAZAREV (Compt. rend. Acad. Sci., U.R.S.S., 1936, 1, 237—238).—In the blood of frogs and mammals those anæsthetics which are most powerful exist almost entirely "bound," whilst those which are weak exist chiefly in aq. solution. Probably the hæmoglobin shares in binding the anæsthetics. W. MCC.

**General narcosis with gases, cyclopropane, carbon dioxide, nitrous oxide, ethylene, and oxygen.** A. CHUECO (Semana méd., 1935, I, 1793—1799). CH. ABS. (p)

**Summation of the action of two soporifics on molecular combination.** H. J. FUCHS (Arch. exp. Path. Pharm., 1936, 181, 215—218).—Mol. combinations of diethylbarbituric acid (I) and bromoisovalerylcarbamide have a soporific action  $>$ , and a toxicity  $<$ , that of (I). F. O. H.

**Sodium propylmethylcarbonylallylbarbiturate, a short-acting hypnotic.** E. E. SWANSON (Proc. Soc. Exp. Biol. Med., 1935, 32, 1563—1565). R. N. C.

**Effects of phenacetin and aspirin, respectively, on action of phenobarbital.** A. GILMAN and H. G. BARBOUR (Proc. Soc. Exp. Biol. Med., 1935, 32, 1634—1636). R. N. C.

**Cinchophen (atophan) therapy and the liver.** T. BRUGSCH (Semana méd., 1935, I, 1907—1910).—Cinchophen mobilises uric acid, reduces inflammation, and stimulates hepatic secretion. CH. ABS. (p)

**Ocular reactions due to arsphenamine.** J. J. SKIRBALL and F. M. THURMAN (Amer. J. Syphilis, 1935, 19, 197—209).—Substitution of I', Bi, or Hg for arsphenamine does not affect the return of the eye condition to normal. CH. ABS. (p)

**Purgative constituent of castor oil.** G. VALETTE and R. SALVANET (Compt. rend. Soc. Biol., 1936, 122, 68—70).—Ricinoleic acid prepared by way of the Li salt exerts a purgative action, but not that prepared by way of the Et ester and saponification with LiOH. R. N. C.

**Pharmacological actions of indolyl-N-methyl-harmine.** I. BAKHSH (Quart. J. Pharm., 1936, 9, 37—47; cf. Gunn, A., 1912, ii, 857).—The min. lethal dose of indolyl-N-methylharmine hydrochloride (I) per kg. by subcutaneous injection is  $0.11$  (frog),  $0.038$  (guinea-pig), and  $0.1$  g. (mouse). Toxic doses

cause a descending paralysis of the central nervous system. Small doses increase whilst large doses diminish blood pressure. (I) dilates the coronary vessels in the isolated rabbit's heart. Conc. solutions cause contraction of frog's skeletal muscle, whilst smooth muscle is first stimulated. (I) kills *Paramaecium caudatum* and *Amoeba proteus* in concn. of 1 in 320,000 and 1 in 1,280,000, respectively, in 24 hr. Judged by toxicity (I) is approx. three times as active as harmine. J. N. A.

Relative values of caffeine and hypertonic glucose and saline solutions in reducing cerebrospinal fluid pressure. A. BLAU (Arch. Int. Med., 1936, 57, 749—757).—Reductions obtained on intravenous injection of hypertonic aq. glucose or caffeine-NaOBz were inconsistent and transient, whereas those with 15% saline were uniform and more persistent. H. G. R.

Pharmacology of caffeine and of tea and coffee. G. R. LYNCH (Analyst, 1936, 61, 300—302).—The action of caffeine on the central nervous system, muscular tissue, and kidney is discussed. E. C. S.

[Pharmacology of] twenty-three quaternary ammonium iodides. H. M. LEE, A. M. VANARENDONK, and K. K. CHEN (J. Pharm. Exp. Ther., 1936, 56, 466—472).—The nicotine- and muscarine-like activities of the compounds are compared. d-, m.p. 206.5—207°, and dl-*Methylephedrine methiodide*, m.p. 230—230.5°, d-, m.p. 212—213°, l-, m.p. 211—212°, and dl-*Methyl- $\psi$ -ephedrine methiodide*, m.p. 168.5—169°,  $\beta$ -hydroxy- $\beta$ -phenylisopropyl-dimethyl-ethyl-, m.p. 166—167°, and -benzyl-dimethyl-ammonium iodide, m.p. 188—189°,  $\beta$ -hydroxy- $\beta$ -phenyl- $\alpha$ -ethyl-, m.p. 162—163°, and  $\beta$ -1:2-diethoxyphenyl-ethyl-trimethylammonium iodides, m.p. 245°, *dendrobine methiodide*, m.p. 246°, *tetrandrine dimethiodide*, m.p. 273°, 4- $\beta$ -ethoxyethyl-, m.p. 93—95°, and 4- $\beta$ -acetoxyethyl-morpholine methiodide, m.p. 123.5—124.5°, are described. H. D.

Absorption of drugs through the oral mucosa. II. III. Fat-water solubility coefficient of alkaloids. R. P. WALTON (Proc. Soc. Exp. Biol. Med., 1935, 32, 1486—1488, 1488—1492).—III. Absorption of drugs with high oil-H<sub>2</sub>O solubility coeffs. is > of those with relatively low coeffs. R. N. C.

[Pharmacology of] morphine, codeine, and their derivatives. XII. Isomerides of morphine and dihydromorphine. N. B. EDDY (J. Pharm. Exp. Ther., 1936, 56, 421—431; cf. A., 1936, 517).—The pharmacological activities of  $\alpha$ -,  $\beta$ -, and  $\gamma$ -isomorphine and of their H<sub>2</sub>-derivatives were compared among themselves and with those of analogous codeine derivatives. H. D.

Pharmacology and therapeutics of curare and its constituents. R. WEST (Proc. Roy. Soc. Med., 1935, 28, 565—578).—Fractionation of the active constituents is described. Tubocurarine and curine are examined. CH. ABS. (p)

Eupaverine in relation to papaverine and visammin. K. SAMAAAN (Quart. J. Pharm., 1936, 9, 23—36).—Eupaverine (I) and papaverine (II), injected intravenously into dogs, have a min.

lethal dose of 60 and 40 mg. per kg., respectively. In the toad, rabbit, and dog, (I) depresses the heart and relaxes all types of smooth muscle by direct action on the muscle fibres, but the degree of action varies greatly. The relative actions of (I), (II), and visammin of antagonising the effect of Ba<sup>++</sup> vary with different types of plain muscle. The low toxicity of (I) compared with (II) is offset by its insolubility. J. N. A.

Analgesic and respiratory action of the morphine group. W. KEIL and F. H. POHLS (Arch. exp. Path. Pharm., 1936, 181, 285—291).—The course and extent of analgesic and respiratory action (the latter being produced by smaller doses than is the former) of morphine alkaloids (I) in rabbits were determined. Morphinised animals have a diminished sensitivity to (I). F. O. H.

Emetic action of lobelanine and lobelanidine. A. CLEMENTI (Arch. exp. Path. Pharm., 1936, 181, 265—272).—Toxicity and emetic and respiratory action were determined in dogs, rabbits, and frogs. F. O. H.

Respiratory stimulating action of lobeline and carbon dioxide on the morphinised respiratory centre in rabbits. B. BEHRENS and W. GRAUBNER (Deut. med. Woch., 1934, 60, 1675—1677). R. N. C.

Relation between nicotine and the sexual hormone I. Lethal dose of nicotine and sexual difference. II. Effect of castration and sexual hormone on nicotine activity. III. Effect of nicotine on morphological and histological changes of female sex organs after injections of female sexual hormones. IV. Antidotal action of luteohormone on nicotine toxicity during anaphylaxis. (A) Effect of nicotine on blood-sugar, blood pressure, and anaphylaxis. (B) Effect of luteohormone on anaphylaxis. (C) Effect of nicotine with luteohormone on anaphylaxis. V. Discussion and conclusion. Y. C. LEE (J. Severance Union Med. Coll., 1935, 2, 80—86, 87—107, 108—127, 128—155, 156—159).—The greater resistance of female animals to the action of nicotine is due to the production of luteohormone. CH. ABS. (p)

Role of glycaemic response to nicotine. Tobacco smoking and blood-sugar. W. J. McCORMICK (Amer. J. Hyg., 1935, 22, 214—220).—Injection of adrenaline into rabbits prior to administration of nicotine reduces the toxic action of the latter. Hyperglycaemia caused by smoking is a protective response and results in decreased potential muscular energy, through lowering the body-reserve of glycogen. CH. ABS. (p)

Determination of the average lethal dose in the biological assay of digitalis by the frog method. K. O. MÖLLER (Quart. J. Pharm., 1936, 9, 7—22).—A method by which the average lethal dose (LD 50) can be determined on 30—40 frogs (kept at a const. temp.) by means of a mortality curve is described. The statistical determination of LD 50 is discussed. "Summer frogs" are much more resistant to digitalis than "winter frogs." J. N. A.

**Antagonistic effect of iodides in baldness and toxicity due to thallium acetate.** O. V. HYKES and F. A. DIAKOV (Nature, 1936, 137, 871).—In addition to KI (cf. A., 1935, 1533), LiI, NaI, and  $MgI_2$  largely counteract the toxic effects in rats due to  $TlOAc$ . L. S. T.

**Influence of diet on the toxicity of mercurochrome and of nearsphenamine.** R. WIEN (Quart. J. Pharm., 1936, 9, 48—59; cf. Burn and Elphick, B., 1930, 881).—The sensitivity of mice towards mercurochrome and nearsphenamine varies with different diets which, however, have no influence on liver-glycogen. J. N. A.

**Ability of rats to discriminate between diets of varying degrees of toxicity.** K. W. FRANK and V. R. POTTER (Science, 1936, 83, 330—332).—Rats are able to detect and differentiate between small quantities of Se in foodstuffs. Sub-lethal injections of  $Na_2SeO_3$  cause a voluntary starvation even when normal diets are offered. L. S. T.

**Toxic wheat grown on soils containing selenium.**—See B., 1936, 515.

**Toxicity of carbon tetrachloride; animal exposures and field studies.** H. F. SMYTH, H. F. SMYTH, jun., and C. P. CARPENTER (J. Ind. Hyg., 1936, 18, 277—298).—100 p.p.m. of  $CCl_4$  vapour are safe for continuous daily exposure of workmen. At a level of 50—400 p.p.m., damaged liver and kidney cells regenerate with increased resistance. P. G. M.

**Toxicity and potential dangers of phenylhydrazine zinc chloride.** W. F. VON OETTINGEN, W. DEICHMANN-GRUEBLER, and W. C. HUEPER (J. Ind. Hyg., 1936, 18, 301—309).—This double salt is less toxic than  $NHPh \cdot NH_2$  (I) as judged by subcutaneous injection in rats; the min. lethal dose is 0.25 mg. as opposed to 0.18 mg. per g. and its effect is more prolonged. Unlike (I), it does not evolve toxic vapours when heated to 100—170°. It destroys red cells and reduces the hæmoglobin content of the blood, but to a smaller degree than (I). It produces more pronounced skin irritation than (I). P. G. M.

**Influence of diet on toxicity of ethylhydrocupreine hydrochloride.** A. J. NEDZEL (J. Lab. Clin. Med., 1935, 20, 944—945).—Rabbits fed exclusively on oats are more, and those on a diet of carrots less, sensitive to ethylhydrocupreine than are those on a mixed diet. Differences are attributed to variations in acid/base ratio resulting from the diets. CH. ABS. (*p*)

**Chronic poisoning by aniline. Acute poisoning by *p*-phenylenediamine.** A. BUZZO, R. CARRATALA, and C. MARTINEZ (Rev. crim. psychiat. med. legal, 1931, 18, 427—433).—Cases are described. Methods of detecting  $p\text{-C}_6\text{H}_4(\text{NH}_2)_2$  are given. CH. ABS. (*p*)

**Hypoglycæmia as a result of agaric (*Amanita phalloides*) poisoning.** L. BINET and J. MAREK (Compt. rend., 1936, 202, 1219—1220).—Aq. extracts, subcutaneously (10 mg. per kg.) or orally administered to dogs, cause a marked hypoglycæmia and uræmia followed by death in several hr. Rabbits show convulsions, and the liver is rendered glycogen-

free. Extracts of non-toxic agarics do not produce these effects. J. L. D.

**Snake venom.** F. MICHEEL and F. JUNG (Z. physiol. Chem., 1936, 239, 217—230).—The dried venom of *Naja flava* when purified by ultrafiltration, dialysis, and fractional pptn. with  $\text{COMe}_2$  at the isoelectric point ( $p_H$  about 7.0) yields an extremely active ( $0.12 \times 10^{-6}$  g. is min. lethal dose per g. for mice) neurotoxin (I), mol. wt. 2500—4000, containing C, H, O, N, S, and combined mineral matter. (I) is stable at  $p_H$  2—8, especially if glycerol is present, but is inactivated by  $O_2$  and reactivated by cysteine at  $p_H$  2—3. (I), which is related to the proteins, probably contains a thiolactone group, but no free  $\cdot\text{SH}$ . The venom also contains a poison having about 12% of the activity of (I). The poison from the venom of vipers *Crotalus adamanteus*, *C. terrificus*, *Bothrops jararaca*, and *Ancistrodon piscivorus* also contains S, has mol. wt.  $\gg$  that of (I), and is more sensitive to attack by acid and alkali. Its stability is greatest at  $p_H$  5.8—6.0. In the venom it is accompanied by a dialysable activator. Albumin, albumose, and (in greater amount) peptone also activate the poison to the same extent. W. McC.

**Ascorbic acid oxidase from drumstick, *Moringa pterygosperma*.** M. SHRINIVASAN (Current Sci., 1935, 4, 407—408).—Drumstick press juice contains an enzyme system (prep. described) which is capable of oxidising ascorbic acid (I) and is inactivated when boiled or treated with  $\text{CCl}_3\text{CO}_2\text{H}$  (cf. Szent-Gyorgi's hexoxidase; A., 1931, 533). The oxidation of (I) occurs best at  $p_H$  5.3 and 37°, and is unimol.; the rate  $\propto$  the quantity of enzyme and is independent of (I) concn. The reaction is inhibited by  $\text{CN}^-$  and  $\text{H}_2\text{S}$  (0.001*M*). Guaiacum, pyrocatechol, pyrogallol, and  $p\text{-C}_6\text{H}_4(\text{NH}_2)_2$  are not oxidised except in presence of  $\text{H}_2\text{O}_2$ . EtOH and  $\text{COMe}_2$  destroy the (I)-oxidising constituent, but leave the peroxidase unaffected. The conclusions of Tauber *et al.* (A., 1935, 1023) concerning the existence of a sp. enzyme capable of oxidising (I) are thus confirmed. H. G. M.

**Mechanism of oxidation processes. XLIV. Dehydrogenating enzyme system of *Acetobacter peroxydans*.** I. H. WIELAND and H. J. PISTOR (Annalen, 1936, 522, 116—137).—EtOH (0.11—0.67*M*) is dehydrogenated to  $\text{MeCHO}$  and a little  $\text{AcOH}$  by *A. peroxydans* (I) in  $O_2$  at  $p_H$  4.5—7 (reaction is retarded considerably at higher  $p_H$ );  $\text{CO}_2$  is not produced. Reaction with 0.05*M*-EtOH is almost completely inhibited by KCN (*M*/4000—*M*/8000) and  $\text{H}_2\text{O}_2$  (*M*/160—*M*/230; *M*/800 has little effect) and retarded by  $\text{NaN}_3$  (*M*/2000—*M*/4000) and  $\text{CN}\cdot\text{ONa}$  (*M*/5000—*M*/10000). Little conversion of  $\text{MeCHO}$  into  $\text{AcOH}$  occurs in  $\text{N}_2$ , indicating absence of mutase.  $\text{H}_2\text{O}_2$  formed during dehydrogenation could not be detected. Since EtOH is also dehydrogenated by (I) +  $\text{H}_2\text{O}_2$  in  $\text{N}_2$  or air, and (I) is free from catalase, the  $\text{H}_2\text{O}_2$  formed is probably used immediately in the respiratory process. When suspensions of (I) are shaken with  $\text{H}_2$  a small amount is absorbed; subsequent addition of  $\text{H}_2\text{O}_2$  (*M*/270) causes rapid consumption of the  $\text{H}_2$  until all  $\text{H}_2\text{O}_2$  has disappeared, but the residue is still able to effect aerobic dehydrogenation of EtOH. The enzyme system prob-

ably contains peroxidase and dehydrogenase. The organism contains cytochrome but no porphyrins.

H. B.

**Amino-acid dehydrogenase. I. Proline dehydrogenase.** N. B. DAS (Biochem. J., 1936, 30, 1080—1087).—A purified dehydrogenase from pig's kidney oxidises *dl*-proline more readily than *d*-alanine, *dl*-phenylalanine, or leucine. Codehydrogenases I and II, flavin-enzyme, glutathione, adenylyl pyrophosphate, and ascorbic acid do not activate the dehydrogenase. When the enzyme solution is heated at 80° at  $p_H$  8 for 5 min. and then added to the original enzyme prep., there is an activation of the oxidation of proline.

J. N. A.

**Liver enzymes. VI. Citric acid dehydrogenase.** L. REICHEL and A. NEEFF (Z. physiol. Chem., 1936, 240, 163—178; cf. A., 1935, 1162; this vol., 242).—The dehydrogenase (I) is purified by fractional pptn. with  $COMe_2$  and with  $COMe_2-Et_2O$ -light petroleum (3:1:1). Adsorption on kaolin and  $Al_2O_3$  followed by elution is not advantageous but electrodialysis is satisfactory. The activity, which is measured, after removal of protein with  $p-C_6H_4Me-SO_3H$ , by determination of residual citric acid as Ca salt, is optimal at  $p_H$  7.6 (pptn. and inactivation at 3.4) with 0.0033*M*-substrate, the max. effect being attained in 3 hr. (I) acts in presence and absence of  $O_2$ . No activity is lost on dialysis and addition of cozymase is without effect, a coenzyme being probably not required.

W. McC.

**Oxidase-like action of certain complex metal salts.**—See this vol., 805.

**Flavins and metabolism. I. Flavins and amylolysis.** A. J. CHARIT. II. Flavins and proteolysis. A. J. CHARIT and N. V. CHAUSTOV (Compt. rend. Acad. Sci. U.R.S.S., 1935, 4, 215—218, 219—224).—I. Lactoflavin and a flavin-containing liver extract exert no influence on amylolysis by diastase or salivary amylase outside the cell, when used alone or in presence of Fe salts or aspartic acid.

II. The oxidised form of flavin under aerobic conditions does not activate the digestion of proteins by trypsin, the action of papain, or the autolytic process of muscle-tissue.

H. G. M.

**Free and bound amylase of barley.** K. MYRBACK and S. MYRBACK (Biochem. Z., 1936, 285, 282—289; cf. this vol., 245).—In general, the liberation of bound amylase (I) in barley is caused only by proteolytic enzymes and is increased by substances (e.g., HCN) which activate these enzymes. Prolonged action of papain (II) on ungerminated barley does not cause destruction of (I). Probably the  $\beta$ -amylase of barley exists partly free and partly bound, the action of (II) consisting in liberating more (I) not in activation.

W. McC.

**Hydrolysis of starch by vegetable amylases. I.** K. MYRBACK (Biochem. Z., 1936, 285, 290—293).—Starch (I), oxidised with I, is hydrolysed by  $\alpha$ -(II) and  $\beta$ -amylase (III) to the same extent as is untreated (I). Malt-amylase (IV) has a more powerful action than have (II) and (III), the action of (II) being slight. Dextrin obtained from (I) by the action of (III) is very slightly affected by (III), is first rapidly

(up to 30% hydrolysis), then slowly attacked by (IV), and is rapidly and extensively attacked by (II). Hence (III) leaves unattacked a component of (I) which is hydrolysed by (II).

W. McC.

**Effect of acetylcholine hydrochloride on the amylolytic activity of pancreatin.** F. CAUJOLLE and R. MONNET (Compt. rend. Soc. Biol., 1936, 121, 1570—1572).—The activity of pancreatic amylase *in vitro* is increased.

R. N. C.

**Malt diastases. II.**—See B., 1936, 565.

**Emulsin. XXVI. Action of osmium tetroxide on sweet almond-emulsin.** B. HELFERICH and F. VORSATZ (Z. physiol. Chem., 1936, 239, 241—256; cf. A., 1935, 783; this vol., 243).—The  $\beta$ -glucosidase (1 unit) of the emulsin (I) is inactivated by  $OsO_4$  (25 mg.), the effect not being due to oxidation, which proceeds much more slowly. Aq.  $H_2S$  and cysteine (II) (1 mol. for each equiv. of active O from  $OsO_4$  has max. effect) if added before oxidation has gone far restore much of the activity. Probably (II) acts by reducing  $OsO_4$ , and no inactivation occurs if (II) and  $OsO_4$  are mixed before adding to (I). The action of  $OsO_4$  is not affected by *l*-proline, indole, and *d*-alanine, but *l*-histidine and ascorbic acid have a slight protective effect. Tryptophan (approx.  $\propto$  its amount) intensifies the action of  $OsO_4$ , the effect being partly counteracted by  $H_2S$  and (II).

W. McC.

**Liberation of the zymase system from the yeast cell by autolysis.** R. NILSSON and F. ALMR (Z. physiol. Chem., 1936, 239, 179—187).—The zymase (I) is extracted partly from fresh and almost completely from dried brewer's yeast by shaking with  $H_2O$  if the extraction is preceded by a sufficiently long period of autolysis. No (I) is liberated by plasmolysis with sugar or glycerol.

W. McC.

**Activator of zymohehexase.** E. BAUER (Z. physiol. Chem., 1936, 239, V; cf. Meyerhof *et al.*, A., 1934, 927).—The activator occurs in dialysed muscle extract. Thermodynamic equilibrium in the reaction hexosediphosphoric acid + 2 dihydroxyacetonephosphoric acid is not attained with dil. solutions of zymohehexase chiefly because of the absence of the activator.

W. McC.

**Nature of cozymase.** K. MYRBACK (Svensk Kem. Tidskr., 1936, 48, 100—103; cf. A., 1935, 1278).—The behaviours of cozymase (I), ouabain, and  $\Delta^2$ -angelicalactone towards oxidising agents indicate that (I) contains a lactone ring, probably 6-membered with two double linkings.

M. H. M. A.

**Cozymase as a phosphate carrier.** R. VESTIN (Z. physiol. Chem., 1936, 240, 99—112).—In dialysed extract of rat's muscle, cozymase (I) and (I) inactivated by heat hydrolyse phosphopyruvic acid (II) and phosphocreatine and act as phosphate carriers in the transfer of  $PO_4$  from (II) to creatine. Heat-inactivated (I) is usually more effective than (I), and is sometimes as effective as adenylic or adenosinetriphosphoric acid.

W. McC.

**Chemistry of highly purified cozymase.** H. VON EULER, H. ALBERS, and F. SCHLENK (Z. physiol. Chem., 1936, 240, 113—126).—Methods of puri-

fication are described. The products of acid-hydrolysis include adenine, nicotinamide, and a pentose-phosphoric acid which together constitute about 60% of the purest material. Cozymase is a dibasic acid each mol. of which takes up 6 I from alkaline solution. W. McC.

**Inhibition of glycolysis by heavy metals. Re-activation by Warburg's co-enzyme and Euler's cozymase.** T. WAGNER-JAUREGG and H. W. RZEPPA (Z. physiol. Chem., 1936, 240, I—IV).—Low concns. of Cu, Fe<sup>++</sup>, and Fe<sup>+++</sup> (but not Zn or Cd) inhibit production of lactic acid (I) from hexose-phosphoric acid in dialysed frog's muscle extract containing MgCl<sub>2</sub> and adenosine triphosphate (II). Warburg's co-enzyme (III) and Euler's cozymase (IV) (75 mol. to 1 of metal) counteract the effect, the amount of (I) then produced being > double that produced with (II) and (III) or (II) and (IV) alone. Cysteine and glutathione counteract much less effectively than do (III) and (IV), whilst adenylic acid from muscle and KCN are inactive. W. McC.

**Mechanism of cerebral glycolysis.** F. P. MAZZA and C. MALAGUZZI-VALERI (Boll. Soc. ital. Biol. sperim., 1935, 10, 725—727).—Brain extract induces the four reactions of the Embden-Meyerhof glycolysis cycle, and, like muscle extract, contains zymohexase and a dialysable co-enzyme, apparently the same as that of muscle. F<sup>-</sup> inhibits breakdown of phosphoglyceric acid (I); it does not interfere with formation of lactic acid (II) from  $\alpha$ -glycerophosphoric acid (III) and AcCO<sub>2</sub>H (IV), but inhibits liberation of H<sub>3</sub>PO<sub>4</sub>. CH<sub>2</sub>I-CO<sub>2</sub>H partly inhibits formation of (II) from (I) and (III), or from (IV) and (III), but does not inhibit breakdown of (I). R. N. C.

**Control of the enzymic action of lipase.** R. ITOH (Nature, 1936, 137, 783).—A substance (I), m.p. 130°, [ $\alpha$ ]<sub>D</sub><sup>18</sup> -77°, which controls the reversible action of lipase, has been isolated from *Ricinus* seed. The EtOH solution exhibits blue-violet fluorescence and two absorption bands with max. at 314 and 285 m $\mu$ . The Liebermann-Burchardt sterol reaction, the Cuboni reaction for oestrogenic hormone, and the vanillin-H<sub>3</sub>PO<sub>4</sub> reaction for bile acid are positive, but the Salkowski reaction for sterol and the Gregory reaction for bile acid are negative. The reduced form of (I) activates the hydrolysis of fat by the *Ricinus* lipase and inhibits the synthesis from glycerol and oleic acid. The oxidised form acts in the reverse manner. L. S. T.

**Castor bean lipase and its activator.** E. TAKAMURA (Proc. Imp. Acad. Tokyo, 1936, 12, 73—74).—From castor seeds have been isolated (a) a highly active lipase giving no reactions with Molisch, biuret, and sterol reagents but an active Millon test, and (b) an activator (I) in the form of needles. The enzyme catalyses both the synthesis and the hydrolysis of oils. (I) has a moderate effect on both processes, but after air oxidation it has an increased action on synthetic but not on the hydrolytic process. After oxidation with H<sub>2</sub>O<sub>2</sub> (I) strongly retards both processes. W. O. K.

**Role of bile acids in the enzymic synthesis of cholesterol.** S. V. NEDSVEDSKI (Z. physiol. Chem.,

1936, 239, 165—166; cf. A., 1935, 1416).—In absence of salts of bile acids, pancreatic lipase (in H<sub>2</sub>O) is destroyed in 24 hr. When Na glycocholate is added, the lipase remains almost unaltered for  $\leq$  10 days.

W. McC.

**Glyoxalase and its co-enzyme. II. Kidney-glyoxalase.** K. NAGAYA, S. YAMAZOYE, and S. NAKAMURA (J. Biochem. Japan, 1936, 23, 41—56).—The difference between kidney- and other tissue-glyoxalases is due to an inhibitory substance (I) in kidney tissue. The inhibition occurs after reaction of (I) with glutathione (II), the reaction product combining with AcCHO at the same rate as does free (II), the respective final products being differentiated by only that from free (II)-AcCHO decompose with glyoxalase to give lactic acid and (II). F. O. H.

**Enzymic hydrolysis of acetylcholine by serum.** E. KAHANE and J. LEVY (Compt. rend., 1936, 202, 781—783).—The "activity" (defined) of serum is const. when there is < 5% of serum in a 0.18—1.8% solution of acetylcholine chloride; it decreases with  $p_H$ , is zero at  $p_H$  6, and increases with rise of temp. to 38°. Serum is inactivated at 70° and by pptn. (EtOH, COMe<sub>2</sub>) of the proteins: dialysates and ultrafiltrates are inactive. J. L. D.

**Variations of the proteolytic activity of kinase-activated pancreatic juice as a function of the quantity of kinase.** M. GUILLAUMIE (Compt. rend. Soc. Biol., 1936, 122, 51—53).—The quantity  $T$  of trypsin produced by a quantity  $x$  of kinase is given by  $T = 70x^{0.49}$ . R. N. C.

**Enzymic histochemistry. XIII. Distribution of enzymes in the stomach of pigs as a function of its histological structure.** K. LINDERSTRÖM-LANG, H. HOLTER, and A. S. OHLSEN (Compt. rend. Trav. Lab. Carlsberg, 1935, 20, No. 11, 66—127).—The enzyme contents of the different portions of the stomach, and curves of the variation of the enzyme content with the distance below the inner surface, are given. HCl is found chiefly in the parietal cells of the fundus at 0.5 mm. depth, pepsin in the chief cells at 2 mm., peptidase in the chief cells of the stomach and the cylinder and Brunner cells of the duodenum, and esterase in the epithelial cells and interstitial tissues.

R. N. C.

**Digestive enzymes in cephalopods.** C. ROMIJN (Acta Brev. neerl. Physiol., 1935, 5, 14—15; Chem. Zentr., 1935, ii, 1385—1386).—The salivary glands of *Sepia officinalis* contain no digestive enzymes. The combined digestive juices of the liver and pancreas at  $p_H$  5.4 contain amylase, tributyrinesterase, proteinase, carboxy- and amino-polypeptidases, and dipeptidase, but no disaccharase, and cannot hydrolyse castor oil. The pancreatic but not the liver-protease requires activation by enterokinase, which can be replaced by extract of the caecum walls, but not by glutathione or H<sub>2</sub>S. The enzymes show optimum activity at neutral or weakly acid  $p_H$ . R. N. C.

**Phosphatases. I. Reaction mechanism of phosphatase from bone.** M. LORA Y TAMAYO and F. SEGOVIA. II. New preparation of a phosphatase from bone. M. LORA Y TAMAYO and J. R. BLANCO (Anal. Fis. Quím., 1936, 34, 363—375,

376—382).—I. The rate of hydrolysis at 38° of Na  $\beta$ -glycerophosphate (I) by phosphatase (II) isolated by the method of Martland *et al.* (A., 1929, 603) from the bones of a young rabbit  $\propto$  the sq. root of the time and the sq. root of the concn. of (II). Optimum conditions are 0.05M solution, at 40°, and  $p_H$  9.7. Ultra-violet irradiation slightly retards the hydrolysis. The optimum  $p_H$  for the hydrolysis of Na  $\alpha$ -glycerophosphate is the same for (I).

II. Agitation of the bones of young rabbits with aq. EtOH containing EtOAc and PhMe yields a new phosphatase more active than (II). F. R. G.

**Accelerant effect of  $\alpha$ -amino-acids on the activity of bone-phosphatase.** O. BODANSKY (J. Biol. Chem., 1936, 114, 273—288).—Low concns. of  $\alpha$ -NH<sub>2</sub>-acids prevent the rapid diminution of the rate of hydrolysis of Na  $\beta$ -glycerophosphate by bone phosphatase (I); the optimal concns. differ for the various acids. Mg<sup>++</sup> has a similar influence, but also increases the initial rate of hydrolysis. With optimal concns. of Mg<sup>++</sup> and glycine (II) the reaction velocity  $\propto$  (I) concn. (II) retards the inactivation of (I) at room temp. H. D.

**Serum-phosphatase in normal young rabbits.** P. D. ROSAHN (Proc. Soc. Exp. Biol. Med., 1935, 32, 1601—1603).—Between 15 and 71 days serum-phosphatase falls linearly with increasing age and wt. R. N. C.

**Separation of  $\alpha$ -glycerophosphatase and pyrophosphatase from bottom yeast.** E. BAUER (Z. physiol. Chem., 1936, 239, 195—206; cf. this vol., 380). The phosphatases of bottom yeast contain 10 times as much pyrophosphatase (I) as  $\alpha$ -glycerophosphatase (II). (I) and (II) differ as regards effect of [H<sup>+</sup>], substrate concn., and activation by Mg<sup>++</sup>. (II) is freed from (I) by adsorption on Al<sub>2</sub>O<sub>3</sub> at  $p_H$  8.6. W. McC.

**Kinetics of cell respiration. I. Rate of oxygen consumption by *Saccharomyces Wanching* as a function of  $p_H$ .** P. S. TANG (J. Cell. Comp. Physiol., 1936, 7, 475—493).—The effect of  $p_H$  varies with the buffer employed. O<sub>2</sub> consumption falls logarithmically in the OAc<sup>-</sup> buffers, but less rapidly in the PO<sub>4</sub><sup>---</sup> and phthalate buffers until a limiting [H<sup>+</sup>] is reached beyond which O<sub>2</sub> consumption falls steeply to zero. In BO<sub>3</sub><sup>---</sup> buffer, respiration falls linearly from  $p_H$  7.7 to 8.9, then increasing to 9.8. The difference of the effects of  $p_H$  in the acid and alkaline ranges suggests the existence of two different respiratory systems in the yeast cells. Respiration is inhibited at high [H<sup>+</sup>] and partly restored on returning to low [H<sup>+</sup>] after an induction period depending on the magnitude of [H<sup>+</sup>] and the time of exposure. R. N. C.

**Selective fermentation. III. Fermentation of hexose-pentose mixtures.** H. SOBOTKA, M. HOLZMAN, and M. REINER (Biochem. J., 1936, 30, 933—940).—Fermentation by brewer's yeast of glucose and to a greater extent of fructose is retarded in the presence of xylose and to a smaller extent of arabinose, the effect being observed in all sugar concns. tested (0.8—6.7%) and with yeast concns. from 0.16 to 15.0% under aerobic and anaerobic conditions. The effect ran parallel with the ratio of the concns. of pentose to hexose, leading sometimes to almost complete sup-

pression of fermentation. The fermentation, although slower, proceeds further, the total CO<sub>2</sub> evolved being often greater. Competitive diffusion of these sugars into the yeast cell is the major factor in the mechanism of this effect. Studies of diffusion permit the differentiation of extracellular, intracellular, and chemically bound H<sub>2</sub>O in yeast. P. W. C.

**$\beta$ -Alanine and "bios."** R. J. WILLIAMS and E. ROHRMAN (J. Amer. Chem. Soc., 1936, 58, 695).—The growth of various yeasts (Wildiers; "Gebrüder Mayer"; Lash Miller; "Rasse M") on a medium containing inositol (5 mg. per litre) in addition to sugar and salts, is stimulated by  $\beta$ -alanine (I) (10<sup>-6</sup> g. per 12 c.c. of culture; with 10<sup>-10</sup> g. inhibition is often found); "old process" yeast responds similarly but requires vitamin-B<sub>1</sub> as a necessary supplement. (I) is effective only in the absence of asparagine. H. B.

**Influence of crystalline hormones on the growth of certain yeasts.** A. P. WEBER (Compt. rend., 1936, 202, 517—519).—*Rhodotorula suganii* and *R. glutinis* var. *Sailoi* are stimulated by folliculin and dihydrofolliculin benzoate and inhibited by heteroauxin. Six other yeasts examined were unaffected by either substance. A. G. P.

**Pharmacological and therapeutic action of fresh yeast. I. Effect on blood-indican. II. Effect on blood-sugar.** U. SAMMARTINO (Arch. Farm. sperim., 1936, 61, 13—23, 24—33).—I. Fresh Fleischmann's yeast diminishes blood-indican in digestive or entero-hepatic disorders, previous dieting not affecting the result.

II. Oral administration of yeast gradually reduces the hyperglycæmia occurring during skin disease etc. R. N. C.

**Inhibition of the Pasteur effect.** K. C. DIXON (Nature, 1936, 137, 742).—A discussion. L. S. T.

**Mechanism of enzyme action. XIII. Phosphorylation and alcoholic fermentation of sugars. Biochemistry of *Fusarium lini*.** B. I. F. F. NORD, E. DAMMANN, and H. HOFSTETTER [with V. SENFTNER and E. ROSDORFF] (Biochem. Z., 1936, 285, 241—269; cf. A., 1933, 982).—In the fermentation of pentoses and hexoses and in the dehydrogenation of alcohols by *F. lini* (living and dried) inorg. P begins to disappear usually 2—5 days after the action and CO<sub>2</sub> is liberated. *F. lini* ferments *d*-xylose (no phosphorylation occurring) and *d*-arabinose. In the absence of inorg. P fermentation is slight, but reaches rates comparable with those of yeast fermentation on addition of inorg. P. No phosphorylation occurs. Accompanying morphological changes indicate that P is involved in rebuilding and buffering the cells. W. McC.

**Alleged necessity for initial phosphorylation in alcoholic carbohydrate degradation.** F. F. NORD, E. DAMMANN, and H. HOFSTETTER (Naturwiss., 1936, 24, 297).—The fermentation of hexoses and pentoses by both living and dried *Fusarium lini*, B., is not necessarily preceded (although it may be accompanied) by esterification of inorg. PO<sub>4</sub><sup>---</sup>. W. O. K.

**Role of formic acid in the biochemical formation of oxalic acid.** B. S. BUTKEVITSCH and L. K.

OSNIZKAJA (Compt. rend. Acad. Sci. U.R.S.S., 1936, 1, 361—364).—Proof that the  $\text{H}_2\text{C}_2\text{O}_4$  (I) produced by moulds is derived from the mycelium (A., 1934, 1263) is given by the following observations. The amount of (I) formed by films of *A. niger* at 30° is not affected by varying the  $[\text{HCO}_2\text{Na}]$  in the solution, and only slightly by replacing this salt completely by  $\text{NaHCO}_3$ . In 6%  $\text{Na}_2\text{HPO}_4$  solution (I) accumulates rapidly at first, but ceases after 2—3 days in the case of 2 day-old films, and after 5 days with films 3 days old, the accumulated (I) amounting to 70% of the loss in wt. of the mycelium. Such exhausted films no longer produce (I) in 1%  $\text{HCO}_2\text{Na}$  or 1.23%  $\text{NaHCO}_3$ , but readily do so (without change in wt.) from 2%  $\text{NaOAc}$ . J. W. B.

**Metabolism of *Aspergillus niger*. I. Effect of phytin on the metabolism.** W. BRAUN and A. FREY (Biochem. Z., 1936, 285, 219—227).—The wt. of the mycelium and the amount of sugar consumed by *A. niger* increase with increasing inorg. and org. P [ $\text{KH}_2\text{PO}_4$  and phytin (I) with 20% of P] content of the medium. Very small amounts of P suffice for max. production of acid by *A. niger*, the P being completely utilised. Acid production varies with the form in which N is given, decreasing with increasing supply of P if the N supply is partly org., but the form in which the N is given has less effect than has that in which P is given. Unconsumed (I) is for the most part hydrolysed by phytase which passes into the solution. When (I) is supplied the P consumption is always > that when inorg. P is given. W. McC.

**Citric acid fermentation. I. Carbon balance.** P. A. WELLS, A. J. MOYER, and O. E. MAY (J. Amer. Chem. Soc., 1936, 58, 555—558).—A C-balance for a strain of *A. niger* grown on a medium containing glucose (I) as the sole source of C is prepared; the final distribution of the C is given. The ratio wt. of citric acid (II) : wt. of  $\text{CO}_2$  produced is that required by a process involving the breakdown of (I) in a manner analogous to that occurring in alcoholic fermentation. The wt. yields of (II) are also the max. obtainable by any process involving decarboxylation of  $\text{AcCO}_2\text{H}$  as one stage (cf. Bernhauer *et al.*, A., 1932, 1168); Emde's mechanism (A., 1935, 407) is similarly excluded. H. B.

**Production of kojic acid from xylose by *Aspergillus flavus*.** H. N. BARHAM and B. L. SMITS (Ind. Eng. Chem., 1936, 28, 567—570).—The fermentation of xylose (I) by *A. flavus* was carried out over 4 years, with only moderate change in kojic acid (II) production. Using a medium containing (I),  $\text{NH}_4\text{NO}_3$ ,  $\text{KH}_2\text{PO}_4$ , and  $\text{MgSO}_4$ , yields of > 20% of (II) were obtained. The effect of variation  $\text{PO}_4^{'''}$ ,  $\text{NH}_4\text{NO}_3$ , (I), and Mg concns. and of  $p_{\text{H}}$  has been investigated. Fe and Ca usually inhibit and Zn has no effect on the fermentation. P. W. C.

**Chemistry of mould tissue. XI. Isolation of leucine and isoleucine from *Aspergillus sydowi*.** D. W. WOOLLEY and W. H. PETERSON (J. Biol. Chem., 1936, 114, 85—90).—Leucine and isoleucine [*p*-toluenesulphonate, m.p. 124° (corr.)] have been obtained by extraction of the dried, defatted mycelium with  $\text{COMe}_2$ . H. G. R.

**Fungicidal power of phenol derivatives. II. Strength in presence of proteins.** G. J. WOODWARD, L. B. KINGERY, and R. J. WILLIAMS (J. Lab. Clin. Med., 1935, 20, 950—953; cf. A., 1935, 409).—Activity of many fungicides in aq. or broth suspensions is lowered by the presence of proteins. The action of I,  $\text{BzOH}$ ,  $\text{Na}_2\text{S}_2\text{O}_3$ , salicylic acid, hexylresorcinol, and chlorothymol is reduced or inhibited by vesicle fluid, blood-serum, or hide powder. Thymol is active in presence of hide powder, but is inhibited by serum or vesicle fluid.  $\text{NaOCl}$  retains its activity in high concns. of proteins. CH. ABS. (p)

**Composition of plankton. I. Plankton from the Ekaterininski pond at Detskoie Selo.** A. VINOGRADOV (Trav. lab. biogeochem. Acad. Sci. U.R.S.S., 1, 33—48).—Analyses are given. CH. ABS. (p)

**Growth curves of *Polytoma uvella*: effect of oxygenation.** P. B. ROTTIER (Compt. rend. Soc. Biol., 1936, 122, 65—68).—The rate of growth is increased by oxygenation. R. N. C.

**Action of various organic antimony compounds on *Schistosoma japonicum* in vitro.** C. M. LEE and H. L. CHUNG (Proc. Soc. Exp. Biol. Med., 1935, 32, 1400—1403).— $\text{Sb}^{\text{III}}$  compounds are more effective than  $\text{Sb}^{\text{V}}$ , and tartar emetic than Fouadin. R. N. C.

**Action of chemotherapeutics on the trypanosome cell.** E. SINGER (Z. Hyg., 1936, 117, 752—756). R. N. C.

**Effect of ethylurethane on bacterial respiration and luminescence.** G. W. TAYLOR (J. Cell. Comp. Physiol., 1936, 7, 409—415). R. N. C.

**Variability in the activity of bacterial enzymes. I. Effect of age of culture.** W. R. WOOLDRIDGE, R. KNOX, and V. GLASS (Biochem. J., 1936, 30, 926—931).—The dehydrogenase activity of many bacterial cells varies considerably with the period between inoculation and reaping of the organism, increasing at first and subsequently decreasing. The max. activity usually occurs within the first 24 hr. of growth but it could not be definitely correlated with the logarithmic phase of growth. P. W. C.

**Oxidation-reduction potentials of some non-sporulating obligate anaerobes.** G. M. DACK and W. BURROWS (Proc. Soc. Exp. Biol. Med., 1935, 32, 1441—1443).—The  $E_h$  curve shows only moderate falls, never reaching  $-300$  mv.; it rises directly lysis begins. R. N. C.

**Relation between respiration and the growth of aerobic bacteria.** J. HIRSON (Rev. Fac. Sci. Univ. Istanbul, 1936, 1, 44—60).—During the linear phase of growth of aerobic bacteria the  $\text{O}_2$  uptake  $\propto$  the increasing bacterial concn. in the culture. During the following period of diminishing growth the  $\text{O}_2$  consumption, after reaching a max., decreases and finally becomes const. at a very low val. during the stationary phase. The increase of  $\text{O}_2$  consumption associated with growth may be made the basis of a manometric method of measuring growth rates. W. O. K.

**Effect of electrolytes added to growth medium on electrophoretic potential of *Esch. coli*.** G. W.

PEARCE, M. W. LISSE, and R. P. TITSLER (Proc. Soc. Exp. Biol. Med., 1935, 32, 1572—1573).—The migration velocity is slightly reduced by  $\text{CaCl}_2$ , increased by  $\text{Na}_2\text{SO}_4$ , and scarcely affected by  $\text{NaCl}$ ,  $\text{AlCl}_3$ , or  $\text{Na}_3\text{PO}_4$ . Adjustment of the initial  $\mu\text{H}$  over the range  $0.8 \pm 1.9$  does not alter the electrophoretic velocity of organisms by  $> 2.5\%$ . R. N. C.

Isolation of the growth factor of pathogenic bacteria. S. HOSOVA, Y. KUWASHIMA, S. KAYO, M. ODA, and K. KAGABE (Proc. Imp. Acad. Tokyo, 1936, 12, 67—69).—From a commercial syrupy condensed extract of the fish, scumbar, a non-hygroscopic grey-white granular substance has been separated which stimulates the growth of *Staphylococcus aureus* and *B. botulinus* on a medium containing alkali hydrolysate of peptone or gelatin, arginine, cysteine hydrochloride, glucose, and salts. Other substances were obtained which acted on *S. aureus* only. W. O. K.

Microbial variants of *B. aertryke* and possible variation in the chemical constitution of its complete somatic antigen. M. CIUCA, L. MESROBIANU, and G. BADENSKI (Compt. rend., 1936, 202, 1314—1316).—On macerating a culture with its metabolic products, a variant obtained yields an antigen serologically identical, but with a different stability in  $\text{H}_2\text{O}$ . H. G. R.

Dehydrogenase of the S and R forms of *B. coli*. E. SORU (Compt. rend. Soc. Biol., 1936, 121, 1647—1649).—When acting as H donor, the rate of decolorisation of methylene-blue by the S form is  $>$  that by the R form. R. N. C.

Hæmatoxins in gas gangrene. J. CELAREK and S. STETKIEWICZ (Compt. rend. Soc. Biol., 1936, 122, 143—144).—Toxins of *B. perfringens* and *B. autematis* purified by pptn. with  $(\text{NH}_4)_2\text{SO}_4$  or adsorption from COMe, with  $\text{BzOH}$  are less toxic to animals than in the crude state; the hæmolytic titre is unchanged. Adsorption with  $\text{BzOH}$  gives better yields of both toxins and hæmolysins than pptn. with  $(\text{NH}_4)_2\text{SO}_4$ . R. N. C.

Immuno-chemistry. I. Preparation and properties of a specific polysaccharide from *B. dysenteriae*, Shiga. W. T. J. MORGAN (Biochem. J., 1936, 30, 909—925).—A modified method is described for the isolation from the "smooth" form of *B. dysenteriae*, Shiga, and purification of a sp. polysaccharide (I) which accounts completely for the serological specificity of the organism and has the following properties:  $[\alpha]_D^{20} + 98^\circ$ , N 1.61%, mol. wt. calc. from NaOI titre 5100, yields 97% of reducing sugars on acid hydrolysis with complete loss of sp. immunological properties, acid equiv. about 9000, negative oreinol, phloroglucinol, naphthorescinol, and protein-tests,  $\text{Ac}$ ,  $[\alpha]_D^{20} + 71^\circ$  and Bz derivative,  $[\alpha]_D^{20} + 63^\circ$ , from both which the original (I) can be regenerated. The N of (I) does not react with  $\text{HNO}_3$  and is therefore probably present as substituted  $\text{NH}_2$ . (I) contains 5% of  $\text{Ac}$ , isolated after acid hydrolysis as  $\text{AcOAg}$ , and this and the N content both fit the requirements of a basic unit consisting of  $\frac{1}{2}$  mol. of hexose with 1 mol. or acetamidohexose (II), such unit appearing from the 1 reduction to be repeated 6 times in the (I) mol.

Colour reactions are used to follow quantitatively the liberation of (II) during acid hydrolysis and the subsequent deacetylation and these indicate that the whole of the N in the hydrolysis products is present as aminohexose. The crude (I) contains, in addition to (I), agar-like polysaccharides, (a)  $[\alpha]_D^{20} - 60^\circ$ , N 5.2%, (b)  $[\alpha]_D^{20} - 20^\circ$ , N 0.6%, which react with anti-agar bodies of immune horse serum, a polysaccharide,  $[\alpha]_D^{20} + 195^\circ$ , identified as glycogen and a substance,  $[\alpha]_D^{20}$  N 14.1%, sol. in 96%  $\text{AcOH}$ . P. W. C.

Analysis of the hydrophile colloids in *B. paratyphosus* colonies. L. BIRCH-HIRSCHFELD (Z. Hyg., 1935, 117, 626—634).—The mucous growth on the colonies is due to a sol. colloidal substance containing acid groups but no N, that can be hydrolysed to 40% of glucose (I) and other weakly- or non-reducing substances. It forms a stable viscous solution in  $\text{H}_2\text{O}$ . Cultures grown at  $37^\circ$  contain small quantities of another hydrophile substance, which can be hydrolysed to a N-rich protein, and a polysaccharide giving 80% of (I) by further hydrolysis. R. N. C.

Cultural studies in the *Salmonella* group, with particular reference to organic acids. F. KAUFFMANN and F. A. BURON (Z. Hyg., 1935, 117, 660—661).—The organisms fall into distinctive fermentative types according to their action on tartrate, citrate, and mucate. R. N. C.

Staphylococcal leucocidin (Neisser-Wechsberg type) and antileucocidin. J. WRIGHT (Lancet, 1936, 230, 1002—1004). A modification of the Neisser-Wechsberg technique for the determination of these substances is described. Their relationship to hæmolysis and antihæmolysis has also been investigated. L. S. T.

Medium for production of staphylococcal toxins. G. RAMON, A. BRETHERLOT, and G. AMOUT (Compt. rend., 1936, 202, 515—516).—Preps. from veal-broth cultures have high toxicity and antigenic activity. A. G. P.

Bacteriophage phenomena in cultures of lactic Streptococci. H. R. WHITEHEAD and G. A. COX (J. Dairy Res., 1936, 7, 55—62).—The isolation of bacteriophages from "starter" cultures is described. Aeration stimulates development of the phage. A. G. P.

Bacterial flora of foremilk and of rennet extract with special reference to acid proteolytic types. N. R. KNOWLES (J. Dairy Res., 1936, 7, 63—74).—Proteolytic cocci are more abundant in old than in fresh rennet samples or in foremilk. These strains probably contribute to the final breakdown of protein degradation products in ripening cheese. A. G. P.

A lactobacillus from Californian wine: *Lactobacillus hilgardii*. H. C. DOUGLAS and W. V. CRESS (Food Res., 1936, 1, 113—119).—The organism, isolated from  $> 20$  samples of dry, red and white wines, ferments glucose, fructose, and xylose with production of acid (mainly lactic and  $\text{AcOH}$ ) but not  $\text{CO}_2$  gas. The optimum temp. of growth is  $31\text{--}37^\circ$ , death occurring within 1 min. at  $63^\circ$ . The max. tolerated  $[\text{EtOH}]$  is 18%. R. C.

Optical properties of fermentation lactic acid.  
 III. Action of inactive lactic acid-producing organisms on optically active lactic acids added to fermentation liquids. H. KATAGIRI and K. KITAHARA (J. Agric. Chem. Soc. Japan, 1936, 12, 281—283; cf. this vol., 247).—Differences in rates of racemisation of *d*- and *l*-lactic acids by *Lactobacillus plantarum* and *L. pentoceticus* are examined.  
 A. G. P.

Biology of *B. cellulosa dissolvens*. Y. KHOUVINE and K. SOETERS (Compt. rend. Soc. Biol., 1936, 122, 59—61).  
 R. N. C.

Enzyme formation and polysaccharide synthesis by bacteria. II. A. CARRUTHERS and E. A. COOPER (Biochem. J., 1936, 30, 1001—1009; cf. A., 1935, 1419).—*B. lactis* synthesises a fructosan polysaccharide from sucrose (I) only. When *Leuconostoc dextranicum* is incubated with (I) the resulting solution, after removal of the formed dextran (II), contained fructose, yet incubation with glucose alone gave little or no (II). Small quantities of EtOH extracts of molasses accelerate growth and (II) formation; this effect is not explained by the added N. The large-scale prep. of (II) from 20% (I) is described.  
 H. D.

Curve of production of glyoxalines related to histamine in some bacterial cultures. M. LEGER, L. DUCHON, A. LESURE, and A. THOMAS (Compt. rend. Soc. Biol., 1936, 121, 1591—1593).—Glyoxaline production by *B. pyocyaneus* (particularly young cultures) and *B. putrificus* is high; it is lower by *B. typhosus*, and almost negative by *B. coli*. It reaches a max. in the first few weeks, afterwards falling; proteins at the same time fall to a steady min. val.  
 R. N. C.

Occurrence of sterols in bacteria. R. H. SIFFERD and R. J. ANDERSON (Z. physiol. Chem., 1936, 239, 270—272; cf. Hecht, A., 1935, 663). The unsaponifiable part of the fat of *Azotobacter chroococcum* yielded a mixture (0.13% of the fat), m.p. 156—158°,  $[\alpha]_D -16^\circ$  in  $\text{CHCl}_3$ , of sterols. The properties of the mixture resembled those of ergosterol rather than those of the usual animal and vegetable sterols.  
 W. McC.

Oxidation of amino-acids by *Bacillus pyocyaneus* (*Pseudomonas aeruginosa*). M. D. WEBSTER and F. BERNHEIM (J. Biol. Chem., 1936, 114, 265—271).—The  $\text{NH}_2$ -acids studied fell into three classes: (a) leucine, isoleucine, and histidine, only the natural isomerides of which were attacked; (b) phenylalanine and valine, of which non-natural isomerides increased the  $\text{O}_2$ -uptake of the bacteria without undergoing de-amination, whilst the natural isomerides were attacked; (c) alanine, serine, tyrosine, and proline, both isomerides of which were rapidly attacked. 0.005*M*-KCN inhibited oxidation and de-amination, whilst 1% NaF or urethane was without influence.  
 H. D.

Lipins of tubercle bacilli. XLIV. Comparative study of lipins of human tubercle bacillus. J. A. CROWDER, F. H. STODOLA, M. C. PANGBOON, and R. J. ANDERSON (J. Amer. Chem. Soc., 1936, 58, 636—642).—Cultures of four recently isolated

strains (A10, A12, A13, A14) and a new batch of H37 (cf. A., 1927, 1111), grown under identical conditions, are extracted with EtOH and  $\text{Et}_2\text{O}$ ; the extracted material is then separated into sol. [further separated into fat (I) and -insol. phosphatide (II)] and  $\text{H}_2\text{O}$ -sol. fractions [containing the polysaccharide previously described *cit.*]. Further extraction with  $\text{CHCl}_3$  followed by EtOH- $\text{Et}_2\text{O}$  removes wax (that from H37 contains little or no sterol). Combined lipins are then isolated from the bacterial residue with EtOH- $\text{Et}_2\text{O}$  containing 1% HCl; these are sterol-free. The amounts of the various fractions obtained vary considerably. All the (II) isolated have low N contents and generally resemble that previously described (*loc. cit.*). The const. of the (I) show considerable variation and indicate the presence of 26 of free fatty acids. The (I) from A12 and H37 contain small amounts of phthocol (III); hydrolysis gives (III), trehalose (but no glycerol), anisole, stearic, tuberculo-stearic, and phthoic acids, and an optically active OII-acid of high mol. wt. The (I) contain 2.47—17.7% of unsaponifiable matter; that from A12 appears to contain a little sterol.  
 H. B.

Influence of temperature on nitrogen fixation by *Azotobacter*.—See B., 1936, 562.

Nodule bacteria. V. Influence of plant extract as accessory substance on the growth of the bacteria. A. ITANO and A. MITSURU (Ber. Ohara Inst. landw. Forsch., 1936, 7, 185; cf. A., 1935, 530).—Growth of the organisms was accelerated by extracts of seedlings and of germinated and ungerminated seeds in the (descending) order named. Optimum concns. differed with the species of plants examined, being greater for nodule-bearing than for non-nodule-bearing legumes, with non-legumes exhibiting an intermediate effect. The action of the extracts is ascribed to the presence in them of growth-accessory substances rather than to their N or inorg. matter contents.  
 A. G. P.

Hypothesis concerning bacteriophage. J. G. WILLIAMS (J. Physiol. Chem., 1936, 40, 477—479). The theory is advanced that phage is a suspension of extremely small crystals of one or more of the compounds in the homologous bacteria. Bacteriophage is thus the seedling of these amorphous compounds by phage particles and their subsequent crystallisation.  
 M. H. H.

Cultivation of poliomyelitis virus. R. JOHNSON (Science, 1936, 83, 324—325). A discussion.  
 L. H. P.

Bacteriocidal effects of vapours from crushed garlic. L. WALTON, M. L. MORGAN, and O. C. LANDERSON (Food Res., 1936, 1, 163—169). The bacteria were grown on agar subjected for various periods to the vapour. Growth of *B. subtilis* (spores) was inhibited after 4 hr. treatment, that of *Serratia marcescens* after 2 hr., and that of *Mycobacterium butyricum* and *M. smegmatis* after 32 min. Boiled and autoclaved garlic were ineffective.  
 B. C. B.

Comparison of resistance of bacteria and embryonic tissue to germicidal substances. V. Iodine. A. J. HALL and A. R. LAZARUS (Proc.

Soc. Exp. Biol. Med., 1935, 32, 1481—1483).—I has the min. toxicity index and max. PhOH coeff. of all the germicides studied (cf. A., 1935, 1421).

R. N. C.

Bactericidal action of mercury on *B. coli* in continuously flowing water. M. LISBONNE and R. SEIGNEURIN (Compt. rend. Soc. Biol., 1936, 122, 18—20).

R. N. C.

Is the pressor effect of a glycerol extract of adrenal glands due to adrenaline? R. G. HOSKINS and J. S. GOTTLIEB (Endocrinol., 1936, 20, 188—191).—The amount of adrenal medullary material extracted has no effect on the pressor effect of the extract, which suggests that the agent responsible is not adrenaline. It is considered to be different from cortin.

R. N. C.

Local adrenaline effect after sympathectomy. I. Peripheral vessels. A. M. WRIGHT, J. H. MULHOLLAND, K. L. MCCLOSKEY, and F. W. COTUI (J. Lab. Clin. Med., 1935, 20, 947—949).

CH. ABS. (p)

Vagotonin and adrenalinæmia. D. SANTENOISE, L. MERKLEN, C. FRANCK, and M. VIDACOVITCH (Compt. rend. Soc. Biol., 1936, 121, 1567—1569).—Vagotonin increases adrenalin secretion.

R. N. C.

Effect of various cortico-adrenal extracts on diphtheria toxin *in vivo* and *in vitro*. R. L. ZWEMER and C. W. JUNGBLUT (Proc. Soc. Exp. Biol. Med., 1935, 32, 1583—1588).

R. N. C.

Effect of cortico-adrenal extract on the course of bacterial intoxications in guinea-pigs. R. W. WHITEHEAD and C. A. FOX (Endocrinol., 1936, 20, 93—99).

R. N. C.

Effects of cattle anterior pituitary extracts and potassium iodide on liver-glycogen in guinea-pigs. R. HOLDEN and E. W. THURSTON (Proc. Soc. Exp. Biol. Med., 1935, 32, 1417—1419).—The depression of liver-glycogen (I) by intraperitoneal injections of anterior pituitary extracts is not modified by previous or simultaneous oral administration of KI. KI alone reduces (I) moderately.

R. N. C.

Effects of human anterior pituitary gland on sex organs and thyroid gland of the guinea-pig. P. KUNKEL and L. LOEB (Proc. Soc. Exp. Biol. Med., 1935, 32, 1413—1417).

R. N. C.

Effect of various anterior pituitary gland preparations on thyroidectomised guinea-pigs. K. C. MORRIN and L. LOEB (Proc. Soc. Exp. Biol. Med., 1935, 32, 1425—1427).

R. N. C.

Effect of an alkaline extract of the anterior pituitary on the weight of the spleen and adrenal glands and on the blood-calcium level. H. B. FRIEDGOOD (Endocrinol., 1936, 20, 159—169).—The spleen and cortex are increased in wt. and blood-Ca rises.

R. N. C.

Calorigenic action of extracts of the anterior lobe of the pituitary in man. W. O. THOMPSON, S. G. TAYLOR, 3rd., P. K. THOMPSON, S. B. NADLER, and L. F. N. DICKIE (Endocrinol., 1936, 20, 55—63).—Thyrotropic hormone increases basal metabolism in every group of patients where the thyroid tissue can still function. Thyroxine and desiccated thyroid

produce calorogenic effects in patients who have become refractory to pituitary extracts. R. N. C.

Action of anterior pituitary hormones on basal metabolism of normal and hypophysectomised pigeons and a paradoxical effect of temperature. O. RIDDLE, G. C. SMITH, R. W. BATES, C. S. MORAN, and E. L. LAHR (Endocrinol., 1936, 20, 1—16).—Prolactin (I), like thyrotropic hormone (II), exhibits calorogenic action, but does not act through the thyroid. Follicle-stimulating hormones and prolactin are without effect, as are also luteinising and adrenotropic hormones when free from (I) and (II). (I) and (II) injected simultaneously act synergistically to one another on O<sub>2</sub> consumption. "Growth-hormone" preps. usually contain (I) and (II). The calorogenic effect is reduced by decreasing the temp. from 32° to 20°.

R. N. C.

Effect of injections of antuitrin-S on the sexually inactive male ground squirrel. B. L. BAKER and G. E. JOHNSON (Endocrinol., 1936, 20, 219—223).

R. N. C.

Substances affecting the ovary from the anterior pituitary and from pregnancy urine. H. W. NIEMEIER (Klin. Woch., 1935, 14, 576).—A follicle-stimulating but non-luteinising substance (I) is obtained from the urine of cancer. Another principle that is inactive *per se* but causes luteinisation when combined with (I) is obtained from pregnancy urine or the anterior pituitary.

R. N. C.

Relation of potency of anterior pituitary-like hormone to hydrogen-ion concentration. C. A. ELDEN and M. D. FELLOWS (Proc. Soc. Exp. Biol. Med., 1935, 32, 1597—1599).—Potency is max. at  $p_H$  6.1—7.3; it is scarcely affected by acid, but varies with the alkali content, being greatly reduced by addition of NaOH, but less changed by an alkaline  $p_H$  which develops on storage for 3 months in the cold. The hormone may be protein-like in nature, or carried down with foreign protein at the isoelectric point,  $p_H$  6.1.

R. N. C.

(A) Habituation to the anterior pituitary hormone. (B) Production of antihormone in serum of resistant animals. E. GUYENOT, E. HELD, and A. MOSZKOWSKA (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 10—12, 12—14).—(A) When guinea-pigs are treated for 30—40 days with anterior pituitary extracts, they become resistant to the action of the hormones which affect the thyroid and the adrenal cortex and to the crinogenic action (which results in the inhibition of œstrus). The auxogenic action on the development of the ovarian follicle and probably the luteinising action does not show this phenomenon of habituation.

(B) The action of anterior pituitary hormone on the thyroid, adrenal cortex, and the crinogenic action on the ovary of the guinea-pig is inhibited by the serum of another guinea-pig made resistant by prolonged treatment with the hormone, the action on the ovary being less complete than that on the other organs. Antibodies are probably formed in the blood of the resistant animals. No evidence could be obtained of the formation of antibodies

against the luteinising or auxogenic actions of the hormone.

W. O. K.

**Chemical changes in the muscle of the hypophysectomised toad.** A. D. MARENZI (Endocrinol., 1936, 20, 184—187).—Asthenia following removal of the whole pituitary or anterior lobe is accompanied by fall of glycogen, inorg. P, phosphocreatine, and glutathione in skeletal muscle, and by reduced production of lactic acid during tetanic stimulation. Grafts or extracts of the glandular or intermedio-neural lobe of the pituitary relieve asthenia, and cause increases of the above constituents that do not usually reach normal.

R. N. C.

**Oxytocic hormone of posterior lobe of pituitary gland.** J. M. GULLAND and S. S. RANDALL (Chem. and Ind., 1936, 442—443).—The evidence adduced by Sealock and du Vigneaud (A., 1935, 1275) that the oxytocic principle contains a reducible ·S·S· is not conclusive because the agent employed, cysteine, is not sp. for ·S·S·. It is possible that the redox system with  $E_0' - 0.190$  volt at  $p_H$  6.0 is actually a ·S·S· ·SH system and that the second redox system with  $E_0' - 0.025$  volt at  $p_H$  6.0 is due to a group of as yet unknown nature (cf. Gulland and Randall, *ibid.*, 542).

W. O. K.

**Depressor substances in the posterior lobe of the pituitary.** E. LARSON (J. Pharm. Exp. Ther., 1936, 56, 396—416).—Histamine (I) was present in aq. extracts of the COMe<sub>2</sub>-sol. and -insol. material of the posterior lobe; EtOH extracts of the latter contained (I) whilst aq. extracts with EtOH gave a ppt. which exhibited oxytocic but not depressor activity.

H. D.

**Antagonism between posterior lobe pituitary hormones and insulin.** H. C. ELLSWORTH (J. Pharm. Exp. Ther., 1936, 56, 417—420).—Small doses of the oxytocic hormone depress, and large doses completely inhibit, insulin hypoglycaemia in dogs; the pressor fraction has little or no effect.

H. D.

**Absence of follicle-stimulating hormone in pituitaries of young pigeons.** O. RIDDLE and J. P. SCHOOLEY (Proc. Soc. Exp. Biol. Med., 1935, 32, 1610—1614).—The hormone appears 1.8 months after hatching in pigeons and 2.5 months after in ring-doves.

R. N. C.

**Uterine response to pitocin.** M. R. WHITE and J. P. PRATT (Endocrinol., 1936, 20, 17—23).

R. N. C.

**Reaction of fish to sex hormones.** S. E. OWEN (Endocrinol., 1936, 20, 214—218).

R. N. C.

**Relation of sex hormones to calcium metabolism in the bone marrow.** O. ARNOLD, F. HOLTZ, and H. MARX (Naturwiss., 1936, 24, 314—317).—The hypocalcaemia and tetany, which accompanies parathyroid deficiency, may be counteracted by administration of the ergosterol derivative contained in the prep. "A.T. 10." During pregnancy and lactation the quantity of "A.T. 10" required increases several-fold, due, probably, to the presence in the body of increased amounts of sex hormone.

W. O. K.

**Effect of endocrine gland preparations on allergic reactions (anterior pituitary extract, pregnancy urine extract, follicular hormone).** B. SOLOMONICA and R. KURZROK (Endocrinol., 1936, 20, 171—173).

R. N. C.

**Pathological conditions induced by oestrogenic compounds in the coagulating gland and prostate of the mouse.** H. BURROWS (Amer. J. Cancer, 1935, 23, 490—512).—Application of ketohydroxy- and trihydroxy-cestrin to the skin of the interscapular region caused lesions in the coagulating gland and the prostate in mice.

CH. ABS. (p)

**Effects of cestrin injections on accessory reproductive organs of the male ground squirrel (*Citellus tridecemlineatus*).** L. J. WELLS (Anat. Rec., 1936, 64, 475—497).

R. N. C.

**Effect of cestrin on the pituitary gland.** W. CRAMER and E. S. HORNING (Lancet, 1936, 230, 1056—1057; cf. this vol., 504).

L. S. T.

**Lack of effect of theelin on somatogenic, thyrotropic, and adrenotropic activity of pituitary.** H. B. SHUMACKER, jun., and A. LAMONT (Proc. Soc. Exp. Biol. Med., 1935, 32, 1568—1570).

R. N. C.

**Induction of an acid vaginal secretion in the immature macaque by injections of cestrin.** B. V. HALL and R. M. LEWIS (Endocrinol., 1936, 20, 210—213).—The  $p_H$  of the fluid is depressed at least 2 units.

R. N. C.

**Folliculin and carbohydrate metabolism.** J. A. COLLAZO and F. B. MARTI (Ann. Méd., 1935, 38, 383—388).—Injection of pure folliculin into bitches caused a 30% increase in blood-sugar and a 96% increase in lactic acid.

NUTR. ABS. (m)

**Paradoxical action of folliculin (menformone) in male animals; effect of male hormone.** S. E. DE JONGH (Arch. int. Physiol., 1935, 50, 348—378; Chem Zentr., 1935, ii, 1569).

R. N. C.

**Preparation of the gonadotropic hormone of pregnant mare's blood.** E. L. GUSTUS, R. K. MEYER, and O. R. WOODS (J. Biol. Chem., 1936, 114, 59—63).—The hormone has been obtained from citrated plasma by selective adsorption on Al(OH)<sub>3</sub>, elution at  $p_H$  3.5, and filtration through a Pasteur-Chamberland filter at  $p_H$  8.3.

H. G. R.

**Two gonadotropic substances in mare serum.** F. J. SAUNDERS and H. H. COLE (Proc. Soc. Exp. Biol. Med., 1935, 32, 1476—1478).—The serum contains a stable luteiniser and a gonadotropic hormone which is destroyed by treatment with H<sub>2</sub>S and incubation, and has not been identified as the follicle-stimulating hormone of Fevold and Hisaw.

R. N. C.

**Effect of oestrogenic hormones on lactation in the cow.** S. J. FOLLEY (Nature, 1936, 137, 741—742).—Administration of oestrogenic hormone to a lactating cow produces a marked diminution in the daily milk yield, but increases the non-fatty solids content and the milk-phosphatase concn. Secretion of milk-fat is a process not closely related to that of other milk-solids.

L. S. T.

**Excretion of ovarian hormone by sows during pregnancy.** M. STRUCK (Deut. tierärztl. Woch., 1935, 43, 260—263; Chem. Zentr., 1935, ii, 1568).—Ovarian hormone excretion in the urine occurs in the 3rd and 4th week, ceases at the 5th, and reappears in the 11th or 12th, thence increasing until parturition, after which it disappears for 14 days. R. N. C.

**Extraction of both œstrin and gonadotropic hormones from a single blood sample.** S. C. FREED (Endocrinol., 1936, 20, 224—225).—Citratd blood is poured into 5 vols. of  $\text{COMe}_2$ , and the ppt. is removed by centrifuging and washed with  $\text{COMe}_2$ . The combined filtrate and washings are evaporated, the residue is extracted with  $\text{Et}_2\text{O}$ , and the  $\text{Et}_2\text{O}$  evaporated off after addition of oil as solvent; the solution contains œstrin. Gonadotropic hormones (I) are extracted from the  $\text{COMe}_2$  ppt. with 50%  $\text{EtOH}$  at  $p_H$  4.4, pptd. with 95%  $\text{EtOH}$ , and extracted twice with a buffer solution at  $p_H$  4.4, which is pptd. twice with 95%  $\text{EtOH}$ , (I) being removed by centrifuging. R. N. C.

**Specificity of the oviduct test for follicular hormone.** W. FLEISCHMANN and S. KANN (Klin. Woch., 1935, 14, 644).—The positive reaction given by male hormone (I) preps. such as Testosan is due to their contents of female hormone; cryst. (I) is inactive. R. N. C.

**Problem of standardisation of follicular hormone and its derivatives.** W. SCHOELLER, M. DOHRN, and W. HOHLWEG (Klin. Woch., 1935, 14, 826—827). R. N. C.

**Excretion of prolan in essential hypertension.** M. SCARF and S. L. ISRAEL (Endocrinol., 1936, 20, 180—183). R. N. C.

**Gonadotropic substance from teratoma of the testis.** S. C. FREED and A. COPPOCK (Proc. Soc. Exp. Biol. Med., 1935, 32, 1589—1591). R. N. C.

**Testicular hormone and Sebright plumage.** C. H. DANFORTH (Proc. Soc. Exp. Biol. Med., 1935, 32, 1474—1476). R. N. C.

**Synthesis of  $\Delta^1$ -dehydroandrosterone.**—See this vol., 854.
